To specify a particular tool directly without allowing the CNC to select a tool, use the following format:

M_ T_ ;

> **NOTE**
> A block for specifying the above command must not contain any other command.

M_ M code set in parameter No. 13252
T_
  If bit 0 (TCF) of parameter No. 13200 is 0:
    Upper 4 digits: Cartridge number (output to <Fn026 to Fn027>)
    Lower 4 digits: Pot number (output to <Fn028 to Fn029>)

If the T code command is not longer than 4 digits, it is output to <Fn026 to Fn027> of the PMC on the assumption that the cartridge number is 1.
To specify a spindle position or standby position, set the pot number to 0.

  Upper 4 digits: Cartridge number (11, 21)
  Lower 4 digits: 0001

If bit 0 (TCF) of parameter No. 13200 is 1:
  Any number from 0 to 99,999,999

If bit 0 (TCF) of parameter No. 13200 is 1 (outputting a T code directly to the output signal), the binary value of the specified T code is output to <Fn026 to Fn029> without modification.

> **NOTE**
> Pot numbers must not exceed 9999.

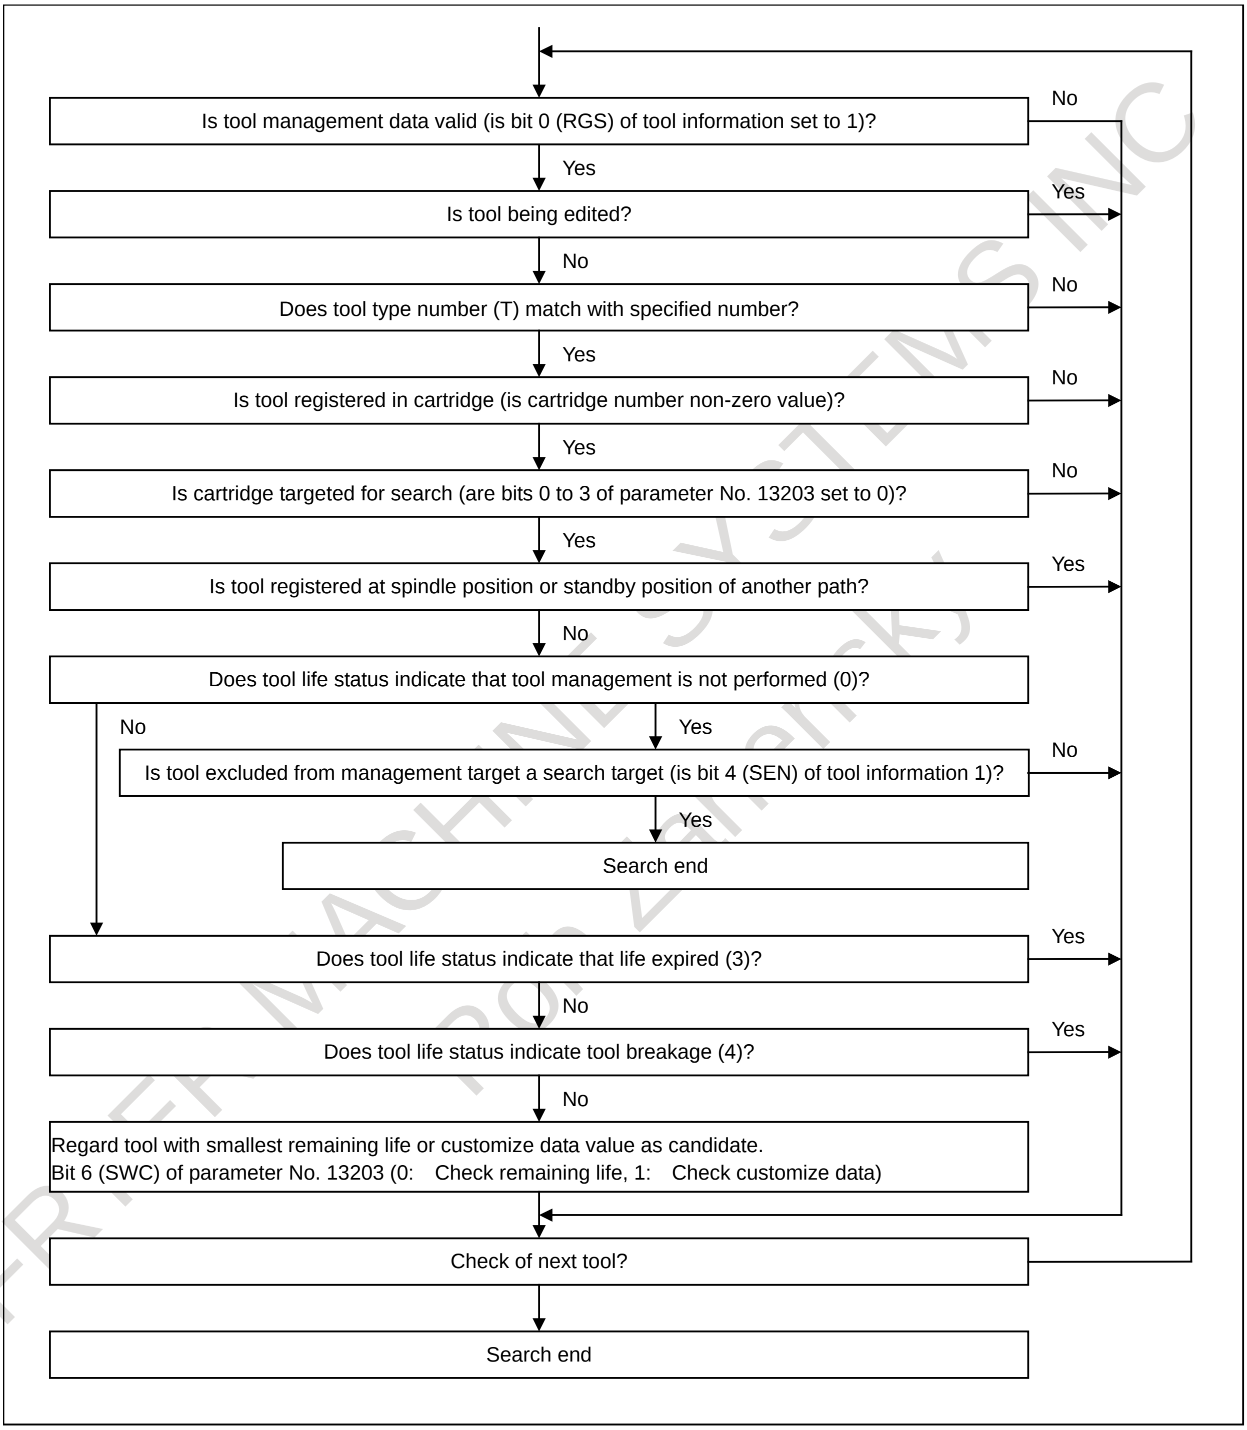
- Search by customize data

If bit 6 (SWC) of parameter No. 13203 is 0, a tool with the shortest life is searched for. If SWC is 1, a tool whose customize data with an arbitrary number holds the smallest is searched for. When SWC is set to 1, the number of the customize data by which a search operation is to be made is set in parameter No. 13260. When 3 is set in parameter No. 13260, the registered tools are searched to find a tool whose customize data 3 holds the smallest. If 0 is set in parameter No. 13260, a tool with the shortest life is searched for.

The customize data by which a search operation is to be made ranges from 1 to 99,999,999. If a negative value is set, its absolute value is assumed. If 0 is set, the tool is regarded as an invalid tool and is excluded from the tools to be searched.

- Tool search order

Tools having a tool type number (T) specified by a program are searched sequentially from tool management data number 1 while registered data contents are checked. The following shows how a search operation is made within the NC:



- System variables

The following tool management data (Table 11.3.1 (c)) of the tool being used as a spindle after a tool change by M06 and the tool to be used next which is specified by a T code can be read through custom macro variables:

Table 11.3.1 (c)

Being used	Item	
#8401	Data number	
#8402	Tool type number (T)	
#8403	Tool life counter	
#8404	Maximum tool life value	
#8405	Tool notice life value	
#8406	Tool life status	
#8407	Customize data 0 (bit)	
#8408	Tool information	
#8409	Tool length compensation number (H)	For machining center systems
#8410	Cutter compensation number (D)	
#8411	Spindle speed (S)	
#8412	Cutting feedrate (F)	
#8413	Tool geometry compensation number (G)	For lathe systems
#8414	Tool wear compensation number (W)	
#8431	Customize data 1	
#8432	Customize data 2	
#8433	Customize data 3	
#8434	Customize data 4	
#8435	Customize data 5	
#8436	Customize data 6	
#8437	Customize data 7	
#8438	Customize data 8	
#8439	Customize data 9	
#8440	Customize data 10	
#8441	Customize data 11	
#8442	Customize data 12	
#8443	Customize data 13	
#8444	Customize data 14	
#8445	Customize data 15	
#8446	Customize data 16	
#8447	Customize data 17	
#8448	Customize data 18	
#8449	Customize data 19

#8451	Customize data 21	
#8452	Customize data 22	
#8453	Customize data 23	
#8454	Customize data 24	
#8455	Customize data 25	
#8456	Customize data 26	
#8457	Customize data 27	
#8458	Customize data 28	
#8459	Customize data 29	
#8460	Customize data 30	
#8461	Customize data 31	
#8462	Customize data 32	
#8463	Customize data 33	
#8464	Customize data 34	
#8465	Customize data 35	
#8466	Customize data 36	
#8467	Customize data 37	
#8468	Customize data 38	
#8469	Customize data 39	
#8470	Customize data 40	

When a cartridge number of a spindle position (11 to 14) or standby position (21 to 24) is specified in #8400, information about the corresponding position can be read.
If the spindle position table or standby position table has an empty pot, <empty> is read from #8402 to #8470.
Value 0 is read from #8401 (data number).
Therefore, machining conditions registered in tool management data can be specified directly by coding, for example, D#8410, H#8409, S#8411, and F#8412 with a tool change macro (such as M06). Similarly, customize data can be referenced by a custom macro, and machining programs can be customized according to the tool used.

- Specifying a tool compensation number

M

When parameter No. 13265 is 0, a compensation number registered as tool management data of a tool attached at a spindle position can be selected by specifying H99 or D99.
(99 is treated as a special number, so 99 cannot be specified directly as a compensation number.)
When other than 0 is set in parameter No. 13265, the number set in the parameter can be specified instead of 99. For example, if parameter No. 13265 is 3, specifying H3 specifies the tool length compensation number registered for the tool at the spindle position.

T

When the tool management function is not used, a tool compensation number is specified also with a T code; when the tool management function is used, the T code is used only to specify a tool type number, so a tool compensation number must be specified with address D.
Except the specifications for addresses, the specifications for the number of permissible digits (parameter No. 3032) and the number of digits consisting of a compensation number (parameter No. 5028), separation of geometry compensation numbers and wear compensation numbers (bit 1 (LGN) of parameter No. 5002), and so on are the same as for T.

If parameter No. 13265 is set to 0, when a compensation number registered for a tool attached at a spindle position is specified, the specification format varies according to the number of digits as follows, which is the same as for conventional T:
When the compensation number is 1 digit long: D9
When the compensation number is 2 digits long: D99
When the compensation number is 3 digits long: D999
Because 9, 99, or 999 is treated as a special number, it cannot be specified directly as a compensation number.
Unless parameter No. 13265 is set to 0, the number set in the parameter can be specified instead of 9, 99, or 999. When parameter No. 13265 is set to 3, specifying D3 specifies the tool geometry compensation number and tool wear compensation number registered for a tool attached at the spindle position.

Multi-path system

Depending on whether the local path is a machining center system or a lathe system, tool compensation numbers are specified by using one of the above methods.

Spindle selection

When specifying compensation numbers of a tool attached to a spindle other than the first spindle, specify the spindle number with address P within the same block that contains H/D. When specifying the first spindle, you can omit P.

D99 P3; Specifying compensation numbers registered for the tool attached at the third spindle
D99 ; Specifying compensation numbers registered for the tool attached at the first spindle

- Read/write operations for tool management data and cartridge management table

The tool management data and cartridge management table can be read from and written to by using the CNC/PMC data window library (FOCAS2). Therefore, a specific tool management system including all available tool data not registered in the CNC can be built easily by using the OPEN CNC.

Similarly, the tool management data and cartridge management table can also be read from and written to using the PMC window.

Tool management data of the tool being used as a spindle after a tool change operation performed by M06 and the tool being selected by specifying a T code can be read using a custom macro.

The user can modify tool management data by MDI from the tool management function screen of the CNC. Addition, modification, and deletion of the above tool management data can be made from a part program (G10). Such data can also be input to and output from external I/O equipment by using the ALL I/O screen and tool management function screen.

- G10 format

Addition, modification, and deletion are performed for the tool management data and cartridge management table from programs.

If a format error is found in the commands from G10 L75/L76/L77 to G11, or if a value beyond the valid data range is specified, alarm PS5312," ILLEGAL COMMAND IN G10 L75/76/77" is issued. In such a case, correct the program. Within the range from G10 to G11, no decimal point can be specified with any address. If a decimal point is specified, alarm PS0007," ILLEGAL USE OFDECIMAL POINT" results.

- Input to and output from external equipment

Input to and output from external equipment are enabled only on the ALL IO screen or tool management screen if the I/O unit number is 4, 6, or 7.

Caution

- The total number of pots of all cartridges is normally 64. It can be expanded to 240 and 1000 optionally.
- When pots are assigned to cartridges, the first cartridge has a top priority.

Example 1

When the maximum number of pots is 64

	Parameter setting	Number of available pots
First cartridge	30	30
Second cartridge	20	20
Third cartridge	20	14
Fourth cartridge	20	0

- If the content of one of parameter Nos. 13220, and 13222 to 13251 is rewritten, tool management data numbers of all cartridges are initialized to 0. This prevents conflict between tool management data and the cartridge management table.

Example 2

If parameter No. 13220 is set to 30 when tool management data number 60 is set for pot number 1 of cartridge 1, nonexistent tool data is regarded as being held in the pot.

- When data is edited, its tool management data number blinks, and it is excluded from the data to be searched for the next tool. In this case, you cannot modify the data by using the PMC or FOCAS2. This condition is maintained until the edit mode ends.

- When a name is set for customize data or the tool life status by using G10, a change to the set name is not made until the display screen is changed to another NC screen.

Signal

Tool change signal TLCH<Fn064.0>,TLCH1 to 4<Fn328.0 to Fn328.3>

[Classification] Output signal

[Function] These signals post that the life of the last one of the tools having the same tool type number has expired.

[Output cond.] These signals turn to “1“ in the following cases:

- When the life of the last one of the tools having the same tool type number has expired
- When the last one of the tools having the same tool type number is treated as a broken tool by tool skip signal TLSKP

These signals turn to “0“ in the following cases:

- When the tool change reset signal is set to “1“.

> **NOTE**
> 1 This signal is provided for each spindle position.
> 2 Fn064.0 is output signals for the first spindle.

Tool change reset signal TLRST<Gn048.7>,TLRST1 to 4<Gn328.0 to Gn328.3>

[Classification] Input signal

[Function] These signals set the tool change signal to “0“.

[Output cond.] When the signals are set to 1, the control unit operates as follows:

- Setting the tool change signal to “0“

> **NOTE**
> 1 Tool change signal TLCH is not cleared by reset.
> 2 This signal is provided for each spindle position.
> 3 Gn048.7 is input signals for the first spindle.

Individual tool change signals TLCHI<Fn064.2>,TLCHI1 to 4<Fn328.4 to Fn328.7>

[Classification] Output signal

[Function] Reports the end of the life of the current tool.

[Output cond.] These signals turn to “1“ in the following cases:

- The end of the life of the current tool is detected.

These signals turn to “0“ in the following cases:

- Individual tool-change reset is executed.

> **NOTE**
> 1 This signal is provided for each spindle position.
> 2 Fn064.2 is output signals for the first spindle.

Individual tool change reset signals TLRSTI<Gn048.6>,TLRSI1 to 4<Gn328.4 to Gn328.7>

[Classification] Input signal

[Function] Sets the individual tool change signal TLCHI to “0“.

[Operation] When the signals are set to “1“, the control unit operates as follows:

- Sets the individual tool change signal to “0“.

NOTE
1 Tool change signal TLCH is not cleared by reset.
2 This signal is provided for each spindle position.
3 Gn048.6 is input signals for the first spindle.

Tool skip signals TLSKP<Gn048.5>,TLSKP1 to 4<Gn329.0 to Gn329.3>

[Classification] Input signal

[Function] These signals can forcibly change a tool whose life has not yet expired. These signals are used when a tool is broken.

[Operation] When the signals are set to “1“, the control unit operates as follows:

- The tool life status of the tool currently used is set to 4 (tool breakage), and the tool is excluded from the tool life management targets.
- When there is no tool that has the same tool type number as the tool currently used and has a remaining life, tool change signal TLCH <Fn064.0> is set to “1“.
- Upon completion of a tool skip operation, tool skip completion signal TLSKF <Fn315.0> is set to “1“.
- The next T code command selects the next tool.

NOTE
1 This signal is provided for each spindle position.
2 Gn048.5 is input signals for the first spindle.

Tool skip completion signals TLSKF<Fn315.0>,TLSKF1 to 4<Fn329.0 to Fn329.3>

[Classification] Output signal

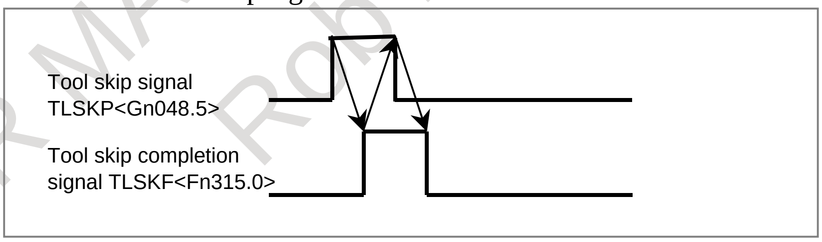
[Function] These signals post that the tool skip signal has been accepted.

[Output cond.] These signals turn to “1“ in the following cases:

- When tool skip signal TLSKP is set to “1“, and tool skip processing is completed When a tool not targeted for tool life management is being used, the tool skip processing is not performed, but the tool skip completion signal is set to “1“.

These signals turn to “0“ in the following cases:

- When the tool skip signal is set to “0“



NOTE
1 This signal is provided for each spindle position.
2 Fn315.0 is output signals for the first spindle.

Tool life count override signals *TLV0 to *TLV9<Gn049.0 to Gn050.1>

[Classification] Input signal

[Function] Overrides the life count (time) if bit 2 (LFV) of parameter No. 6801 is specified.
Each of the ten binary code signals has a unique override value that becomes valid when the signal is set to “0“. The life count is overridden by the sum of the valid override values. The override value can be specified in steps of 0.1, within the range of 0 to 102.3.

$$\text{Override value} = \sum_{i=0}^{9} \left\{ 2^i \times Vi \right\} \text{ times}$$

*TLV0	0.1	*TLV2	0.4	*TLV4	1.6	*TLV6	6.4	*TLV8	25.6
*TLV1	0.2	*TLV3	0.8	*TLV5	3.2	*TLV7	12.8	*TLV9	51.2

Example)

When *TLV7, *TLV6, and *TLV3 are set to “0“, the override value is calculated as follows:

12.8+6.4+0.8=20.0

The life count is multiplied by 20.0.

[Operation] The actual cutting time is counted and multiplied by the override value obtained by the signals. The calculated time is used as the basis for tool-life management.

Tool search in-progress signal TLMSRH<Fn315.1>

[Classification] Output signal

[Function] This signal posts that the CNC is searching for a tool.

[Output cond.] This signal turns to “1“ in the following cases:

- When the CNC is searching for a tool having the tool type number specified by a T code
- When the CNC is searching for a tool having the same tool type number as for the tool currently used whose life has expired during life management
- When tool skip signal TLSKP <Gn048.5> is input while the CNC is searching for a tool having the same tool type number

This signal turns to “0“ in the following cases:

- When a search operation is completed

> **NOTE**
> When tool search in-progress signal TLMSRH is 1, be careful not to rewrite tool management data by using the PMC window and FOCAS2.

Tool management data modification in-progress signal TLMG10<Fn315.2>

[Classification] Output signal

[Function] This signal posts that a modification to the tool management data, cartridge management table, or string data is being made by the G10 L75/L76/L77 command.

[Output cond.] This signal turns to “1“ in the following cases:

- When a modification to the tool management data or cartridge management table is being made by the G10 L75/L76/L77 command

This signal turns to “0“ in the following cases:

- When the modification mode of the tool management data and cartridge management table is ended by a G11 command, a reset, and so on

> **NOTE**
> When tool management data modification in-progress signal TLMG10 is 1, be careful not to rewrite tool management data by using the PMC window and FOCAS2.

Tool management data output in-progress signal TLMOT<Fn315.4>

[Classification] Output signal

[Function] This signal posts that the tool management data, cartridge management table, or string data is being output.

[Output cond.] This signal turns to “1“ in the following cases:

- When outputting of the tool management data or cartridge management table has started

This signal turns to 0 in the following cases:
- When outputting processing is completed

> **NOTE**
> When tool management data output in-progress signal TLMOT is 1, be careful not to rewrite tool management data by using the PMC window and FOCAS2.

Tool management data edit in-progress signal TLMEM<Fn315.7>

[Classification] Output signal

[Function] This signal posts that the tool management data edit mode is set.

[Output cond.] This signal turns to “1“ in the following cases:
- When the tool management data edit mode starts on the tool management data screen

This signal turns to “0“ in the following cases:
- When the tool management data edit mode ends on the tool management data screen

Tool life expiration notice signals TLCHB<Fn064.3>, TLCHB1 to 4<Fn329.4 to Fn329.7>

[Classification] Output signal

[Function] These signals post that the life of the tool being used has almost expired.

[Output cond.] These signals turn to “1“ in the following cases:
- When the life value of the currently used tool becomes the notice life value in the tool management data or less

  If bit 3 (ETE) of parameter No. 13200 is 0, these signals are output when the lives of all the tools having the same tool type number as the currently used tool have expired, and the currently used tool is the last tool. In this case, the same notice life value must be set for all tools having the same type number. (Previous notice of expiration for each type number)

  If bit 3 (ETE) of parameter No. 13200 is 1, these signals are output by checking only the life value of the currently used tool even when the life of a tool having the same tool type number as the currently used tool is still left. (Previous notice of expiration for each tool)

  Actually, these signals are set to “1“ when completion signal FIN is posted in response to an M06 command if the number of use times is specified; if time is specified, these signals are set to 1 during machining.

These signals turn to “0“ in the following cases:
- When the life value of the currently used tool becomes greater than the notice life value in the tool management data.
  Actually, these signals are set to “0“ when a change to a tool having a life value greater than the notice life value has been made.
- If the notice life value is set to 0, these signals are not output.

> **NOTE**
> Fn064.3 is input signals for the first spindle.

Tool life counting disable signals TLNCT1 to 4<Gn329.4 to Gn329.7>

[Classification] Input signal

[Function] These signals specify not to perform tool life counting for each spindle.

[Operation] When the signals are set to “1“, the control unit operates as follows:

- The CNC does not perform tool life management for the tool attached at the corresponding spindle position (the first to fourth spindle).

Life expiration signal TMFNFD<Fn315.6>

[Classification] Output signal

[Function] This signal indicates whether a valid tool whose life still remains is left among the tools having the type number specified by a T code.

[Output cond.] This signal turns to “1“ in the following cases:

When a T code is specified, the tools having the type number specified by the T code include no valid tool whose life still remains.

> **NOTE**
> In this case, it is necessary for the PMC to stop the operation by issuing an external alarm and request a tool change. If the selected tool is used continuously with no alarm issued, the life of the tool is counted up. The tool (cartridge and pot) selected by the CNC at this time is a tool having the largest tool management data number among the tools having a specified tool type number.

This signal turns to “0“ in the following cases:

- When a T code is specified, the tools having the type number specified by the T code include a valid tool whose life still remains.

> **NOTE**
> This signal is valid when bit 6 (NAM) of parameter No. 13200 is set to 1.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3108						**PCT**		

[Input type] Parameter input
[Data type] Bit path

#2 PCT For modal T display on the program check screen:
0: A specified T value is displayed.
1: HD.T and NX.T are displayed.
Values displayed follow bit 1 (THN) of parameter No. 13200.

	#7	#6	#5	#4	#3	#2	#1	#0
6801						**LVF**		

[Input type] Parameter input
[Data type] Bit path

#2 LVF When the life of a tool is counted in terms of time with the tool management function, the tool life count override signals *TLV0 to *TLV9 <Gn049.0 to Gn050.1> are:
0: Invalid.
1: Valid.

> **NOTE**
> The use of this parameter varies depending on whether the tool management function or tool life management function is used.

6811	**Tool life count restart M code**

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 127 (not including 01, 02, 30, 98, and 99)

When 0 is set, this parameter is ignored.
When an M code for tool life count restart is specified, the counting of the life of the tool attached at the spindle position is started.
When the type for counting the number of use times is selected, the target of life counting is switched to the tool attached at the spindle position, and the life count is incremented by 1.
When the type for counting time is selected, the target of life counting is switched to the tool attached at the spindle position, with no other operations performed.
If the tool attached at the spindle position is not a tool under tool life management, no operation is performed.

> **NOTE**
> The use of this parameter varies depending on whether the tool management function or tool life management function is used.

	#7	#6	#5	#4	#3	#2	#1	#0
13200	NFD	NAM	T0O	TP2	ETE	TRT	THN	TCF

[Input type] Parameter input
[Data type] Bit path

#0 TCF When a T code is specified with the tool management function:
0: A cartridge number and pot number found by the NC are output.
1: The specified T code is output without modification.

#1 THN When NX.T and HD.T are displayed with the tool management function:
0: The tool type numbers at the first spindle position and the first standby position are displayed.
1: The values specified from the PMC window are displayed.

#2 TRT As the remaining lifetime value for outputting the tool life arrival notice signal:
0: The remaining lifetime of the last tool is used.
1: The sum of the remaining lifetimes of the tools with the same type number is used.

NOTE
This parameter is valid when bit 3 (ETE) of parameter No. 13200 is set to 0 (arrival notice for each type number).

#3 ETE The tool life arrival notice signal is output:
0: For each tool type.
1: For each tool.

#4 TP2 The output format of cartridge management data is:
0: New registration format (G10L76P1 format).
1: Modification format (G10L76P2 format).

#5 T0O When T0 is specified:
0: A tool search is made assuming that the tool type number is 0.
1: The cartridge number and pot number are assumed to be 0.

#6 NAM When a T code is specified, but a valid tool with a remaining lifetime cannot be found:
0: The alarm PS5317, "LIVES OF ALL TOOLS EXPIRED" is issued.
1: The alarm is not issued. Instead, the tool with the maximum tool management number is selected from the tools of the specified tool type, and TMFNFD<F315.6> is set to “1“.

#7 NFD When a T code is specified, but a valid tool with a remaining lifetime cannot be found in the cartridge:
0: The spindle position and standby position are also searched.
1: The spindle position and standby position are not searched.

	#7	#6	#5	#4	#3	#2	#1	#0
13201							TDN	

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#1 TDN On the tool management function screen, the character string for indicating the tool life status can contain:
0: Up to 6 characters.
1: Up to 12 characters.

	#7	#6	#5	#4	#3	#2	#1	#0
13202	DOM	DOT		DO2		DOY	DCR	

[Input type] Parameter input
[Data type] Bit

#1 DCR On the tool management function screen, tool nose radius compensation data is:
0: Displayed.
1: Not displayed.

> **NOTE**
> This parameter is valid when the machine control type is the lathe system or compound system.

#2 DOY On the tool management function screen, Y-axis offset data is:
0: Displayed.
1: Not displayed.

> **NOTE**
> This parameter is valid when the machine control type is the lathe system or compound system.

#4 DO2 On the tool management function screen, the second geometry tool offset data is:
0: Displayed.
1: Not displayed.

> **NOTE**
> This parameter is valid when the machine control type is the lathe system or compound system.

#6 DOT On the tool management function screen, the tool offset data (X, Z) of the T series is:
0: Displayed.
1: Not displayed.

> **NOTE**
> This parameter is valid when the machine control type is the lathe system or compound system.

#7 DOM On the tool management function screen, the tool offset data of the M series is:
0: Displayed.
1: Not displayed.

> **NOTE**
> This parameter is valid when the machine control type is the machining center system or compound system.

	#7	#6	#5	#4	#3	#2	#1	#0
13203	TCN	SWC			NM4	NM3	NM2	NM1

[Input type] Parameter input
[Data type] Bit path

#0 NM1 The first cartridge is:
0: Searched.
1: Not searched.

#1 NM2 The second cartridge is:
0: Searched.
1: Not searched.

#2 NM3 The third cartridge is:
0: Searched.
1: Not searched.

#3 NM4 The fourth cartridge is:
0: Searched.
1: Not searched.

#6 SWC The tools with the same tool type number are searched for:
0: Tool with the shortest lifetime.
1: Tool with the small customization data number.
In this case, a customization data number is to be set in parameter No. 13260.

#7 TCN Tool life count operation is triggered by:
0: M06/restart M code. (A T code alone does not start counting.)
1: T code. (Count operation is not started by M06.)

13220	Number of valid tools in tool management data

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 64 (Extended to 240 or 1000 by the addition of an option)
This parameter sets the number of valid tools in tool management data.

13221	M code for tool life count restart

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 65535
When 0 is set in this parameter, this parameter is ignored.

When an M code for tool life count restart is specified, the counting of the life of the tool attached at the spindle position is started. When the type for counting the number of use times is selected, the target of life counting is switched to the tool attached at the spindle position, and the life count is incremented by 1.
When the type for counting time is selected, the target of life counting is switched to the tool attached at the spindle position but no other operations are performed. If the tool attached at the spindle position is not a tool under tool life management, no operation is performed.
The M code set in parameter No. 6811 waits for FIN. However, the M code set in this parameter does not wait for FIN.
The M code set in parameter No. 13221 must not be specified in a block where another auxiliary function is specified.
The M code set in parameter No. 13221 does not wait for FIN. So, do not use the M code for other purposes.

NOTE
The use of this parameter varies depending on whether it is used by the tool management function or tool life management function.

13222	Number of data items in the first cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 64 (Extended to 240 or 1000 by the addition of an option)
This parameter sets the number of data items used with the first cartridge.

13223	Start pot number of the first cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 9999
This parameter sets the start pot number to be used with the first cartridge. Pot numbers starting with the value set in this parameter and sequentially incremented by 1 are assigned to all data items.

13227	Number of data items in the second cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 64(Extended to 240 or 1000 by the addition of an option)
This parameter sets the number of data items used with the second cartridge.

13228	Start pot number of the second cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 9999

This parameter sets the start pot number to be used with the second cartridge. Pot numbers starting with the value set in this parameter and sequentially incremented by 1 are assigned to all data items.

13232	Number of data items in the third cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 64(Extended to 240 or 1000 by the addition of an option)

This parameter sets the number of data items used with the third cartridge.

13233	Start pot number of the third cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 9999

This parameter sets the start pot number to be used with the third cartridge. Pot numbers starting with the value set in this parameter and sequentially incremented by 1 are assigned to all data items.

13237	Number of data items in the fourth cartridge

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 64(Extended to 240 or 1000 by the addition of an option)

This parameter sets the number of data items used with the fourth cartridge.

13238	Start pot number of the fourth cartridge

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 9999

This parameter sets the start pot number to be used with the fourth cartridge. Pot numbers starting with the value set in this parameter and sequentially incremented by 1 are assigned to all data items.

13250	Number of valid spindles

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 4

This parameter sets the number of spindle positions usable with the tool management function.

13251	Number of valid standby positions

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 4

This parameter sets the number of standby positions usable with the tool management function.

13252	M code for specifying a particular tool

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 65535

This parameter sets not a tool type number but an M code for directly specifying the T code of a particular tool.

13260	Customization data number to be searched for

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 40

When bit 6 (SWC) of parameter No. 13203 is set to 1, this parameter sets a customization data number to be searched for.

The valid data range is 1 to 4 when the option for customization data extension is not selected. When the option for customization data extension (5 to 20) is selected, the valid data range is 1 to 20. When the option for customization data extension (5 to 40) is selected, the valid data range is 1 to 40.
When bit 6 (SWC) of parameter No. 13203 is set to 0, or a value not within the valid data range is set, the search function based on customization data is disabled, and the tool with the shortest lifetime is searched for.

13265	Number for selecting a spindle position offset number

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 9999

This parameters sets an H/D code for selecting an offset number registered in the data of the tool attached at the spindle position.
When 0 is set, an ordinary used code such as H99/D99 is used. When a value other than 0 is set, H99/D99 no longer has a particular meaning. So, when H99/D99 is specified in this case, the specification of offset number 99 is assumed.
With the T series, address D only is used to specify a tool number and offset number, so that a restriction is imposed on the number of digits. So, the valid data range of this parameter varies according the number of digits of an offset number.
When the number of digits of an offset number is 1: to 9
When the number of digits of an offset number is 2: to 99
When the number of digits of an offset number is 3: to 999
When parameter No.5028 is set, the data range is as follows regardless of the number of digits of an offset number.
When No.5028 is set to 1: to 9
When No.5028 is set to 2: to 99
When No.5028 is set to 3: to 999
When No.5028 is set to 4: to 9999

NOTE
The use of this parameter varies depending on whether it is used by the tool management function or tool life management function.

Alarm and message

Number	Message	Description
PS0154	NOT USING TOOL IN LIFE GROUP	H99 or D99 is specified when no tool management data number is assigned to the spindle position. Correct the program.
PS0374	ILLEGAL REGISTRATION OF TOOL MANAGER(G10)	G10L75 or G10L76 data was registered during the following data registration: - From the PMC window. - From the FOCAS2. - By G10L75 or G10L76 in another system. Command G10L75 or G10L76 again after the above operation is completed.
PS5312	ILLEGAL COMMAND IN G10 L75/76/77	One of formats in G10L75, G10L76, or G10L77 to G11 commands is in error, or the command value is out of data range. Modify the program.
PS5316	TOOL TYPE NUMBER NOT FOUND	A tool with the specified tool-type number could not be found. Modify the program or register the tool.
PS5317	ALL TOOL LIFE IS OVER	The lives of all tools with the specified tool-type number have expired. Replace the tool.

Limitation

When this function is enabled, in lathe systems an offset number is specified with address D, so D cannot be used for other purposes. As arguments of macro calls in custom macros, D can be specified as done before.

Reference item

Manual name	Item name
OPERATOR'S MANUAL (B-64694EN)	Tool management function

11.3.2 Tool Management Extension Function

The following functions have been added to the tool management function:
1. Customization of tool management data display
2. Setting of spindle position/standby position display
3. Input of customize data with the decimal point
4. Protection of various tool information items with the KEY signal
5. Selection of a tool life count period
6. Each tool data screen
7. Total life time display for tools of the same type

They will be explained in detail below.

11.3.2.1 Customization of tool management data display

With the tool management data screen display customization function, the display positions of screen elements (type number, tool information, life counter, and so forth) on the tool management screen can be changed and whether to display or hide such screen elements can be chosen using the G10 format. This function enables a customized tool management screen to be configured.

11.3.2.2 Setting of spindle position/standby position display

In MG on the tool management data screen, a spindle position or standby position is displayed as a number such as 11, 12, and 13. With the spindle position/standby position display setting function, three arbitrary characters can be displayed using the G10 format.

11.3.2.3 Input of customize data with the decimal point

With the function for input of customize data with the decimal point, the number of decimal places can be set using the G10 format for each customize data item (customize data 1, ..., 40) to enable data input with the decimal point.

11.3.2.4 Protection of various tool information items with the KEY signal

When tool management data is in the edit state, various information items can be modified. By setting bit 0 (TDL) of parameter No. 13204 to 1, tool management data can be protected with the KEY signal so that various information items are not registered, modified, and deleted.

11.3.2.5 Selection of a tool 5life count period

A tool life count period can be chosen between 1 sec and 8 msec on a tool-by-tool basis.
Bit 5 of tool information is used to make a life count period selection.

Item	Description
Data length	1 byte (flag data)
#5 REV	0 : A life count period of 1 sec is used. (S) 1 : A life count period of 8 msec is used. (M)

Range of count is as follows.
1sec : 0 to 3,599,999 seconds (999 hours 59 minutes 59 seconds)
8msec: 0 to 3,599,992 ms (59 minutes 59 seconds 992 milliseconds)

NOTE
This function is valid when the tool information TIM (#1) is set to 1.

11.3.2.6 Each tool data screen

All data for a specified tool can be extracted and displayed.

11.3.2.7 Total life time display for tools of the same type

The remaining lives of tools with the same type numbers are totaled, and totals are displayed in order by tool type number or by remaining life. Also, tools with the same tool type numbers are displayed in a list.

- Total life data display

Total life data screen display changes in screen configuration depending on whether the tool life arrival notice signal is to be output for each tool type or for each tool.
The tool life arrival notice signal changes in output method depending on the settings of bit 3 (ETE) of parameter No. 13200 and bit 2 (TRT) of parameter No. 13200.
Under the following conditions, the tool life arrival notice signal is output for the same tool type number, and the total notice life and the state are added to the display items on the total life data screen.

- Details of data

Bit 3 (ETE) of parameter No. 13200	Bit 2 (TRT) of parameter No. 13200	Description of display
0	1	Total notice life and state items are displayed.

The details of the data displayed on the total life data screen are as follows:

- Sort No.

Item	Description
Data length	2byte
Valid data range	1 to maximum number of tools (64, 240, or 1,000)

The number representing a tool of a different type is displayed. The maximum number of tools differs with the options used.

- Tool type number (T code)

Item	Description
Data length	4byte
Valid data range	1 to 99,999,999

The tool type number (T code) set on the tool management data screen is displayed.

- Total remaining life

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Times Time specifications: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to2,147,483,647 times When time is specified: 0 to 359,999,999 s (99999 hours 59 minutes 59 seconds) 0 to 359,999,999 milliseconds (99 hours 59 minutes 59 seconds 999 milliseconds)

The remaining lives of tools with the same tool type number, as determined by subtracting the life counter value from the maximum life, are totaled for each number of times or for each time and displayed.

- Total life counter

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Time When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 2,147,483,647 times When time is specified: 0 to 359,999,999 s (99999 hours 59 minutes 59 seconds) 0 to 359,999,999 milliseconds (99 hours 59 minutes 59 seconds 999 milliseconds)

The life counter values of the same-type tools set on the tool management data screen (for each tool type number) are totaled for each number of times or for each time and displayed.

- Total maximum life

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Time When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 2,147,483,647 time When time is specified: 0 to 359,999,999 s (99999 hours 59 minutes 59 seconds) 0 to 359,999,999 milliseconds (99 hours 59 minutes 59 seconds 999 milliseconds)

The maximum lives of the same-type tools set on the tool management data screen (for each tool type number) are totaled for each number of times or for each time and displayed.

- Number (number of tools)

Item	Description
Data length	2byte
Valid data range	1 to maximum number of tools (64, 240, or 1,000)

The numbers of tools of the same types are totaled and displayed. The maximum number of tools change depending on the options used.

- Total notice life

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Times When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 2,147,483,647 times When time is specified: 0 to 359,999,999 s (99999 hours 59 minutes 59 seconds) 0 to 359,999,999 milliseconds (99 hours 59 minutes 59 seconds 999 milliseconds)

The notice lives of same-type tools set on the tool management data screen (for each tool type number) are totaled for each number of times or for each time and displayed.

- Status

Item	Description
Data length	1byte
Data details	0: -- 1: Notice

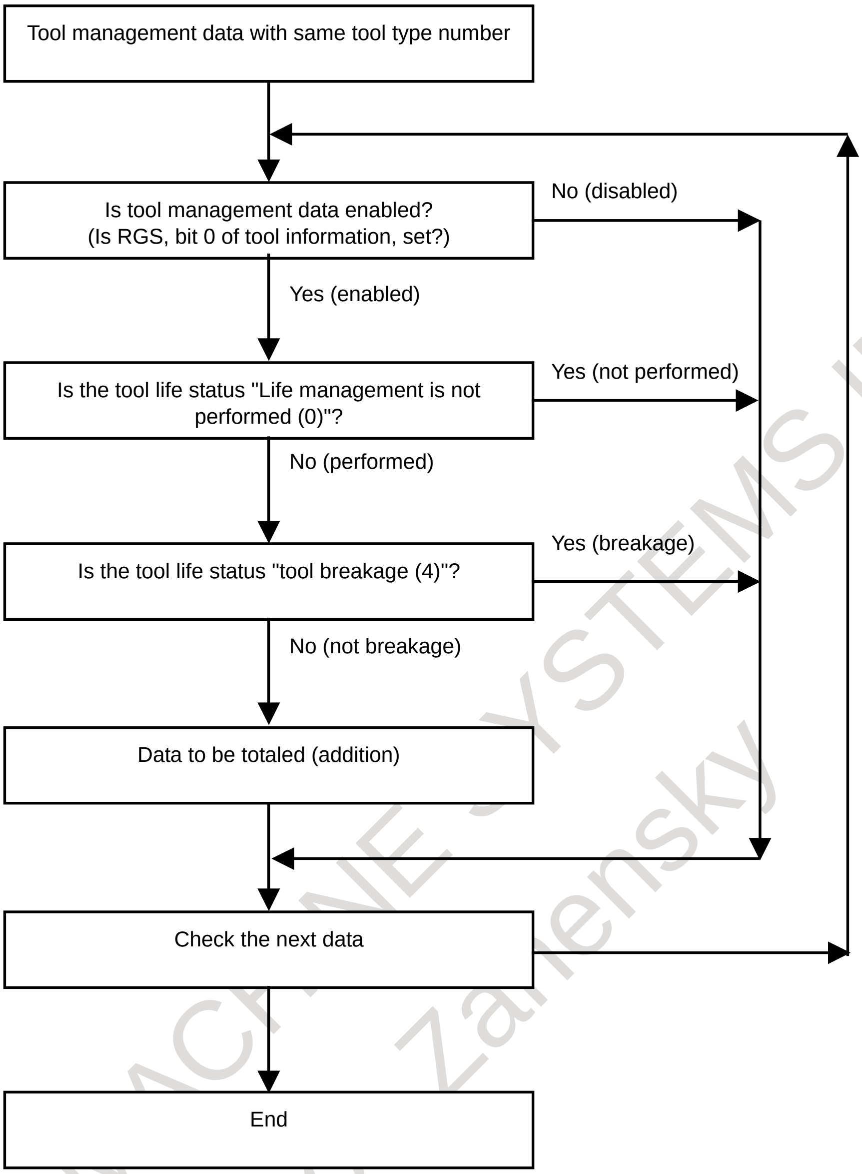
The status indicating whether the tool life arrival signal has been output is displayed.

- Sort function

On the total life data screen, sorting in either ascending or descending order is possible with the following data:

- Tool type number
- Total remaining life
- Data to be totaled

The data to be totaled on the total life data screen is that for those tools that satisfy the following conditions.



NOTE

1 If data is with the same tool type number and both time and number of times are specified as life count types, and the data is to be totaled, the data is totaled for both each time and each number of times and displayed in the time and number of times fields.
2 In the number column, the number of all tools with the same tool type number is displayed regardless of the tool life status.
3 The total life counter, total remaining live, total maximum life, and total notice life are displayed in time display in sec units if data in sec and in ms exist in the same tool. Any fractional part of ms data is truncated.
4 If the total remaining life is negative, zero is displayed.
5 If the total life counter, total remaining live, total maximum life, or total notice life is larger than the display maximum, an asterisk "*" is displayed.
Number of times:**********
Time:*****H**M**S (in sec. units)/ **H**M**S*** (in msec. units)

> **NOTE**
> 6 If one of the following operation is performed, total life data is updated:
> (a) Pressing of the soft key [UPDATE] or [SWITCH]
> (b) Pressing of the soft key [T-ASCE-SORT], [T-DESC-SORT], [R-ASCE-SORT], or [R-DESC-SORT]
> (c) Switching to another screen and return to the total life data screen

- Detailed life data display

The detailed life data screen displays the tool information specific to the same-type tools displayed on the total life data screen.

- Data details
  The details of the data displayed on the detailed life data screen are as follows:

- Tool type number (T code)

Item	Description
Data length	4byte
Valid data range	1 to 99,999,999

The tool type number (T code) set on the tool management data screen is displayed.

- Order

Item	Description
Data length	2byte
Valid data range	1 to maximum number of tools (64, 240, or 1,000)

Those tools whose tool life status is "enabled" are displayed in either of the following orders:
- If bit 6 (SWC) of parameter No. 13203 is 0, the order starting with the one with the shortest remaining life.
- If bit 6 (SWC) of parameter No. 13203 is 1, the order starting with the smallest customize data number set in parameter No. 13260.

For those tools whose tool life status is not "Tool not yet used (1)" or "Life remains (2)", the order item is displayed as an "-" (hyphen), and those tools are displayed in order by tool management data number, after ordered tools.
The maximum for the valid data range differs depending on the option used.

- Remaining tool life value

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Times When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 99,999,999 times When time is specified: 0 to 3,599,999 s (999 hours 59 minutes 59 seconds) 0 to 3,599,999 milliseconds (59 minutes 59 seconds 999 milliseconds)

- The remaining life value is equal to [Maximum tool life value - Tool life counter value]. If the maximum tool life value is less than the tool life counter (resulting in a negative value), 0 is displayed.

- Tool life counter

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Times When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 99,999,999 times When time is specified: 0 to 3,599,999 s (999 hours 59 minutes 59 seconds) 0 to 3,599,999 milliseconds (59 minutes 59 seconds 999 milliseconds)

- Maximum tool life value

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Times When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 99,999,999 times When time is specified: 0 to 3,599,999 s (999 hours 59 minutes 59 seconds) 0 to 3,599,999 milliseconds (59 minutes 59 seconds 999 milliseconds)

- Notice life value

Item	Description
Data length	4byte
Unit of data	When the number of use times is specified: Times When time is specified: Seconds/milliseconds
Valid data range	When the number of use times is specified: 0 to 99,999,999 times When time is specified: 0 to 3,599,999 s (999 hours 59 minutes 59 seconds) 0 to 3,599,999 milliseconds (59 minutes 59 seconds 999 milliseconds)

- Tool life status

Item	Description
Data length	1byte
Data details	0: Life management is not performed. 1: Tool not yet used 2: Life remains. 3: Life expired. 4: Tool breakage (skip)

NOTE

1 If, in a multi-path system, customize data number is specified for the order specification (bit 6 (SWC) of parameter No. 13203 =1), the order indicated is based on the customize data number specified in parameter No. 13260 of the path currently displayed.

2 Detailed life data is updated if either of the following operation is performed:
(a) Pressing of the soft key [UPDATE]
(b) Switching to another screen and return to the total life data details screen

Signal

Tool management data protection signals TKEY0 to TKEY5<G330.0 to G330.5>

[Classification] Input signal

[Function] These signals permit those operations from the MDI unit that will change the memory description. Six signals are available, as described below, which protect different tool information.

If TDL, bit 0 (TDL) of parameter No. 13204, is 0

- The tool management data protection signals are invalid.

If TDL is 1

- TKEY0 : Permits the input of tool type numbers.
- TKEY1 : Permits the input of tool information. (If tool management function oversize tool support is used, permits the input of tool shape numbers.)
- TKEY2 : Permits the input of the tool life counter value, maximum tool life value, notice life value, tool life status.
- TKEY3 : Permits the input of tool compensation-related information (such as tool length compensation number and cutter compensation number).
- TKEY4 : Permits the input of the spindle speed (S)/feedrate (F).
- TKEY5 : Permits the input of customize data-related data (customize data items 0, ..., 40).

[Operation] If a signal is 0, the corresponding operation is prohibited.
If a signal is 1, the corresponding operation is permitted.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G330			TKEY5	TKEY4	TKEY3	TKEY2	TKEY1	TKEY0

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
13200					ETE	TRT		

[Input type] Parameter input
[Data type] Bit path

#2 TRT As the remaining lifetime value for outputting the tool life arrival notice signal:
0: The remaining lifetime of the last tool is used.
1: The sum of the remaining lifetimes of the tools with the same type number is used.

> **NOTE**
> This parameter is valid when bit 3 (ETE) of parameter No. 13200 is set to 0 (arrival notice for each type number).

#3 ETE The tool life arrival notice signal is output:
0: For each tool type.
1: For each tool.

	#7	#6	#5	#4	#3	#2	#1	#0
13201						TDB		TDC

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 TDC The function of customizing the tool management data screen of the tool management function is:
0: Disabled.
1: Enabled.

#2 TDB The tool management function displays tool information in the:
0: Conventional mode.
1: 1/0 mode.

	#7	#6	#5	#4	#3	#2	#1	#0
13204								TDL

[Input type] Parameter input
[Data type] Bit

#0 TDL The protection function for tool management data using a key is:
0: Disabled.
1: Enabled.

Alarm and message

Number	Message	Description
PS5312	ILLEGAL COMMAND IN G10 L75/76/77	In commands from G10 L75/L76/L77 to G11, there is a format error, or a value beyond the specifiable range is specified. Correct the program.

OPERATOR'S MANUAL (B-64694EN)	Tool Management Extension Function

11.3.3 Tool Management Function Oversize Tools Support

Overview

Tool management function oversize tools support is added to the tool management function.
The figure of an oversize tool can be defined freely, and the figure of each oversize tool is registered. When an oversize tool is stored in a cartridge, interference with tools stored in other pots is considered. This function is usable with cartridges of chain type and matrix type.

Explanation

Usually, a tool, when stored in a cartridge, occupies one pot only. An oversize tool occupies pots other than the position where the tool is stored. This point is taken into consideration for tool management.
When the tool information #2 of the tool management data is set to 1, the tool is set as an oversize tool.
- Tool information

Item	Description
Data length	1byte (Flag data)
#2 BDT	0: Normal tool (N) 1: Oversize tool (B)

Oversize tools each having a different figure can be freely defined to form oversize tool patterns through MDI input on the tool figure setting screen, G10 data input, or inputting a file. Up to 20 patterns can be registered. An identification number (hereinafter referred to as a tool figure number) is assigned to each patterned figure, and a tool figure number suitable for each tool figure is set in the tool management data.

- Tool geometry number (GNO)

Item	Description
Data length	2byte
Valid data range	0 to 20

When a tool is registered in the cartridge management table, the figure of the tool is determined from the tool figure number of the tool so that the tool can be registered only if the tool does not interfere with other tools.

When using this function, set the type of cartridge with parameters. For the chain type, set a pot start number and the number of pots with the conventional parameters. When using the matrix type, use the same parameter as for the chain type to specify a pot start number, and use the parameters for specifying the number of pots in the vertical direction (hereinafter referred to as the number of rows) and the parameter for specifying the number of pots in the horizontal direction (hereinafter referred to as the number of columns) to specify the number of pots. As shown in the figure below, processing is performed, assuming that pot numbers are assigned from the upper-left corner to the lower-right corner of the cartridge as viewed when you face the front of the cartridge.

No tool can be stored in a way that causes interference with the outer frame of the cartridge.

When pattern start number is 21

Oversize tool

Pots occupied by oversize tool

Tool figure setting screen

Tool figure No.	Left direction	Right direction	Upper direction	Lower direction	Figure
1	2	2	2	2	A
2	1	1	1	1	A
3	2	3	3	1	A
4	2	0	0	0	A
5	2	2	2	2	A
Omitted					
19	1	3	2	2	A
20	2	2	4	4	A

NOTE

1 Even if a tool figure number is set in the tool management data, the tool is regarded as a normal tool when the tool information #2 is set to 0.

2 If all data items corresponding to a tool figure number are set to 0 (0 for the upper, lower, left, and right directions), the tool is regarded as a normal tool even when the tool information #2 is set to 1.

- Tool figure setting screen

The area occupied by a tool depends on whether the tool is stored in a cartridge of matrix type or a cartridge of chain type. A tool stored in a cartridge of matrix type occupies pots in the upper, lower, left, and right directions. A tool stored in a cartridge of chain type occupies pots only in the left and right directions.

- Cartridge of matrix type

The area occupied by a tool stored in a cartridge of matrix type is described below.
Set left, right, upper, and lower pots occupied relative to a reference pot in steps of 0.5 pot. The maximum specifiable value is 4 (for 2 pots). (See Fig. 11.3.3 (a).)
As shown in Fig. 11.3.3 (b), the pots located in the slant directions relative to a reference pot are automatically assumed to be occupied areas so that the occupied areas form a rectangle. However, if the same value, 3 or a greater value, is set for the left, right, upper, and lower directions, and figure B is selected, the four corners of the square can be excluded from the occupied areas as shown in Fig. 11.3.3 (c). When a tool has a circular figure, the tool can be stored efficiently in pots if figure B is selected.

Table 11.3.3 (a) Tool figure data

Tool pattern No.	Left direction	Right direction	Upper direction	Lower direction	Figure
1	0	3	2	1	A
2	2	2	1	3	A
Omitted					
19	1	1	1	1	A
20	2	3	2	2	A

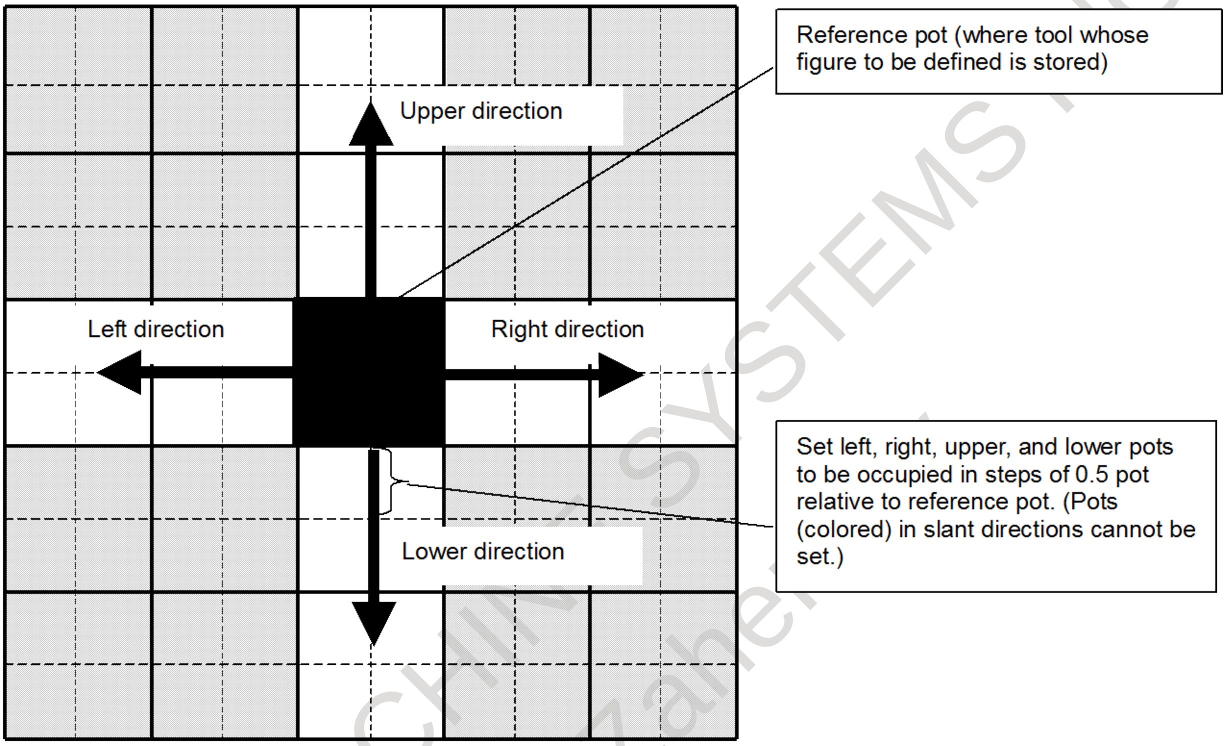

Fig. 11.3.3 (a) Tool figure data setting

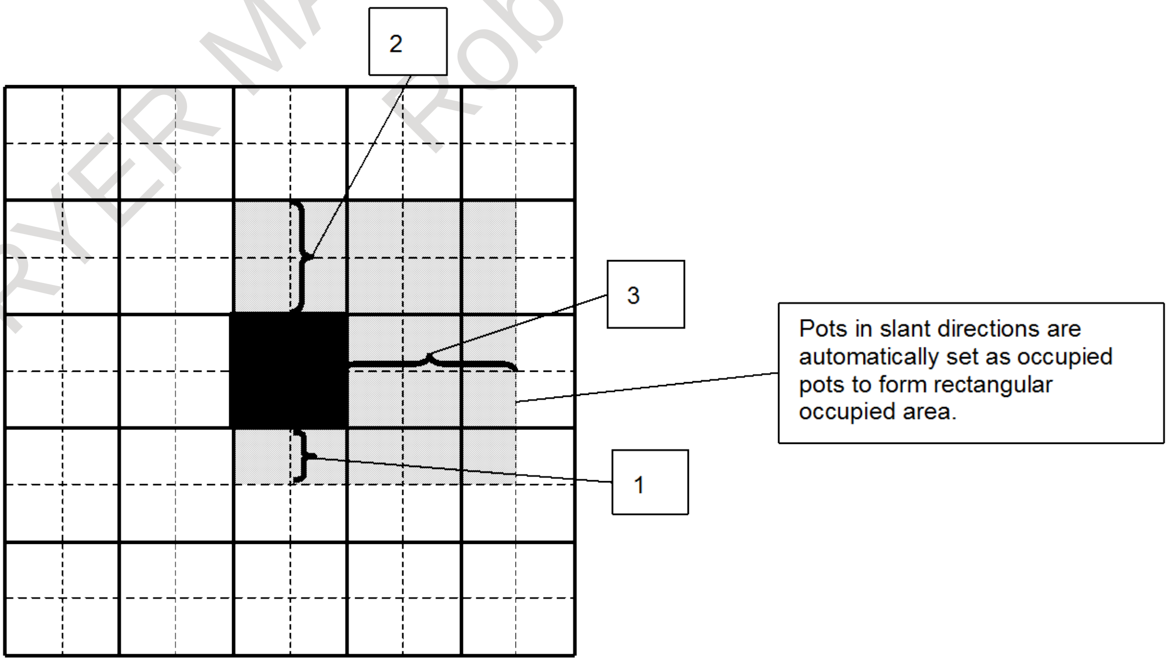

Fig. 11.3.3 (b) For tool figure pattern number 1 in Table 11.3.3 (a)

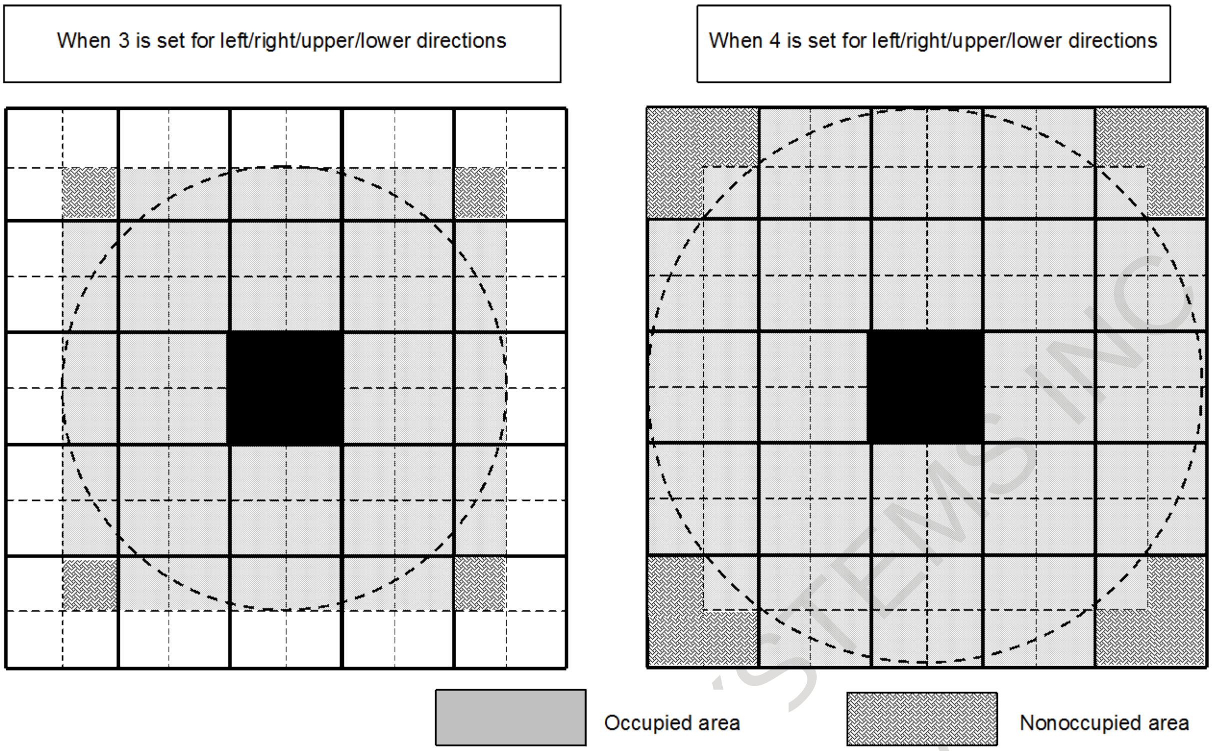

Fig. 11.3.3 (c) Occupied area for figure B

- Cartridge of chain type

The area occupied by a tool stored in a cartridge of chain type is described below.
As with the matrix type, input data on the tool figure setting screen. In this case, set pots to be occupied only in the left and right directions. The specification of pots in the upper and lower directions and a figure are ignored.

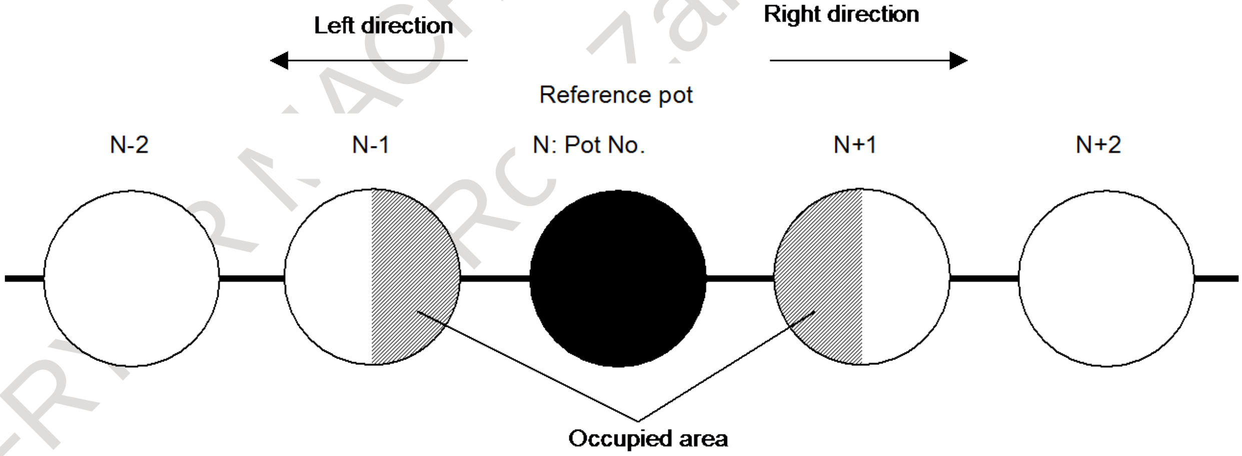

Fig. 11.3.3 (d) For tool figure data 19

NOTE

1. Tool figure data cannot be modified if the tool for which the tool figure number is set is registered in the cartridge.
2. When changing the tool figure number of a tool registered in the cartridge, ensure that the figure after the change does not interfere with other tools. If interference with other tools occurs, a warning is issued to disable an attempt to change the tool figure number.

- System variables

The following tool management data of the tool being used as a spindle after a tool change by M06 and the tool to be used next which is specified by a T code can be read through custom macro variables. The custom macro variable is a read-only variable.

Number	Item
#8415	Tool figure number (A)

- Tool management extension function

- Customization of tool management data display
  In customization of tool management data display with the tool management extension function, tool figure number display can be customized.

R	Item	Display width
12	Tool figure number (A)	3

- Protection of diverse tool information with KEY signals
  With the tool management data protection signal, TKEY1 <G330.1>, the input of tool shape numbers using MDI keys is prohibited.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
13240					MT4	MT3	MT2	MT1

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 MT1 The first cartridge is of the:
0: Chain type.
1: Matrix type.
When this parameter is set to 1, parameter No. 13222 is invalid.

#1 MT2 The second cartridge is of the:
0: Chain type.
1: Matrix type.
When this parameter is set to 1, parameter No. 13227 is invalid.

#2 MT3 The third cartridge is of the:
0: Chain type.
1: Matrix type.
When this parameter is set to 1, parameter No. 13232 is invalid.

#3 MT4 The fourth cartridge is of the:
0: Chain type.
1: Matrix type.
When this parameter is set to 1, parameter No. 13237 is invalid.

13241	Number of rows of the first cartridge (when the cartridge is of the matrix type)

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the first cartridge is of the matrix type (bit 0 (MT1) of parameter No. 13240 is set to 1), set the number of rows in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13241) × (setting of parameter No. 13242) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the first cartridge is invalid.

13242	Number of columns of the first cartridge (when the cartridge is of the matrix type)

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the first cartridge is of the matrix type (bit 0 (MT1) of parameter No. 13240 is set to 1), set the number of columns in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13241) × (setting of parameter No. 13242) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the first cartridge is invalid.

13243	Number of rows of the second cartridge (when the cartridge is of the matrix type)

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the second cartridge is of the matrix type (bit 1 (MT2) of parameter No. 13240 is set to 1), set the number of rows in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13243) × (setting of parameter No. 13244) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the second cartridge is invalid.

13244	Number of columns of the second cartridge (when the cartridge is of the matrix type)

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the second cartridge is of the matrix type (bit 1 (MT2) of parameter No. 13240 is set to 1), set the number of columns in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13243) × (setting of parameter No. 13244) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the second cartridge is invalid.

13245	Number of rows of the third cartridge (when the cartridge is of the matrix type)

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the third cartridge is of the matrix type (bit 2 (MT3) of parameter No. 13240 is set to 1), set the number of rows in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13245) × (setting of parameter No. 13246) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the third cartridge is invalid.

13246	Number of columns of the third cartridge (when the cartridge is of the matrix type)

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the third cartridge is of the matrix type (bit 2 (MT3) of parameter No. 13240 is set to 1), set the number of columns in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13245) × (setting of parameter No. 13246) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the third cartridge is invalid.

13247	Number of rows of the fourth cartridge (when the cartridge is of the matrix type)

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the fourth cartridge is of the matrix type (bit 3 (MT4) of parameter No. 13240 is set to 1), set the number of rows in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13247) × (setting of parameter No. 13248) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the fourth cartridge is invalid.

13248	Number of columns of the fourth cartridge (when the cartridge is of the matrix type)

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 1000

When the fourth cartridge is of the matrix type (bit 3 (MT4) of parameter No. 13240 is set to 1), set the number of columns in the pot in this parameter. The setting must satisfy the following condition, however: The sum total of the value obtained by (setting of parameter No. 13247) × (setting of parameter No. 13248) and the number of pots of other cartridges should not exceed 64 (1000 at maximum). If this condition is not satisfied or this parameter is set to 0, the fourth cartridge is invalid.

Alarm and message

Number	Message	Description
PS5312	ILLEGAL COMMAND IN G10 L75/76/77	In commands from G10 L75/L76/L77 to G11, there is a format error, or a value beyond the specifiable range is specified. Correct the program.
PS5360	TOOL INTERFERENCE CHECK ERROR	This alarm is issued when interference with another tool is caused by a data modification based on G10 data input or file inputting or when an attempt is made to modify the tool figure data of a tool registered in the cartridge.
PS5361	ILLEGAL MAGAZINE DATA	Tools stored in the cartridge are interfering with each other. Reregister the tools in the cartridge, or modify the tool management data or tool figure data. If this alarm is issued, no tool interference check is made when tools are registered in the cartridge management table. Moreover, empty pot search operation does not operate normally. If this alarm is issued, the power must be turned off before operation is continued.

OPERATOR’S MANUAL (B-64694EN)	TOOL MANAGEMENT FUNCTION FOR OVERSIZE TOOLS

11.4 TOOL COMPENSATION

11.4.1 Cutter Compensation and Tool Nose Radius Compensation

Overview

- Cutter compensation

Use of cutter compensation can offset a programmed tool path by the tool radius set in the CNC when machining is performed.
When the radius of the tool to be used for machining is measured and set as the offset value in the CNC, the tool moves along the offset path to cut a programmed profile. Therefore, even when the tool diameter changes, you must only change the offset value and need not modify the program.

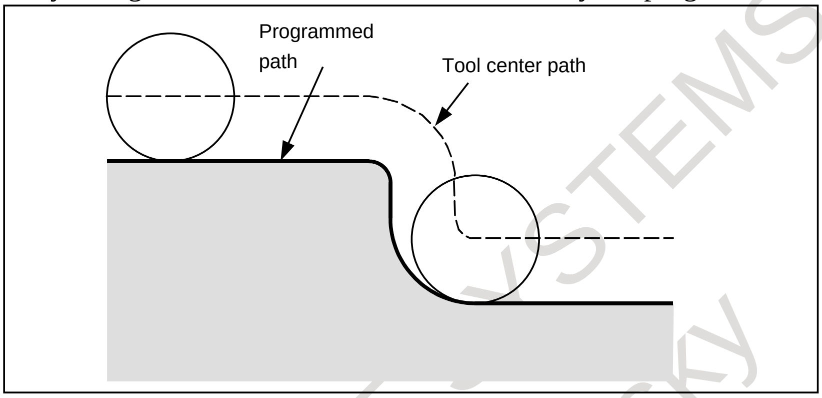

Fig.11.4.1 (a)

To obtain the actual offset tool path, the CNC internally calculates intersections of a straight line and a straight line, an arc and an arc, and a straight line and an arc automatically. The programmer only has to program a machining profile, therefore, programming can be done very easily.

- Tool nose radius compensation

Use of tool-nose radius compensation can offset a programmed tool path by the tool nose radius set in the CNC when machining is performed. When a machining profile is programmed using this function, and the radius of the tool nose to be used for actual machining is measured and set as the offset value in the CNC, the tool moves along the offset path to cut the programmed profile. Therefore, even when the tool nose radius changes, you must only change the offset value and need not modify the program.

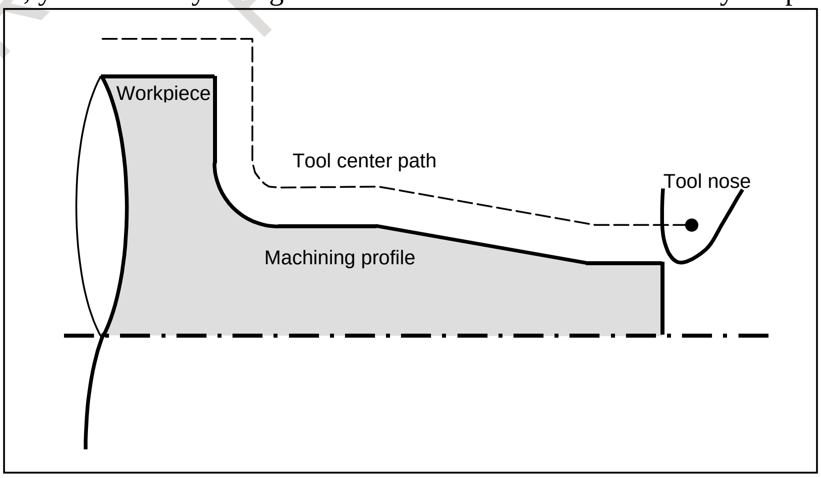

Fig.11.4.1 (b)

To obtain the actual offset tool path, the CNC internally calculates intersections of a straight line and a straight line, an arc and an arc, and a straight line and an arc automatically. The programmer only has to program a machining profile, therefore the programming can be done very easily.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
5000								SBK

[Input type] Setting input
[Data type] Bit path

#0 SBK With a block created internally for tool radius - tool nose radius compensation:
0: A single block stop is not performed.
1: A single block stop is performed.
This parameter is used to check a program including cutter compensation/tool nose radius compensation.

	#7	#6	#5	#4	#3	#2	#1	#0
5001								
				EVR				

[Input type] Parameter input
[Data type] Bit path

#4 EVR When a tool compensation value is changed in tool radius - tool nose radius compensation mode:
0: Enables the change, starting from that block where the next D or H code is specified.
1: Enables the change, starting from that block where buffering is next performed.

	#7	#6	#5	#4	#3	#2	#1	#0
5002	WNP						LGN	

[Input type] Parameter input
[Data type] Bit path

#1 LGN Geometry offset number of tool offset
0: Is the same as wear offset number
1: Specifies the geometry offset number by the tool selection number

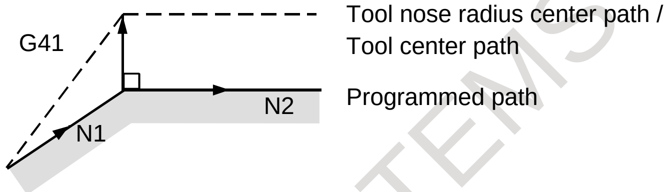
> **NOTE**
> This parameter is valid when tool geometry/wear compensation is specified.

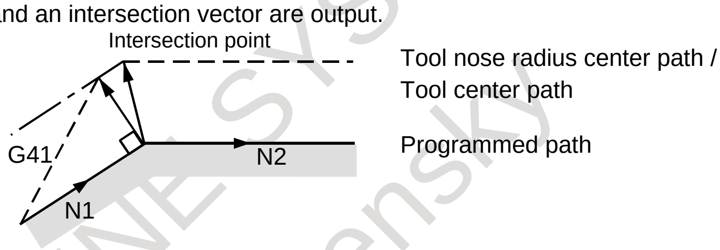
#7 WNP Imaginary tool tip number used for tool nose radius compensation, when the tool geometry/wear compensation function is equipped, is the number specified by:
0: Geometry offset number
1: Wear offset number

	#7	#6	#5	#4	#3	#2	#1	#0
5003							**SUV**	**SUP**

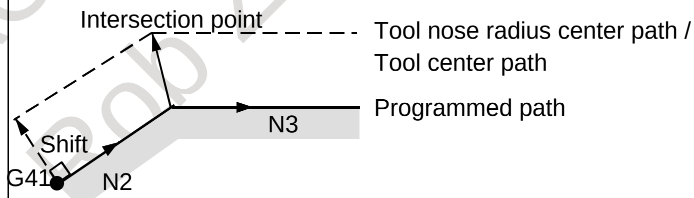
[Input type] Parameter input
[Data type] Bit path

#0 SUP
#1 SUV These bits are used to specify the type of startup/cancellation of tool radius - tool nose radius compensation.

<table>
<tr><th>SUV</th><th>SUP</th><th>Type</th><th>Operation</th></tr>
<tr><td>0</td><td>0</td><td>Type A</td><td>A compensation vector perpendicular to the block next to the startup block or the block preceding the cancellation block is output.


</td></tr>
<tr><td>0</td><td>1</td><td>Type B</td><td>A compensation vector perpendicular to the startup block or cancellation block and an intersection vector are output.


</td></tr>
<tr><td>1</td><td>0
1</td><td>Type C</td><td>When the startup block or cancellation block specifies no movement operation, the tool is shifted by the cutter compensation amount in a direction perpendicular to the block next to the startup or the block before cancellation block.



When the block specifies movement operation, the type is set according to the SUP setting; if SUP is 0, type A is set, and if SUP is 1, type B is set.</td></tr>
</table>

> **NOTE**
> When SUV,SUP = 0,1 (type B), an operation equivalent to that of FS16*i*-T is performed.

	#7	#6	#5	#4	#3	#2	#1	#0
5004								
						ODI		

[Input type] Parameter input
[Data type] Bit path

#2 ODI The setting of a tool radius - tool nose radius compensation value is corrected as:
0: Radius value
1: Diameter value

	#7	#6	#5	#4	#3	#2	#1	#0
5008				MCR	CNV		CNC	

[Input type] Parameter input
[Data type] Bit path

#1 CNC
#3 CNV These bits are used to select an interference check method in the tool radius - tool nose radius compensation mode.

CNV	CNC	Operation
0	0	Interference check is enabled. The direction and the angle of an arc are checked.
0	1	Interference check is enabled. Only the angle of an arc is checked.
1	-	Interference check is disabled.

For the operation taken when the interference check shows the occurrence of an reference (overcutting) , see the description of bit 5 (CAV) of parameter No. 19607.

NOTE
Checking of only the direction cannot be set.

#4 MCR If G41/G42 (tool radius - tool nose radius compensation) is specified in the MDI mode, an alarm is:
0: Not raised.
1: Raised. (Alarm PS5257 “G41/G42 NOT ALLOWED IN MDI MODE”)

	#7	#6	#5	#4	#3	#2	#1	#0
5009								
			TIP					

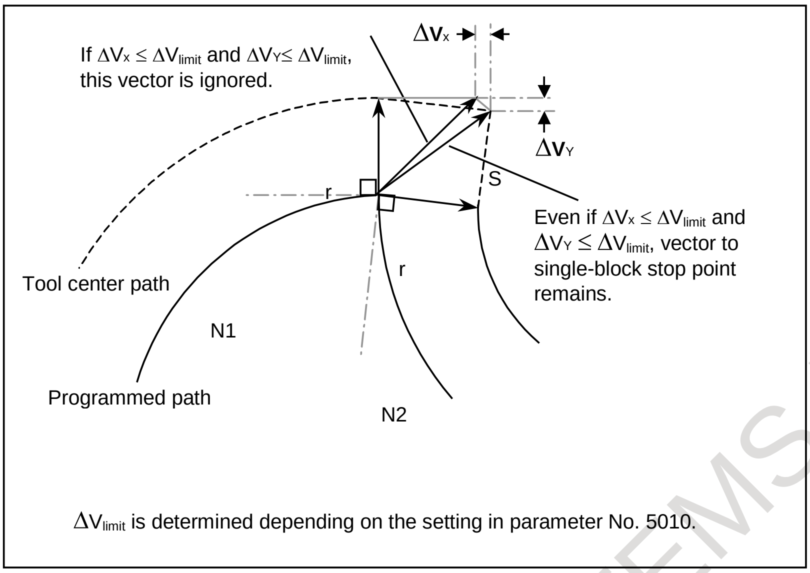
[Input type] Parameter input
[Data type] Bit path

NOTE
When this parameter is set, the power must be turned off before operation is continued.

#5 TIP In tool radius - tool nose radius compensation, the virtual tool tip direction is:
0: Not used.
1: Used.

5010	Limit for ignoring the small movement resulting from tool radius - tool nose radius compensation

[Input type] Setting input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
When the tool moves around a corner in cutter compensation or tool nose radius compensation mode, the limit for ignoring the small travel amount resulting from compensation is set. This limit eliminates the interruption of buffering caused by the small travel amount generated at the corner and any change in feedrate due to the interruption.



5024	Number of tool compensation values

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 999

Set the maximum allowable number of tool compensation values used for each path.
Ensure that the total number of values set in parameter No. 5024 for the individual paths is within the number of compensation values usable in the entire system. The number of compensation values usable in the entire system depends on the option configuration.
If the total number of values set in parameter No. 5024 for the individual paths exceeds the number of compensation values usable in the entire system, or 0 is set in parameter No. 5024 for all paths, the number of compensation values usable for each path is a value obtained by dividing the number of compensation values usable in the entire system by the number of paths.
Tool compensation values as many as the number of compensation values used for each path are displayed on the screen. If tool compensation numbers more than the number of compensation values usable for each path are specified, an alarm PS0115 “VARIABLE NO. OUT OF RANGE” is issued.
For example, 64 tool compensation sets are used, 20 sets may be allocated to path 1, 30 sets to path 2, and 14 sets to path 3. All of 64 sets need not be used.

	#7	#6	#5	#4	#3	#2	#1	#0
5042							OFC	OFA

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 OFA

#1 OFC These bits are used to specify the increment system and valid data range of a tool offset value.

For metric input

OFC	OFA	Unit	Valid data range
0	1	0.01mm	±9999.99mm
0	0	0.001mm	±9999.999mm
1	0	0.0001mm	±9999.9999mm

For inch input

OFC	OFA	Unit	Valid data range
0	1	0.001inch	±999.999inch
0	0	0.0001inch	±999.9999inch
1	0	0.00001inch	±999.99999inch

	#7	#6	#5	#4	#3	#2	#1	#0
19607	NAG	NAA	CAV			CCC		

[Input type] Parameter input
[Data type] Bit path

#2 CCC In the cutter compensation/tool nose radius compensation mode, the outer corner connection method is based on:
0: Linear connection type.
1: Circular connection type.

#5 CAV When an interference check for cutter compensation/tool nose radius compensation finds that interference (overcutting) occurred:
0: Machining stops with the alarm PS0041," INTERFERENCE IN CUTTER COMPENSATION".
(Interference check alarm function)
1: Machining is continued by changing the tool path to prevent interference (overcutting) from occurring. (Interference check avoidance function)
For the interference check method, see the descriptions of bit 1 (CNC) of parameter No. 5008 and bit 3 (CNV) of parameter No. 5008.

#6 NAA When the interference check avoidance function for cutter compensation/tool nose radius compensation considers that an avoidance operation is dangerous or that a further interference to the interference avoidance vector occurs:
0: An alarm is issued.
When an avoidance operation is considered to be dangerous, the alarm PS5447," DANGEROUS AVOIDANCE AT G41/G42" is issued.
When a further interference to the interference avoidance vector is considered to occur, the alarm PS5448," INTERFERENCE TO AVD. AT G41/G42" is issued.
1: No alarm is issued, and the avoidance operation is continued.

> ⚠ **CAUTION**
> When this parameter is set to 1, the path may be shifted largely. Therefore, set this parameter to 0 unless special reasons are present.

#7 NAG If the gap vector length is 0 when the interference check avoidance function for cutter compensation/tool nose radius compensation is used:
0: Avoidance operation is performed.

1: Avoidance operation is not performed.

19625	Number of blocks to be read in the cutter compensation/tool nose radius compensation mode

[Input type] Setting input
[Data type] Byte path
[Valid data range] 3 to 8

This parameter sets the number of blocks to be read in the cutter compensation/tool nose radius compensation mode. When a value not greater than 3 is set, the specification of 3 is assumed. When a value not less than 8 is set, the specification of 8 is assumed. As a greater number of blocks are read, an overcutting (interference) forecast can be made with a command farther ahead. However, the number of blocks read and analyzed increases, so that a longer block processing time becomes necessary.

Even if the setting of this parameter is modified in the MDI mode by stopping in the cutter compensation/tool nose radius compensation mode, the setting does not become valid immediately. Before the new setting of this parameter can become valid, the cutter compensation/tool noise radius compensation mode must be canceled, then the mode must be entered again.

Alarm and message

Number	Message	Description
PS0033	NO INTERSECTION AT 41/42	The intersection cannot be obtained by the intersection calculation in cutter or tool-nose radius compensation. Modify the program.
PS0034	ONLY G00/G01 ALLOWED IN STUP/EXT BLK	In cutter or tool-nose radius compensation, a startup or cancellation is performed in the following mode. Modify the program. G02/G03 : Circular interpolation or helical interpolation G35/G36 : Circular threading
PS0035	CAN NOT COMMANDED G31	- G31 cannot be specified. This alarm is generated when a G code (such as for cutter or tool-nose radius compensation) of group 07 is not canceled. - A torque limit skip was not specified in a torque limit skip command (G31P98 or P99). Specify the torque limit skip in the PMC window or the like. Or, specify the torque limit override by address Q.
PS0037	CAN NOT CHANGE PLANE IN G41/G42	The compensation plane G17/G18/G19 was changed during cutter or tool-nose radius compensation. Modify the program.
PS0041	INTERFERENCE IN G41/42	In cutter or tool-nose radius compensation, excessive cutting may occur. Modify the program.
PS0042	G45/G48 NOT ALLOWED IN CRC	Tool offset (G45 to G48) is commanded in tool compensation. Modify the program.
PS5445	CAN NOT COMMAND MOTION IN G39	Corner circular interpolation (G39) of cutter compensation or tool nose radius compensation is not specified alone but is specified with a move command.
PS5446	NO AVOIDANCE AT G41/G42	Because there is no interference evade vector, the interference check evade function of cutter compensation or tool nose radius compensation cannot evade interference.
PS5447	DANGEROUS AVOIDANCE AT G41/G42	The interference check evade function of cutter compensation or tool nose radius compensation determines that an evade operation will lead to danger.

Number	Message	Description
PS5448	INTERFERENCE TO AVD. AT G41/G42	In the interference check evade function of cutter compensation or tool nose radius compensation, a further interference occurs for an already created interference evade vector.

11.4.2 Tool Length Compensation

M

Overview

When the difference between the tool length assumed at the time of programming and the tool length of the tool actually used for machining is set in offset memory, the difference in tool length can be corrected without modifying the program.
G43 and G44 specify the offset direction, and a number following the tool length compensation specification address (H code) specifies the tool length compensation amount set in the offset memory.

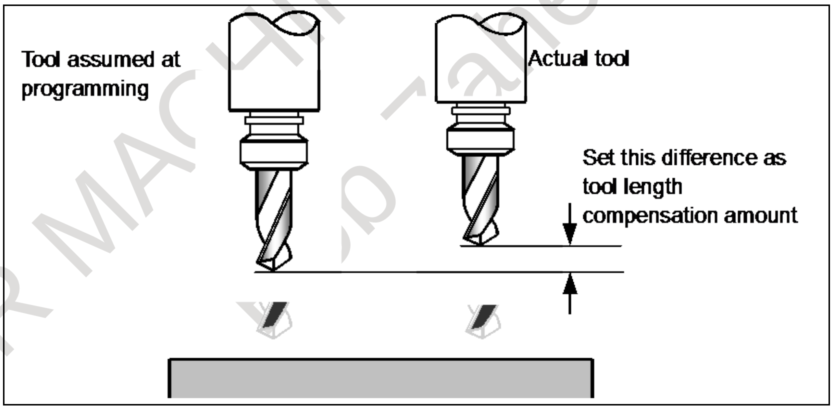

Fig.11.4.2 (a)

One of the following three methods is available, depending on the type of axis that can be subject to tool length compensation:

- Tool length compensation A
  Compensates the value of the tool length on the Z axis.
- Tool length compensation B
  Compensates the value of the tool length on vertical direction of plane selection .
- Tool length compensation C
  Compensates the value of the tool length on a specified axis.

T

Extended tool selection function is necessary to use this function with lathe system. Moreover, the tool change method needs to be ATC type (bit 3(TCT) of parameter No.5040) = 1).

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3104								
		DAL		DRL				

[Input type] Parameter input
[Data type] Bit path

#4 DRL Relative position
0: The actual position displayed takes into account tool length offset.
1: The programmed position displayed does not take into account tool length offset.

#6 DAL Absolute position
0: The actual position displayed takes into account tool length offset.
1: The programmed position displayed does not take into account tool length offset.

> **NOTE**
> In lathe systems, whether to exclude a tool offset when displaying the absolute position is determined by the setting of bit 1 (DAP) of parameter No. 3129.

	#7	#6	#5	#4	#3	#2	#1	#0
5001		EVO						
		EVO			TAL		TLB	TLC

[Input type] Parameter input
[Data type] Bit path

#0 TLC
#1 TLB These bits are used to select a tool length compensation type.

Type	TLB	TLC
Tool length compensation A	0	0
Tool length compensation B	1	0
Tool length compensation C	-	1

The axis to which cutter compensation is applied varies from type to type as described below.
Tool length compensation A : Z-axis at all times
Tool length compensation B : Axis perpendicular to a specified plane (G17/G18/G19)
Tool length compensation C : Axis specified in a block that specifies G43/G44

#3 TAL Tool length compensation C
0: Generates an alarm when two or more axes are offset
1: Not generate an alarm even if two or more axes are offset

#6 EVO If a tool compensation value modification is made for tool length compensation A or tool length compensation B in the offset mode (G43 or G44):
0: The new value becomes valid in a block where G43, G44, or an H code is specified next.
1: The new value becomes valid in a block where buffering is performed next.

	#7	#6	#5	#4	#3	#2	#1	#0
5003		LVK						

[Input type] Parameter input
[Data type] Bit path

#6 LVK By reset, Tool length compensation vector is
0: Canceled
1: Not canceled.

	#7	#6	#5	#4	#3	#2	#1	#0
5007	3OF	3OC						

[Input type] Parameter input
[Data type] Bit path

#6 3OC If tool length compensation is not cancelled before 3-dimensional coordinate conversion is specified, an alarm is:
0: Not raised.
1: Raised. (alarm PS0049 ,” ILLEGAL COMMAND (G68,G69)”)

#7 3OF If 3-dimensional coordinate conversion is not nested with a command for tool length compensation, or if 3-dimensional coordinate conversion is specified during tool length compensation and another command for tool length compensation is specified:
0: No alarm is issued.
1: The alarm PS0049 ,” ILLEGAL COMMAND (G68,G69)” is issued.

Example 1) An alarm is raised in the following cases:

```
1) G68 X_ Y_ Z_ I_ J_ K_ R_ ;
      :
   G43 H1 ;
      :
   G69 ;                              ← PS0049 raised
      :
   G49 ;
2) G43 H1 ;
      :
   G68 X_ Y_ Z_ I_ J_ K_ R_ ;
      :
   G49(G43H2,H2 etc.) ;               ← PS0049 raised
      :
   G69 ;
```

Example 2) No alarm is raised in the following cases:

```
3) G68 X_ Y_ Z_ I_ J_ K_ R_ ;
     :
   G43 H1 ;
     :
   G49 ;
     :
   G69 ;
4) G43 H1 ;
     :
   G68 X_ Y_ Z_ I_ J_ K_ R_ ;
     :
   G69 ;
     :
   G49 ;
```

NOTE

A command to cancel tool length compensation (G28, etc.) will not cause an alarm to be raised. If a command like this is specified in the G68 mode, program as indicated in 3) above.

```
G43 H1 ;
  :
G68 X_ Y_ Z_ I_ J_ K_ R_ ;
  :
G28 X_ Y_ Z_ ;            ← Offset is cancelled.
  :                         No alarm is raised.
G69 ;
```

Alarm and message

Number	Message	Description
PS0027	NO AXES COMMANDED IN G43/G44	No axis is specified in G43 and G44 blocks for the tool length offset type C. Offset is not canceled but another axis is offset for the tool length offset type C. Multiple axes were specified for the same block when the tool length compensation type is C.
PS0049	ILLEGAL COMMAND(G68,G69)	When 3-dimensional coordinate conversion (G68 or G69) was specified, the tool compensation was not canceled. Or, programs of 3-dimensional coordinate conversion (G68, G69) and tool compensation (G43, G44 or G49) were not nested. Or, the 3-dimensional coordinate conversion was specified during the tool length compensation and another tool length compensation was specified.
PS0336	TOOL COMPENSATION COMMANDED MORE TWO AXES	For a tool length compensation C, an attempt was made to command the offset to other axes without canceling the offset. Or, for a tool length compensation C, multiple axes are specified in G43 or G44 block.

OPERATOR'S MANUAL (B-64694EN)	Tool length compensation

11.4.3 Tool Length Compensation Shift Types

M

Overview

A tool length offset operation can be performed by shifting the program coordinate system. The coordinate system containing the axis subject to tool length compensation is shifted by the tool length compensation value. A tool length compensation shift type can be selected with bit 6 (TOS) of parameter No. 5006 or bit 2 (TOP) of parameter No. 11400. If no move command is specified together with the G43, G44, or G49 command, the tool will not move along the axis. If a move command is specified together with the G43, G44, or G49 command, the coordinate system will be shifted first, then the tool will move along the axis.
One of the following three methods is available, depending on the type of axis that can be subject to tool length compensation:

- Tool length compensation A
  Compensates the value of the tool length on the Z axis.
- Tool length compensation B
  Compensates the value of the tool length on one of the X, Y, and Z axis.
- Tool length compensation C
  Compensates the value of the tool length on a specified axis.

Explanation

- Offset direction

If the tool length compensation value specified with an H code (and stored in offset memory) is G43, the coordinate system is shifted to the + side; if G44, to the - side. If the sign of the tool length compensation value is -, the coordinate system is shifted to the - side if G43 and to the + side if G44. G43 and G44 are modal G codes; they remain valid until another G code in the same group is used.

- Specifying a tool length compensation value

The tool length compensation value corresponding to the number (offset number) specified with an H code (and stored in offset memory) is used. The tool length compensation corresponding to the offset number 0 always means 0. It is not possible to set a tool length compensation value corresponding to H0.

- Compensation axis

Specify one of tool length compensation types A, B, and C, using bits 0 (TLC) and 1 (TLB) of parameter No. 5001.

- Specifying offset on two or more axes

Tool length compensation B enables offset on two or more axes by specifying offset axes in multiple blocks.

To perform offset on X and Y axes

G19 G43 H_;	Performs offset on the X axis.
G18 G43 H_;	Performs offset on the Y axis.

Tool length compensation C suppresses the generation of an alarm even if offset is performed on two or more axes at the same time, by setting bit 3 (TAL) of parameter No. 5001 to 1.

- Tool length compensation cancel

To cancel offset, specify either G49 or H0. Canceling offset causes the shifting of the coordinate system to be undone. If no move command is specified at this time, the tool will not move along the axis.

- Staring and canceling tool length compensation

Once a command for starting or canceling tool length compensation (*2) is issued in a mode such as cutter compensation (*1), no look-ahead block interpretation is carried out until the tool length compensation start or cancel request block is finished. So, the following operations occur.

- The spindle decelerates to a stop in the start or cancel block.
- The compensation vector for tool compensation becomes perpendicular to the block just before the start or cancel block, resulting in an overcut or insufficient cut, because no look-ahead interpretation is carried out.
- No command specified after the start or cancel block is executed until the block is finished.

*1 No look-ahead block interpretation is carried out for the following commands:
  - G codes, except G40, in group 07
    (for such modes as cutter compensation (G41/G42))

*2 The following commands are included.
  - Tool length compensation (G43/G44)

- Operation when a tool compensation value is changed in the tool length compensation mode

Bit 1 (MOF) of parameter No. 5000 can be used to specify what operation to perform when a tool length compensation value is changed (*3) in the cutter compensation mode (*1) and tool length compensation mode (*2).

- If bit 1 (MOF) of parameter No. 5000 = 0:
  The axis is shifted by the amount of change in the tool length compensation value.
- If bit 1 (MOF) of parameter No. 5000 = 1:
  Until an absolute command is issued to the compensated axis since the change of the tool length compensation value, the axis is shifted by the amount of change in the tool length compensation value.

*1 The following commands are included.
  - G codes, except G40, in group 07
    Cutter compensation (G41/G42)

*2 The following commands are included.
  - Tool length compensation (G43/G44)

*3 "Changing a tool length compensation value" pertains to:
  - Issuing the H code (or, with the extended tool select function in the lathe system, D code) in a program
  - Changing a compensation value on the offset screen, by the G10 command, system variables, or the window function if bit 6 (EVO) of parameter No. 5001 = 1.

Caution

⚠ **CAUTION**

1 Specifying tool length compensation (a shift type) first and then executing an incremental command causes the tool length compensation value to be reflected in the coordinates only, not in the travel distance of the machine; executing an absolute command causes the tool length compensation value to be reflected in both the movement of the machine and the coordinates.
2 If a programmable mirror image is effective, the tool length offset is applied in the specified direction.
3 No scaling magnification is applied to the tool length offset value.
4 No coordinate system rotation is applied to the tool length offset value. Tool length offset is effective in the direction in which the offset is applied.
5 The tool length offset operation is independent of the cutter compensation offset operation.
6 3-dimensional coordinate conversion is applied to tool length offset. If tool length offset is made effective to multiple axes, the tool length offset must be canceled for one axis at a time.
7 With the WINDOW command, changing bit 6 (TOS) of parameter No. 5006 or bit 2 (TOP) of parameter No. 11400 during automatic operation does not cause the tool length offset type to be changed.
8 If offset has been performed on two or more axes with tool length compensation B, a G49 command causes the offset to be canceled on all axes; H0 causes the offset to be canceled only on the axis vertical to the specified plane.
9 If the tool length compensation value is changed by changing the offset number, this simply means that the value is replaced by a new tool length compensation value; it does not mean that a new tool length compensation value is added to the old tool length compensation.
10 If using cutter compensation, set bit 2 (OFH) of parameter No. 5001 to 0, specify tool length compensation with an H code, and specify cutter compensation with a D code.
11 If reference position return (G28 or G30) has been specified, tool length offset is canceled for the axis specified at the time of positioning on the reference point; however, tool length offset is not canceled for an un-specified axis. If reference position return has been specified in the same block as that containing tool length offset cancel (G49), tool length offset is canceled for both the specified and un-specified axes at the time of positioning on the mid-point.
12 With a machine coordinate system command (G53), tool length offset is canceled for the axis specified at the time of positioning on the specified point.
13 The tool length compensation vector canceled by specifying G53, G28, or G30 during tool length compensation is restored as described below:
For tool length compensation types A and B, if bit 6 (EVO) of parameter No. 5001 is 1, the vector is restored in the block buffered next; for all of tool length compensation types A, B, and C, it is restored in a block containing an H, G43, or G44 command if parameter is 0.
14 When a tool compensation shift type is used, no look-ahead interpretation is made if a command for starting or canceling compensation such as tool length compensation is issued in the tool radius/ tool-nose radius compensation mode. As a result, it is likely that an overcut or insufficient cut may occur. To avoid this problem, issue the command before the tool radius/ tool-nose radius compensation mode is entered or in a place where machining is not affected.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
5000							MOF	

[Input type] Setting input
[Data type] Bit path

#1 MOF When the tool length compensation shift type (bit 6 (TOS) is set to 1 of parameter No. 5006 or bit 2 (TOP) of parameter No. 11400 is set to 1) is used, if the tool length compensation amount is changed(NOTE 3) in the tool length compensation mode (NOTE 1) when look-ahead blocks are present(NOTE 2):

0: Compensation is performed for the change in compensation amount as the movement type.

1: Compensation is not performed for the change until a tool length compensation command (offset number) and an absolute programming for the compensation axis are specified.

> **NOTE**
> 1 The tool length compensation mode refers to the following state:
> - Tool length offset (G43/G44)
>
> 2 "When look-ahead blocks are present" means as follows:
> - The modal G code of the G codes (such as tool radius - tool nose radius compensation) of group 07 is other than G40.
>
> One look-ahead block during automatic operation and multiple look-ahead blocks in the AI contour control mode are not included in the state "when look-ahead blocks are present".
>
> 3 Changes in tool length compensation amount are as follows:
> - When the tool length compensation number is changed by H code (or D code for the extended tool selection function for lathe systems)
> - When G43 or G44 is specified to change the direction of tool length compensation
> - When the tool length compensation amount is changed using the offset screen, G10 command, system variable, PMC window, and so forth during automatic operation if bit 1 (EVO) of parameter No. 5001 is set to 1.
> - When the tool length compensation vector is restored after being temporarily canceled by G53, G28, or G30 during tool length compensation.

	#7	#6	#5	#4	#3	#2	#1	#0
5001								
					TAL		TLB	TLC

[Input type] Parameter input
[Data type] Bit path

#0 TLC
#1 TLB These bits are used to select a tool length compensation type.

Type	TLB	TLC
Tool length compensation A	0	0
Tool length compensation B	1	0

Type	TLB	TLC
Tool length compensation C	-	1

The axis to which cutter compensation is applied varies from type to type as described below.
Tool length compensation A : Z-axis at all times
Tool length compensation B : Axis perpendicular to a specified plane (G17/G18/G19)
Tool length compensation C : Axis specified in a block that specifies G43/G44

#3 TAL Tool length compensation C
0: Generates an alarm when two or more axes are offset
1: Not generate an alarm even if two or more axes are offset

	#7	#6	#5	#4	#3	#2	#1	#0
5006		TOS						

[Input type] Parameter input
[Data type] Bit

#6 TOS Set a tool length compensation or tool offset operation.
0: Tool length compensation or tool offset operation is performed by an axis movement.
1: Tool length compensation or tool offset operation is performed by shifting the coordinate system.

	#7	#6	#5	#4	#3	#2	#1	#0
11400						TOP		

[Input type] Parameter input
[Data type] Bit path

#2 TOP Set a tool length compensation or tool offset operation.
0: Tool length compensation or tool offset operation is performed by an axis movement.
1: Tool length compensation or tool offset operation is performed by shifting the coordinate system.

NOTE
This parameter is an-individual path parameter having the same function as bit 6 (TOS) of parameter No. 5006.
To use different compensation types for individual paths, set the parameter TOS with 0 and specify a compensation type for each path separately, using the parameter TOP. If the parameter TOS is 1, the parameter TOP is assumed to be 1 even if it is 0.

11.4.4 Second Geometry Tool Offset

T

Overview

To compensate for the difference in tool mounting position and in selected position, this function adds 32 sets of second geometry tool offset for each of the X, Z, and Y axes for all paths (up to 2000 sets for all paths and up to 999 sets for a single path).
In contrast to this offset, the ordinary tool geometry offset is called the first geometry tool offset.
It is possible to apply a tool offset value (tool wear offset + tool geometry offset) in the reverse direction, using an appropriate signal.
This function may be used if the compensation value differs even with a single tool for a mechanical reason depending on the mounting position (inside/outside) or the selected position (right/left).

NOTE
1 To use the second geometry tool offset, the geometry and wear compensation are required.
2 To use the second geometry tool offset for the Y axis, the Y axis offset is required.

Example

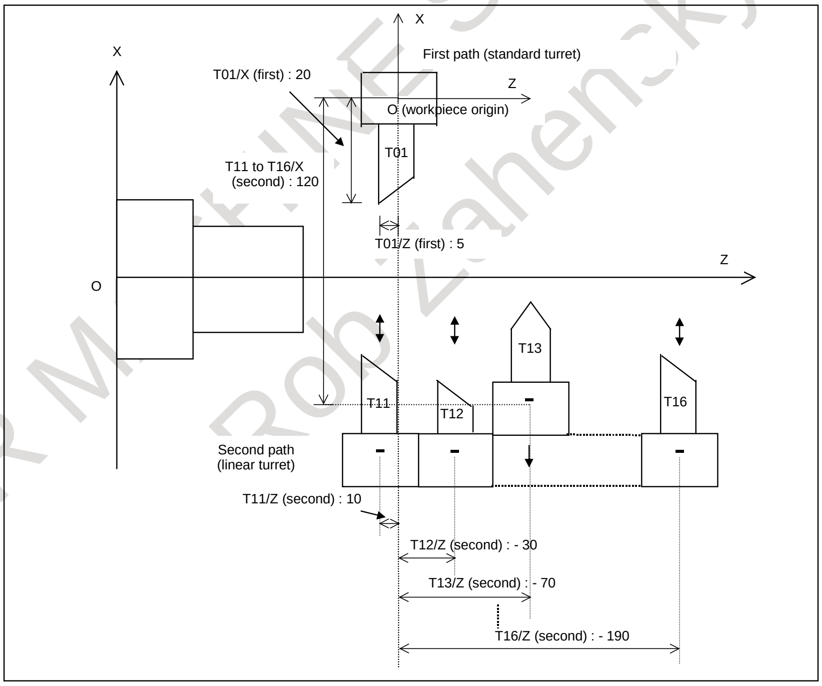

Fig. 11.4.4

In the machine configuration shown in the Fig. 11.4.4, for the offset data for the tool mounted to the first path (standard turret), set the offset data of the tool itself as the first geometry tool offset data. (The second geometry tool offset data is 0.) For the offset data for the tool mounted to the second path (linear turret), set the offset data of the tool itself as the first geometry tool offset data and the offset data from the workpiece origin at the mounting position as the second geometry tool offset data. Usually, the offset data of the tool itself is measured separately from the offset data at the mounting position, these data can be set separately by using the second geometry tool offset.

Table 11.4.4

First geometry tool offset			Second geometry tool offset		
No.	**X axis**	**Z axis**	**No.**	**X axis**	**Z axis**
01	20.000	5.000	01	0.000	0.000
:	:	:	:	:	:
10	25.000	8.000	10	0.000	0.000
11	-20.000	5.000	11	120.000	10.000
12	-10.000	3.000	12	120.000	-30.000
13	-15.000	0.000	13	120.000	-70.000
:	:	:	:	:	:
16	-18.000	7.000	16	120.000	-190.000

- Offset data

The data for the second geometry tool offset can be set for each path. The number of items of the data can be set with parameter No. 5024. The data remains stored even after the power is turned off.
If the data is to be made common to paths, use the memory common to paths.

Signal

Second geometry tool offset signal G2SLC<Gn090.7>

[Classification] Input signal

[Function] This signal selects whether to use the second geometry tool offset.

[Operation] When a tool number is specified with a T code, only the first geometry tool offset is used as the tool geometry offset value if this signal is 0; if this signal is 1, the value obtained by adding the second geometry tool offset to the first geometry tool offset is used as the tool geometry offset value.

> **NOTE**
> To switch this signal, use an M code for suppressing buffering. If the signal is switched without suppressing buffering during automatic operation, it is likely that no offset may work properly.

Second geometry tool offset axis selection signals G2X,G2Z,G2Y<Gn090.4, Gn090.5, Gn090.6>

[Classification] Input signal

[Function] These signals select the axis for which the second geometry tool offset is added to the first geometry tool offset.

[Operation] If these signals are set to 0, the second geometry tool offset is not added to the controlled axis corresponding to the axis bit.
If these signals are set to 1, the second geometry tool offset is added to the controlled axis corresponding to the axis bit.
These signals are valid when the second geometry tool offset signal G2SLC is set to 1.

> **NOTE**
> G2Y requires the Y-axis offset.

Tool offset direction signals G2RVX,G2RVZ,G2RVY<Gn090.0, Gn090.1, Gn090.2>

[Classification] Input signal

[Function] When a tool offset is used, these signals change the direction of the compensation amount.
The direction of the tool offset for compensation is determined by tool movement as follows:
0: The same direction as the direction indicated by the sign

1: The opposite direction to the direction indicated by the sign

> **NOTE**
> 1 G2RVY requires the Y-axis offset.
> 2 This signal cannot shift a coordinate.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn090	G2SLC	G2Y	G2Z	G2X		G2RVY	G2RVZ	G2RVX

Parameter

3032	Allowable number of digits for the T code

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 1 to 8
Set the allowable numbers of digits for the T code.
When 0 is set, the allowable number of digits is assumed to be 8.

	#7	#6	#5	#4	#3	#2	#1	#0
3290			GO2					

[Input type] Parameter input
[Data type] Bit path

#5 GO2 Setting the second geometric tool offset value by MDI key input is:
0: Disabled.
1: Not disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
5002		LWM		LGT			LGN	

[Input type] Parameter input
[Data type] Bit path

#1 LGN Geometry offset number of tool offset
0: Is the same as wear offset number
1: Specifies the geometry offset number by the tool selection number

> **NOTE**
> This parameter is valid when tool geometry/wear compensation is specified.

#4 LGT Tool geometry compensation
0: Compensated by the shift of the coordinate system
1: Compensated by the tool movement

> **NOTE**
> This parameter is valid when tool geometry/wear compensation is specified.

#6 LWM Tool offset operation based on tool movement is performed:
0: In a block where a T code is specified.
1: Together with a command for movement along an axis.

5024	Number of tool compensation values

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 999

Set the maximum allowable number of tool compensation values used for each path.
Ensure that the total number of values set in parameter No. 5024 for the individual paths is within the number of compensation values usable in the entire system. The number of compensation values usable in the entire system depends on the option configuration.
If the total number of values set in parameter No. 5024 for the individual paths exceeds the number of compensation values usable in the entire system, or 0 is set in parameter No. 5024 for all paths, the number of compensation values usable for each path is a value obtained by dividing the number of compensation values usable in the entire system by the number of paths.
Tool compensation values as many as the number of compensation values used for each path are displayed on the screen. If tool compensation numbers more than the number of compensation values usable for each path are specified, alarm PS0115 “VARIABLE NO. OUT OF RANGE” is issued.
For example, 64 tool compensation sets are used, 20 sets may be allocated to path 1, 30 sets to path 2, and 14 sets to path 3. All of 64 sets need not be used.

5028	Number of digits of an offset number used with a T code command

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 4

Specify the number of digits of a T code portion that is used for a tool offset number (wear offset number when the tool geometry/wear compensation function is used).
When 0 is set, the number of digits is determined by the number of tool compensation values.
When the number of tool compensation values is 1 to 9: Lower 1 digit
When the number of tool compensation values is 10 to 99: Lower 2 digits
When the number of tool compensation values is 100 to 999: Lower 3 digits

[Example] When an offset number is specified using the lower 2 digits of a T code, set 2 in parameter No. 5028.
Txxxxxx yy
xxxxxx : Tool selection
yy : Tool offset number

In tool management function, set 4 in this parameter to set 4-digit number in parameter No.13265.

> **NOTE**
> A value longer than the setting of parameter No. 3032 (allowable number of digits of a T code) cannot be set.

Manual name	Item name
OPERATOR'S MANUAL (For Lathe System) (B-64694EN-1)	Second Geometry Tool Offset

11.5 TOOL LIFE MANAGEMENT

Tools are classified into several groups, and a tool life (use count or use duration) is specified for each group in advance. Each time a tool is used, its life is counted, and when the tool life expires, a new tool that is sequenced next within the same group is selected automatically. With this function, the tool life can be managed while machining is being performed continuously. Data for tool life management consists of tool group numbers, tool life values, tool numbers, and codes for specifying a tool offset value. These data items are registered in the CNC.

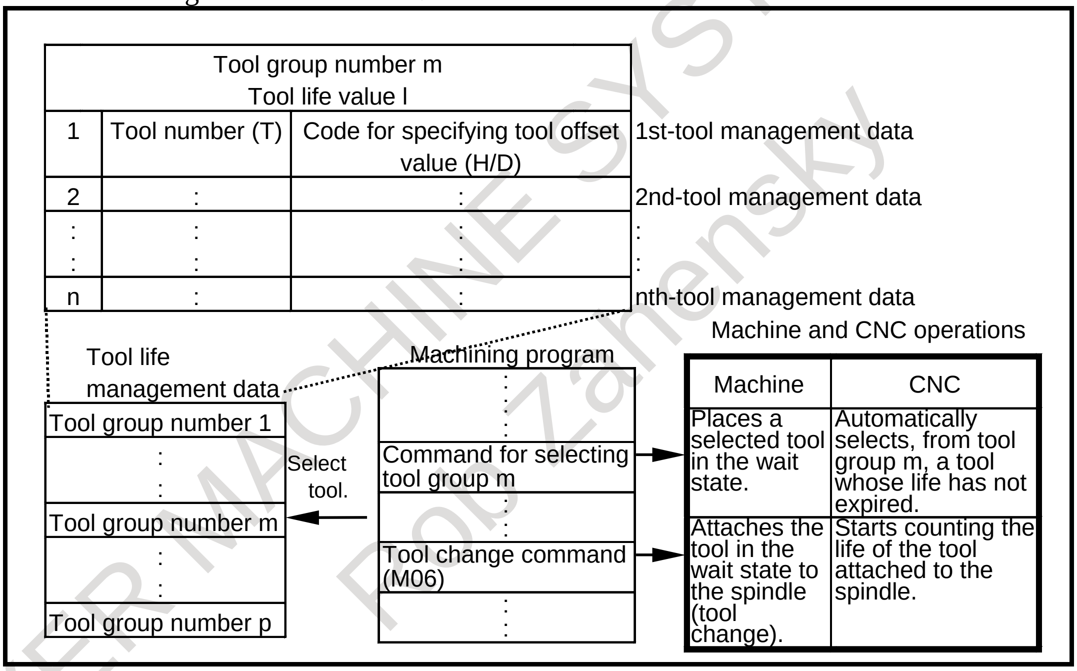

Fig. 11.5 (a) Tool selection from machining program

M

A group is selected by a T code, and tool life counting is started by the M06 command.

T

The T series has two tool change types (the turret type and the ATC type). The turret type uses only a T code to select a group, specify a tool offset value, and start tool life counting, whereas the ATC type, like the M series, uses a T code to select a group and the M06 command to start tool life counting. With the ATC type, only a D code is used for specifying a tool offset value. The tool change type is selected by bit 3 (TCT) of parameter No. 5040.

> ⚠ **CAUTION**
> This function cannot be used if bit 1 (LGN) of parameter No. 5002 is set to 1 to use the same number as the tool selection number to specify a geometric offset number.

- Life management B function

If the tool life management B function is enabled, the maximum tool life value can be extended, and the tool life expiration prior notice signal TLCHB <Fn064.3> can be output to post tool life expiration in advance when the remaining life (the life value - the life counter value) has reached the remaining life setting. The remaining life setting is registered as tool life management data in the CNC in advance.
The tool life management B function is enabled by setting bit 4 (LFB) of parameter No. 6805 to 1.

M

If the tool life management B function is enabled, the function for selecting a tool group by an arbitrary group number can be used.

T

The tool life management B function can be used. However, the function for selecting a tool group by an arbitrary group number can be used only if the tool change type is the ATC type (bit 3 (TCT) of parameter No. 5040 = 1).

- Maximum number of tool life management groups and multi-path system

Up to 256 tool life management groups can be used in the entire CNC system.
For each path, set a maximum number of groups to be used in parameter No. 6813.
The maximum number of groups must be a multiple of the minimum number of groups (eight groups). If the maximum number of groups is 0, the tool life management function is disabled.

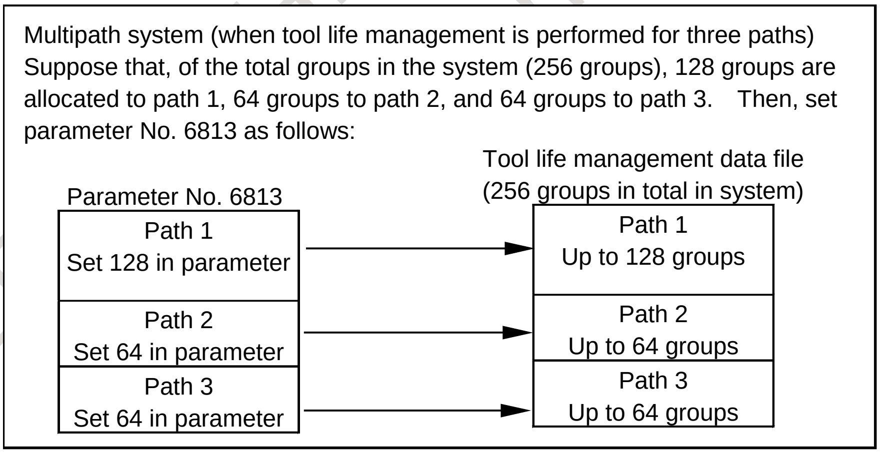

Fig. 11.5 (b) Group allocation in entire system

Signal

Tool change signal TLCH <Fn064.0>

[Classification] Output signal
[Function] Informs that the life of the last tool in a group has expired.
[Output cond.] The signal becomes 1 when:
- The life of the last tool in a group has expired, after the next tool of the group was selected each time the life of each tool in the group expired.

The signal becomes 0 when:
- There is no group whose life has expired.

When the signal is 1, it is reset to 0 by informing the CNC that tool change has been finished for all groups in which the life of all tools had expired, by inputting the tool change reset signal TLRST from the PMC or operating on the MDI.

> ⚠ **CAUTION**
> If the tool life is specified by use count, the tool change signal TLCH becomes 1 when the CNC is reset by a command such as M02 or M30 after the tool life has expired or when the tool life count restart M code is issued.
> If the tool life count type is specified by duration, the TLCH becomes 1 when the tool life expires, even if machining is in progress. Machining, however, continues until the end of the program.

Tool change reset signal TLRST <Gn048.7>

[Classification] Input signal

[Function] Clears all execution data, such as tool life count values and marks "*" and "@", for a group.
After replacing all tools in the groups in which the life of all the tools has expired (as shown on the screen) with new ones, input this signal by specifying a group number, using the tool group number selection signals (TL01 to TL512). Setting bit 4 (GRS) of parameter No. 6800 to 1 can clear execution data for all registered groups without inputting the tool group number select signal.
Execution data can be cleared also by operating on the MDI.

[Operation] When the signal changes from 0 to 1, the control unit behaves as explained below.

- If the lives of all tools in the group specified by the tool group number selection signals (TL01 to TL512) have expired, the related information is cleared. Therefore, when a subsequent program command specifies the group number, tools are selected from the beginning. If the group specified by the tool group number selection signals (TL01 to TL512) contains at least one tool whose life has not expired, no special operation takes place.

> **NOTE**
> Set the tool change reset signal TLRST from 0 to 1 only when the control unit is not in the reset state (the RST signal is 1) and the following conditions are satisfied:
> 1) If bit 5 (TRS) of parameter No. 6805 = 0
> Reset state (the OP signal is 0)
> 2) If bit 5 (TRS) of parameter No. 6805 = 1
> <1>Reset state (the OP signal is 0)
> <2>Automatic operation stop state (the STL signal and the SPL signal are 0 and the OP signal is 1)
> <3>Automatic operation stop state (the STL signal is 0 and the SPL signal is 1)
> (In the automatic operation stop state, automatic operation pause state, and automatic operation start state (the STL signal is 1) during execution of a data setting command (G10 L3), however, the tool change reset signal TLRST is invalid.)

Individual tool change signal TLCHI <Fn064.2>

[Classification] Output signal

[Function] When the tool life count is specified by duration, this signal informs that the life of the currently used tool has expired. The signal can be used to cause an interrupt to program execution, to run a tool change program, and, after tool exchange, to resume the interrupted program execution.

[Operation] The signal becomes 1 when:

- The life of the currently used tool has expired.

The signal becomes 0 when:

- An individual tool change reset is executed.

Individual tool change reset signal TLRSTI <Gn048.6>

[Classification] Input signal

[Function] Resets the individual tool change signal TLCHI to 0.

[Operation] When this signal becomes 1, the control unit behaves as explained below.

- The individual tool change signal is reset to 0.

> **NOTE**
> 1 These signals are valid only for tool life management in which the tool life count type is specification by duration.
> 2 The individual tool change signal TLCHI is not cleared by a reset.

Tool skip signal TLSKP <Gn048.5>

[Classification] Input signal

[Function] Skips a tool whose life has not expired and selects the next tool forcibly. One of the following two methods can be selected according to the setting of bit 3 (SIG) of parameter No. 6800:

(i) How to specify a group number by using the tool group number select signals (SIG = 1)
Specify the group number of the tool to be skipped by using the tool group number selection signals (TL01 to TL512), then set the tool skip signal to 1. The next T code command will then select the next tool in the group which is specified to be skipped.

(ii) How not to specify a group number by using the tool group number select signals (SIG = 0)
Set the tool skip signal TLSKP to 1 without specifying any group number. The group to which the currently selected tool belongs is then assumed to be specified.
The next T code command will select the next tool in the group for which the skip is specified.

When the tool skip signal TLSKP is set to 1 for the last tool, the tool change signal TLCH is set to 1.

[Operation] When this signal is set from 0 to 1, the control unit behaves as explained below:

- Among the tools whose lives have not expired in the group for which a skip operation is specified, the smallest tool number in the tool life management table is marked with "#". When the group is specified again by a T code command, the marked tool is skipped, and the next new tool is selected.
  When the tool skip signal TLSKP is set to 1 for the last tool, the tool change signal TLCH is set to 1.

⚠ **CAUTION**

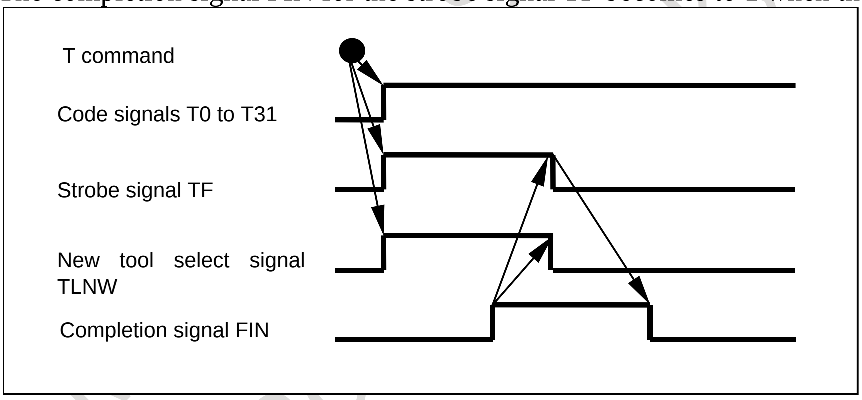
The tool skip signal TLSKP can be used even in the automatic operation start state (the STL signal is 1), but a tool selection from a group by a T command is made when the command is buffered. This means that after the command is buffered, inputting the tool skip signal TLSKP does not select the next tool. Therefore, when supplying the tool skip signal TLSKP in the automatic operation start state (the STL signal is 1), disable tool selection, for example, by suppressing buffering before setting the signal from 0 to 1.

New tool select signal TLNW <Fn064.1>

[Classification] Output signal

[Function] Notifies the PMC that a new tool has been selected from a group. This signal can be used, for example, if the tool length offset value of a newly selected tool is to be measured automatically when the tool is selected.

[Output cond.] The signal becomes 1 if:
A next new tool is selected because the life of the tools used in the group has expired when a tool group number is commanded by T code command.
After the code signal for the new tool is sent out, the TLNW becomes 1 at the same time when the tool function strobe signal TF is sent out.
The signal becomes 0 if:
The completion signal FIN for the strobe signal TF becomes to 1 when the TLNW is 1.



Tool group number selection signals TL01 to TL512 <Gn047.0 to Gn048.1>

[Classification] Input signal

[Function] These signals specify a tool group number. Before the tool change reset signal TLRST or the tool skip signal TLSKP is input, the target group for the tool change reset operation or tool skip operation is specified with these signals.

[Operation] The table given below shows the correspondence between tool group numbers and the tool group signals by providing several examples. A binary number plus 1 indicates a tool group number. A group with a specified number is then selected.

TL512	TL256	TL128	TL64	TL32	TL16	TL08	TL04	TL02	TL01	Tool group number
0	0	0	0	0	0	0	0	0	0	1
0	0	0	0	0	0	0	0	0	1	2
0	0	0	0	0	0	0	0	1	0	3
0	0	0	0	0	0	0	0	1	1	4
0	0	0	0	0	0	0	1	0	0	5
0	0	0	0	0	0	1	0	0	1	10
0	0	0	0	0	0	1	1	1	0	15
0	0	0	0	0	1	0	0	1	1	20

TL512	TL256	TL128	TL64	TL32	TL16	TL08	TL04	TL02	TL01	Tool group number
0	0	0	0	0	1	1	1	0	1	30
0	0	0	0	1	0	0	1	1	1	40
0	0	0	0	1	1	0	0	0	1	50
0	0	0	1	1	0	0	0	1	1	100

1	1	1	1	1	1	1	1	1	1	1024

Tool life count override signals *TLV0 to *TLV9 <Gn049.0 to Gn050.1>

[Classification] Input signal

[Function] If the tool life count type is specified by duration, the life count can be overridden by setting bit 2 (LFV) of parameter No. 6800 = 1. Ten binary code signals are available, and they correspond to override values as follows:

$$\text{Override value} = \sum_{i=0}^{9} \{2i \times Vi\} \text{ times}$$

Keep the override values within the range stated above.
Where, if *TLVi is 1, Vi = 0
if *TLVi is 0, Vi = 1
Therefore, each signal has the following weight:

Signal	Magnification	Signal	Magnification	Signal	Magnification
*TLV0	0.1	*TLV4	1.6	*TLV8	25.6
*TLV1	0.2	*TLV5	3.2	*TLV9	51.2
*TLV2	0.4	*TLV6	6.4	-	-
*TLV3	0.8	*TLV7	12.8	-	-

Example:
If *TLV7, *TLV6, and *TLV3 are 0, the override value is calculated as follows: 12.8 + 6.4 + 0.8 = 20.0
So, the life count is multiplied by 20.
If all signals are 1, the override value is 0. So, set an override value within the range from 0 to 99.9 in steps of 0.1.
If 99.9 times is exceeded, the actual override value is clamped by 99.9 times.

[Operation] The actual cutting time obtained by life counting specified by duration is multiplied by the override value specified by these signals, and the multiplication result is assumed to be the count time for tool life management. For example, let the override value be 0.1, and the actual cutting time be 1000 seconds. Then, the tool life count time is assumed to be 100 seconds.

Tool life arrival notice signal TLCHB <Fn064.3>

[Classification] Output signal

[Function] If the tool life management B function is enabled (bit 4 (LFB) of parameter No. 6805 = 1), specifying a remaining life value to be used till selection of a new tool enables the tool life arrival notice signal to be issued when life counting shows that the remaining life value of a group (life value minus life counter value) becomes lower than or equal to the remaining life setting, in order to inform in advance that the tool life will expire soon.

By bit 4 (ARL) of parameter No. 6802, it is possible to select whether to output the tool life arrival notice signal for each tool or the last tool in the group.

Bit 3 (GRP) of parameter No. 6802 can be used to specify which remaining life setting (that is, one specified in parameter Nos. 6844 and 6855 or one registered as tool life management data) to use.

[Output cond.] The signal is set to 1 if:

- Remaining life (life value - life counter value) ≤ remaining life setting provided that bit 7 (RMT) of parameter No. 6802 = 0
- Remaining life (life value - life counter value) = remaining life setting provided that bit 7 (RMT) of parameter No. 6802 = 1

The signal is reset to 0 if:

- Remaining life (life value - life counter value) > remaining life setting provided that bit 7 (RMT) of parameter No. 6802 = 0
- Remaining life (life value - life counter value) ≠ remaining life setting provided that bit 7 (RMT) of parameter No. 6802 = 1

> **NOTE**
> 1 The signal changes when life counting is performed.
> 2 When using a life count override, reset bit 7 (RMT) of parameter No. 6802 to 0.
> 3 When the life count is specified by duration, the unit of the remaining life and remaining life setting to be compared varies depending on the life count interval (bit 0 (FCO) of parameter No. 6805). If the tool life is counted every second, the unit of the values to be compared is one minute; if the tool life is counted every 0.1 second, the unit of the values to be compared is 0.1 minute.

If bit 7 (CTB) of parameter No. 6803 is 1, this signal can be set to 0 when an operation such as the following is performed.

- Clears the execution data on the list screen of tool life management.
- Deletes all tool group data at a time, adds a tool number, or deletes tool data on the edit screen of tool life management.
- Clears the execution data by the tool change reset signal TLRST <Gn048.7>.
- Registers, changes, or deletes all tool life management group data by the G10 command.
- Executes the FOCAS2 cnc_clrcntinfo function (which clears the tool life counter or tool information).
- Replaces a tool with a tool of which life is not managed by the M06 command.

Tool life counting disable signal LFCIV<Gn048.2>

[Classification] Input signal

[Function] Disables tool life counting for selected tools.

[Operation] If the signal turns to 1, the control unit behaves as explained below.

- No life counting is performed for selected tools.

NOTE

The tool life counting disable signal LFCIV<Gn048.2> is valid if bit 6 (LFI) of parameter No. 6804 is 1.

Tool life counting disabled signal LFCIF<Fn093.2>

[Classification] Output signal

[Function] Informs that tool life counting is disabled for selected tools.

[Output cond.] The signal becomes 1 when:

- Tool life counting is disabled because the tool life counting disable signal LFCIV is 1.

The signal becomes 0 when:

- Tool life counting is enabled because the tool life counting disable signal LFCIV is 0.

Number of remaining tools notification signal TLAL <Fn154.0>

[Classification] Output signal

[Function] Informs that the number of remaining tools in the group selected with a T code command is equal to or less than the setting of parameter No. 6846.

[Output cond.] The signal becomes 1 when:

- The number of remaining tools in the group selected with a T code command is equal to or less than the setting of parameter No. 6846.

The signal becomes 0 when:

- A value is input to parameter No. 6846.
- Using a G10 command, registration is performed that involves the erasure of all life management data groups.
- Using a T code command, a group is selected in which the number of remaining tools is greater than the setting of parameter No. 6846.

The signal also becomes 0 when any of the following is executed in the group that has caused the number of remaining tools notification signal TLAL to be generated.

- Clearing of execution data, using the tool change reset signal TLRST <Gn048.7>.
- Change and deletion of life management data, using a G10 command.
- Batch deletion of tool groups from the group edit screen of tool life management, addition of tool data to the screen, and deletion from the screen.
- Clearing of tool execution data from the group edit screen of tool life management.
- Clearing of execution data from the list screen of tool life management.
- Execution of any of the FOCAS2 functions below.
  (cnc_clrcntinfo, cnc_deltlifegrp, cnc_deltlifedt, cnc_instlifedt, cnc_wrt1info, cnc_wrt2info, cnc_wr1tlifedata, cnc_wr1tlifedat2, cnc_wr2tlifedata)

NOTE

1 This signal is used in the M series only.

2 If the setting of parameter No. 6846 is 0, the number of remaining tools notification signal TLAL is not output.

Example)

If three tools are registered in a group, and the number of remaining tools is set to 1 (parameter No. 6846 = 1), the timing chart of the number of remaining tools notification signal TLAL is as shown in Fig. 11.5 (c).

The number of remaining tools notification signal TLAL is output at the same time as the T code for the third tool.

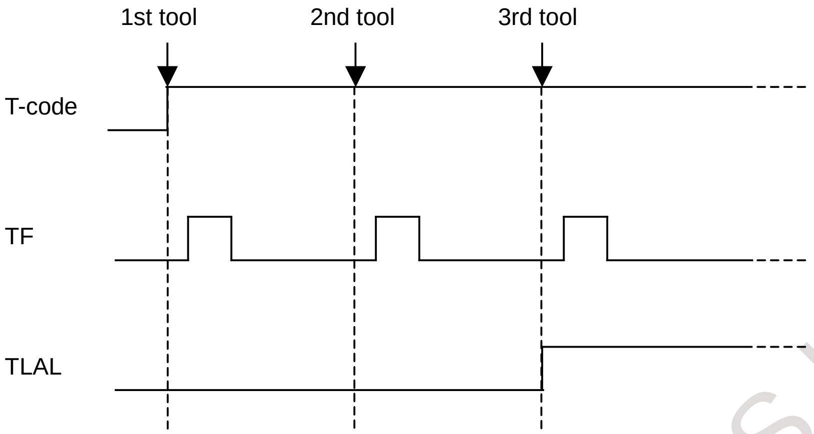

Fig. 11.5 (c) Timing chart of the number of remaining tools notification signal TLAL

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
6800	**M6T**	**IGI**	**SNG**	**GRS**	**SIG**	**LTM**	**GS2**	**GS1**

[Input type] Parameter input
[Data type] Bit path

#0 GS1
#1 GS2 For the maximum number of groups set in parameter No. 6813, up to four tools can be registered per group. The combination of the number of registrable groups and the number of tools per group can be changed by setting GS1 and GS2.

GS2	GS1	Number of groups	Number of tools
0	0	1/8 of maximum number of groups (No. 6813)	32
0	1	1/4 of maximum number of groups (No. 6813)	16
1	0	1/2 of maximum number of groups (No. 6813)	8
1	1	Maximum number of groups (No. 6813)	4

NOTE
After changing these parameters, set data again by using G10 L3 ;(registration with deleting data of all groups).

#2 LTM The tool life count type is specified by:
0: Count.
1: Duration.

NOTE
After changing this parameter, set data again by using G10 L3 ;(registration after deletion of data of all groups).

#3 SIG In tool skip by signals, the group number is:
0: Not input by the tool group number selection signals TL01～TL512<Gn047.0 ～ Gn048.1>.
1: Input by the tool group number selection signals.

NOTE
When this parameter is set to 0, a tool of the currently used group is skipped.

#4 GRS When the tool change reset signal TLRST <Gn048.7> is input:
0: If the life of the group specified by the tool group number selection signals TL01 to TL512 <Gn047.0 to Gn048.1> has expired, the execution data of the group is cleared.
1: The execution data of all registered groups is cleared.
If this parameter is set to 1, the execution data of all registered groups are cleared also when the clear operation to clear execution data is performed on the tool life management list screen.

#5 SNG When the tool skip signal TLSKP <Gn048.5> is input while a tool not controlled by the tool life management function is being used:
0: A tool of the most recently used group or a specified group (bit 3 (SIG) of parameter No. 6800) is skipped.
1: The tool skip signal is ignored.

#6 IGI Tool back numbers are:
0: Not ignored.
1: Ignored.

#7 M6T A T code specified in the same block as M06 is:
0: Assumed to be a back number.
1: Assumed to be a command specifying the next tool group.

	#7	#6	#5	#4	#3	#2	#1	#0
6801	M6E				EMD	LVF	TSM	
	M6E				EMD	LVF		

NOTE
The use of this parameter varies depending on whether the tool management function or tool life management function is used.

[Input type] Parameter input

[Data type] Bit path

#1 TSM In the tool life management function, life counting is performed as follows when more than one offset is specified:
0: Counting is performed for each tool number.
1: Counting is performed for each tool.

#2 LVF When the life value is counted by duration in the tool management function or tool life management function, tool life count override signals *TLV0 to *TLV9 <Gn049.0 to Gn050.1> are:
0: Not used.
1: Used.

#3 EMD In the tool life management function, the mark "*" indicating that the life has expired is displayed when:
0: The next tool is used.
1: The life has just expired.

> **NOTE**
> If this parameter is set to 0, the "@" mark (indicating that the tool is in use) is kept displayed unless the next tool whose life has not expired is used. If this parameter is set to 1, marks are displayed in different ways depending on the life count type.
> If the life count type is the duration specification type, the "*" mark (indicating that the life has expired) appears when the life has expired. If the life count type is the count specification type, one count is not assumed until the end of the program (M02, M30, and so on). Therefore, even when the life value and the tool life counter value match, the "*" mark (life has expired) does not appear. The "*" mark (life has expired) appears when the tool is used again by a tool group command (T code) or tool change command (M06) issued after the CNC is reset.

#7 M6E When a T code is specified in the same block as M06:
0: The T code is treated as a back number or the group number to be selected next. Which number is assumed depends on the setting of bit 7 (M6T) of parameter No. 6800.
1: Life counting for the tool group starts immediately.

	#7	#6	#5	#4	#3	#2	#1	#0
6802	RMT	TSK	TGN	ARL	GRP	E17	TCO	T99

[Input type] Parameter input
[Data type] Bit path

#0 T99 When M99 of the main program is executed, and if there is a tool group whose life is expired:
0: The tool change signal is not output.
1: The tool change signal is output and the automatic operation stop state is entered..

If the life count is specified by use count and this parameter 1, the tool change signal TLCH <Fn064.0> is output and the automatic operation becomes a stopped state if there is a tool group whose life is expired when the M99 command is specified.

If the life count type is the duration specification type, the automatic operation becomes a stopped state if the life of at least one tool group has expired.

M

If the life count is specified by use count, after the M99 command is specified, a tool group command (T code) selects, from a specified group, a tool whose life has not expired, and the next tool change command (M06) increments the tool life counter by one.

T

If the life count is specified by use count, when a tool group command (T code) is specified after the M99 command is specified, a tool whose life has not expired is selected from a specified group, and the tool life counter is incremented by one.
When the tool change type is the ATC type (bit 3 (TCT) of parameter No. 5040 = 1), the same specifications as for the M series apply.

#1 TCO
#2 E17 Specifies whether to allow the FOCAS2 or PMC window function to write tool information of a group being used or a group to be used next during automatic operation (the automatic operation signal OP <Fn000.7> is set to 1).

<table>
<tr><th colspan="3" rowspan="4">Condition</th><th colspan="3">Bit 1 (TCO) of parameter No. 6802</th></tr>
<tr><th rowspan="3">0</th><th colspan="2">1</th></tr>
<tr><th colspan="2">Bit 2 (E17) of parameter No. 6802</th></tr>
<tr><th>1</th><th>0</th></tr>
<tr><td rowspan="3">During automatic operation</td><td rowspan="2">Group being used or to be used next</td><td>Tool being used</td><td>×</td><td>△</td><td>○</td></tr>
<tr><td>Tool not being used</td><td>×</td><td>○</td><td>○</td></tr>
<tr><td colspan="2">Group neither being used nor to be used next</td><td>○</td><td>○</td><td>○</td></tr>
<tr><td colspan="3">Not during automatic operation</td><td>○</td><td>○</td><td>○</td></tr>
</table>

○: Tool information can be written from FOCAS2 and PMC window.
×: Tool information cannot be written from FOCAS2 and PMC window.
When an attempt is made to write tool information from PMC window, completion code 13 (REJECT ALARM) is returned.
△: Tool information cannot be cleared.

NOTE
When tool information of a tool being used (marked with "@") in the group being used or to be used next or tool information of the most recently used tool (marked with "@") in a group that is neither the group being used nor the group to be used next is cleared, the life counter is reset to 0.
It is possible to modify tool information of a tool in the group to be used next. However, because tool selection is already completed, the selected tool does not change even when the tool information is modified.
This parameter has no influence on modifications to tool information by edit operations from the tool life management screen.

#3 GRP Management data of tool life arrival notice signal TLCHB <Fn064.3> is:
0: Managed using the remaining life value set in parameter No. 6844 and 6845.
1: Managed using the remaining life value set in tool life management data.

> **NOTE**
> When the tool life arrival notice signal function is used, bit 4 (LFB) of parameter No. 6805 must be set to 1 to enable the tool life management B function.

#4 ARL Tool life arrival notice signal TLCHB <Fn064.3> of tool life management is:
- 0: Output for each tool.
- 1: Output for the last tool of a group.

This parameter is valid only when bit 3 (GRP) of parameter No. 6802 is set to 1.

#5 TGN In the tool life management function, the optional group number function is:
- 0: Not used.
- 1: Used.

> **NOTE**
> When the optional group number function is used, bit 4 (LFB) of parameter No. 6805 must be set to 1 to enable the tool life management B function.
> In lathe systems, the optional group number function can be used if the tool change type is the ATC type (bit 3 (TCT) of parameter No. 5040 = 1).

#6 TSK If the count type in tool life management is the duration type, then when the last tool of a group is skipped by a signal:
- 0: The count value for the last tool equals the life value.
- 1: The count value for the last tool remains unchanged.

#7 RMT Tool life arrival notice signal TLCHB <Fn064.3> is turned 1 and 0 as follows:
- 0: The signal is turned 1 if the remaining life value (the life value minus the life counter value) is smaller than or equal to the remaining life setting. The signal is turned 0 if the remaining life value (the life value minus the life counter value) is greater than the remaining life setting.
- 1: The signal is turned 1 if the remaining life value (the life value minus the life counter value) is equal to the remaining life setting. The signal is turned 0 if the remaining life value (the life value minus the life counter value) is not equal to the remaining life setting.

> **NOTE**
> When using the life count override feature, set bit 7 (RMT) of parameter No. 6802 to 0. When the life count is specified by duration, the unit used for determining the result of comparison between the remaining life and the remaining life setting varies depending on the life count interval (bit 0 (FCO) of parameter No. 6805). If the life is counted every second, the comparison is made in units of 1 minute; if the life is counted every 0.1 second, the comparison is made in units of 0.1 minute.

	#7	#6	#5	#4	#3	#2	#1	#0
6803	CTB							

[Input type] Parameter input

[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off once.

 # 7 CTB Whether to turn the tool life arrival notice signal TLCHB <Fn064.3> of tool life management off is determined when life counting starts. An additional turn-off condition is:
0: Not added.
1: Added.
The tool life arrival notice signal is turned off when one of the following operations is performed for the currently used group:
- Clears the execution data on the list screen of tool life management.
- Deletes all tool group data at a time, adds a tool number, or deletes tool data on the edit screen of tool life management.
- Clears the execution data by the tool change reset signal TLRST <Gn048.7>.
- Registers, changes, or deletes all tool life management group data by the G10 command.
- Executes the FOCAS2 cnc_clrcntinfo function (which clears the tool life counter or tool information).
- Replaces a tool with a tool of which life is not managed by the M06 command.

	#7	#6	#5	#4	#3	#2	#1	#0
6804		LFI				ETE	TCI	

[Input type] Parameter input
[Data type] Bit path

#1 TCI During automatic operation (the automatic operation signal OP<Fn000.7> is 1), editing of tool life data is:
0: Disabled.
1: Enabled.

> **NOTE**
> When this parameter is set to 1, tool life data can be edited even during automatic operation (the OP signal is 1). If the target group for editing is the group being used or the group to be used next, however, only presetting of the life counter is permitted, and other data cannot be modified.

#2 ETE In the tool life management screen, when the life of the last tool in the group is expired, the mark of the tool:
0: depends on setting bit 3 (EMD) of parameter No. 6801.
1: is "*" mark.

If bit 2 (ETE) of parameter No. 6804 is set to 1, when the life counter of the final tool in the group becomes equal to the life value, the mark "*" indicating that the life of tool has been expired is displayed on the last tool of the tool life management screen.
When tool change signal TLCH <Fn064.0> is 1, if the tool information of the final tool is acquired in FOCAS 2 or PMC window, the tool indicates that the life has been expired.

#6 LFI In tool life management, counting of the life of a selected tool is:
0: Enabled.

1: Enabled or disabled according to the status of tool life counting disable signal LFCIV <Gn048.2>.

	#7	#6	#5	#4	#3	#2	#1	#0
6805	TAD	TRU	TRS	LFB			FGL	FCO

[Input type] Parameter input
[Data type] Bit path

#0 FCO If the life count type is the duration specification type, the life is counted as follows:
0: Every second.
1: Every 0.1 second.
According to the setting of this parameter, the increment system of life values and tool life counter values displayed on the tool life management screen is set as follows:

Parameter FCO	0	1
Increment system for display and setting of life values and life counter values	1-minute increments	0.1-minute increments

NOTE
After changing the setting of this parameter, set data again by using G10L3;(registration after deletion of data of all groups).

#1 FGL If the life count type is the duration specification type, life data registered by G10 is:
0: In minute increments.
1: In 0.1-second increments.

#4 LFB The tool life management B function is:
0: Disabled.
1: Enabled.
When the tool life management B function is enabled, the following functions can be used:
<1> Tool life value extension (count specification: 99999999 times, duration specification: 100000 minutes)
<2> Optional group number function
<3> Tool life arrival notice function
In lathe systems, if the tool change type is the ATC type (bit 3 (TCT) of parameter No. 5040 = 1), the optional group number function can be used.

#5 TRS Tool change reset signal TLRST <Gn048.7> is valid when reset signal RST <Fn001.1> is not 1 and:
0: The reset state (automatic operation signal OP<Fn000.7> is 0) is observed.
1: The reset state (automatic operation signal OP is 0), automatic operation stop state (cycle start lamp signal STL <Fn000.5> and feed hold lamp signal SPL <Fn000.4> are 0 and OP is 1), or the automatic operation pause state (STL is 0 and SPL is 1) is observed. The TLRST signal, however, is invalid when the automatic operation stop state, automatic operation pause state, and automatic operation start state (STL is 1) is observed during execution of a data setting command (G10L3).

#6 TRU When the life count type is the duration specification type, and the life is counted every second (bit 0 (FCO) of parameter No. 6805 is set to 0):
0: Cutting time less than one second is discarded and is not counted.
1: Cutting time less than one second is rounded up and is counted as one second.

> **NOTE**
> If the life is counted every 0.1 second (bit 0 (FCO) of parameter No. 6805 is set to 1), cutting time less than 0.1 second is always rounded up and is counted as 0.1 second.

#7 TAD With tool change type D (bit 7 (M6E) of parameter No. 6801 is set to 1), when a block specifying M06 contains no T command:
0: An alarm PS0153, "T-CODE NOT FOUND" is issued.
1: No alarm is issued.

6810	Tool life management ignore number

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 99999999

This parameter sets the tool life management ignore number.
When the value specified in a T code exceeds the value set in this parameter, the value obtained by subtracting the parameter-set value from the T code value is assumed to be the tool group number for tool life management.

6811	Tool life count restart M code

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 127 (except 01, 02, 30, 98, and 99)

When 0 is specified, it is ignored.
When the life is specified by count, the tool change signal TLCH <Fn064.0> is output if the life of at least one tool group has expired when the tool life count restart M code is issued.
The T code (tool life management group command) specified after the tool life count restart M code selects a tool whose life has not expired from a specified group, and the next M06 command increments the tool life counter by one.
When the life is specified by duration, specifying the tool life count restart M code causes nothing. When 0 is set in this parameter, the tool life count restart M code is invalid. When the data of M code exceeds 127 values, set 0 in parameter No. 6811, and set the value of M code in parameter No. 13221. The data range of parameter No. 13221 is from 0 to 255.

> **NOTE**
> The use of this parameter varies depending on whether the tool management function or tool life management function is used.

6813	Maximum number of groups in tool life management

> **NOTE**
> After this parameter has been set, the power must be turned off once.

[Input type] Parameter input
[Data type] Word path
[Unit of data] Group
[Valid data range] 0, 8, 16 to 256

This parameter sets the maximum number of groups to be used for each path. As the maximum number of groups, set a multiple of eight. When the tool life management function is not used, 0 must be set. Set this parameter so that the total number of groups in all paths does not exceed the total number of groups in the entire system (256 groups).

> **NOTE**
> When the power is turned on, all tool life management file data is initialized. So, tool life management data must be set for all paths that use tool life management.

6844	Remaining tool life (use count)

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 9999

This parameter sets a remaining tool life (use count) used to output the tool life expiration notice signal TLCHB <Fn064.3> when the tool life is specified by use count. If a value greater than the tool life value or 0 is set in this parameter, the tool life notice signal is not output.

6845	Remaining tool life (use duration)

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] min
[Valid data range] Not greater than the tool life value

This parameter sets the remaining tool life (use duration) used to output the tool life notice signal TLCHB <Fn064.3> when the tool life is specified by use duration. If a value greater than the tool life value or 0 is specified in this parameter, the tool life notice signal is not output.

> **NOTE**
> When the life is counted every 0.1 second (bit 0 (FCO) of parameter No. 6805 = 1), the parameter value is in 0.1-minute increments.

6846	Remaining tool number in a group

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 127

This parameter sets the remaining tool number in a group.
When the remaining tool number in the group selected by the T code is smaller than or equal to the value set in this parameter, the remaining tool number notice signal TLAL <Fn154.0> is output. When this parameter is set to 0, the remaining tool number notice signal is not output.

13221	M code for tool life count restart

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 255 (not including 01, 02, 30, 98, and 99)

When 0 is set, this parameter is ignored.

For the operation of an M code for tool life count restart, see the description of parameter No. 6811.
This parameter is used when an M code for tool life count restart exceeds 127.
Set parameter No. 6811 to 0, and set the value of an M code in this parameter.

> **NOTE**
> The use of this parameter varies depending on whether it is used by the tool management function or tool life management function.

13265	H code for using the tool length offset in tool life management

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 9999

Usually, when H99 is specified, tool length offset is enabled by the H code of the tool being used. By setting any H code in this parameter, any H code instead of H99 can be used. If 0 is specified, H99 is assumed.
A value ranging from 0 to 9999 can be set.

> **NOTE**
> The use of this parameter varies depending on whether it is used by the tool management function or tool life management function.

13266	D code for enabling cutter compensation in tool life management

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 9999

Usually in tool life management, specifying D99 allows the D code of the tool being used to enable cutter compensation. By setting any D code in this parameter, the D code instead of D99 can be used. If 0 is set, D99 is assumed.
The valid data range is 0 to 9999.

Alarm and message

Number	Message	Description
PS0149	FORMAT ERROR IN G10L3	In registration (G10L3 to G11) of tool life management data, an address other than Q1, Q2, P1, and P2 or an unusable address was specified.
PS0150	ILLEGAL LIFE GROUP NUMBER	The tool group number exceeded the maximum allowable value. The tool group number (P after specification of G10 L3;) or the group number given by the tool life management T code in a machining program is exceeded the maximum allowable value.
PS0151	GROUP NOT FOUND AT LIFE DATA	The tool group specified in a machining program is not set in tool life management data.
PS0152	OVER MAXIMUM TOOL NUMBER	The number of tools registered in one group exceeded the maximum allowable registration tool number.
PS0153	T-CODE NOT FOUND	In registration of tool life data, a block in which the T code needs to be specified does not include the T code. Alternatively, in tool exchange method D, M06 is specified solely. Modify the program.
PS0154	NOT USING TOOL IN LIFE GROUP	The H99 command, D99 command, or the H/D code set by parameters Nos. 13265 and 13266 was specified when no tool belonging to a group is used.
PS0155	ILLEGAL T-CODE COMMAND	In the machining program, the T code that is present in the block containing M06 does not correspond to the group currently being used. Modify the program.

Number	Message	Description
PS0156	P/L COMMAND NOT FOUND	The P and L commands are not specified in the beginning of a program for setting a tool group. Modify the program.
PS0157	TOO MANY TOOL GROUPS	In registration of tool life management data, the group setting command block counts of P (group number) and L (tool life) exceeded the maximum group count.
PS0158	TOOL LIFE VALUE OUT OF RANGE	The life value that is being set is too large. Change the setting.
PS0159	ILLEGAL TOOL LIFE DATA	Tool life management data is corrupted for some reason. Register the tool data in the tool group or the tool data in the group again by G10L3; or MDI input.
PS0430	TOOL LIFE PAIRS ZERO	Tool life management group number parameter No. 6813 is 0.
PS0431	ILLEGAL T/R DATA OF TOOL LIFE	The arbitrary group number (T) or remaining amount setting (R) is invalid.
IO1104	OVER MAXIMUM TOOL LIFE PAIRS	The maximum number of tool life management pairs is exceeded. Modify the setting of the maximum number of tool life management pairs in parameter No. 6813.

12 PROGRAM COMMAND

12.1 DECIMAL POINT PROGRAMMING / CALCULATOR-TYPE DECIMAL POINT PROGRAMMING

Overview

Numerical values can be entered with a decimal point. A decimal point can be used when entering a distance, time, or speed. Decimal points can be specified with the following addresses:

X, Y, Z, U, V, W, A, B, C, I, J, K, Q, R, F ......Machining center system (for a type common to all axes)
X, Y, Z, U, V, W, A, B, C, I, J, K, R, F ....Lathe system

There are two types of decimal point notation: calculator-type notation and standard notation.
When calculator-type decimal point notation is used, a value without decimal point is considered to be specified in millimeters, inches or degree. When standard decimal point notation is used, such a value is considered to be specified in least input increments. Select either calculator-type or standard decimal point notation by using the bit 0 (DPI) of parameter No. 3401. Setting the bit 0 (AXDx) of parameter No. 3455 to 1 enables the calculator-type decimal input to be set up for individual axes separately. Values can be specified both with and without decimal point in a single program.

Program command	Calculator-type decimal point programming	Standard type decimal point programming
X1000 Command value without decimal point	1000mm Unit : mm	1mm Unit : Least input increment (0.001mm)
X1000.0 Command value with decimal point	1000mm Unit : mm	1000mm Unit : mm

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3401								DPI

[Input type] Parameter input
[Data type] Bit path

#0 DPI When a decimal point is omitted in an address that can include a decimal point
0: The least input increment is assumed. (Normal decimal point input)
1: The unit of mm, inch, degree, or second is assumed. (Calculator- type decimal point input)

	#7	#6	#5	#4	#3	#2	#1	#0
3455								AXDx

[Input type] Parameter input
[Data type] Bit axis

#0 AXDx If a decimal point is omitted for an axis address with which a decimal point can be used, the value is determined:
0: In accordance with the least input increment. (Normal decimal point input)
1: In millimeters, inches, degrees, or seconds. (calculator-type decimal point input)

NOTE
This parameter specifies the calculator-type decimal point input function for each axis.
For the same axis name, be sure to make the same setting.

Alarm and message

Number	Message	Description
PS0007	ILLEGAL USE OF DECIMAL POINT	A decimal point (.) was specified at an address where no decimal point may be specified, or two decimal points were specified.

12.2 G CODE SYSTEM

12.2.1 G Code List in the Lathe System

T

Overview

There are three G code systems : A,B, and C. Select a G code system using bits 7 (GSC) and 6 (GSB) of parameter No. 3401.

Table 12.2.1 G code list

G code system			Group	Function
A	B	C		
G00	G00	G00	01	Positioning (Rapid traverse)
G01	G01	G01	01	Linear interpolation (Cutting feed)
G02	G02	G02	01	Circular interpolation CW or helical interpolation CW
G03	G03	G03	01	Circular interpolation CCW or helical interpolation CCW
G04	G04	G04	00	Dwell
G05	G05	G05	00	AI contour control (command compatible with high precision contour control)
G05.1	G05.1	G05.1	00	AI contour control
G05.4	G05.4	G05.4	00	HRV3 on/off
G07.1 (G107)	G07.1 (G107)	G07.1 (G107)	00	Cylindrical interpolation
G08	G08	G08	00	AI contour control (advanced preview control compatible command)
G09	G09	G09	00	Exact stop
G10	G10	G10	00	Programmable data input
G10.6	G10.6	G10.6	00	Tool retract and recover
G10.8	G10.8	G10.8	00	Programmable internal data change
G11	G11	G11	00	Programmable data input cancel
G12.1 (G112)	G12.1 (G112)	G12.1 (G112)	21	Polar coordinate interpolation mode
G13.1 (G113)	G13.1 (G113)	G13.1 (G113)	21	Polar coordinate interpolation cancel mode
G17	G17	G17	16	XpYp plane selection
G18	G18	G18	16	ZpXp plane selection

G code system			Group	Function
A	B	C		
G19	G19	G19	16	YpZp plane selection
G20	G20	G70	06	Input in inch
G21	G21	G71	06	Input in mm
G22	G22	G22	09	Stored stroke check function on
G23	G23	G23	09	Stored stroke check function off
G25	G25	G25	08	Spindle speed fluctuation detection off
G26	G26	G26	08	Spindle speed fluctuation detection on
G27	G27	G27	00	Reference position return check
G28	G28	G28	00	Return to reference position

	G23	CLR	G70		G91	G19	G18	G01

[Input type] Parameter input
[Data type] Bit path

#0 G01 Mode entered when the power is turned on or when the control is cleared
0: G00 mode (positioning)
1: G01 mode (linear interpolation)

#1 G18 Plane selected when power is turned on or when the control is cleared
0: G17 mode (plane XY)
1: G18 mode (plane ZX)

#2 G19 Plane selected when power is turned on or when the control is cleared
0: The setting of bit 1 (G18) of parameter No. 3402 is followed.
1: G19 mode (plane YZ)
When this bit is set to 1, set bit 1 (G18) of parameter No. 3402 to 0.

#3 G91 When the power is turned on or when the control is cleared
0: G90 mode (absolute programming)
1: G91 mode (incremental programming)

#4 FPM At power-on time or in the cleared state:
0: G99 or G95 mode (feed per revolution) is set.
1: G98 or G94 mode (feed per minute) is set.

#5 G70 The commands for inch input and metric input are:
0: G20 (inch input) and G21 (metric input).
1: G70 (inch input) and G71 (metric input).

#6 CLR Reset button on the MDI unit, external reset signal, reset and rewind signal, and emergency stop signal
0: Cause reset state.
1: Cause clear state.
For the reset and clear states, refer to Appendix in the OPERATOR'S MANUAL.

#7 G23 When the power is turned on
0: G22 mode (stored stroke check on)
1: G23 mode (stored stroke check off)

	#7	#6	#5	#4	#3	#2	#1	#0
4902								G26
								G26

[Input type] Parameter input
[Data type] Bit path

#0 G26 When power is turned on or when the control is cleared:
0: G25 mode (spindle speed fluctuation detection is disabled) is selected.
1: G26 mode (spindle speed fluctuation detection is enabled) is selected.

Alarm and message

Number	Message	Description
PS0010	IMPROPER G-CODE	An unusable G code is specified.

Note

NOTE

1 When the power is turned on or the cleared state is set by a reset (bit 6 (CLR) of parameter No. 3402 is set to 1), modal G codes are placed in the following states:
(1) G codes marked with ◤ in G code lists are enabled.
(2) When the system is cleared due to power-on or reset, whichever specified, either G20 or G21, remains effective.
(3) Bit 7 (G23) of parameter No. 3402 is used to specify whether G22 or G23 is to be selected upon power-on. The selection of G22 or G23 is not, however, changed when the CNC is cleared upon a reset. When the system is cleared due to reset, whichever specified, either G22 or G23, remains effective.

2 G codes of group 00 except G10 and G11 are single-shot G codes.

NOTE

3 Alarm PS0010 is displayed when a G code not listed in the G code list is specified or a G code without a corresponding option is specified.
4 G codes of different groups can be specified in the same block.
If G codes of the same group are specified in the same block, the G code specified last is valid.
5 If a G code of group 01 is specified in a canned cycle for drilling, the canned cycle is canceled in the same way as when a G80 command is specified. G codes of group 01 are not affected by G codes for specifying a canned cycle.
6 When G code system A is used for a canned cycle for drilling, only the initial level is provided at the return point.
7 G codes are displayed for each group number.

12.3 PROGRAM CONFIGURATION

Overview

A program consists of the following components:

Table 12.3 (a) Program components

Components	Descriptions
Program code start	Symbol indicating the start of a program file
Leader section	Used for the title of a program file, etc.
Program start	Symbol indicating the start of a program
Program section	Commands for actual machining
Comment section	Comments or directions for the operator
Program code end	Symbol indicating the end of a program file

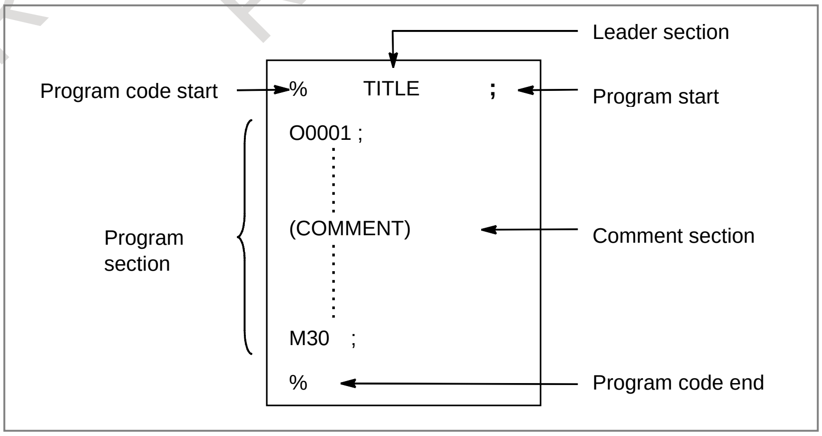

Fig. 12.3 (a) Program configuration

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
0100							CTV	

[Input type] Setting input
[Data type] Bit

#1 CTV Character counting for TV check in the comment section of a program.
0: Performed
1: Not performed

	#7	#6	#5	#4	#3	#2	#1	#0
3201		NPE	N99					

[Input type] Parameter input
[Data type] Bit path

#5 N99 With an M99 block, when bit 6 (NPE) of parameter No. 3201 is set to 0, program registration is assumed to be:
0: Completed
1: Not completed

#6 NPE With an M02, M30, or M99 block, program registration is assumed to be:
0: Completed
1: Not completed

6030	M code to execute external device subprogram calls

[Input type] Setting input
[Data type] 2-word path
[Valid data range] 0 to 99999999

Set the M code to execute external device subprogram calls. When 0 is set, M198 is used. M01, M02, M30, M98, and M99 cannot be used to execute external device subprogram calls. When a negative number, 1, 2, 30, 98, or 99 is set for this parameter, M198 is used to execute external device subprogram calls.

Alarm and message

Number	Message	Description
SR0001	TH ERROR	A TH error was detected during reading from an input device. The read code that caused the TH error and how many statements it is from the block can be verified in the diagnostics screen.
SR0002	TV ERROR	An error was detected during the single–block TV error. The TV check can be suppressed by setting bit 0 (TVC) of parameter No. 0000 to 0.
PS5010	END OF RECORD	The EOR (End of Record) code is specified in the middle of a block. This alarm is also generated when the percentage at the end of the NC program is read.

12.4 PART PROGRAM STORAGE SIZE / NUMBER OF REGISTERABLE PROGRAMS

The following table lists the combinations of program storage sizes and the total number of registerable programs.

Part program storage size	Number of registerable programs expansion 1
2Mbyte	1000

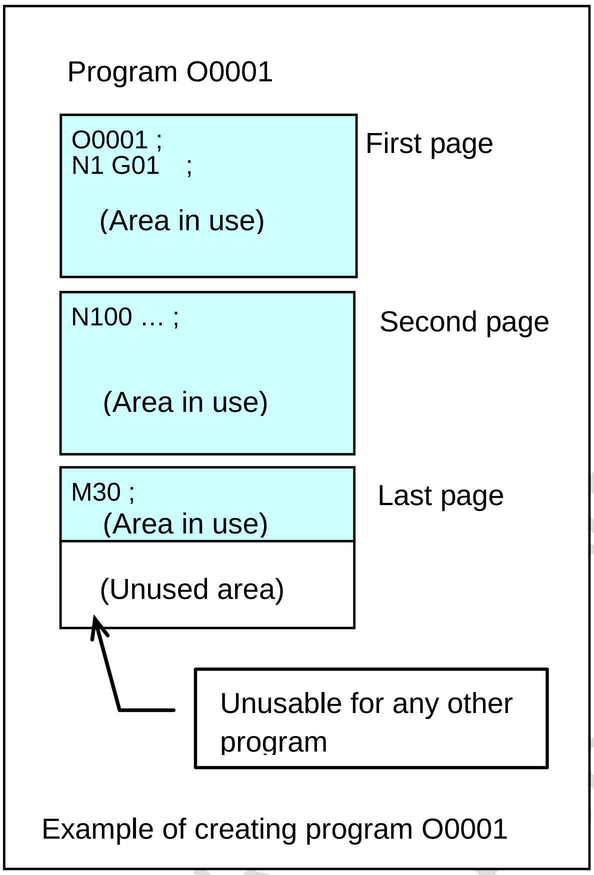

Fig. 13.4

> **NOTE**
> 1 Creating one folder results in the number of programs yet to be registerable decreasing one.
> 2 The program storage size means the maximum size of a program if the program is the one and only program registered.
> 3 If more than one program is registered, the total size of registerable programs reduces for the following reason.
> The FS0*i*-F Plus manage programs in page units. The unit of program storage is managed also in page units. When a program is created, as many pages as necessary to store the program are secured, and the program is stored on these pages. Generally, the last program storage page has an unused area (Fig. 13.4). This unused area cannot be used to store any other program. For the sake of program management, it is regarded as an area in use.
> The FS0*i*- C uses a similar way of management, but the unit of pages in it differs from that in the FS0*i*-F Plus. So, if more than one program is registered in the FS0*i*-F Plus, the total program size of registerable programs in the FS0*i*-F Plus differs from that in the FS0*i*-C.

OPERATOR’S MANUAL (B-64694EN)	Program management

12.5 INCH/METRIC CONVERSION

Overview

Either inch or metric input (least input increment) can be switched by the following five methods.

- G code(G20/G21)
- SETTING (HANDY) screen/setting bit 2 (INI) parameter No. 0000
- PMC Window
- Programable parameter input(G10)
- Custom macro variable #3005

Explanation

- Switching method using a G code(G20/G21)

The unit of input data is switched by G20/G21. It switches to inch input by G20, and metric input by G21. Please refer to the OPERATOR'S MANUAL (Common to Lathe System/Machining Center System)(B-64694EN) for switching conditions of G20/G21.

- Switching method using a SETTING (HANDY) screen/setting parameter

The unit of input data is switched by SETTING (HANDY) screen or setting bit 2 (INI) parameter No. 0000. Please refer to the OPERATOR'S MANUAL (Common to Lathe System/Machining Center System)(B-64694EN) for switching conditions.

- Switching method using a PMC Window

The unit of input data is switched by writing setting data of PMC window (low speed type). Please refer to the PMC Programming Manual (B-64513EN) for details.

- Switching method using a programable parameter input(G10)

Setting bit 2 (INI) parameter No. 0000 is rewritten by the G10 command, and the unit of input data is switched.

- Switching method using a custom macro variable

The unit of input data is switched by system variable #3005.

- Switching position

The unit of input data is switched at the reference position of the machine coordinate system origin. When the bit 1 (INAx) of parameter No. 14000 set to 1, if an inch-metric switch command is executed at a position other than the machine coordinate system origin (position = zero), the alarm PS5362, “CONVERT INCH/MM AT REF-POS” is generated.

- In case G code(G20/G21), it is possible to change the unit at the positions other than 0 of the machine coordinate by the following settings.

(a) Setting bit 2 (IRFx) of parameter No. 14000 to 1 enables inch/metric conversion to be performed in the reference position (parameter No. 1240). However, enable a function of workpiece coordinate system (bit 0 (NWZ) of parameter No. 8136 is 0).

(b) Setting bit 0 (NIM) of parameter No. 11222 enables inch/metric conversion to be performed even in positions other than the reference position. However, enable functions of workpiece coordinate system and workpiece coordinate system preset (bit 0 (NWZ) of parameter No. 8136 is 0 and bit 1 (NWC) of parameter No. 8136 is 0).

- In case SETTING (HANDY) screen or setting parameter or PMC Window, it is possible to change the unit at the positions other than 0 of the machine coordinate by the following settings.

(c) Setting bit 0 (NIM) of parameter No. 11222 enables inch/metric conversion to be performed even in positions other than the reference position. However, enable functions of workpiece coordinate system and workpiece coordinate system preset (bit 0 (NWZ) of parameter No. 8136 is 0 and bit 1 (NWC) of parameter No. 8136 is 0).

(d) Setting bit 0 (NIM) of parameter No. 11222 and bit 3 (IMRx) of parameter No. 14000 enables inch/metric conversion to limit in the reference position (parameter No. 1240). However, enable functions of workpiece coordinate system and workpiece coordinate system preset (bit 0 (NWZ) of parameter No. 8136 is 0 and bit 1 (NWC) of parameter No. 8136 is 0).

Table 12.5 (a) The position that inch / metric conversion can be changed by G code(G20/G21)

Parameter No.				Position that can be changed		
14000			11222	Reference point (parameter No. 1240)		Other than the reference position
#1(INAx)	#2(IRFx)	#3(IMRx)	#0(NIM)	=0	≠0	
0	0	0	0	Changed	Not changed	Not changed
1	0	0	0	Changed	Not changed (*1)	Not changed (*1)

-	-	0	1	Changed	Changed	Changed
-	-	1	1	Changed	Changed	Not changed (*1)

(*1) Alarm(PS5362)

Table 12.5 (b) The position that inch / metric conversion can be changed by SETTING (HANDY) screen or setting parameter or PMC Window

Parameter No.				Position that can be changed		
14000			11222	Reference point (parameter No. 1240)		Other than the reference position
#1(INAx)	#2(IRFx)	#3(IMRx)	#0(NIM)	=0	≠0	
0	0	0	0	Changed	Not changed	Not changed
1	0	0	0	Changed	Not changed (*1)	Not changed (*1)
-	1	0	0	Changed	Not changed	Not changed (*1)
-	-	0	1	Changed	Changed	Changed
-	-	1	1	Changed	Changed	Not changed (*1)

(*1) Alarm(PS5362)

Signal

Inch input signal INCH<Fn002.0>

[Classification] Output signal

[Function] This signal informs that inch input mode is active.

[Output cond.] 1indicates that the inch input mode (G20) is in progress, and 0 indicates that metric input mode (G21) is in progress.

> **NOTE**
> This signal changes to the corresponding state when the following methods.
> - SETTING (HANDY) screen/setting bit 2 (INI) parameter No. 0000.
> - Parameter INI is rewritten by Programable parameter input (G10)
> - System variable #3005

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn002								INCH

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
0000						INI		

[Input type] Setting input
[Data type] Bit path

#2 INI Unit of input
0: In metrics
1: In inches

	#7	#6	#5	#4	#3	#2	#1	#0
1001								INM

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 INM Least command increment on the linear axis
0: In mm (metric system machine)
1: In inches (inch system machine)

	#7	#6	#5	#4	#3	#2	#1	#0
1006							ROSx	ROTx

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 ROTx
#1 ROSx Setting linear or rotary axis.

ROSx	ROTx	Meaning
0	0	Linear axis (1) Inch/metric conversion is done. (2) All coordinate values are linear axis type. (Is not rounded in 0 to 360°) (3) Stored pitch error compensation is linear axis type (Refer to parameter No. 3624)

ROSx	ROTx	Meaning
0	1	Rotary axis (A type) (1) Inch/metric conversion is not done. (2) Machine coordinate values are rounded in 0 to 360°. Absolute coordinate values and relative coordinate values can be selected without rounding / rounding according to bits 0 (ROAx) and 2 (RRLx) of parameter No. 1008. (3) Stored pitch error compensation is the rotation type. (Refer to parameter No. 3624) (4) Automatic reference position return (G28, G30) is done in the reference position return direction and the move amount does not exceed one rotation.
1	1	Rotary axis (B type) (1) Inch/metric conversion is not done. (2) Machine coordinate values, absolute coordinate values and relative coordinate values are linear axis type. (Is not rounded in 0 to 360°). (3) Stored pitch error compensation is linear axis type (Refer to parameter No. 3624) (4) Cannot be used with the rotary axis roll-over function and the index table indexing function (M series)
Except for the above.		Setting is invalid (unused)

1240	Coordinate value of the reference position in the machine coordinate system

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm, inch, deg (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
Set the coordinate values of the reference position in the machine coordinate system.

	#7	#6	#5	#4	#3	#2	#1	#0
3104								MCN

[Input type] Parameter input
[Data type] Bit path

#0 MCN Machine position
0: Regardless of whether input is made in mm or inches, the machine position is displayed in mm for millimeter machines, or in inches for inch machines.
1: When input is made in mm, the machine position is displayed in mm, and when input is made in inches, the machine position is displayed in inches accordingly.

	#7	#6	#5	#4	#3	#2	#1	#0
3405								AUX

[Input type] Parameter input
[Data type] Bit path

#0 AUX When the second auxiliary function is specified in the calculator-type decimal point input format or with a decimal point, the multiplication factor for a value output (onto the code signal) relative to a specified value is such that:
0: The same multiplication factor is used for both of metric input and inch input.
1: A multiplication factor used for inch input is 10 times greater than that used for metric input.

When the second auxiliary function is specified in the calculator-type decimal point input format or with a decimal point, the value output onto the code signal is a specified value multiplied by a value indicated below.

Increment system		Parameter AUX=0	Parameter AUX=1
Metric input system	IS-A for reference axis	100 times	100 times
	IS-B for reference axis	1000 times	1000 times
	IS-C for reference axis	10000 times	10000 times
Inch input system	IS-A for reference axis	100 times	1000 times
	IS-B for reference axis	1000 times	10000 times
	IS-C for reference axis	10000 times	100000 times

	#7	#6	#5	#4	#3	#2	#1	#0
11222						IMG	CIM	NIM

[Input type] Parameter input
[Data type] Bit path

#0 NIM Automatic conversion of a coordinate system by an inch/metric conversion command (G20 or G21) is:
0: Not performed.
1: Performed.

#1 CIM When an inch/metric conversion command (G20 or G21) is specified, if the workpiece coordinate system is shifted by the shift amount as described below:
0: An alarm PS1298”ILLEGAL INCH/METRIC CONVERSION” is issued.
1: Clearing of the shift amount is performed.

If bit 0 (NIM) of parameter No. 11222 is set to 1, or if bit 2 (IRF) of parameter No. 14000 is set to 1, this parameter clears the following:
- Manual intervention made when the manual absolute signal*ABSM<Gn006.2> is off
- Issuance of a move command with the machine locked
- Movement by handle interrupt
- Operation with a mirror image
- Shifting of a workpiece coordinate system when a local coordinate system or workpiece coordinate system is set up

#2 IMG Inch/metric conversion is:
0: Performed with the G20/G21 (G70/G71).
1: Not performed with the G20/G21 (G70/G71).

> **NOTE**
> If bit 2 of parameter No. 11222 is 1 (inch/metric conversion with G20/G21 is disabled), only bit 2 of parameter No. 0 can be used to perform inch/metric conversion. If bit 2 of parameter No.0 = 0, the metric system is used. If bit 2 of parameter No.0 = 1, the inch system is used.

	#7	#6	#5	#4	#3	#2	#1	#0
14000					IMRx	IRFx	INAx	

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#1 INAx If an inch-metric switch command is executed at a position of the machine coordinate system origin other than zero,
0: No alarm is issued.
1: Alarm PS5362, "CONVERT INCH/MM AT REF-POS" is issued.

#2 IRFx An inch-metric switch command (G20, G21) at the reference position is:
0: Disabled.
1: Enabled.

> **NOTE**
> 1 When this function is enabled for an axis, if an attempt to switch between the inch and metric unit is made although the tool is not at the reference position on that axis, an alarm PS5362 is issued, and switching between the inch and metric unit is canceled. Be sure to move the tool to the reference position by, for example, specifying G28 before switching between the inch and metric unit.
> 2 This function enables the inch/metric switching commands (G20 and G21) at the reference position. It does not enable the switching of the setting input unit (bit 2 (INI) of parameter No.0000).
> 3 Switching between inch and metric by setting the setting input unit (bit 2 (INI) of parameter No. 0000) is enabled only when the machine coordinate of the first reference position is 0 (parameter No. 1240 is 0) and presence on the first reference position is assumed. For a system in which the machine coordinate of the first reference position is not 0, set this parameter to 1 and specify G20/G21 in the first reference position to switch between inch and metric.
> 4 When this function is disabled, the switching is enabled only when the machine coordinate of the first reference position is 0 (parameter No. 1240 is 0) and presence on the first reference position is assumed.

#3 IMRx When bit 0 (NIM) of parameter No.11222 is set to 1, the reference position return before commanding inch/metric conversion :
0: Not required.
1: Required.

NOTE
1 Check the reference position return end signals ZP1 to ZP8 <Fn094> of the axes actually moving during Composite control.
2 When parking the master axis during synchronization control, check the reference position return end signals ZP1 to ZP8<Fn094> of the slave axis.
3 Bit 3 (IMRx) of parameter No.14000 is not set for the synchronous control on the slave axis. When IMRx = 1, the reference position return end signals ZP1 to ZP8<Fn094> of the slave axis must be "1".

Warning

⚠ **WARNING**
When switching inch input (G20) to metric input (G21) and vice versa, tool compensation values are automatically converted.

Note

NOTE
1 When the least input increment and the least command increment systems are different, the maximum error is half of the least command increment. This error is not accumulated.
(Example)
- Increment system : IS-B
- Least input increment (for input uit) : In case of "0.0001" inch
- Least command increment (for machine unit) : "0.00254" -> "0.003"
(Difference =
0.00046 : About 1/2 of least command increment)
Input "0.0001 inch" -> the moving increment of the machine "0.00254 mm".
However, when the increment system is IS-B, the value of the movement of the machine becomes "0.003 mm".
Therefore, the error margin of "0.00046 mm" (About 1/2 of least command increment) is generated as a difference.
2 The inch and metric input can also be switched using bit 2 (INI) of parameter No. 0000.
3 If a function selected using bit 2 (IRF) of parameter No. 14000 or bit 0 (NIM) of parameter No. 11222 is not used, be sure to perform inch/metric switching at the reference position (machine coordinate system origin).

Alarm and message

Number	Message	Description
PS1298	ILLEGAL INCH/METRIC CONVERSION	(1) When the bit 1 (CIM) of parameter No. 11222 set to 0, and the workpiece coordinate system has been shifted from the machine coordinate system by the following, the inch/metric conversion has been performed. - Manual intervention performed with the manual absolute signal being off - Machine locked - Handle interrupt - Mirror image - Workpiece coordinate system shift caused by local coordinate system setting (G52) or workpiece coordinate system setting (G92) (2) Inch/metric conversion was executed in a modal state where it can not command. Check the modal state. (3) Inch/metric conversion can not be commanded with programmable parameter input or # 3005 (setting data). It commands G20/G21 or G70/G71. (4) During automatic operation, inch / metric conversion by MDI input or PMC window was done. Stop automatic operation and command.
PS5362	CONVERT INCH/MM AT REF-POS	(1) When the bit 1 (INAx) of parameter No. 14000 set to 1, the inch-metric switch command is executed at a position of the machine coordinate system origin other than zero. (2) When the bit 3 (IMRx) or bit 2 (IRFx) of parameter No. 14000 set to 1, the inch-metric switch command is executed at the other than reference position (parameter No. 1240). Perform an inch/metric conversion after returning to the reference position. (3) When bit 0 (NIM) of parameter No.11222 set to 1, the inch/metric conversion by programmable parameter input or #3005 (setting data) was executed at a position other than the machine coordinate system origin (position = zero). Please command it at the machine coordinate zero position.

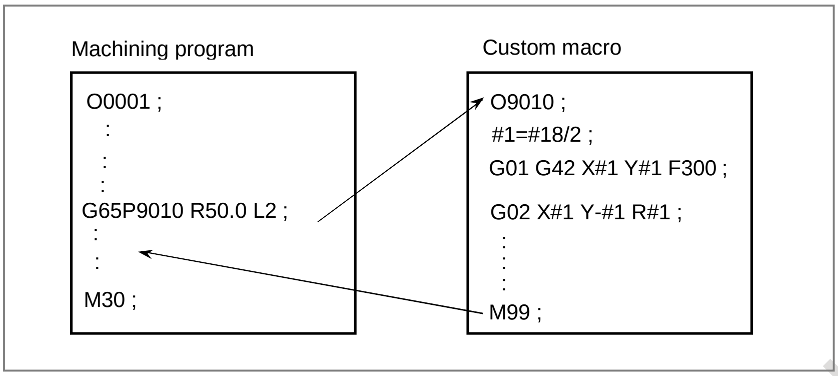
12.6 CUSTOM MACRO

12.6.1 Custom Macro

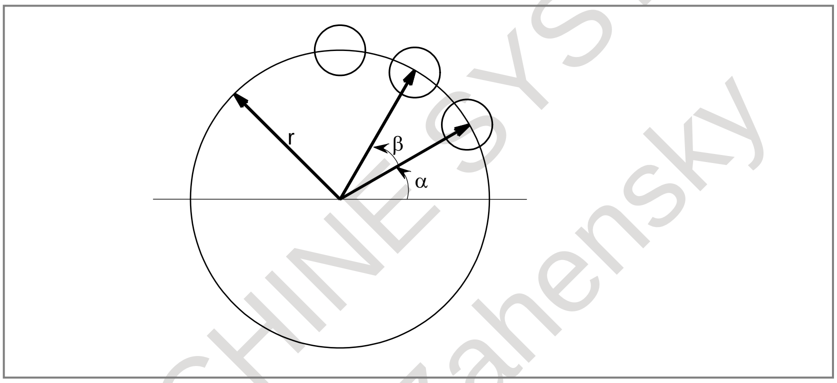
Overview

A subprogram is useful for repeatedly executing the same operation. With the custom macro function, however, variables, operation commands, conditional branches, and so forth can be used to create general-purpose programs more simply for pocketing, user-specific canned cycles, and so forth.

From a machining program, a custom macro can be called with a simple instruction as in the case of a subprogram.



Thus, when a function is programmed as a custom macro body, the function can be made more universal. This means that a program can be created using variables for values that can change or are not defined yet. This feature also leads to application of group technology.
For example, classify similar workpieces into a group and create a general-purpose custom macro by using variables for such a group. Thus, the need for programming for an individual workpiece in the group can be eliminated by assigning desired values to the variables.



As an example, the bolt hole circle shown above can be created simply. By creating and once registering a custom macro for the bolt hole circle, the CNC can operate as if it had a bolt hole circle function.
The programmer can use the bolt hole circle function by remembering the following command:

G65 Pp Rr Aα Bβ Kk ;
P : Macro number of bolt hole circle
r : Radius
α: Start angle
β: Angle between circles
k : Number of circles

Signal

Custom Macro Input Signals

UI000 to UI015<Gn054,Gn055>, UI016 to UI031<Gn056,Gn057>, UI100 to UI131<Gn276 to Gn279>, UI200 to UI231<Gn280 to Gn283> UI300 to UI331<Gn284 to Gn287>

[Classification] Input signal

[Function] No function is provided for the control unit. These signals can be read by a custom macro as a type of system variable, and are used for interface between custom macros and the PMC.
These signals correspond to system variables as indicated below.

- When the bit 0 (MIF) of parameter No. 6001 is set to 0 :

Signals	Q'ty	Variables	Correspondence of values
UI000	1	#1000	
UI001	1	#1001	
UI002	1	#1002	
UI003	1	#1003	0 at 0 and 1 at 1
:	:	:	
UI014	1	#1014	
UI015	1	#1015	
UI000 to UI015	16	#1032	Unsigned 16-bit binary code *1

*1 Variable value #1032 = $\sum_{i=0}^{15}\{\#[1000+i]\times 2^{i}\}$

These system variables cannot be used on the left side of an assignment statement.

- When the bit 0 (MIF) of parameter No. 6001 is set to 1 :

Signals	Q'ty	Variables	Correspondence of values
UI000	1	#1000	
UI001	1	#1001	
UI002	1	#1002	
UI003	1	#1003	0 at 0 and 1 at 1
:	:	:	
UI030	1	#1030	
UI031	1	#1031	
UI000 to UI031	32	#1032	Signed 32-bit binary code *1
UI100 to UI131	32	#1033	Signed 32-bit binary code *1
UI200 to UI231	32	#1034	Signed 32-bit binary code *1
UI300 to UI331	32	#1035	Signed 32-bit binary code *1

*1 Variable value #(1032+n) = $\sum_{i=0}^{30}\{2^{i}\times V_{i}\}-2^{31}\times V_{31}$

Where Vi=0 when UIni is 0 and Vi=1 when UIni is 1

n : 0 to 3

These system variables cannot be used on the left side of an assignment statement.

Custom Macro Output Signals

UO000 to UO015<Fn054,Fn055>, UO100 to UO131<Fn056 to Fn059>
UO016 to UO031<Fn276,Fn277>, UO200 to UO231<Fn280 to Fn283>
UO300 to UO331<Fn284 to Fn287>

[Classification] Output signal

[Function] No function is provided for the control unit. These signals can be read or written by a custom macro as a type of system variable, and are used for interface between custom macros and the PMC.

These signals correspond to system variables as indicated below.

- When the bit 0 (MIF) of parameter No. 6001 is set to 0 :

Signals	Q'ty	Variables	Correspondence of values
UO000	1	#1100	
UO001	1	#1101	
UO002	1	#1102	
UO003	1	#1103	0 at 0 and 1 at 1
:	:	:	
UO014	1	#1114	
UO015	1	#1115	
UO000 to UO015	16	#1132	Unsigned 16-bit binary code *1
UO100 to UO131	32	#1133	Signed 32-bit binary code *2

*1 Variable value #1132 = $\sum_{i=0}^{15}\left\{\#[1100+i]\times 2^{i}\right\}$

*2 Variable value #1133 = $\sum_{i=0}^{30}\left\{2^{i}\times V_{i}\right\}-2^{31}\times V_{31}$

Where Vi=0 when UO1i is 0and Vi=1 when UO1i is 1
These system variables can be used on the left side of an assignment statement as well as on the right side.
The value assigned to the system variable used on the left side last is used for the value of the system variable to be assigned (sent) on the right side.

- When the bit 0 (MIF) of parameter No. 6001 is set to 1 :

Signals	Q'ty	Variables	Correspondence of values
UO000	1	#1100	0 at 0 and 1 at 1
UO001	1	#1101	
UO002	1	#1102	
UO003	1	#1103	
:	:	:	
UO030	1	#1130	
UO031	1	#1131	
UO000 to UO031	32	#1132	Signed 32-bit binary code *1
UO100 to UO131	32	#1133	Signed 32-bit binary code *1
UO200 to UO231	32	#1134	Signed 32-bit binary code *1
UO300 to UO331	32	#1135	Signed 32-bit binary code *1

*1 Variable value #(1132+n) = $\sum_{i=0}^{30}\left\{2^{i}\times V_{i}\right\}-2^{31}\times V_{31}$

Where Vi=0 when UOni is 0and Vi=1 when UOni is 1
n : 0 to 3

These system variables can be used on the left side of an assignment statement as well as on the right side.
The value assigned to the system variable used on the left side last is used for the value of the system variable to be assigned (sent) on the right side.

Custom Macro Input Signals for Interface Signal R Addresses
UI400 to UI431 <Rr to Rr+3>
UI500 to UI531 <Rr+4 to Rr+7>
UI600 to UI631 <Rr+8 to Rr+11>
UI700 to UI731 <Rr+12 to Rr+15>

[Classification] Input signal

[Function] No function is provided for the control unit. These signals can be read by a custom macro as a type of system variable, and are used for interface between custom macros and the PMC.
These signals correspond to system variables as indicated below.

Signals	Q'ty	Variables	Correspondence of values
UI400	1	#1036	0 at 0 and 1 at 1
UI401	1	#1037	
:	:	:	
UI431	1	#1067	
UI400 to UI431	32	#1068	Signed 32-bit binary code
UI500 to UI531	32	#1069	Signed 32-bit binary code
UI600 to UI631	32	#1070	Signed 32-bit binary code
UI700 to UI731	32	#1071	Signed 32-bit binary code

The letter r represents a setting of parameter No. 6093.
These system variables cannot be used on the left side of an assignment statement.

> **NOTE**
> These signals are available when bit 2 (IFR) of parameter No. 6020 is set to 1.

> ⚠ **WARNING**
> To set bit 2 (IFR) of parameter No. 6020 to 1, set an appropriate value to parameter No.6094 beforehand.
> When parameter No.6094 is 0, R0~ of an internal relay is set. If the internal relay R0~ is used to another area, the operation not intended might be done.

Custom Macro Output Signals for Interface Signal R Addresses
UO400 to UO431 <Rr to Rr+3>
UO500 to UO531 <Rr+4 to Rr+7>
UO600 to UO631 <Rr+8 to Rr+11>
UO700 to UO731 <Rr+12 to Rr+15>

[Classification] Output signal

[Function] No function is provided for the control unit. These signals can be read or written by a custom macro as a type of system variable, and are used for interface between custom macros and the PMC.
These signals correspond to system variables as indicated below.

Signals	Q'ty	Variables	Correspondence of values
UO400 UO401 : UO431	1 1 : 1	#1136 #1137 : #1167	0 at 0 and 1 at 1
UO400 to UO431	32	#1168	Signed 32-bit binary code
UO500 to UO531	32	#1169	Signed 32-bit binary code
UO600 to UO631	32	#1170	Signed 32-bit binary code
UO700 to UO731	32	#1171	Signed 32-bit binary code

The letter r represents a setting of parameter No. 6094.
These system variables can be used on the left side of an assignment statement as well as on the right side. Using these system variables on the right side enables the last value assigned (sent) to each variable on the left side to be read.

> **NOTE**
> These signals are available when bit 2 (IFR) of parameter No. 6020 is set to 1.

> ⚠ **WARNING**
> To set bit 2 (IFR) of parameter No. 6020 to 1, set an appropriate value to parameter No.6094 beforehand.
> When parameter No.6094 is 0, R0~ of an internal relay is set. If the internal relay R0~ is used to another area, the operation not intended might be done.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
6000	SBV		SBM	HGO		HMC	MGO	G67
	SBV		SBM	HGO	V15	HMC	MGO	G67

[Input type] Parameter input
[Data type] Bit path

#0 G67 If the macro modal call cancel command (G67) is specified when the macro modal call mode (G66/G66.1) is not set:
0: Alarm PS1100, "CANCEL WITHOUT MODAL CALL" is issued.
1: The specification of G67 is ignored.

#1 MGO When a GOTO statement for specifying custom macro control is executed, from the start of the program to 20 sequence numbers of executed block:
0: A high-speed branch is not executed.
1: A high-speed branch is executed.

#2 HMC A custom macro is executed:
0: At a normal speed.
1: At a high-speed.

> **NOTE**
> This parameter is Automatic setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

#3 V15 As system variable numbers for tool offset:
0 : The standard system variable numbers for the Series 16 are used.
1 : The same system variable numbers as those used for the Series 15 are used.
The tables indicate the system variables for tool offset numbers 1 to 999. The values for tool offset numbers 1 to 200 can be read from or assigned to the system variables in parentheses.

		System variable number	
		V15 = 0	**V15 = 1**
Tool length offset	Geometry offset value	#11001 to #11999 (#2201 to #2400)	#10001 to #10999 (#2001 to #2200)
	Wear offset value	#10001 to #10999 (#2001 to #2200)	#11001 to #11999 (#2201 to #2400)
Tool radius offset	Geometry offset value	#13001 to #13999	#12001 to #12999
	Wear offset value	#12001 to #12999	#13001 to #13999

#4 HGO When a GOTO statement in a custom macro control command is executed, a high-speed branch to the 30 sequence numbers immediately before the executed statement is:
0: Not made.
1: Made.

#5 SBM Custom macro statement
0: Not stop the single block
1: Stops the single block
If you want to disable the single blocks in custom macro statements using system variable #3003, set this parameter to 0. If this parameter is set to 1, the single blocks in custom macro statements cannot be disabled using system variable #3003. To control single blocks in custom macro statements using system variable #3003, use bit 7 (SBV) of parameter No. 6000.

#7 SBV Custom macro statement
0: Not stop the single block
1: By system variable # 3003, single block stop control is enabled / disabled

		Bit 5 (SBM) of parameter No. 6000	
		0	**1**
Bit 7 (SBV) of parameter No. 6000	**0**	Disables single block stop.	Enables single block stop. (With variable #3003, single block stop cannot be enabled/disabled. Single block stop is enabled at all times.)
	1	Enables single block stop. (With variable #3003, single block stop can be enabled/disabled.)	

	#7	#6	#5	#4	#3	#2	#1	#0
6001		CCV	TCS	CRO	PV5		PRT	MIF

[Input type] Parameter input
[Data type] Bit path

#0 MIF The custom macro interface signals are based on:
0: Standard specification.
(The signals UI000 to UI015, UO000 to UO015, and UO100 to UO131 are used.)
1: Extended specification.
(The signals UI000 to UI031, UI100 to UI131, UI200 to UI231, UI300 to UI331, UO000 to UO031, UO100 to UO131, UO200 to UO231, and UO300 to UO331 are used.)

#1 PRT Reading zero when data is output using a DPRINT command
0: Outputs a space
1: Outputs no data

#3 PV5 Custom macro common variables:
0: #500 to #549 are output. (Note)
1: #100 to #149 and #500 to 549 are output. (Note)

> **NOTE**
> Output variables are as the table according to the combination of added options.

When the parameter PV5=0

		Addition of custom macro common variables: Disable (bit 6 (NCV) of parameter No.8135 is 1)	Addition of custom macro common variables: Enable (bit 6 (NCV) of parameter No.8135 is 0)
Option "Embedded macro"	Non	#500 to #549	#500 to #999
	Yes	#500 to #549	#500 to #999

When the parameter PV5=1

		Addition of custom macro common variables: Disable (bit 6 (NCV) of parameter No.8135 is 1)	Addition of custom macro common variables: Enable (bit 6 (NCV) of parameter No.8135 is 0)
Option "Embedded macro"	Non	#100 to #149 and #500 to #549	#100 to #199 and #500 to #999
	Yes	#100 to #149, #200 to #499 and #500 to #549	#100 to #199, #200 to #499 and #500 to #999

#4 CRO ISO code in BPRWT or DPRNT command
0: Outputs only "LF" after data is output
1: Outputs "LF" and "CR" after data is output

#5 TCS Custom macro (subprogram)
0: Not called using a T code
1: Called using a T code

#6 CCV Common variables #100 to #149(NOTE) cleared by power-off are:
0: Cleared to <null> by reset
1: Not cleared by reset

> **NOTE**
> Cleared variables are as the table according to the combination of added options.

		Addition of custom macro common variables	
		Disable (bit 6 (NCV) of parameter No.8135 is 1)	Enable (bit 6 (NCV) of parameter No.8135 is 0)
Option "Embedded macro"	Non	#100 to #149	#100 to #199
	Yes	#100 to #149 and #200 to #499	#100 to #199 and #200 to #499

	#7	#6	#5	#4	#3	#2	#1	#0
6004						VHD		NAT
			D15					NAT

[Input type] Parameter input
[Data type] Bit path

#0 NAT The results of the custom macro functions ATAN (with 2 arguments) and ASIN are specified as follows:
0: The result of ATAN is 0 to 360.0.
The result of ASIN is 270.0 to 0 to 90.0.
1: The result of ATAN is -180.0 to 0 to 180.0.
The result of ASIN is -90.0 to 0 to 90.0.

#2 VHD With system variables #5121 to #5140:
0: The tool offset value (geometry offset value) in the block currently being executed is read. (This parameter is valid only when tool geometry/tool wear compensation memories are available.)
1: An interrupt travel distance based on manual handle interrupt is read.

#5 D15 When tool compensation memory C is used, for reading or writing tool offset values (for up to offset number 200) for D code (tool radius), the same system variables, #2401 through #2800, as Series 15 are:
0: Not used.
1: Used.

When bit 3 (V15) of parameter No. 6000 is set to 1

D code				
Compensation number	Geometry		Wear	
	Variable number	Variable name	Variable number	Variable name
1	#2401	[#_OFSDG[1]]	#2601	[#_OFSDW[1]]
2	#2402	[#_OFSDG[2]]	#2602	[#_OFSDW[2]]
3	#2403	[#_OFSDG[3]]	#2603	[#_OFSDW[3]]
:	:	:	:	:
199	#2599	[#_OFSDG[199]]	#2799	[#_OFSDW[199]]
200	#2600	[#_OFSDG[200]]	#2800	[#_OFSDW[200]]

	#7	#6	#5	#4	#3	#2	#1	#0
6005				AXM				
				AXM				

[Input type] Parameter input
[Data type] Bit path

#4 AXM Bit 4 (MSV) of parameter No.6019 and bit 4 (TSV) of parameter No.6021 are :
0: valid only during coordinate system shift type compensation.
1: valid both during coordinate system shift type compensation and axis movement type compensation.

	#7	#6	#5	#4	#3	#2	#1	#0
6007				CVA	MGE	BCS	SCS	DPG

[Input type] Parameter input
[Data type] Bit path

#0 DPG Specifies whether to allow G codes with a decimal point to be called.
0: Do not allow.
1: Allow.

#1 SCS Specifies whether to call subprograms with S codes.
0: Do not call with S codes.
1: Call with S codes.

#2 BCS Specifies whether to call subprograms with the second auxiliary function codes.
0: Do not call with the second auxiliary function codes.
1: Call with the second auxiliary function codes.

#3 MGE Specifies whether a G code modal call is made.
0: Make a call for each block (equivalent to G66.1).
1: Make a call after movement (equivalent to G66).

#4 CVA The format for macro call arguments is specified as follows:
0: Arguments are passed in NC format without modifications.
1: Arguments are converted to macro format then passed.
[Example]
When "G65 P_ X10 ;" is specified, the value in local variable #24 in the calling program is set as follows:

Command	CVA=0	CVA=1
#24	0.01	0.01
ADP[#24]	10.0	0.01

> **NOTE**
> External operations are the same unless the ADP function is used.

	#7	#6	#5	#4	#3	#2	#1	#0
6008	IJK	GMP	ADD	ISO	KOP		MCA	F16

[Input type] Parameter input
[Data type] Bit path

#0 F16 The precision of operation is based on:
0: New specification.
1: FS16*i* compatible specification.

#1 MCA A macro alarm specification based on system variable #3000 is selected as follows:
0: An alarm number obtained by adding 3000 to a value assigned to variable #3000 and the corresponding message are displayed. (A value from 0 to 200 can be assigned to variable #3000.)
1: A value assigned to variable #3000 and the corresponding message are displayed. (A value from 0 to 4095 can be assigned to variable #3000.)

[Example]
Execution of #3000=1 (ALARM MESSAGE);
When bit 1 (MCA) of parameter No. 6008 is set to 0:
The alarm screen displays "MC 3001 ALARM MESSAGE".
When bit 1 (MCA) of parameter No. 6008 is set to 1:
The alarm screen displays "MC0001 ALARM MESSAGE".

#3 KOP When the NC is reset in the state where the line is made open by POPEN:
0: Communication continues, and the line is left open.
1: Communication stops, and the line is closed.

#4 ISO 0: When the EIA code is used, the bit patterns of codes specified instead of [,], #, *, =, ?, @, &, and _ are set in parameters Nos. 6010 to 6018.
1: When the ISO/ASCII code is used, the bit patters of codes specified instead of [,], #, *, =, ?, @, &, and _ are set in parameters Nos. 6010 to 6018.

#5 ADD When the number of digits in the integer part, a, in the format specification [a,b] of the DPRNT statement is less than the number of digits in the integer part of an output variable value:
0: The specified number of digits only are output, with the unspecified digits discarded.
1: An alarm for excessive digits is issued.

#6 GMP The calling of M, S, T, a second auxiliary function code, or a particular code during the calling of a G code, and the calling of a G code during the calling of M, S, T, a second auxiliary function code, or particular code are:
0: Not allowed. (They are executed as an ordinary G, M, S, T, second auxiliary function code, and NC address.)
1: Allowed.

#7 IJK For addresses I, J, and K specified as arguments:
0: Argument specification I or II is automatically determined.
1: Argument specification I is always used.

Example

When K_J_I_ is specified:
- When this parameter is set to 0:
  Argument specification II is used and K=#6, J=#8, and I=#10 are specified.
- When this parameter is set to1:
  Argument specification I is used and I=#4, J=#5, and K=#6 are specified regardless of the specification order.
  (Argument specification II cannot be used.)

	#7	#6	#5	#4	#3	#2	#1	#0
6009						MAA		MSM

[Input type] Parameter input
[Data type] Bit path

#0 MSM When an M code or M codes specified for a macro call or macro calls (multiple macro call specification) are not at the beginning of the block:
0: Alarm PS0127”DUPLICATE NC,MACRO STATEMENT” is issued.
1: The macro or macros are called based on the M code or M codes. All addresses specified in the same block are used as arguments. (Special Macro Call using M code)

NOTE
1 When MSM is set to 1 and an M code specified for a macro call is not at the beginning of the block, argument specification II cannot be used.
2 When MSM is set to 1 and an M code specified for a macro call is not at the beginning of the block, the number of repetitions (L) cannot be used.

#2 MAA When a Macro Call using M code or Special Macro Call using M code are executed:
0: Address G does not become an argument.
The addresses that can be used as arguments are as shown in the tables below.
- Usual Macro Call

Address	Variable number
A	#1
B	#2
C	#3
D	#7
E	#8
F	#9
G	*1
H	#11
I	#4

Address	Variable number
J	#5
K	#6
L	*2
M	#13 *3
M(Call code)	*4
N	#14 *5
P	#16
Q	#17
R	#18

Address	Variable number
S	#19
T	#20
U	#21
V	#22
W	#23
X	#24
Y	#25
Z	#26

*1: Address G can not command. If address G is commanded, alarm PS0129“USE 'G' AS ARGUMENT ” occurs.
*2: Address L is a number of times in which the macro call is repeated.
*3: Address M other than call code is passed to variable #13.
*4: Address M for call code does not become an argument.
*5: Address N is passed to variable #14.

- Special Macro Call

Address	Variable number
A	#1
B	#2
C	#3
D	#7
E	#8
F	#9
G	*1
H	#11
I	#4

Address	Variable number
J	#5
K	#6
L	*2
M	#13 *3
M(Call code)	*4
N	#14 *5
P	#16
Q	#17
R	#18

Address	Variable number
S	#19
T	#20
U	#21
V	#22
W	#23
X	#24
Y	#25
Z	#26

*1: Even if address G is commanded, PS alarm does not occur. And address G does not become an argument.
*2: Address L does not become a number of times in which the macro call is repeated, and does not become an argument.
*3: Address M other than call code is passed to variable #13.
*4: Address M for call code does not become an argument.
*5: Address N is passed to variable #14, and becomes a sequence number.

1: Address G becomes an argument.The addresses that can be used as arguments are as shown in the tables below.

- Usual Macro Call

Address	Variable number
A	#1
B	#2
C	#3
D	#7
E	#8
F	#9
G	#28 to #32 *1
H	#11
I	#4

Address	Variable number
J	#5
K	#6
L	*2
M	#13 *3
M(Call code)	*4
N	#14 *5
P	#16
Q	#17
R	#18

Address	Variable number
S	#19
T	#20
U	#21
V	#22
W	#23
X	#24
Y	#25
Z	#26

*1: The first five addresses G in ascending order of G code groups are used as arguments and passed to variables #28 to #32.
*2: Address L is a number of times in which the macro call is repeated.
*3: Address M other than call code is passed to variable #13.
*4: Address M for call code does not become an argument.
*5: Address N is passed to variable #14.

- Special Macro Call

Address	Variable number	Address	Variable number	Address	Variable number
A	#1	J	#5	S	#19
B	#2	K	#6	T	#20
C	#3	L	#12 *2	U	#21
D	#7	M	#13 *3	V	#22
E	#8	M(Call code)	#27 *4	W	#23
F	#9	N	#14 *5	X	#24
G	#28 to #32 *1	P	#16	Y	#25
H	#11	Q	#17	Z	#26
I	#4	R	#18		

*1: The first five addresses G in ascending order of G code groups are used as arguments and passed to variables #28 to #32.
*2: Address L is passed to variable #12, and does not become a number of times in which the macro call is repeated.
*3: Address M other than call code is passed to variable #13.
*4: Address M for call code is passed to variable #27.
*5: Address N is passed to variable #14, and becomes a sequence number.

	#7	#6	#5	#4	#3	#2	#1	#0
6010	*7	*6	*5	*4	*3	*2	*1	*0
6011	=7	=6	=5	=4	=3	=2	=1	=0
6012	#7	#6	#5	#4	#3	#2	#1	#0
6013	[7	[6	[5	[4	[3	[2	[1	[0
6014	]7	]6	]5	]4	]3	]2	]1	]0
6015	?7	?6	?5	?4	?3	?2	?1	?0
6016	@7	@6	@5	@4	@3	@2	@1	@0
6017	&7	&6	&5	&4	&3	&2	&1	&0
6018	_7	_6	_5	_4	_3	_2	_1	_0

[Input type] Parameter input
[Data type] Bit path

*0 to *7 : The bit pattern of the EIA or ISO/ASCII code indicating * is set.
=0 to =7 : The bit pattern of the EIA or ISO/ASCII code indicating = is set.
#0 to #7 : The bit pattern of the EIA or ISO/ASCII code indicating # is set.
[0 to [7 : The bit pattern of the EIA or ISO/ASCII code indicating [is set.
]0 to]7 : The bit pattern of the EIA or ISO/ASCII code indicating] is set.
?0 to ?7 : The bit pattern of the EIA or ISO/ASCII code indicating ? is set.
@0 to @7 : The bit pattern of the EIA or ISO/ASCII code indicating @ is set.
&0 to &7 : The bit pattern of the EIA or ISO/ASCII code indicating & is set.
_0 to _7 : The bit pattern of the EIA or ISO/ASCII code indicating _ is set.
0: A corresponding bit is 0.
1: A corresponding bit is 1.

	#7	#6	#5	#4	#3	#2	#1	#0
6019	SFN		EDP		OFN	DPD		
	SFN		EDP	MSV	OFN			

[Input type] Parameter input
[Data type] Bit

#2 DPD When argument D is specified for a macro call without a decimal point, the number of decimal places:
0: Is assumed to be 0.
[Example]
When G65PppppD1 is specified, #7=1.0000 is passed as the argument.
1: Depends on the increment system of the reference axis.
[Example]
When the increment system of the reference axis is IS-B and G65PppppD1 is specified, #7=0.0010 is passed as the argument.

#3 OFN The format of the name of a file output by the external output command (DPRNT or BPRNT) is:
0: PRNTxxxx.DAT (xxxx: 0000 to 9999).
1: MCR_PRNT.TXT (fixed).

#4 MSV When Tool length compensation shift type is used, the value in which Tool offset value, Tool length offset and Tool holder offset are :
#5041 - #5060, #100101 - #100150 (Current position)
#5061 - #5080, #100151 - #100200 (Skip position):
0: It is included in above-mentioned system value.
1: It is not included in above-mentioned system value.
Only in the machining center system, this parameter becomes effective. In the lathe system, bit 4 (TSV) of parameter No.6021 is valid. This parameter is valid both during coordinate system shift type compensation and axis movement type compensation if bit 4 (AXM) of parameter No.6005 is set to 1.

#5 EDP Precision setting for macro relational operators is:
0: Disabled.
1: Enabled.

NOTE
Parameter No. 6100 is used to set the number of significant digits after the decimal point.

#7 SFN The format of the name of a file output by the external output command (DPRNT or BPRNT) is:
0: PRNTxxxx.DAT (xxxx: 0000 to 9999).
If the power is off and on, xxxx is reset to 0000.
1: PRNTxxxx.DAT (xxxx: 0000 to 9999).
If the power is off and on, xxxx is continued and the next number is applied.

NOTE
The setting value of bit 7 (SFN) of parameter No. 6019 is effective in case of that bit 3 (OFN) of parameter No. 6019 equals 0.

	#7	#6	#5	#4	#3	#2	#1	#0
6020					NCM	IFR	NC2	NC1

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 NC1 The setting of the number of custom macro variables common to paths for #100 to #199 (#499) (parameter No. 6036) is:

0: Valid.
As many custom macro variables #100 to #199 (or #100 to #499) set for this path as the number set in parameter No. 6036 are used as custom macro variables common to tool paths.

1: Invalid.
Custom macro variables #100 to #199 (or #100 to #499) set for this path are all used as variables for the path.

> **NOTE**
> For path 1, be sure to set this parameter to 0.

> **Example**
> In a 4-path system, when parameters are set as listed below, custom macro variables for paths 1 to 3 are used as variables common to these paths, but for path 4, custom macro variables for the path are used.

Path number	No. 6036	NC1	Used custom macro variables
1	20	0	Custom macro variables #100 to #119 are used as variables common to these paths, and other custom macro variables are used independently for the relevant path.
2		0	
3		0	
4		1	Custom macro variables for path 4 are all used independently.

#1 NC2 The setting of the number of custom macro variables common to paths for #500 to #999 (parameter No. 6037) is:

0: Valid.
As many custom macro variables #500 to #999 set for this path as the number set in parameter No. 6037 are used as custom macro common variables between each path.

1: Invalid.
Custom macro variables #500 to #999 set for this path are all used as variables for the path.

> **NOTE**
> For path 1, be sure to set this parameter to 0.

Example

In a 4-path system, when parameters are set as listed below, custom macro variables for paths 1 to 3 are used as variables common to these paths, but for path 4, custom macro variables for the path are used.

Path number	No. 6037	NC2	Used custom macro variables
1	50	0	Custom macro variables #500 to #999 are used as variables common to these paths, and other custom macro variables are used independently for the relevant path.
2		0	
3		0	
4		1	Custom macro variables for path 4 are all used independently.

#2 IFR The custom macro interface signal R address is:
0: Disabled.
1: Enabled.

NOTE

Set the start address of each R area in parameter No. 6093 or 6094.

⚠ **WARNING**

To set the parameter IFR=1, set an appropriate value to parameter No.6094 beforehand.
When the parameter No.6094 is 0, R0~ of an internal relay is set. If the internal relay R0~ is used to another area, the operation not intended might be done.

#3 NCM Position where comment section of machining program can be inserted and handling of comment section inserted in block of #3000 (macro alarm) / #3006 (stop with a message) are decided.

0: The position in which comment section can be inserted in macro statements is as follows.

(ABC) #100 =1; Head of the block
#100 =1 (ABC); End of the block
N01 (ABC) #100 =1; Just behind of the sequence number
It cannot be inserted just after variable / constant value / variable name.

When inserting the comment section into the block of # 3000 (macro alarm) / # 3006 (macro message), the order of the character string as the message and the character string as comment section part is as follows.

#3000 =1 (ALARM MESSAGE) (COMMENT 1) (COMMENT 2);

The first bracket is assumed as the message, and the second and subsequent ones as the comment section.

1: The position in which comment section can be inserted in macro statements is as follows.

(ABC) #100 =1; Head of the block
#100 =1 (ABC); End of the block
N01 (ABC) #100 =1; Just behind of the sequence number
#100(ABC) =1; Just behind of variable number
#100 =#101 +1.(ABC) *#102; Just behind of numeric values
#100 =[#_UIL[1]](ABC) *100.; Just behind of the name of variable

When inserting the comment section into the block of # 3000 (macro alarm) / # 3006 (macro message), the order of the character string as the message and the character string as comment section part is as follows.

#3000 =1 (COMMENT 1) (COMMENT 2) (ALARM MESSAGE);

The last bracket is regarded as a message, and brackets before it are regarded as an comment section.

	#7	#6	#5	#4	#3	#2	#1	#0
6021				TSV				

[Input type] Parameter input
[Data type] Bit

#4 TSV When Tool length compensation shift type is used, the value in which Tool offset value, Tool length offset and Tool holder offset are :
#5041 - #5060, #100101 - #100150 (Current position)
#5061 - #5080, #100151 - #100200 (Skip position):
0: It is included in above-mentioned system value.
1: It is not included in above-mentioned system value.
Only in the lathe system, this parameter becomes effective. In the machining center system, bit 4 (MSV) of parameter No.6019 is valid. This parameter is valid both during coordinate system shift type compensation and axis movement type compensation if bit 4 (AXM) of parameter No.6005 is set to 1.

NOTE
1 If bit 2 (LWT) of parameter No.5002 is set to 1 (coordinate system shift type wear compensation) and tool compensation is executed, the wear compensation value is not included in the system variables independently of bit 4 (TSV) of parameter No.6021.
2 If bit 4 (LGT) of parameter No.5002 is set to 0 (coordinate system shift type geometry compensation) and tool compensation is executed, the geometry compensation value is not included in the system variables independently of bit 4 (TSV) of parameter No.6021.

6031	Start number of common variables to be protected among the common variables (#500 to #999)
6032	End number of common variables to be protected among the common variables (#500 to #999)

[Input type] Parameter input
[Data type] Word path
[Valid data range] 500 to 999

Among the common variables #500 to #999, the range of common variables specified by this parameter can be protected (by setting their attributes to read-only). If a write attempt (on the left side) is made, an alarm is issued.

NOTE
Set 0 in both parameters Nos. 6031 and 6032 not to protect common variables.

6036	Number of custom macro variables common between each path (for #100 to #199 (#499))

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 400

When the memory common to paths is used, this parameter sets the number of custom macro common variables to be shared (custom macro variables common to paths). Common variables #100 to #199 (up to #499 in a system with the embedded macro option) may be shared. Ensure that the maximum number of usable macro common variables is not exceeded.

Example
When 20 is set in parameter No. 6036
#100 to #119: Shared by all paths
#120 to #149: Used by each path independently

NOTE
1 When the adding custom macro common variables is enabled (bit 6(NCV) of parameter No.8135 is 0), up to #199 is available.
2 To use up to #499, the embedded macro option is required.
3 When 0 or a negative value is set, the memory common to paths is not used.
4 When the option for embedded macro is effective and the addition of custom macro common variables is disabled (bit 6 (NCV) of parameter No.8135 is 1), #150 to #199 can not be used but this parameter should be set the number which includes #150 to #199.

6037	Number of custom macro variables common between each path (for #500 to #999)

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 500

When the memory common to paths is used, this parameter sets the number of custom macro common variables to be shared (custom macro variables common to paths). Common variables #500 to #999 may be shared. Ensure that the maximum number of usable macro common variables is not exceeded.

Example
When 50 is set in parameter No. 6037
#500 to #549: Shared by all paths
#550 to #599: Used by each path independently

NOTE
1 When the adding custom macro common variables is enabled (bit 6(NCV) of parameter No.8135 is 0), up to #999 is available.
2 When 0 or a negative value is set, the memory common to paths is not used.

6038	Start G code used to call a custom macro

[Input type] Parameter input
[Data type] Word path

[Valid data range] -9999 to 9999

6039	Start program number of a custom macro called by G code

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 1 to 9999

6040	Number of G codes used to call custom macros

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 255

Set this parameter to define multiple custom macro calls using G codes at a time. With G codes as many as the value set in parameter No. 6040 starting with the G code set in parameter No. 6038, the custom macros of program numbers as many as the value set in parameter No. 6040 starting with the program number set in parameter No. 6039 can be called. Set 0 in parameter No. 6040 to disable this mode of calling.

If a negative value is set in parameter No. 6038, the modal call mode is entered. Whether the modal call is equivalent to G66 or G66.1 depends on bit 3 (MGE) of parameter No. 6007.

[Example] When parameter No. 6038 = 900, parameter No. 6039 = 1000, and parameter No. 6040 = 100 are set, a set of 100 custom macro calls (simple calls) is defined as follows:

G900 → O1000
G901 → O1001
G902 → O1002
:
G999 → O1099

When the setting of parameter No. 6038 is changed to -900, the same set of custom macro calls (modal calls) is defined.

NOTE

1. When the following conditions are satisfied, all calls using these parameters are disabled:
   1) When a value not within the specifiable range is set in each parameter
   2) (Value of parameter No. 6039 + value of parameter No. 6040 - 1) > 9999
2. The specification of a mixture of simple calls and modal calls is not allowed.
3. If a range of G codes set by these parameters duplicate G codes specified in parameters Nos. 6050 to 6059, the calls specified by parameters Nos. 6050 to 6059 are made preferentially.

6041	Start G code with a decimal point used to call a custom macro

[Input type] Parameter input
[Data type] Word path
[Valid data range] -999 to 999

6042	Start program number of a custom macro called by G code with a decimal point

[Input type] Parameter input

[Data type] 2-word path
[Valid data range] 1 to 9999

6043	Number of G codes with a decimal point used to call custom macros

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 255

Set this parameter to define multiple custom macro calls using G codes with a decimal point at a time. With G codes with a decimal point as many as the value set in parameter No. 6043 starting with the G code with a decimal point set in parameter No. 6041, the custom macros of program numbers as many as the value set in parameter No. 6043 starting with the program number set in parameter No. 6042 can be called. Set 0 in parameter No. 6043 to disable this mode of calling.

If a negative value is set in parameter No. 6041, the modal call mode is entered. Whether the modal call is equivalent to G66 or G66.1 depends on bit 3 (MGE) of parameter No. 6007.

[Example] When parameter No. 6041 = 900, parameter No. 6042 = 2000, and parameter No. 6043 = 100 are set, a set of 100 custom macro calls (simple calls) is defined as follows:

G90.0 → O2000
G90.1 → O2001
G90.2 → O2002
:
G99.9 → O2099

When the setting of parameter No. 6041 is changed to -900, the same set of custom macro calls (modal calls) is defined.

NOTE

1 When the following conditions are satisfied, all calls using these parameters are disabled:
   1) When a value not within the specifiable range is set in each parameter
   2) (Value of parameter No. 6042 + value of parameter No. 6043 - 1) > 9999
   3) When bit 0 (DPG) of parameter No. 6007 = 0 (to disable calls using G codes with a decimal point)
2 The specification of a mixture of simple calls and modal calls is not allowed.
3 If a range of G codes set by these parameters duplicate G codes specified in parameters Nos. 6060 to 6069, the calls specified by parameters Nos. 6060 to 6069 are made preferentially.

6044	Start M code used to call a subprogram

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 3 to 99999999

6045	Start program number of a subprogram called by M code

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 1 to 9999

6046	Number of M codes used to call subprograms (number of subprograms called by M codes)

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 32767

Set this parameter to define multiple subprogram calls using M codes at a time. With M codes as many as the value set in parameter No. 6046 starting with the M code set in parameter No. 6044, the subprograms of program numbers as many as the value set in parameter No. 6046 starting with the program number set in 6045 can be called. Set 0 in parameter No. 6046 to disable this mode of calling.

[Example] When parameter No. 6044 = 80000000, parameter No. 6045 = 3000, and parameter No. 6046 = 100 are set, a set of 100 subprogram calls is defined as follows:

M80000000 → O3000
M80000001 → O3001
M80000002 → O3002
:
M80000099 → O3099

NOTE

1. When the following conditions are satisfied, all calls using these parameters are disabled:
   1) When a value not within the specifiable range is set in each parameter
   2) (Value of parameter No. 6045 + value of parameter No. 6046 - 1) > 9999
2. If a range of M codes set by these parameters duplicate M codes specified in parameters Nos. 6071 to 6079, the calls specified by parameters Nos. 6071 to 6079 are made preferentially.

6047	Start M code used to call a custom macro

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 3 to 99999999

6048	Start program number of a custom macro called by M code

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 1 to 9999

6049	Number of M codes used to call custom macros (number of custom macros called by M codes)

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 32767

Set this parameter to define multiple custom macro calls using M codes at a time. With M codes as many as the value set in parameter No. 6049 starting with the M code set in parameter No. 6047, the custom macros of program numbers as many as the value set in parameter No. 6049 starting with the program number set in parameter No. 6048 can be called. Set 0 in parameter No. 6049 to disable this mode of calling.

[Example] When parameter No. 6047 = 90000000, parameter No. 6048 = 4000, and parameter No. 6049 = 100 are set, a set of 100 custom macro calls (simple calls) is defined as follows:
M90000000 → O4000
M90000001 → O4001
M90000002 → O4002
:
M90000099 → O4099

> **NOTE**
> 1 When the following conditions are satisfied, all calls using these parameters are disabled:
> 1) When a value not within the specifiable range is set in each parameter
> 2) (Value of parameter No. 6048 + value of parameter No. 6049 - 1) > 9999
>
> 2 If a range of M codes set by these parameters duplicate M codes specified in parameter No. 6080 through No. 6089, the calls specified by parameter No. 6080 through 6089 are made preferentially.

6050	**G code that calls the custom macro of program number 9010**
to	**to**
6059	**G code that calls the custom macro of program number 9019**

[Input type] Parameter input
[Data type] Word path
[Valid data range] (-9999 to 9999 : excluding 0, 5, 65, 66 and 67)

Set the G codes used to call the custom macros of program numbers 9010 to 9019. However, note that when a negative value is set in this parameter, it becomes a modal call. For example, if this parameter is set to -11, the modal call mode is entered by G11.
Whether the modal call is equivalent to G66 or G66.1 depends on bit 3 (MGE) of parameter No. 6007.

6060	**G code with a decimal point used to call the custom macro of program number 9040**
to	**to**
6069	**G code with a decimal point used to call the custom macro of program number 9049**

[Input type] Parameter input
[Data type] Word path
[Valid data range] -999 to 999

Set the G codes used to call the custom macros of program numbers 9040 to 9049. However, note that when a negative value is set in this parameter, it becomes a modal call. For example, if this parameter is set to -11, the modal call mode is entered by G11.
Whether the modal call is equivalent to G66 or G66.1 depends on bit 3 (MGE) of parameter No. 6007. Set G codes in the format Gm.n. The value expressed by ($m \times 10+n$) is set in the parameter. The values m and n must satisfy the following relationships: $0 \leq m \leq 99$, $0 \leq n \leq 9$.

> **NOTE**
> Parameter Nos. 6060 to 6069 are valid when bit 0 (DPG) of parameter No. 6007 is set to 1.

6071	**M code used to call the subprogram of program number 9001**
to	**to**
6079	**M code used to call the subprogram of program number 9009**

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 3 to 99999999 (excluding 30, 98 and 99)

These parameters set the M codes that call the subprograms of program numbers 9001 to 9009.

> **NOTE**
> If the same M code is set in these parameters, the younger number is called preferentially. For example, if 100 is set in parameter No. 6071 and 6072, and programs O9001 and O9002 both exist, O9001 is called when M100 is specified.

6080	**M code used to call the custom macro of program number 9020**
to	**to**
6089	**M code used to call the custom macro of program number 9029**

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 3 to 99999999 (excluding 30, 98 and 99)

Set the M codes used to call the custom macros of program numbers 9020 to 9029. The simple call mode is set.

> **NOTE**
> 1 If the same M code is set in these parameters, the younger number is called preferentially. For example, if 200 is set in parameters Nos. 6081 and 6082, and programs O9021 and O9022 both exist, O9021 is called when M200 is specified.
> 2 If the same M code is set in a parameters Nos. 6071 to 6079 used to call subprograms and in a parameters Nos. 6080 to 6089 used to call custom macros, a custom macro is called preferentially. For example, if 300 is set in parameters Nos. 6071 and 6081, and programs O9001 and O9021 both exist, O9021 is called when M300 is specified.

6090	**ASCII code that calls the subprogram of program number 9004**
6091	**ASCII code that calls the subprogram of program number 9005**

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 65(A:41H) to 90(Z:5AH)

These parameters set the ASCII codes that call subprograms in decimal.
The settable addresses are indicated below.

Address	Parameter setting value	T series	M series
A	65	O	O
B	66	O	O
D	68	X	O
F	70	O	O

Address	Parameter setting value	T series	M series
H	72	O	O
I	73	O	O
J	74	O	O
K	75	O	O
L	76	O	O
M	77	O	O
P	80	O	O
Q	81	O	O
R	82	O	O
S	83	O	O
T	84	O	O
V	86	X	O
X	88	X	O
Y	89	X	O
Z	90	X	O

NOTE
1 When address L is set, the number of repeats cannot be specified.
2 Set 0 when no subprogram is called.

6093	Top address of custom macro interface signal R address (input signal)

6094	Top address of custom macro interface signal R address (output signal)

NOTE
When these parameters are set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to maximum address (multiple of 4. 0, 4, 8, ...)
Set the top address of custom macro interface signal R address. 128 signals starting at the top address are allocated.

[Example]

Parameter	System variable number	Signal to use	Attribute
No.6093=1000	#1068 #1069 #1070 #1071	R1000 to R1003 R1004 to R1007 R1008 to R1011 R1012 to R1015	R
No.6094=1100	#1168 #1169 #1170 #1171	R1100 to R1103 R1104 to R1107 R1108 to R1111 R1112 to R1115	R/W

*) The R and R/W attributes of variables represent, respectively, read-only and read/write enabled.

NOTE
1. Each value specified with this parameter must be a multiple of 4 (0, 4, 8, ⋯). Otherwise, this function is disabled.
2. If a non-existent R address or system relay address is set, the corresponding system variable becomes invalid. The effective R address area varies depending on the PMC used and its memory. Be sure to specify a usable range by checking the specification of the PMC in use.
3. When setting the parameter, make sure that the input signal addresses do not overlap with the output signal addresses.

6100	Precision setting for relational operators

[Input type] Parameter input
[Data type] Byte
[Valid data range] 0 to 15

This parameter sets the number of digits after the decimal point in two values to be compared using the custom macro relational operator. The two values are rounded off to the specified number of digits before comparison.

NOTE
1. This function is enabled by setting bit 5 (EDP) of parameter No. 6019 to 1.
2. This function is disabled if parameter No. 6100 is set to a value out of the valid data range.

	#7	#6	#5	#4	#3	#2	#1	#0
6210						DSK		

[Input type] Parameter input
[Data type] Bit path

#2 DSK Skip position reading (system variables #5421 to #5440, #100701 to #100750) by the detection unit is:
0: Disabled.
1: Enabled.

	#7	#6	#5	#4	#3	#2	#1	#0
8106						CVP		

[Input type] Parameter input
[Data type] Bit

 # 2 CVP By a reset in path other than path 1, the custom macro variables common to paths set to the common variables #100 to #499 cleared by power-off is
0: not cleared to <null>.
1: cleared to <null>. (it depend to the bit 6(CCV) of parameter No.6001.)

> **NOTE**
> 1 When a reset is made in path 1, it is cleared regardless of the setting of this parameter. (it depend to the parameter CCV)
> 2 This parameter is invalid for the path that the bit 0(NC1) of parameter No.6020 is 1.

	#7	#6	#5	#4	#3	#2	#1	#0
11648						ESE		

[Input type] Parameter input
[Data type] Bit

#2 ESE ELSE statement of IF statement is:
0: Not used
1: Used. The following specifications are added.
- The following instruction format is added to IF statement.
  - IF[<conditional expression>] THEN; ~ ENDIF;
  - IF[<conditional expression>] THEN Macro statement1;
    ELSE Macro statement2;
  - IF[<conditional expression>] THEN; ~ ELSE; ~ ENDIF;
- IF statement multiplexing (nest management) is enable.
- "ELSE", and "ENDIF" are added to reserved words.

11649	Number of custom macro variables common to each path (for #98000 to #98499)

[Input type] Parameter input
[Data type] Word
[Valid data range] 0 to 500

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

When the custom macro variables common to each path is used, this parameter sets the number of custom macro common variables to be shared out of common variables #98000 to #98499. Be sure that the maximum number of available macro common variables is not exceeded.

> **Example**
> When 100 is set in parameter No.11649
> #98000 to #98099: Variables are shared by all paths
> #98100 to #98499: Variables are used by each path independently

> **NOTE**
> 1 Addition of custom macro common variables 1000 is required.
> 2 When 0 or a negative value is set, the custom macro variables common to each path is not used.
> 3 By parameter NC4(No.11654#0), commonness/independence of variables can be set for each path.

11652	Start number of common variables to be protected among the common variables (#98000 to #98499)

11653	End number of common variables to be protected among the common variables (#98000 to #98499)

[Input type] Parameter input
[Data type] 2-Word path
[Valid data range] 0, 98000 to 98499

Among the common variables #98000 to #98499, the range of common variables specified by this parameter can be protected (by setting their attributes to read-only). If value is written to protected variable (on the left side), an alarm is issued.

NOTE
Set 0 in both parameter No.11652 and No.11653 not to protect common variables.

	#7	#6	#5	#4	#3	#2	#1	#0
11654								NC4

[Input type] Parameter input
[Data type] Bit path

NOTE
When this parameter is set, the power must be turned off before operation is continued.

 # 0 NC4 The parameter No.11649 (Number of custom macro variables common to each path for #98000 to #98499) is:
0: Effective.
Among custom macro variable #98000-#98499 in this path, the number set in parameter No.11649 becomes the number of variables shared between each path.
1: Not effective.
Custom macro variable #98000-#98499 in this path are independent of other path.

NOTE
This parameter for path 1 must be set to 0.

Example
In a 4-path system, when parameters are set as listed below, custom macro variables #98000 to #98099 for paths 1 to 3 are used as variables common to these paths, but for path 4, custom macro variables #98000 to #98099 for the path 4 are used independently.

Path number	No.11649	NC4	Used custom macro variables
1	100	0	Custom macro variables #98000 to #98099 are used as variables common to these paths, and other custom macro variables are used independently.
2		0	
3		0	
4		1	All custom macro variables for path 4 are used independently.

Alarm and message

Number	Message	Description
PS0077	TOO MANY SUB,MACRO NESTING	The total number of subprogram and macro calls exceeds the permissible range. Another subprogram call was executed during an external memory subprogram call.
PS0110	OVERFLOW :INTEGER	An integer went out of range during arithmetic calculations.
PS0111	OVERFLOW :FLOATING	A decimal point (floating point number format data) went out of range during arithmetic calculations.
PS0112	ZERO DIVIDE	An attempt was made to divide by zero in a custom macro.
PS0114	ILLEGAL EXPRESSION FORMAT	The format used in an expression in a custom macro statement is in error. The parameter program format is in error.
PS0115	VARIABLE NO. OUT OF RANGE	An illegal No. was specified in a local variable, common variable or a system variable in a custom macro. A non–existent custom macro variable No. was specified in the EGB axis skip function (G31.8), or there are not enough custom macro variables for storing the skip position.
PS0116	WRITE PROTECTED VARIABLE	An attempt was made in a custom macro to use on the left side of an expression a variable that can only be used on the right side of an expression.
PS0118	TOO MANY BRACKET NESTING	Too many brackets "[ ]" were nested in a custom macro. Nesting of [] is up to five times including [] of function.
PS0119	ARGUMENT VALUE OUT OF RANGE	The value of an argument in a custom macro function is out of range.
PS0122	TOO MANY MACRO NESTING	The nesting of the custom macro call exceeded the allowable range.
PS0124	MISSING END STATEMENT	The END instruction corresponding to the DO instruction was missing in a custom macro.
PS0125	MACRO STATEMENT FORMAT ERROR	The format used in a macro statement in a custom macro is in error.
PS0126	ILLEGAL LOOP NUMBER	There is an error in the number of the DO and END statements of the custom macro, or it exceeds the allowable range (1 to 3).
PS0127	DUPLICATE NC,MACRO STATEMENT	An NC statement and macro statement were specified in the same block.
PS0129	USE 'G' AS ARGUMENT	G is used as an argument in a custom macro call. G can be specified as an argument only in an every-block call (G66.1).
PS1091	DUPLICATE SUB-CALL WORD	More than one subprogram call instruction was specified in the same block.
PS1092	DUPLICATE MACRO-CALL WORD	More than one macro call instruction was specified in the same block.
PS1093	DUPLICATE NC-WORD & M99	An address other than O, N, P or L was specified in the same block as M99 during the macro modal call state.
PS1095	TOO MANY TYPE-2 ARGUMENT	More than ten sets of I, J and K arguments were specified in the type–II arguments (A, B, C, I, J, K, I, J, K, ...) for custom macros.
PS1096	ILLEGAL VARIABLE NAME	An illegal variable name was specified. A code that cannot be specified as a variable name was specified. [#_OFSxx] does not match the tool offset memory option configuration.
PS1097	TOO LONG VARIABLE NAME	The specified variable name is too long.
PS1098	NO VARIABLE NAME	The specified variable name cannot be used as it is not registered.

Number	Message	Description
PS1099	ILLLEGAL SUFFIX [ ]	A suffix was not specified to a variable name that required a suffix enclosed by [ ]. A suffix was specified to a variable name that did not require a suffix enclosed by [ ]. The value enclosed by the specified [ ] was out of range.
PS1100	CANCEL WITHOUT MODAL CALL	Call mode cancel (G67) was specified even though macro continuous–state call mode (G66) was not in effect.
PS1101	ILLEGAL CNC STATEMENT IRT.	An interrupt was made in a state where a custom macro interrupt containing a move instruction could not be executed.
PS1115	READ PROTECTED VARIABLE	An attempt was made in a custom macro to use on the right side of an expression a variable that can only be used on the left side of an expression.
PS1124	MISSING DO STATEMENT	The DO instruction corresponding to the END instruction was missing in a custom macro.
PS1128	SEQUENCE NUMBER OUT OF RANGE	The jump destination sequence No. in a custom macro statement GOTO instruction was out of range (valid range: 1 to 99999999).
PS1129	MISSING IF STATEMENT	There is no “IF” corresponding to "ELSE" and "ENDIF".
PS1130	TOO MANY IF STATEMENT NESTING	The maximum value of the nesting of IF statement was exceeded. Up to 10 levels are allowed.
PS1131	MISSING OPEN BRACKET	The number of left brackets ([) is less than the number of right brackets ()) in a custom macro statement.
PS1132	MISSING CLOSE BRACKET	The number of right brackets (]) is less than the number of left brackets ([] in a custom macro statement.
PS1133	MISSING '='	An assignment directive (=) is missing in the arithmetic calculation instruction in a custom macro statement.
PS1137	IF STATEMENT FORMAT ERROR	The format used in the IF statement in a custom macro is in error.
PS1138	WHILE STATEMENT FORMAT ERROR	The format used in the WHILE statement in a custom macro is in error.
PS1139	SETVN STATEMENT FORMAT ERROR	The format used in the SETVN statement in a custom macro is in error.
PS1141	ILLEGAL CHARACTER IN VAR. NAME	The SETVN statement in a custom macro contacts a character that cannot be used in a variable name.
PS1142	TOO LONG V-NAME (SETVN)	The variable name used in a SETVN statement in a custom macro exceeds 8 characters (31 characters when the custom macro variable name expansion function is enabled).
PS1143	BPRNT/DPRNT STATEMENT FORMAT ERROR	The format used in the BPRINT statement or DPRINT statement is in error.

Diagnosis data

Diagnosis	1493	Number of macro statement blocks executed by custom and execution macros

[Data type] 2-word

[Unit of data] Block

The number of macro statement blocks executed by custom and execution macros per 1024 ms is displayed.

This data provides an indication of the actual macro statement processing speed.

12.6.2 Indirect Axis Address Command

Overview

When the custom macro function is enabled, indirect specification by an axis number can be performed by using AX[(axis-number)] instead of directly specifying an axis name during specification for an axis address.
In addition, the axis number corresponding to the axis name can be obtained by using AXNUM[(axis-name)].

Explanation

- Indirect axis address

Indirect axis address AX[] can be used to perform a command for an axis with an axis number (AX[] must be followed by "=").

AX[(axis-number)]=(value);

(axis-number) :1 to number-of-control-axis (Number of each path for a multipath system)
(value) :Value for the axis specified by its axis number

When the specified (axis-number) is invalid, the alarm PS0331, "ILLEGAL AXIS NUMBER IN AX[]" occurs. If there is a value in the decimal place digits, the number rounded off is treated as (axis number).
A variable such as a local variable, common variable, or system variable can also be used as (axis-number). When calculation using a variable name is performed for (axis-number), however, the variable name must be enclosed with [].

1. AX[1]=100.0;
   A value of 100.000 is specified for the first axis.
2. AX[#500]=200.0;
   A value of 200.000 is specified for the axis having the value stored in #500 as its axis number.
3. AX[#500+1]=300.0;
   A value of 300.000 is specified for the axis having the value stored in #500 plus 1 as its axis number.
4. SETVN 500 [ABC];
   AX[#ABC]=400.0;
   A value of 400.000 is specified for the axis having the value stored in #ABC(#500) as its axis number.
5. SETVN 500 [ABC];
   AX[[#ABC]+1]=500.0;
   A value of 500.000 is specified for the axis having the value stored in #ABC(#500) plus 1 as its axis number.
6. SETVN 500 [ABC];
   AX[#ABC+1]=500.0;
   The alarm PS0114"ILLEGAL EXPRESSION FORMAT" occurs.

- AXNUM function

AXNUM[] can be used to obtain an axis number.

AXNUM[(axis-name)];

If the specified (axis-name) is invalid, the alarm PS0332, "ILLEGAL AXIS ADDRESS IN AXNUM[]" occurs.

When the number of control axes is three and the first axis name is "X", the second axis name is "Y", and the third axis name is "Z"
1. #500=AXNUM[X];
   A value of 1 is stored in #500.
2. #501=AXNUM[Y];
   A value of 2 is stored in #501.
3. #502=AXNUM[Z];
   A value of 3is stored in #502.
4. #503=AXNUM[A];
   The alarm PS0332 occurs.

Example

Example where the first axis name is "X", the second axis name is "Y", and the third axis name is "Z1"

```
N10 SETVN 500[AXIS1,AXIS2,AXIS3] ;
N20 [#AXIS1]=AXNUM[X] ;
N30 [#AXIS2]=AXNUM[Y] ;
N40 [#AXIS3]=AXNUM[Z1] ;
N50 G92 AX[#AXIS1]=0 AX[#AXIS2]=0 AX[#AXIS3]=0 ;
N60 G01F1000. ;
N70 AX[#AXIS1]=100.0 AX[#AXIS2]=100.0 AX[#AXIS3]=100.0 ;
N80 G02 AX[#AXIS1]=200. 0 AX[#AXIS1]=200.0 R50.0 ;
N90 M02;
```

Limitation

When the custom macro function is enabled, "AX" and "AXN" cannot be used as extended axis names and are assumed as AX[] and AXNUM[], respectively.

Alarm and message

Number	Message	Description
PS0331	ILLEGAL AXIS NUMBER IN AX[]	An illegal value is specified for an AX[] axis number.
PS0332	ILLEGAL AXIS ADDRESS IN AXNUM[]	An illegal value is specified for an AXNUM[] axis address.

12.6.3 Interruption Type Custom Macro

Overview

When a program is being executed, another program can be called by inputting an interrupt signal UINT <Gn053.3> from the machine. This function is referred to as an interruption type custom macro function.

Explanation

Program an interrupt command in the following format:

M96 Pxxxx;	**Enables custom macro interrupt**
M97 ;	**Disables custom macro interrupt**

Use of the interruption type custom macro function allows the user to call a program during execution of an arbitrary block of another program. This allows programs to be operated to match situations which vary from time to time.

(1) When a tool abnormality is detected, processing to handle the abnormality is started by an external signal.

(2) A sequence of machining operations is interrupted by another machining operation without the cancellation of the current operation.
(3) At regular intervals, information on current machining is read.
:

Listed above are examples like adaptive control applications of the interruption type custom macro function.

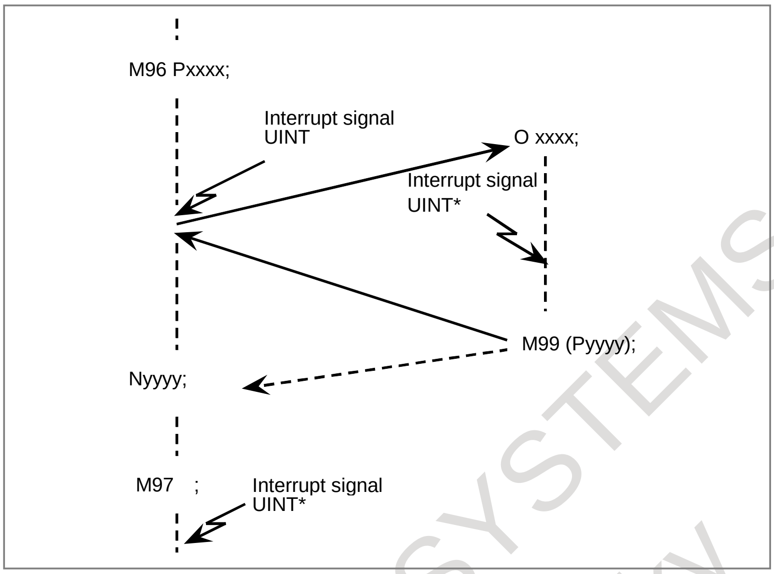

Fig. 12.6.3 Interruption type custom macro function

When M96Pxxxx is specified in a program, subsequent program operation can be interrupted by an interrupt signal UINT input to execute the program specified by Pxxxx. When the interrupt signal UINT (marked with an asterisk (*) in Fig. 12.6.3) is input during execution of the interrupt program or after M97, it is ignored.

Signal

Interrupt signal for custom macro UINT<Gn053.3>

[Classification] Input signal

[Function] This signal calls and executes a program in memory.
During execution, a program in automatic operation is suspended.
To enable this signal to be accepted, a particular miscellaneous function must be specified in a command program for automatic operation. In addition, automatic operation must already be started to accept this signal. The particular miscellaneous function code is set by parameter Nos. 6003, 6033 and 6034.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn053					UINT			

Parameter

- Various Setting for Custom Macro

	#7	#6	#5	#4	#3	#2	#1	#0
6003	MUS		MSB	MPR	TSE	MIN	MSK	

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#1 MSK Absolute coordinates at that time during custom macro interrupt
- 0: Not set to the skip coordinates (system variables #5061 and later)
- 1: Set to the skip coordinates (system variables #5061 and later)

#2 MIN Custom macro interrupt
- 0: Performed by interrupting an in-execution block (Custom macro interrupt type I)
- 1: Performed after an in-execution block is completed (Custom macro interrupt type II)

#3 TSE Custom macro interrupt signal UINT
- 0: Edge trigger method (Rising edge)
- 1: Status trigger method

#4 MPR Custom macro interrupt valid/invalid M code
- 0: M96/M97
- 1: M code set using parameters Nos. 6033 and 6034

#5 MSB Interrupt program
- 0: Uses a dedicated local variable (Macro-type interrupt)
- 1: Uses the same local variable as in the main program (Subprogram- type interrupt)

#7 MUS Interrupt-type custom macro
- 0: Not used
- 1: Used

- Setting M code that makes custom macro interrupt effective/ineffective

6033	**M code that validates a custom macro interrupt**

6034	**M code that invalidates a custom macro interrupt**

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 03 to 99999999 (excluding 30, 98 and 99)

These parameters can be used when bit 4 (MPR) of parameter No. 6003 is 1. M96 is used as a valid M code and M97 is used as an invalid M code when MPR is 0, irrespective of the state of this parameter.

Note

> **NOTE**
> 1 No interrupt-type custom macro can be used during multiple repetitive canned cycle execution.
> 2 No interrupt-type custom macro can be used during return operation in dry run after search operation when the program is restarted.

NOTE

3 The alarm PS1101 is issued in the following cases:
- <1> Case where an interrupt is made in the programmable mirror image (G51.1) mode and G51.1 is further specified in the interrupted program
- <2> Case where an interrupt is made in the coordinate system rotation (G68) mode and G68 is further specified in the interrupted program
- <3> Case where an interrupt is made in the scaling (G51) mode and G51 is further specified in the interrupted program

4 During program execution in cycle operation, interrupt type II is used, regardless of the setting of bit 2 (MIN) of parameter No. 6003. Cycle operation has the following functions:
- <1> Automatic reference position return
- <2> Cutter or tool nose radius compensation (when multiple blocks are generated from one specified block as in a case where an acute turn is made on the outside)
- <3> Canned cycle
- <4> Automatic tool length measurement (M series) / Automatic tool offset (T series)
- <5> Optional chamfering corner R
- <6> Normal direction control
- <7> Cutting point interpolation for cylindrical interpolation

OPERATOR'S MANUAL (B-64694EN)	Interrupt-type custom macro

12.6.4 Embedded Macro

Overview

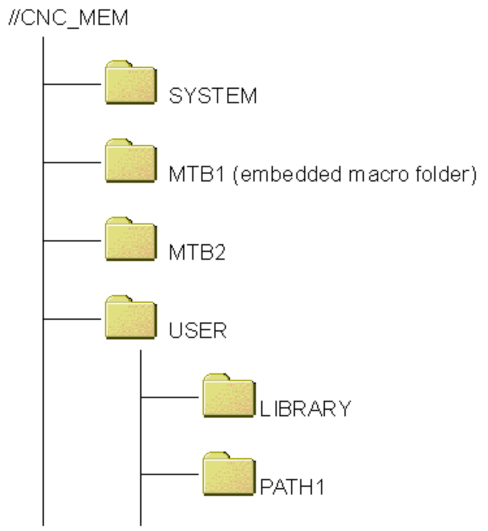
This function protects a program created by a machine tool builder, by storing the program in a folder dedicated to embedded macros (hereinafter referred to as an MTB1 folder) and assigning an attribute to the folder.
At the same time, the following functions are available:

(1) A dedicated program memory capacity of 100K bytes (corresponding to about 260 m) is provided in addition the ordinary program memory capacity.
The number of registerable programs remains unchanged from the ordinary number of registerable programs.

(2) To the MTB1 folder, an attribute such as edit prohibition and edit/display prohibition can be assigned. Moreover, by using a dedicated password and keyword, a set value can be locked.

(3) A program stored in the MTB1 folder can be used by calling based on a code such as M/T codes, macro calling based on a G code, macro calling based on G65/G66, and subprogram calling based on an M code such as M98.

(4) Custom macro common variables (#200 to #499) are added.



Detailed explanation

(1) Program memory capacity

A dedicated program memory capacity of 100K bytes (corresponding to about 260 m) is provided in addition the ordinary program memory capacity.

The dedicated program memory capacity is managed separately from the ordinary program memory capacity. Program memory capacity information (used pages and free pages) is displayed as described below.

- When the MTB1 folder is displayed
  Embedded macro program memory capacity
- When another folder is displayed
  Ordinary program memory capacity

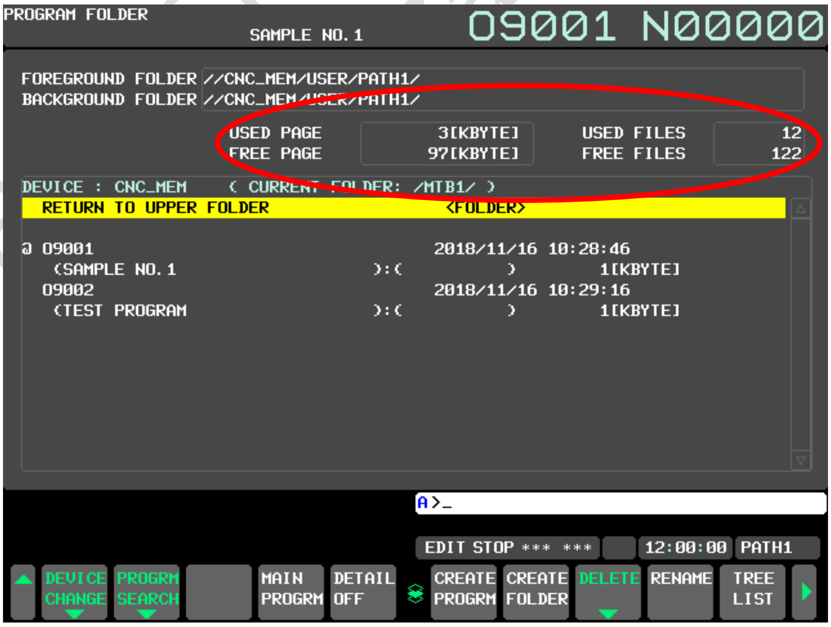


Fig. 12.6.4 (a) Program memory capacity

(2) Number of registerable programs

Ordinary programs and dedicated programs can be registered as long as the total number of those programs does not exceed the number of registerable programs.

(3) Program protection function
One of two attributes can be assigned to the MTB1 folder.
1) Edit prohibition
Editing of the programs in the folder is prohibited.
- The contents of programs cannot be edited.
- No program name and program attribute can be modified.
- No program can be deleted.
No new program can be created in the folder.
2) Edit/display prohibition
The contents of programs in the folder cannot be edited.
No new program can be created in the folder.
The programs in the folder become invisible.
No program in the folder can be output to an external device.
By setting the edit prohibition attribute or edit/display prohibition attribute, the programs in the folder can be protected from modification and deletion due to an operation error.

NOTE
Subfolders cannot be created in the MTB1 folder.

(4) Password and keyword
By setting a password in parameter No. 11311 and setting a keyword in parameter No. 11312, the attribute setting of the MTB1 folder can be locked.
In the locked state, the attribute of the MTB1 folder cannot be changed. Thus, the protection of the programs in the MTB1 folder cannot be canceled without setting the correct keyword.
- Locked state
The locked state means the state where the value of the password parameter No. 11311 and the value of the keyword parameter No. 11312 differ from each other.
The values set in these parameters are not displayed.
- Unlocked state
The unlocked state means the state where the value of the password parameter No. 11311 and the value of the keyword parameter No. 11312 match each other.
The values set in these parameters are not displayed.
- State where no key is set
When 0 is displayed in the password parameter No. 11311, no password is set yet.

NOTE
The attribute of the MTB1 folder can be changed only in the unlocked state.

(5) Calling
A program stored in the MTB1 folder can be used by calling based on a code such as M/T codes, macro calling based on a G code, macro calling based on G65/G66, and subprogram calling based on an M code such as M98.
For macro calling based on a G code, G codes used for calling are additionally set as indicated below.
Parameters are used to set the relationship between a G code used for macro calling and the number of a called program. Up to ten sets can be set.

Example)
Suppose that the following (Table 12.6.4 (a)) are set by the parameters:

Table 12.6.4 (a)

	First group	Second group	Third group
G code	No.12020=100	No.12023=150	No.12026=900
Program number	No.12021=8000	No.12024=7500	No.12027=8300
Number of G codes/programs	No.12022=10	No.12025=5	No.12028=30

Then the G codes call the programs in the Table 12.6.4 (b):

Table 12.6.4 (b)

G code	Called program
G100 to G109	O8000 to O8009
G150 to G154	O7500 to O7504
G900 to G929	O8300 to O8329

NOTE

When this function is enabled, the MTB1 folder is added to the top of the search order as a program search folder for macro call and subprogram call.

(1) If a program to be called is registered in the MTB1 folder, the program in the MTB1 folder is called.

(2) If a program to be called is not registered in the MTB1 folder, the program is searched for according to parameter No. 3457.

(6) Macro variable

Common variables #200 to #499 are added.

These variables are independent variables on a path-by-path basis as with variables #100 to #199.

- When the power is turned off, the variables are initialized and the data becomes null.
- When bit 3 (PV5) of parameter No. 6001 is set to 1, the custom macro outputs common variables #100 to #199, #200 to #499, and #500 to #599.
- When bit 6 (CCV) of parameter No. 6001 is set to 0, common variables #100 to #199 and #200 to #499 are cleared to null by a reset. When CCV is set to 1, these common variables are not cleared by a reset.

NOTE

By specifying parameter No. 6036, variables can be made common to all paths. If the option for the embedded macro function is specified but the addition of custom macro common variables is disabled (bit 6 (NCV) of parameter No.8135 is 1), #150 to #199 are unusable. However, in this parameter, set a number including #150 to #199.

Example of setting)

When 200 is set in parameter No. 6036:

#100 to #299: Common to all paths

#300 to #449: Used independently on a path-by-path basis

#150 to #199 can be used when the adding custom macro common variables is enabled (bit 6(NCV) of parameter No.8135 is 0).

Operation explanation

Procedure for creating programs in the MTB1 folder

(1) Creation

<1> Make the MTB1 folder empty.
Delete all programs and folders from the MTB1 folder.

<2> Create a program in the MTB1 folder.
A program can also be read through an external device.

<3> Set G code numbers for calling and program numbers to be called in parameters Nos. 12020 to 12049 as needed.

<4> Determine a password then specify it in parameter No. 11311.
Specify the same value as the password in parameter No. 11312 (keyword) to unlock the key.

<5> Set the desired attribute of the MTB1 folder.
<6> Set a value other than the password in parameter No. 11312 (keyword) to lock the key.

(2) Modification/addition
<1> Set the same value as the password in parameter No. 11312 (keyword) to unlock the key.
<2> Cancel the attribute of the MTB1 folder.
<3> Modify a program in the MTB1 folder or add a program to the MTB1 folder.
<4> Set the desired attribute of the MTB1 folder.
<5> Set a value other than the password in parameter No. 11312 (keyword) to lock the key.

(3) Copy (copy to another NC)
<1> Make the MTB1 folder empty.
Delete all programs and folders from the MTB1 folder.
<2> Read a program to the MTB1 folder through an external device.
<3> Set G code numbers for calling and program numbers to be called in parameters Nos. 12020 to 12049 as needed.
<4> Set a password in parameter No. 11311.
Set the same value as the password in parameter No. 11312 (keyword) to unlock the key.
<5> Set the desired attribute of the MTB1 folder.
<6> Set a value other than the password in parameter No. 11312 (keyword) to lock the key.

Setting of the attribute of the MTB1 folder

(1) Set the same value as the password in parameter No. 11312 (keyword) to unlock the key.
(2) Set the EDIT mode to display the program list screen.
Operate the soft keys in the order shown Fig. 12.6.4 (b).

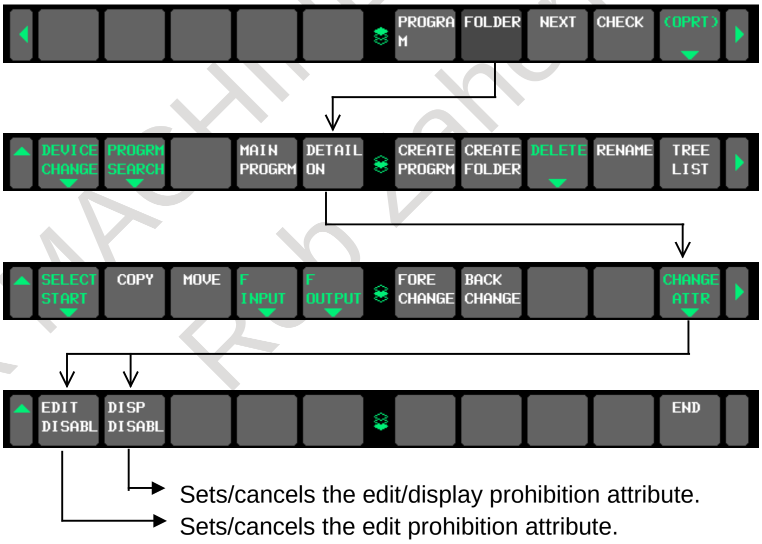

Fig. 12.6.4 (b)

(3) Place the cursor on the MTB1 folder then press a desired attribute soft key.

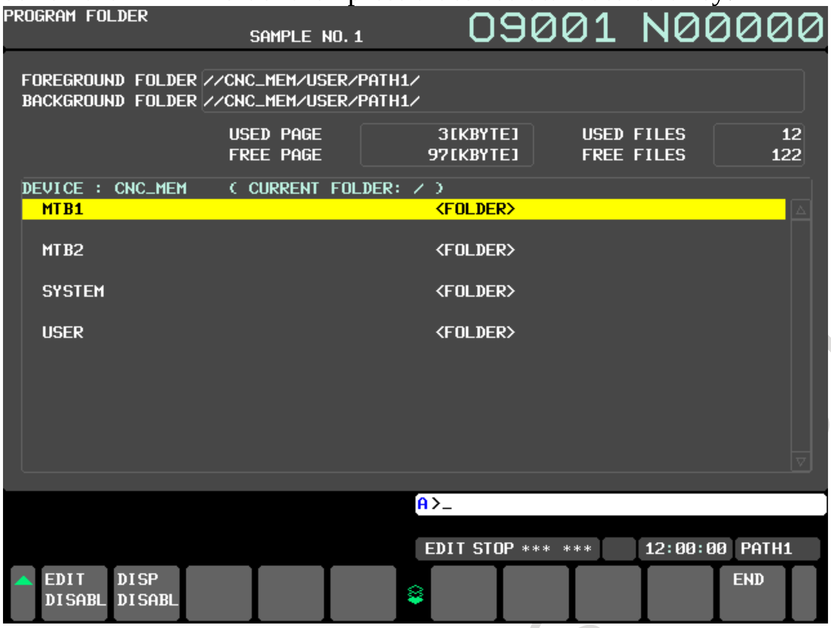

Fig. 12.6.4 (c) Attribute setting

Display when the edit prohibition attribute is assigned

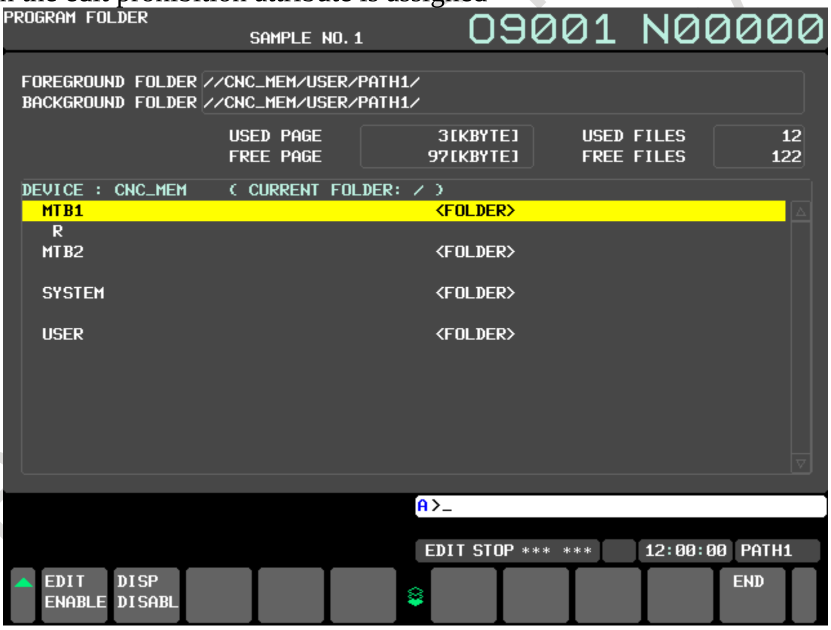

Fig. 12.6.4 (d) Edit prohibition attribute

Display when the edit/display prohibition attribute is assigned

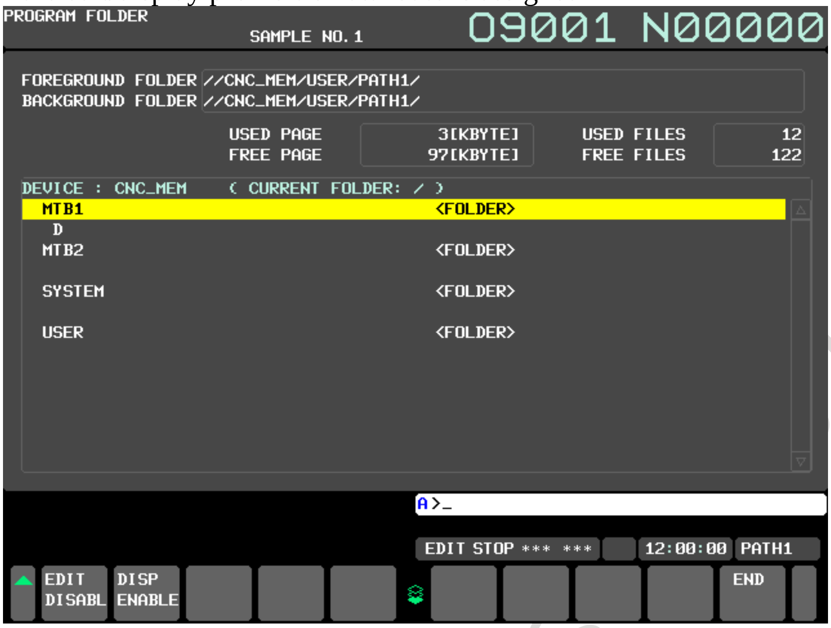

Fig. 12.6.4 (e) Edit/display prohibition attribute

(4) Set a value other than the password in parameter No. 11312 (keyword) to lock the key.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3457	SCF	SCC			SYS	MC1	MC2	LIB

[Input type] Parameter input
[Data type] Bit path

NOTE

1 The parameters LIB, MC2, MC1, and SYS are used to set a search folder for the following subprogram/macro calls:
- Subprogram call based on an M code
- Subprogram call based on a particular address
- Subprogram call based on a second auxiliary function code
- Macro call based on a G code
- Macro call based on an M code
- Macro call based on a T code
- One-touch macro call

2 The parameter SCF is used to set whether to add a search folder for the following subprogram/macro calls:
- Subprogram call based on M98
- Figure copy based on G72.1/G72.2
- Macro call based on G65/G66/G66.1
- Macro interrupt based on M96

#0 LIB The common program directory "//CNC_MEM/USER/LIBRARY/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

#1 MC2 MTB dedicated directory 2 "//CNC_MEM/MTB2/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

#2 MC1 MTB dedicated directory 1 "//CNC_MEM/MTB1/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

#3 SYS The system directory "//CNC_MEM/SYSTEM/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

NOTE
When multiple folders are specified, LIB, MC2, MC1, and SYS are searched in this order.

#6 SCC The same folder as the main program is added to the top of the search order as a search folder for the following each subprogram call and macro call.
- Subprogram call by an M code
- Subprogram call by a specific code
- Subprogram call by a second auxiliary function code
- Macro call by an S code
- Macro call by a T code
- Macro call by a G code
- Macro call by an M code
- One-touch macro call

The same folder as the main program is:
0: Not added in the search order.
1: Added in the search order.
When a search folder is added, a search is made in the following order:
0) Folder only for embedded macro (With the embedded macro-function.)
1) Folder where the main program is stored
2) Common program folder, which is an initial folder (LIBRARY)
3) MTB-dedicated folder 2, which is an initial folder (MTB2)
4) MTB-dedicated folder 1, which is an initial folder (MTB1)
5) System folder, which is an initial folder (SYSTEM)
The folders of 2) through 5) can be excluded from search target folders by setting the bits 0 (LIB), 1 (MC2), 2 (MC1), and 3 (SYS) of parameter No. 3457.

#7 SCF A search folder is:
0: Not added.
1: Added.

When a search folder is added, a search is made in the following order:
0) Folder only for embedded macro (With the embedded macro-function.)
1) Folder where the main program is stored
2) Common program folder, which is an initial folder (LIBRARY)
3) MTB-dedicated folder 2, which is an initial folder (MTB2)
4) MTB-dedicated folder 1, which is an initial folder (MTB1)
5) System folder, which is an initial folder (SYSTEM)

The folders of 3) through 5) can be excluded from search target folders by setting the bits 1 (MC2), 2 (MC1), and 3 (SYS) of parameter No. 3457.

	#7	#6	#5	#4	#3	#2	#1	#0
6001		CCV			PV5			

[Input type] Parameter input
[Data type] Bit path

#3 PV5 Custom macro common variables:
0: #500 to #549 are output. (Note)
1: #100 to #149 and #500 to 549 are output. (Note)

> **NOTE**
> Output variables are as the table according to the combination of added options.

When the parameter PV5=0

		Addition of custom macro common variables	
		Disable (bit 6 (NCV) of parameter No.8135 is 1)	Enable (bit 6 (NCV) of parameter No.8135 is 0)
Option “Embedded macro”	Non	#500 to #549	#500 to #999
	Yes	#500 to #549	#500 to #999

When the parameter PV5=1

		Addition of custom macro common variables	
		Disable (bit 6 (NCV) of parameter No.8135 is 1)	Enable (bit 6 (NCV) of parameter No.8135 is 0)
Option “Embedded macro”	Non	#100 to #149 and #500 to #549	#100 to #199 and #500 to #999
	Yes	#100 to #149, #200 to #499 and #500 to #549	#100 to #199, #200 to #499 and #500 to #999

#6 CCV Common variables #100 to #149(NOTE) cleared by power-off are:
0: Cleared to <null> by reset
1: Not cleared by reset

> **NOTE**
> Cleared variables are as the table according to the combination of added options.

		Addition of custom macro common variables	
		Disable (bit 6 (NCV) of parameter No.8135 is 1)	Enable (bit 6 (NCV) of parameter No.8135 is 0)
Option “Embedded macro”	Non	#100 to #149	#100 to #199
	Yes	#100 to #149 and #200 to #499	#100 to #199 and #200 to #499

6036	Number of custom macro variables common to tool path (for #100 to #199 (#499))

[Input type] Parameter input
[Data type] Word

[Valid data range] 0 to 400

When the memory common to paths is used, this parameter sets the number of custom macro common variables to be shared (custom macro variables common to paths). Common variables #100 to #199 (up to #499 in a system with the embedded macro option) may be shared. Ensure that the maximum number of usable macro common variables is not exceeded.

Example

When 20 is set in parameter No. 6036
#100 to #119: Shared by all paths
#120 to #149: Used by each path independently

NOTE

1 When the adding custom macro common variables is enabled (bit 6(NCV) of parameter No.8135 is 0), up to #199 is available.
2 To use up to #499, the embedded macro option is required.
3 When 0 or a negative value is set, the memory common to paths is not used.
4 When the option for embedded macro is effective and the addition of custom macro common variables is disabled (bit 6 (NCV) of parameter No.8135 is 1), #150 to #199 can not be used but this parameter should be set the number which includes #150 to #199.

	#7	#6	#5	#4	#3	#2	#1	#0
8106						CVP		

[Input type] Parameter input
[Data type] Bit

 # 2 CVP By a reset in path other than path 1, the custom macro variables common to paths set to the common variables #100 to #499 cleared by power-off is

0: not cleared to <null>.
1: cleared to <null>. (it depend to the bit 6(CCV) of parameter No.6001.)

NOTE

1 When a reset is made in path 1, it is cleared regardless of the setting of this parameter. (it depend to the parameter CCV)
2 This parameter is invalid for the path that the bit 0(NC1) of parameter No.6020 is 1.

11311	Password for embedded macro

[Input type] Parameter input
[Data type] 2-word
[Valid date range] 0 to 99999999

The password to set the attribute of the folder for the embedded macro (MTB1 folder) is set. When the values other than 0 are set to this parameter and the value is different from the parameter No. 11312 of the key word, the attribute of the MTB1 folder is locked.
Thereafter, the attribute of the MTB1 folder is locked unless the same value as the password is set to the key word. Moreover, the value of the password cannot be changed.

- When the key is open,
  The attribute of the MTB1 folder can be changed.

- When it locks or the key is not set,
  The attribute of the MTB1 folder can not be changed.

11312	Key word for embedded macro-function

[Input type] Parameter input
[Data type] 2-word
[Valid date range] 0 to 99999999

The key word in order to set the attribute of the folder for the embedded macro (MTB1 folder) is set.

> **NOTE**
> The value is not displayed even if the parameter is set. Moreover, when the power is turned off, this parameter becomes 0.

12020	G code number for the embedded macro (first)
12023	G code number for the embedded macro (second)
12026	G code number for the embedded macro (third)
12029	G code number for the embedded macro (fourth)
12032	G code number for the embedded macro (fifth)
12035	G code number for the embedded macro (sixth)
12038	G code number for the embedded macro (seventh)
12041	G code number for the embedded macro (eighth)
12044	G code number for the embedded macro (ninth)
12047	G code number for the embedded macro (tenth)

[Input type] Parameter input
[Data type] Word path
[Valid date range] 1 to 999

12021	Macro program number for the embedded macro (first)
12024	Macro program number for the embedded macro (second)
12027	Macro program number for the embedded macro (third)
12030	Macro program number for the embedded macro (fourth)
12033	Macro program number for the embedded macro (fifth)
12036	Macro program number for the embedded macro (sixth)
12039	Macro program number for the embedded macro (seventh)

12042	Macro program number for the embedded macro (eighth)

12045	Macro program number for the embedded macro (ninth)

12048	Macro program number for the embedded macro (tenth)

[Input type] Parameter input
[Data type] 2-word path
[Valid date range] 1 to 9999

12022	Number of G code macro for embedded macro (first)

12025	Number of G code macro for embedded macro (second)

12028	Number of G code macro for embedded macro (third)

12031	Number of G code macro for embedded macro (fourth)

12034	Number of G code macro for embedded macro (fifth)

12037	Number of G code macro for embedded macro (sixth)

12040	Number of G code macro for embedded macro (seventh)

12043	Number of G code macro for embedded macro (eighth)

12046	Number of G code macro for embedded macro (ninth)

12049	Number of G code macro for embedded macro (tenth)

[Input type] Parameter input
[Data type] Word path
[Valid date range] 1 to 255

The data of the macro call by G code added by the embedded macro is set. G code number and the macro program number for it are set, and the number of G codes is set. These sets can be set up to ten. If G code number duplicates, it gives priority from former set. The set whose G code number, macro program number, or number is 0 is invalid.

[Example] In case that the range of macro program number is 7000 to 8999:

	First group	Second group	Third group
G code	No. 12020=100	No. 12023=150	No. 12026=900
Program number	No. 12021=8000	No. 12024=7500	No. 12027=8300
Number	No. 12022=10	No. 12025=5	No. 12028=30

The following program is called by each G code.

G code	Called program
G100 toG109	O8000 to O8009
G150 to G154	O7500 to O7504
G900 to G929	O8300 to O8329

> **NOTE**
> The parameter value is regarded as 0 when data outside the range is set to the setting value of each parameter..

Note

> **NOTE**
> 1 The programs in the folder dedicated to embedded macros (MTB1 folder) can also be deleted by the following operations:
> - SRAM initialization operation
> - Clearing of program files with the IPL function
>
> 2 The programs in the MTB1 folder can be saved/restored in a batch by the following operations:
> - Saving/restoring of SRAM data in a batch with the BOOT function
> - Saving/restoring with the automatic data backup function (when programs are included as targets)
> - Output to an external device/input from an external device
>
> 3 To the programs in the MTB1 folder, the following protection functions are applied in addition to the protection of this function based on the folder attribute:
> - Parameter-based protection function for programs with O numbers in the eight thousands and nine thousands
> - Protection function based on a key and program encryption
> - Attribute setting for programs
>
> 4 This function differs from the embedded macro function of the FS16/18/21*i*-B in the following:
> - Program storage method
> - Program creation procedure
> - Program protection mechanism, etc.

	PROGRAM MANAGEMENT

12.7 CANNED CYCLE FOR DRILLING

12.7.1 Canned Cycle for Drilling

Overview

Canned cycles for drilling make it easier for the programmer to create programs. With a canned cycle for drilling, a frequently-used machining operation can be specified in a single block with a G code; without canned cycles for drilling, normally more than one block is required. In addition, the use of canned cycles for drilling can shorten the program to save memory.

Explanation

A canned cycle for drilling consists of a sequence of six operations.

Operation 1 Positioning a hole position
Operation 2 Rapid traverse up to point R level
Operation 3 Hole machining

Operation 4 Operation at the bottom of a hole
Operation 5 Retraction to point R level
Operation 6 Rapid traverse up to the initial point

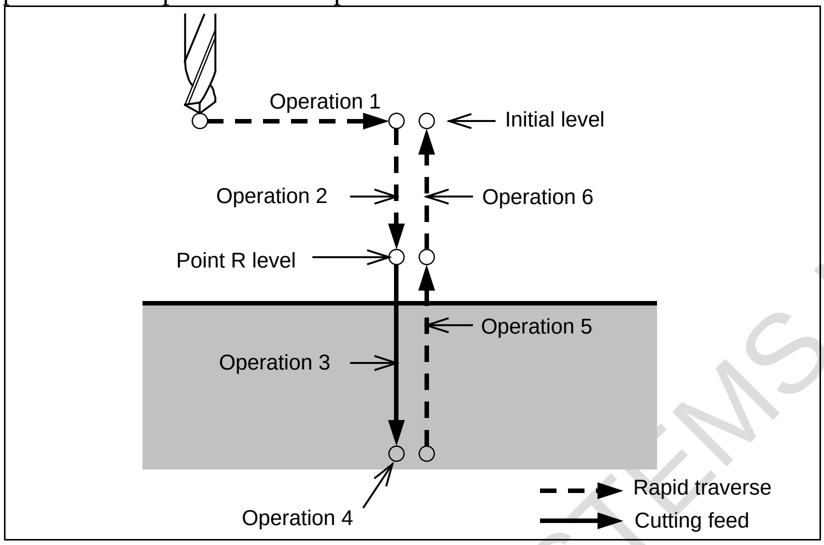

Fig. 12.7.1 (a) Canned cycle for drilling operation sequence

- Spindle control

In some canned cycles for drilling, a spindle command to rotate the spindle in reverse direction may be output automatically.

The following canned cycles for drilling require spindle control:

<Machining center system>		<Lathe system>	
Counter tapping cycle	G74	Face tapping cycle	G84
Fine boring cycle	G76	Side tapping cycle	G88
Tapping cycle	G84		
Boring cycle	G86		
Back boring cycle	G87		
Boring cycle	G88		

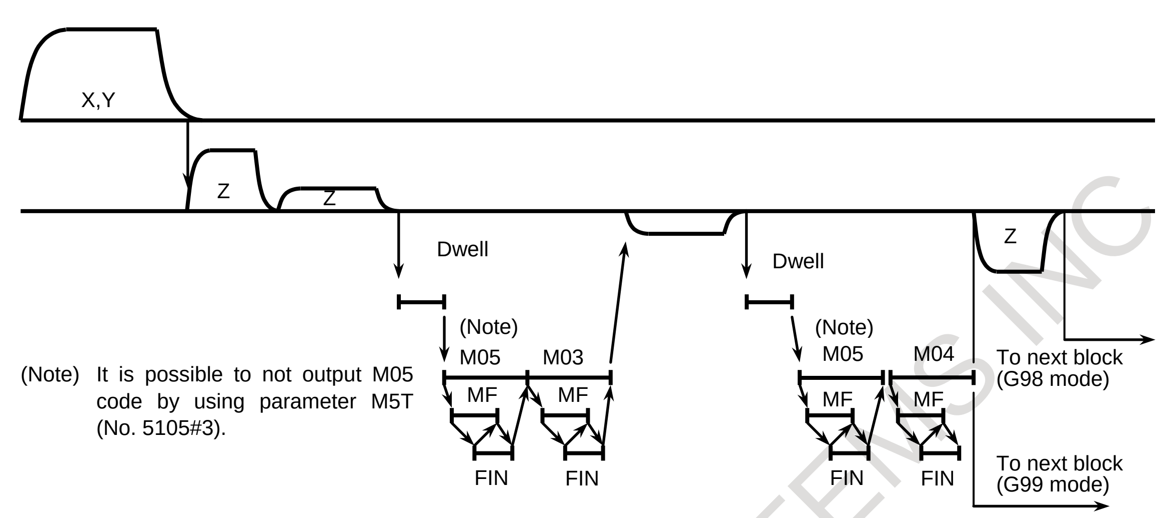
For spindle control, the following normal miscellaneous functions are used:
See the description of the miscellaneous functions.

M03 CW spindle rotation
M04 CCW spindle rotation
M05 Spindle stop
M19 Spindle orientation (machining center system)

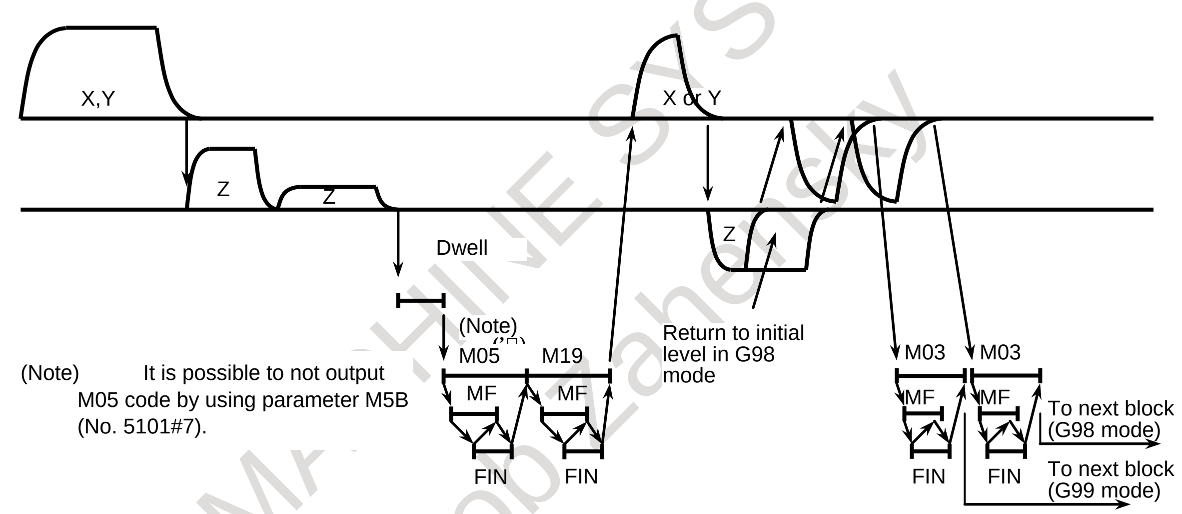
When the rotation direction of the spindle is to be switched from one direction to the other (for example, when M04 is output during M03 operation), a parameter can specify whether to send M05 at the time switching.

Timing charts are described in the following page:

G74 (Counter tapping cycle)



G76 (Fine boring cycle)



G84 (Tapping cycle)

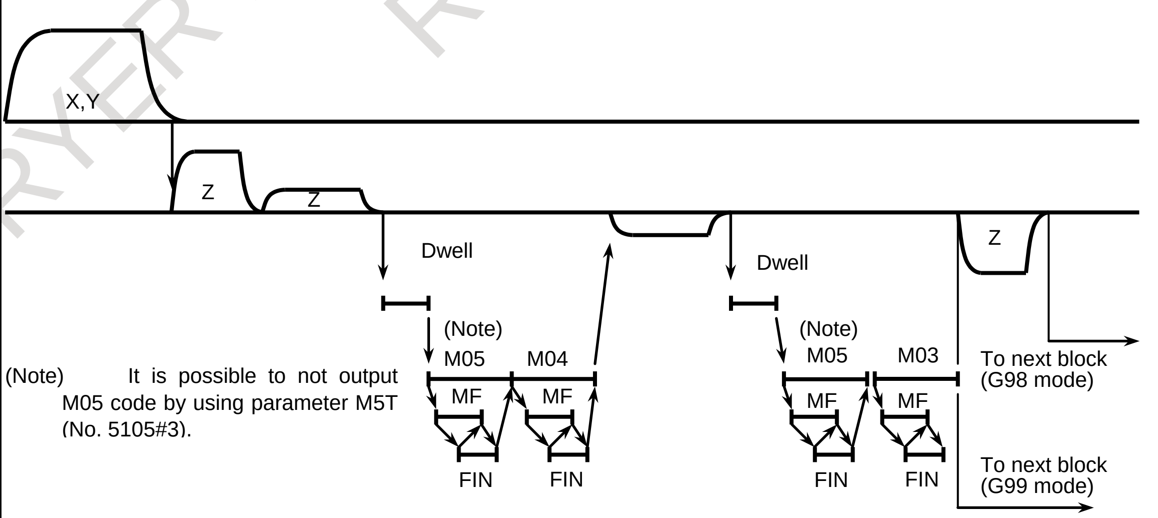


Fig. 12.7.1 (b) Machining of canned cycle for machining center system (1/2)

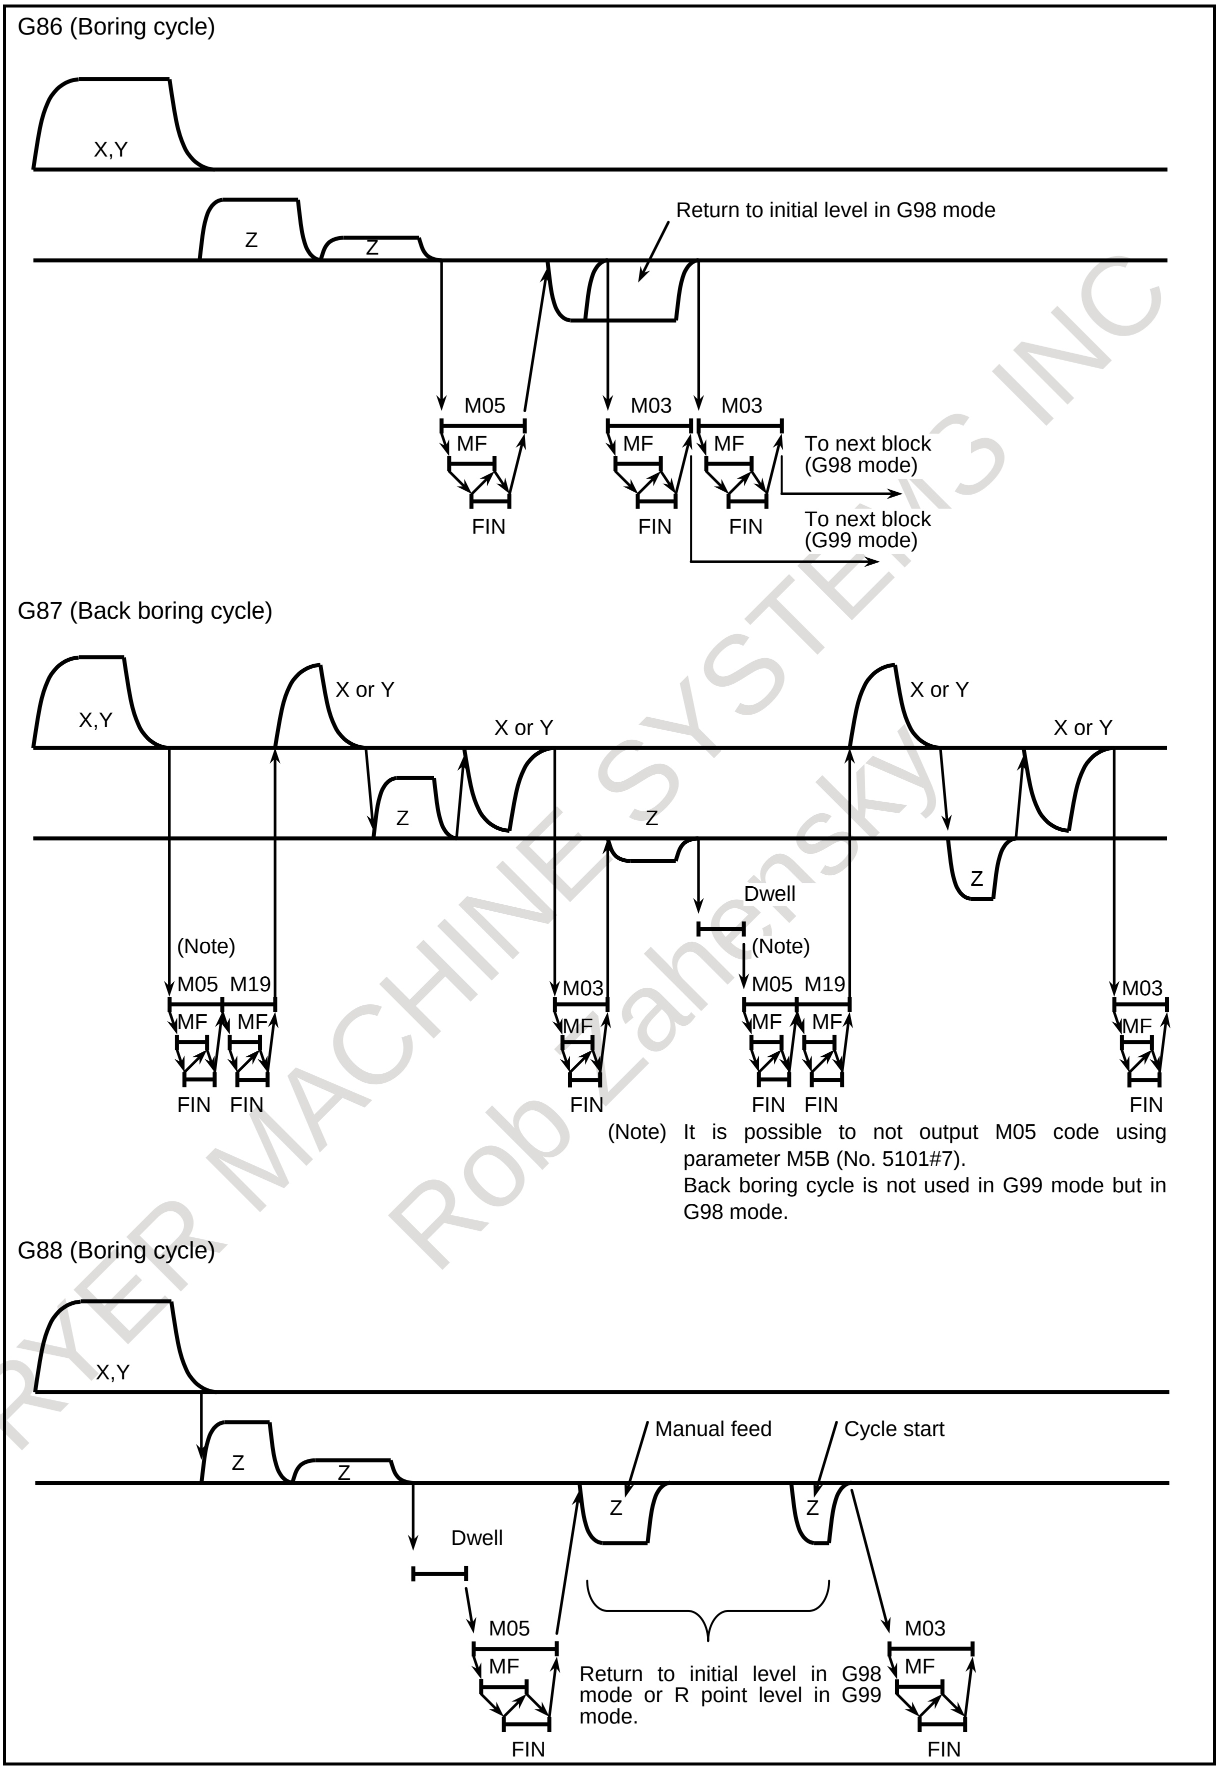

Fig. 12.7.1 (c) Machining of canned cycle for machining center system (2/2)

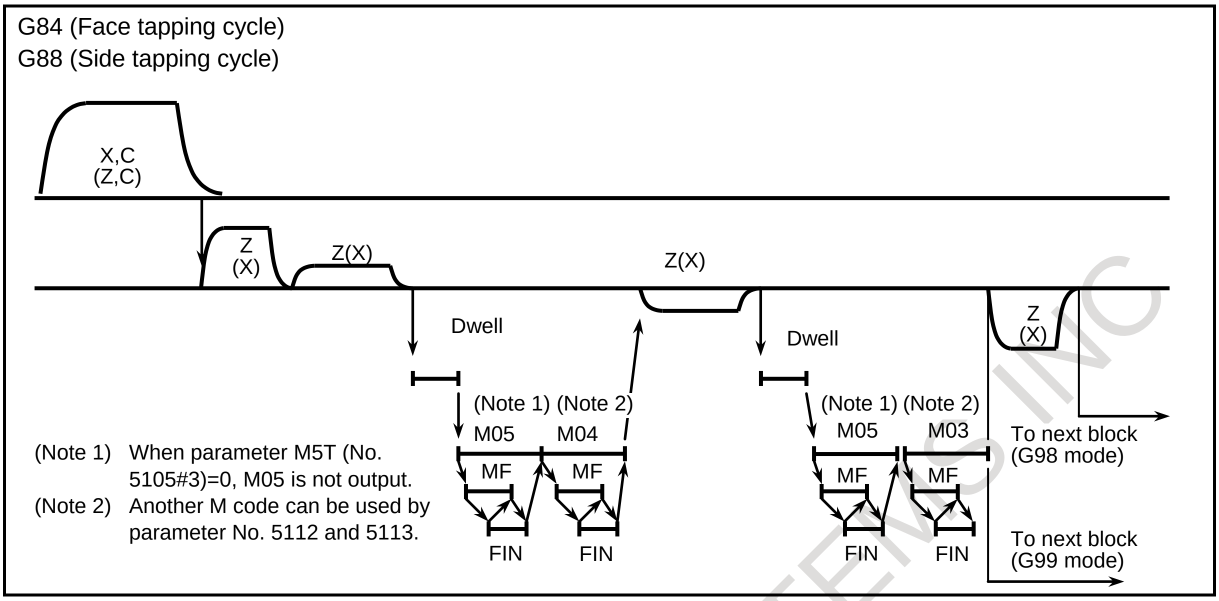

Fig. 12.7.1 (d) Machining of canned cycle for lathe system

- M code used for C-axis clamp/unclamp

T

When an M code specified in parameter No. 5110 for C-axis clamp is commanded, the CNC issues the M code for C-axis clamp after the tool is positioned and before the tool is fed in rapid traverse to the point-R level. The CNC also issues the M code (M code C-axis clamp +1) for C-axis unclamp after the tool retracts to the point-R level. The tool dwells for the time specified in parameter No. 5111.

- Tapping signal

During a tapping cycle, the tapping signal TAP <Fn001.5> is output. The tapping signal is output not only during the tapping machining but also during the G code of the tapping cycle is valid.

- Override

During tapping, cutting feedrate override is always set to 100%.

- Feed hold

When the feed hold key is pressed during tapping, the movement is not stopped immediately but the movement is stopped when the tool is returned to level R.

- Dry run

The bit 5 (TDR) of parameter No. 1401 specifies whether dry run is valid during tapping.

- Small-hole peck drilling cycle execution signal

M

In the small-hole peck drilling cycle mode, the small-hole peck drilling cycle execution signal PECK2 <Fn066.5> is output when positioning at point R on the drilling direction axis is started after positioning at a specified hole position is performed with G83 specified. This signal is not output if another canned cycle is specified or this mode is canceled by G80, a reset, or an emergency stop.

- Overload torque detection signal

M

For the overload torque detection signal in the small-hole peck drilling cycle, a skip signal SKIP#1 <X004.7>, SKIP#2 <X013.7>, or SKIP#3 <X011.7> is used. The skip signal is valid (a retract operation is performed) only when the tool on the drilling direction axis is located between point R and point Z and the tool is moving forward or performing a cutting operation.

Signal

Tapping signal TAP<Fn001.5>

[Classification] Output signal

[Function] Reports that the system is in tapping mode.

[Output cond.] The signal is set to “1” when:

- The system is in tapping cycle mode.
  (G74,G84 : for M series)
  (G84,G88 : for T series)
- The system is in tapping mode.
  (G63 : for M series)

The signal is set to “0” when:

- The system is in neither tapping cycle mode nor tapping mode.
- A reset or emergency stop is specified.

Overload torque detection signal SKIP$^{\#1}$<X004.7>, SKIP$^{\#2}$<X013.7>, SKIP$^{\#3}$<X011.7>

M

[Classification] Input signal

[Function] Refracts the tool on which an overload torque is imposed.

[Operation] When this signal is set to “1”, the control unit performs the following operation:

- When an overload torque is imposed, the tool is retracted to point R then machining is repeated after changing the spindle speed and cutting feedrate.
- This signal is valid (a retract operation is performed) only when the tool on the drilling axis is located between point R and point Z and the tool is moving forward or performing a cutting operation.

NOTE
This signal is used also as a skip signal.

Small-hole peck drilling cycle execution signal PECK2<Fn066.5>

M

[Classification] Output signal

[Function] Posts whether the small-hole peck drilling cycle is being executed.

[Output cond.] This signal is set to “1” for the following period:

- Period from the start time of positioning at point R on the drilling direction axis after positioning at a hole position is performed with G83 specified in this cycle mode until another canned cycle, which may be G80, or a G code of group 01 is specified or until this mode is canceled by a reset or emergency stop.
- This signal is not set to “1” in a state other than the above.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
0001							FCV	

[Input type] Setting input
[Data type] Bit path

#1 FCV Program format
0: FANUC Series 16 program format
1: FANUC Series 15 program format

NOTE
1 Programs created in the FANUC Series 15 program format can be used for operation on the following functions:
   1 Subprogram call M98
   2 Thread cutting G32 (T series)
   3 Canned cycle G90, G92, G94 (T series)
   4 Multiple repetitive canned cycle G71 to G76 (T series)
   5 Drilling canned cycle G83.1, G80 to G89 (T series) / G73, G74, G76, G80 to G89 (M series)
2 When the FANUC Series 15 program format is used for this CNC, some limits may add. Refer to the Operator’s Manual.

	#7	#6	#5	#4	#3	#2	#1	#0
1401			TDR					

[Input type] Parameter input
[Data type] Bit path

#5 TDR Dry run during threading or tapping (tapping cycle G74 or G84, rigid tapping)
0: Enabled
1: Disabled

	#7	#6	#5	#4	#3	#2	#1	#0
3708		TSO						

[Input type] Parameter input
[Data type] Bit path

#6 TSO During a threading or tapping cycle, the spindle override is:
0: Disabled (tied to 100%).
1: Enabled.

> **NOTE**
> During rigid tapping, the override is tied to 100%, irrespective of the setting of this parameter.

	#7	#6	#5	#4	#3	#2	#1	#0
5101						RTR	EXC	FXY
	M5B						EXC	FXY

[Input type] Parameter input
[Data type] Bit path

#0 FXY The drilling axis in the drilling canned cycle, or cutting axis in the grinding canned cycle is:
0: Z-axis at all times.
1: Axis selected by the program

> **NOTE**
> In the case of the T series, this parameter is valid only for the drilling canned cycle in the FANUC Series 15 program format.

#1 EXC G81
0: Specifies a drilling canned cycle
1: Specifies an external operation command

#2 RTR G83 and G87
0: Specify a high-speed peck drilling cycle
1: Specify a peck drilling cycle

#7 M5B In drilling canned cycles G76 and G87:
0: Outputs M05 before an oriented spindle stops
1: Not output M05 before an oriented spindle stops

	#7	#6	#5	#4	#3	#2	#1	#0
5102	RDI	RAB			F16			

[Input type] Parameter input
[Data type] Bit path

#3 F16 When the FANUC Series 15 program format is used (with bit 1 (FCV) of parameter No. 0001 set to 1), a canned drilling cycle is specified using :
0: FANUC Series 15 program format
1: FANUC Series 16 program format. However, the number of repetitions is specified using address L.

#6 RAB When a canned drilling cycle using the FANUC Series 15 program format is specified (with bit 1 (FCV) of parameter No. 0001 set to 1 and bit 3 (F16) of parameter No. 5102 set to 0), address R specifies:
0: Increment command.
1: Absolute command with G code system A. With G code system B or C, G90 and G91 are followed.

#7 RDI When a canned drilling cycle using the FANUC Series 15 program format is specified (with bit 1 (FCV) of parameter No. 0001 set to 1 and bit 3 (F16) of parameter No. 5102 set to 0), address R is based on:
0: Radius specification.
1: Diameter/radius specification of the drilling axis.

	#7	#6	#5	#4	#3	#2	#1	#0
5103		TCZ			PNA	DCY		
		TCZ				DCY		SIJ

[Input type] Parameter input
[Data type] Bit path

#0 SIJ When the FANUC Series 15 program format is used (with bit 1 (FCV) of parameter No. 0001 set to 1), a tool shift value for the drilling canned cycle G76 or G87 is specified by:
0: Address Q. Set a tool retraction direction in parameter No. 5148.
1: Address I, J, or K.

#2 DCY When an axis (axis different from the drilling axis) perpendicular to the positioning plane is specified in a drilling canned cycle:
0: The specified axis is used as a drilling axis.
1: The axis specified in the block where the G code for the drilling canned cycle is specified is used as a drilling axis. The specified axis is used as a positioning axis.

NOTE
This parameter is valid when bit 0 (FXY) of parameter No. 5101 is set to 1.

#3 PNA In a drilling canned cycle using the FANUC Series 15 program format (with bit 1 (FCV) of parameter No. 0001 set to 1 and bit 3 (F16) of parameter No. 5102 set to 0), when a plane where no axis is present is specified in the drilling canned cycle mode:
0: An alarm is issued.
1: No alarm is issued.

#6 TCZ In a tapping cycle (excluding rigid tapping), an accumulated zero check in the tapping step (forward, backward) is:
0: Not performed.
1: Performed.

Execute a tapping cycle (excluding rigid tapping) with the servo feed forward (bit 1 (FEED) of parameter No. 2005). If an impact is detected, set this parameter to 1.

	#7	#6	#5	#4	#3	#2	#1	#0
5105				K0D	M5T			SBC
					M5T			SBC

[Input type] Parameter input

[Data type] Bit path

#0 SBC In a drilling canned cycle, chamfer cycle, or corner rounding cycle:
- 0: A single block stop is not performed.
- 1: A single block stop is performed.

#3 M5T When the rotation direction of the spindle is changed from forward rotation to reverse rotation or from reserve rotation to forward rotation in a tapping cycle (G84/G88 with the T series, or G84/G74 with the M series):
- 0: M05 is output before output of M04 or M03.
- 1: M05 is not output before output of M04 or M03.

#4 K0D When K0 is specified in a drilling canned cycle (G80 to G89):
- 0: Drilling operation is not performed, but drilling data only is stored.
- 1: One drilling operation is performed.

5110	M code for C-axis clamping in canned cycles for drilling

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 99999998

This parameter sets the M code for C-axis clamping in canned cycles for drilling.

NOTE
When bit 4 (CME) of parameter No. 5161 is 1, the M code for C-axis clamping for the first pair is assumed.

5111	Dwell time when C-axis unclamping is specified in drilling canned cycle

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 32767
[Unit of data]

Increment system	IS-A	IS-B	IS-C	Unit
	10	1	0.1	msec

(The increment system does not depend on whether inch input or metric input is used.)

This parameter sets the dwell time when C-axis unclamping is specified in a drilling canned cycle.

5112	Spindle forward-rotation M code in drilling canned cycle

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 99999999

This parameter sets the spindle forward-rotation M code in a drilling canned cycle.

NOTE
M03 is output when 0 is set.

5113	Spindle reverse-rotation M code in drilling canned cycle

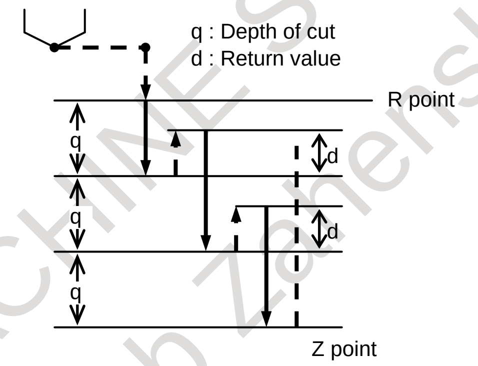
[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 99999999
This parameter sets the spindle reverse-rotation M code in a drilling canned cycle.

> **NOTE**
> M04 is output when 0 is set.

5114	Return value of high-speed peck drilling cycle

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets the return value in high-speed peck drilling cycle.

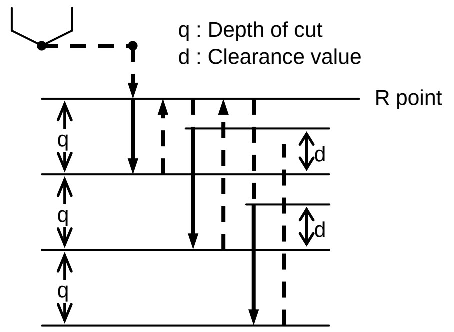
G73 (M series)
G83 (T series, when the bit 2 (RTR) of parameter No. 5101 is set to 0)



5115	Clearance value in a peck drilling cycle

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets a clearance value in a peck drilling cycle.

G83 (M series)
G83 (T series, when the bit 2 (RTR) of parameter No. 5101 is set to 1)



5148	Tool retraction direction after orientation in a fine boring cycle or back boring cycle

[Input type] Parameter input
[Data type] Byte axis
[Valid data range] -24 to 24

This parameter sets an axis and direction for tool retraction after spindle orientation in a fine boring cycle or back boring cycle. For each boring axis, an axis and direction for tool retraction after orientation can be set. Set a signed axis number.

[Example] Suppose that:
When the boring axis is the X-axis, the tool retraction direction after orientation is -Y.
When the boring axis is the Y-axis, the tool retraction direction after orientation is +Z.
When the boring axis is the Z-axis, the tool retraction direction after orientation is -X.
Then, set the following (assuming that the first, second, and third axes are the X-axis, Y-axis, and Z-axis, respectively):
Set -2 in the parameter for the first axis. (The tool retraction direction is -Y.)
Set 3 in the parameter for the second axis. (The tool retraction direction is +Z.)
Set -1 in the parameter for the third axis. (The tool retraction direction is -X.)
Set 0 for other axes.

5149	Override for retraction in a boring cycle (G85/G89)

[Input type] Parameter input
[Data type] Word path
[Unit of data] %
[Valid data range] 0 to 2000

This parameter sets an override value for the feedrate of retraction in a boring cycle. The cutting feedrate override signal and the second feedrate override signal are valid, regardless of the setting of this parameter. The setting of this parameter is valid even when the override cancel signal is set to “1”.
When 0 is set in this parameter, the following operation is performed:
For the T series
Operation performed when 200 is set in this parameter (The retraction feedrate is two times greater than the cutting feedrate.)
For the M series
Operation performed when 100 is set in this parameter (The retraction feedrate is the cutting feedrate.)

	#7	#6	#5	#4	#3	#2	#1	#0
5160		DNC			CYM			
				TSG	CYM	NOL	OLS	

[Input type] Parameter input
[Data type] Bit path

#1 OLS When an overload torque detection signal is received in a small-hole peck drilling cycle, the feedrate and spindle speed are:
0: Not changed.
1: Changed.

#2 NOL When the depth of cut per action is satisfied although no overload torque detection signal is received in a small-hole peck drilling cycle, the feedrate and spindle speed are:
0: Not changed.
1: Changed.

#3 CYM When a subprogram call is specified in a block specifying other commands in the canned cycle mode:
0: No alarm is issued. (When a command of address P is specified, the command is handled as both a command specifying a dwell time and a command specifying a subprogram number in a canned cycle.)
1: An alarm is issued.

#4 TSG The overload torque detection signal for a small-hole peck drilling cycle:
0: Depends on the parameter settings for the skip function.
1: Does not depend on the parameter settings for the skip function.

When this parameter is set to 1, the X address can be used for the overload torque signal even with the skip signal setting disabled. Even when the overload torque detection signal does not depend on the skip function parameter settings, parameter No. 3012 and bit 1 (SK0) of parameter No. 6200 remain valid.

#6 DNC When drilling axis is not commanded in the canned cycle command block for lathe system:
0: An alarm PS0566 "DRILLING AXIS IS NOT COMMANDED" is not issued.
1: An alarm PS0566 "DRILLING AXIS IS NOT COMMANDED" is issued.

NOTE
- The alarm PS0566 isn’t issued when drilling axis isn’t commanded except for the canned cycle command block for lathe system.

	#7	#6	#5	#4	#3	#2	#1	#0
5162						RED		
								RCK

[Input type] Parameter input
[Data type] Bit

#0 RCK When the command which relates to the reference position return such as G28 is commanded during the canned cycle for drilling:
0: Alarm PS0044 is not detected, and execute the program command.
1: Alarm PS0044 is detected.

#2 RED When selecting the drilling axis by the plane selection command in the canned cycle for drilling of the lathe system, the rotation axis (the axis on which the parameter ROTx (No.1006 # 0) = 1 is set) is
0: the target of the drilling axis.
1: excluded from the target of the drilling axis.

> **NOTE**
> - When using cylindrical interpolation, parallel axes of the basic three axes may be set in the parameter (No. 1022) of the rotation axis. In this case, if the rotation axis is excluded from the target of the drilling axis, set this parameter.

5163	M code that specifies the small-hole peck drilling cycle mode

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 1 to 99999999
This parameter sets an M code that specifies the small-hole peck drilling cycle mode.

5164	Percentage of the spindle speed to be changed at the start of the next advancing after an overload torque detection signal is received

[Input type] Parameter input
[Data type] Word path
[Unit of data] %
[Valid data range] 1 to 255
This parameter sets the percentage of the spindle speed to be changed at the start of the next advancing after the tool is retracted because the overload torque detection signal is received.
$S2 = S1 \times d1 \div 100$
S1: Spindle speed to be changed
S2: Spindle speed changed
Set d1 as a percentage.

> **NOTE**
> When 0 is set, the spindle speed is not changed.

5165	Percentage of the spindle speed to be changed at the start of the next advancing when no overload torque detection signal is received

[Input type] Parameter input
[Data type] Word path
[Unit of data] %
[Valid data range] 1 to 255
This parameter sets the percentage of the spindle speed to be changed at the start of the next advancing after the tool is retracted without the overload torque detection signal received.
$S2 = S1 \times d2 \div 100$
S1: Spindle speed to be changed
S2: Spindle speed changed
Set d2 as a percentage.

NOTE
When 0 is set, the spindle speed is not changed.

5166	Percentage of the cutting feedrate to be changed at the start of the next cutting after an overload torque detection signal is received

[Input type] Parameter input
[Data type] Word path
[Unit of data] %
[Valid data range] 1 to 255

This parameter sets the percentage of the cutting feedrate to be changed at the start of cutting after the tool is retracted and advances because the overload torque detection signal is received.

$F2 = F1 \times b1 \div 100$

F1: Cutting feedrate to be changed
F2: Cutting feedrate changed

Set b1 as a percentage.

NOTE
When 0 is set, the cutting feedrate is not changed.

5167	Percentage of the cutting feedrate to be changed at the start of the next cutting when no overload torque detection signal is received

[Input type] Parameter input
[Data type] Word path
[Unit of data] %
[Valid data range] 1 to 255

This parameter sets the percentage of the cutting feedrate to be changed at the start of cutting after the tool is retracted and advances without the overload torque detection signal received.

$F2 = F1 \times b2 \div 100$

F1: Cutting feedrate to be changed
F2: Cutting feedrate changed

Set b2 as a percentage.

NOTE
When 0 is set, the cutting feedrate is not changed.

5168	Lower limit of the percentage of the cutting feedrate in a small-hole peck drilling cycle mode

[Input type] Parameter input
[Data type] Byte path
[Unit of data] %
[Valid data range] 1 to 255

This parameter sets the lower limit of the percentage of the cutting feedrate changed repeatedly to the specified cutting feedrate.

$FL = F \times b3 \div 100$

F: Specified cutting feedrate
FL: Changed cutting feedrate

Set b3 as a percentage.

5170	Number of the macro variable to which to output the total number of retractions during cutting

[Input type] Parameter input
[Data type] Word path
[Valid data range] 100 to 149

This parameter sets the number of the custom macro common variable to which to output the total number of times the tool is retracted during cutting. The total number cannot be output to common variables #500 to #599.

5171	Number of the macro variable to which to output the total number of retractions because of the reception of an overload torque detection signal

[Input type] Parameter input
[Data type] Word path
[Valid data range] 100 to 149

This parameter sets the number of the custom macro common variable to which to output the total number of times the tool is retracted after the overload torque detection signal is received during cutting. The total number cannot be output to common variables #500 to #599.

5172	Feedrate of retraction to point R when no address I is specified

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

This parameter sets the feedrate of retraction to point R when no address I is specified.

5173	Feedrate of advancing to the position just before the bottom of a hole when no address I is specified

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

This parameter sets the feedrate of advancing to the position just before the bottom of a previously machined hole when no address I is specified.

5174	Clearance in a small-hole peck drilling cycle

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis

[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets the clearance in a small-hole peck drilling cycle.

Alarm and message

Number	Message	Description
PS0044	G27-G30 NOT ALLOWED IN FIXED CYC	The command which relates to the reference position return is commanded in canned cycle mode for drilling. Modify the program.
PS0045	ADDRESS Q NOT FOUND (G73/G83)	In a high-speed peck drilling cycle or peck drilling cycle, the amount of each-time cutting is not specified. Modify the program.
PS0566	DRILLING AXIS IS NOT COMMANDED	When the parameter DNC (No.5160#6) is set to 1, drilling axis is not commanded in the canned cycle command block for lathe system. Modify the program.
PS5329	M98 AND NC COMMAND IN SAME BLOCK	A subprogram call which is not a single block was commanded during canned cycle mode. Modify the program.

Diagnosis data

520	Total number of retract operations during cutting after G83 is specified

521	Total number of retract operations based on reception of the overload torque detection signal during cutting after G83 is specified

> **NOTE**
> The total number of retract operations output to Nos. 520 and 521 is cleared to zero by the G83 command after the small-hole peck drilling cycle mode is set.

522	Coordinate on the drilling axis where a retract operation was started (least input increment)

523	Difference between the coordinate on the drilling axis where the previous retract operation was started and the coordinate on the drilling axis where the current retract operation was started (least input increment: previous value - current value)

OPERATOR'S MANUAL (B-64694EN)	Canned cycle for drilling

12.7.2 Canned Cycle Overlap for Drilling

Overview

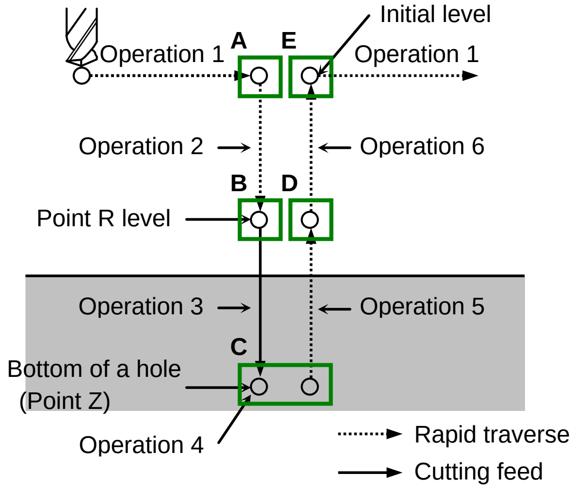
With this function, during the canned cycle mode for drilling, the command can overlap with the next block for the settime of the time constant of the acceleration/deceleration after interpolation.
This speeds up the operation of the canned cycle for drilling and shortens the cycle time.

Explanation

This function is valid when bit 0 (HDCx) of parameter No.1680 is set to 1.

- Operations in which overlap is valid

Fig. 12.7.2 (a) Operations in which overlap is shows the operations in which overlap is valid in the operation sequence of canned cycle for drilling.
When bits 0 to 5 of parameter No.1681 are set to 1, overlap is invalid in each operation.



Operation 1 : Positioning
Operation 2 : Rapid traverse up to point R level
Operation 3 : Hole machining
Operation 4 : Operation at the bottom of a hole
Operation 5 : Retraction to point R level
Operation 6 : Rapid traverse up to the initial point

Point A - Point E : Overlap is valid.

When canned cycle for drilling is canceled at point E, no overlap is done at point E.
Also, since the operation varies slightly depending on the type of cycle, please refer to "Canned Cycle Overlap for Drilling" of OPERATOR'S MANUAL (B-64694EN) for details.

Fig. 12.7.2 (a) Operations in which overlap is valid

NOTE
When overlap is done, in-position check is invalid.

- Supported canned cycle for drilling

Table 12.7.2 (a), Table 12.7.2 (b) Canned cycle for drilling (Lathe system), Table 12.7.2 (c) Canned cycle for drilling in series 15 program format (Lathe system) shows canned cycle for drilling supported by this function.

M

Table 12.7.2 (a) Canned cycle for drilling (Machining center system)

G code	Drilling	Operation at the bottom of a hole	Retraction	Application
G73	Intermittent feed	-	Rapid traverse	High-speed peck drilling cycle
G81	Cutting feed	-	Rapid traverse	Drilling cycle, spot drilling cycle
G82	Cutting feed	Dwell	Rapid traverse	Drilling cycle, counter boring cycle
G83	Intermittent feed	-	Rapid traverse	Peck drilling cycle
G85	Cutting feed	-	Cutting feed	Boring cycle
G86	Cutting feed	Spindle stop	Rapid traverse	Boring cycle
G89	Cutting feed	Dwell	Cutting feed	Boring cycle

T

Table 12.7.2 (b) Canned cycle for drilling (Lathe system)

G code	Drilling axis	Drilling	Operation at the bottom of a hole	Retraction	Application
G83	Z axis	Intermittent feed Cutting feed	Dwell	Rapid traverse	Front drilling cycle
G85	Z axis	Cutting feed	Dwell	Cutting feed	Front boring cycle
G87	X axis	Intermittent feed Cutting feed	Dwell	Rapid traverse	Side drilling cycle
G89	X axis	Cutting feed	Dwell	Cutting feed	Side boring cycle

Table 12.7.2 (c) Canned cycle for drilling in series 15 program format (Lathe system)

G code	Drilling	Operation at the bottom of a hole	Retraction	Application
G83.1	Intermittent feed	-	Rapid traverse	High-speed peck drilling cycle
G81	Cutting feed	-	Rapid traverse	Drilling cycle, spot drilling cycle
G82	Cutting feed	Dwell	Rapid traverse	Drilling cycle, counter boring cycle
G83	Intermittent feed	-	Rapid traverse	Peck drilling cycle
G85	Cutting feed	-	Cutting feed	Boring cycle
G89	Cutting feed	Dwell	Cutting feed	Boring cycle

- Overlap time

Set the overlap time of this function to the parameters No.1686 and No.1687.
Parameters No.1686 and No.1687 are used as the time constant of the acceleration/deceleration after interpolation common to both cutting feed and rapid traverse in canned cycle for drilling in which this function is valid.
The command can overlap with the next block for the overlap time set within the time constant of the acceleration/deceleration after interpolation. (Fig.12.7.2 (b))

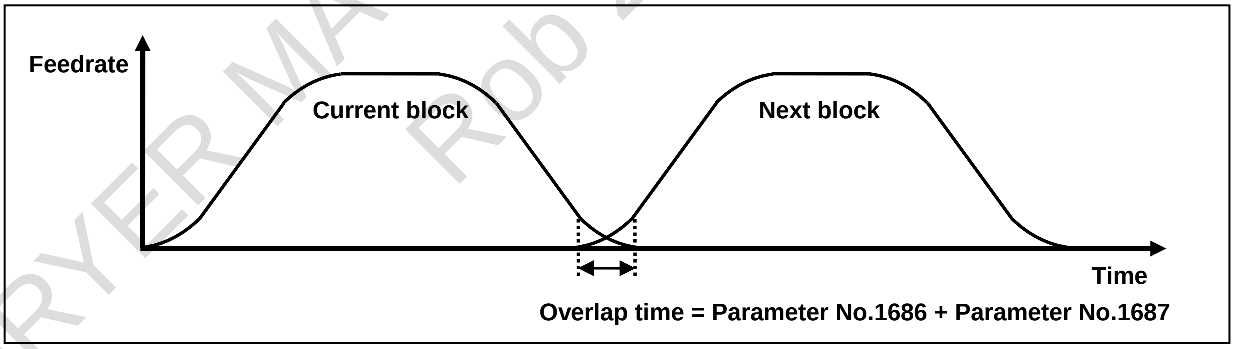


Fig.12.7.2 (b) Overlap time

Parameters No.11248 and No.11249 are valid for axes whose parameters No.1686 and No.1687 are both set to 0. (Table 12.7.2 (d))
Parameters No.11248 and No.11249 are the overlap time of Smart overlap. For Smart overlap, refer to "Smart Overlap" in this manual.

Table 12.7.2 (d) Relationship between parameter setting and time constant of acceleration/deceleration after interpolation for Canned cycle overlap for drilling

Parameter No.1686	Parameter No.1687	Time constant 1 of acceleration/deceleration in Canned cycle overlap for drilling	Time constant 2 of acceleration/deceleration in Canned cycle overlap for drilling
0	0	Parameter No.11248 is valid.	Parameter No.11249 is valid.
Other than 0	0	Parameter No.1686 is valid.	Parameter No.1687 is valid.
0	Other than 0	Parameter No.1686 is valid.	Parameter No.1687 is valid.
Other than 0	Other than 0	Parameter No.1686 is valid.	Parameter No.1687 is valid.

This function has the following features, so usually the overlap amount can be increased compared to Smart overlap.

- Since it is limited to operation within a cycle, interference due to overlap is less likely to be a problem.
- Overlap can be invalidated for each cycle operation.

To reduce the cycle time, it is recommended that the overlap time of this function is set to the parameters No.1686 and No.1687 separately from Smart overlap.

Normally, the overlap time constant 2 is not used. Set the parameters No.1687 and No.11249 to 0.

- Acceleration/deceleration after interpolation during canned cycle for drilling

The following parameters are used as the time constant of the acceleration/deceleration after interpolation in canned cycle for drilling in which this function is valid.
The relationship between the parameters and the time constant of the acceleration/deceleration is shown in Table 12.7.2 (e)and Fig. 12.7.2 (c).

Table 12.7.2 (e) Acceleration/deceleration after interpolation during canned cycle for drilling

Move command	Time constant of the acceleration/deceleration
Rapid traverse	T1 : Parameter No.1620 T2 : Parameter No.1682 T3 : Parameter No.1686(Overlap time)
Cutting feed	T1 : Parameter No.1683 T2 : None T3 : Parameter No.1687 (Overlap time)

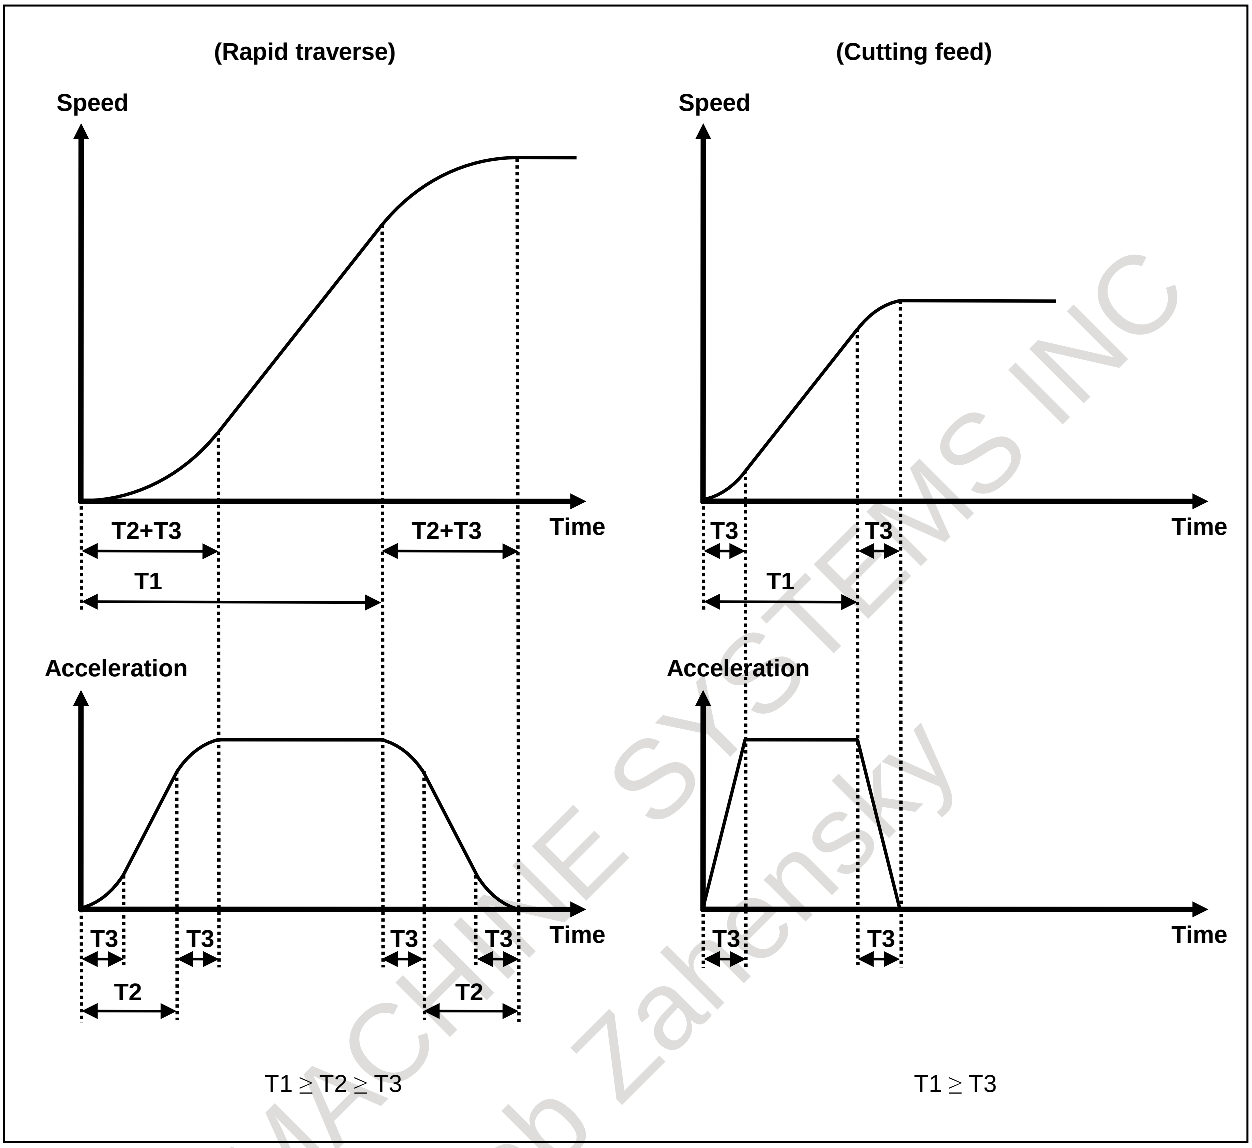

Fig. 12.7.2 (c) Acceleration/deceleration after interpolation during canned cycle for drilling

- Acceleration/deceleration during canned cycle for drilling (When the acceleration/deceleration before interpolation is valid)

The following parameters are used as the time constant of the acceleration/deceleration after interpolation in canned cycle for drilling in which this function is valid.

When the acceleration/deceleration before interpolation is valid, such as AI contour control I and AI contour control II, the relationship between the parameters and the time constant of the acceleration/deceleration is shown in Table 12.7.2 (f).

Table 12.7.2 (f) Acceleration/deceleration during canned cycle for drilling (When the acceleration/deceleration before interpolation is valid)

Move command	Time constant of the acceleration/deceleration
Rapid traverse	T1 : Parameter No.1671 (Acc/dec before interpolation) (Maximum allowable acceleration rate) T2 : Parameter No.1672 (Acc/dec before interpolation) Parameter No.1684 (Acc/dec after interpolation) T3 : Parameter No.1686 (Acc/dec after interpolation) (Overlap time)

Move command	Time constant of the acceleration/deceleration
Cutting feed	T1 : Parameter No.1660 (Acc/dec before interpolation) (Maximum permissible acceleration) T2 : Parameter No.1772 (Acc/dec before interpolation) Parameter No.1685 (Acc/dec after interpolation) T3 : Parameter No.1686 (Acc/dec after interpolation) (Overlap time)

- Tool path error at corner by overlap

When overlap is done where the movement direction changes, the overlapped path passes inward compared to the programmed path. (Fig. 12.7.2 (d))

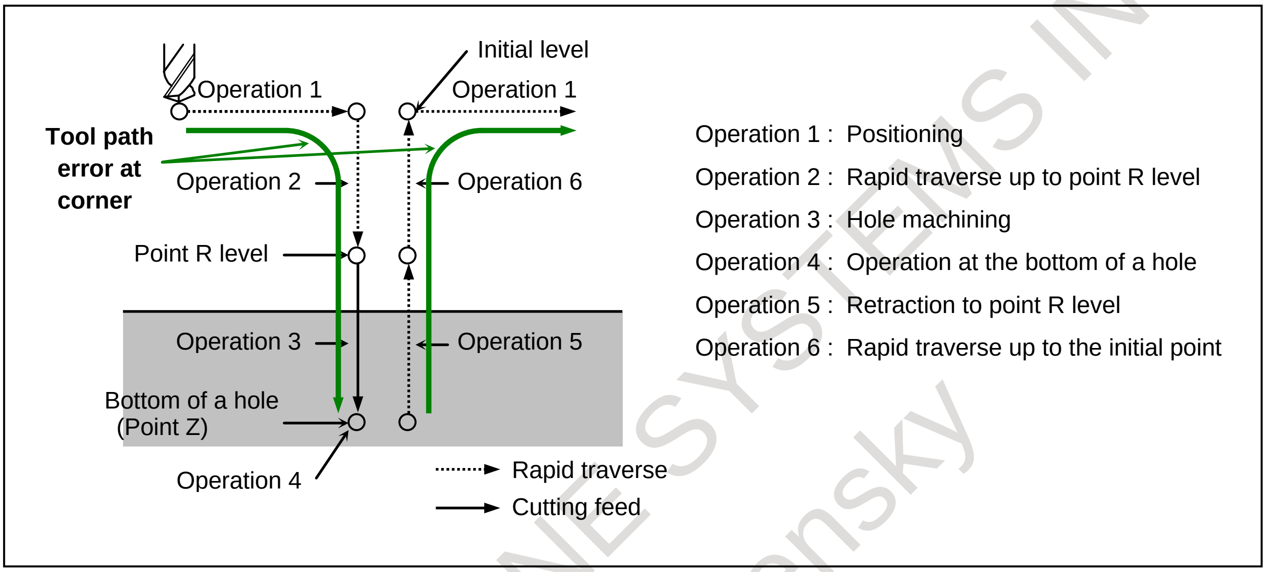

Fig. 12.7.2 (d) Tool path error at corner by overlap

When the overlap operations are continuous, overlap is performed not only between two blocks, but also over two or more blocks. (Fig. 12.7.2 (e))

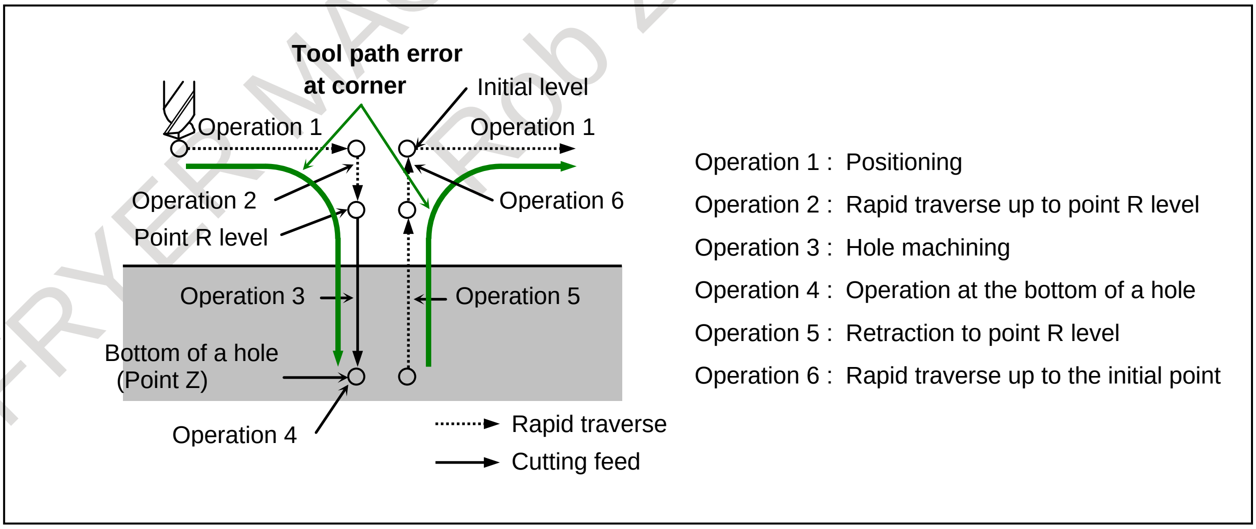

Fig. 12.7.2 (e) Tool path error at corner by overlap (2)

NOTE

It is necessary to care that tool does not interfere with workpiece by tool path error at corner.
When bit 0 (DPS) of parameter No.1681 is set to 1, overlap is invalid at corner. If it is required to avoid tool path error at corner, please set DPS to 1.

- Tool path error at bottom of a hole by overlap

When dwell is not commanded at the bottom of a hole, overlap is done at the bottom of the hole.
In this case, the tool does not reach the programmed hole bottom because the direction of movement is reversed before the programmed hole bottom. (Fig. 12.7.2 (f))

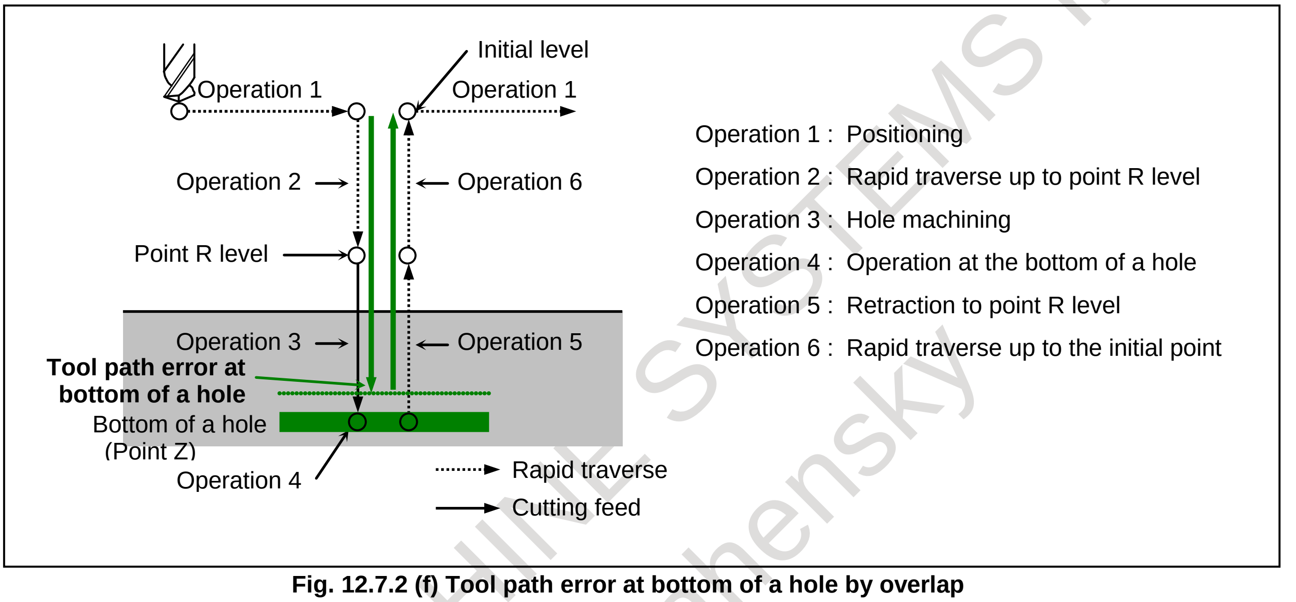

Fig. 12.7.2 (f) Tool path error at bottom of a hole by overlap

NOTE

When bit 5 (DZL) of parameter No.1681 is set to 1, overlap is invalid at bottom of a hole. If accuracy at bottom of a hole is required, please set DZL to 1.

- Relationships with other functions

The relationships with other functions are as follows.

- Rapid traverse block overlap

This function can be used with rapid traverse block overlap.
When these functions are used at the same time, overlap is done at the earlier timing of this function and rapid traverse block overlap.

- Cs contour control

When positioning is executed with the Cs contour control axis, the in-position check of the Cs contour control axis is done even when the overlap is valid.

- Limitation

This function cannot be used with the following functions.

- Small-hole peck drilling cycle (G83) (Machining center system)
- 3-dimensional coordinate system conversion
- Tilted working plane indexing (Machining center system)
- Angular axis control
- Retrace (Machining center system)
- Manual handle retrace

- Synchronous/Composite control (Lathe system)
- Superimposed control (Lathe system)
- Index table indexing (Machining center system)

Note

NOTE

1 When overlap is done between the rapid traverse block and the cutting feed block, the feedrate might be higher than the cutting feedrate at the start position of the cutting feed block. This is more likely to occur when the overlap time (parameter No.1686 and No.1687) is too large againstthe time constant of the acceleration/deceleration. In such a case, please adjust to reduce the overlap time.

2 When the feed-forward function is used at the same time, shock may occur between the rapid traverse block and the cutting feed block. In such a case, please use the following servo software and validate the cutting/rapid feed-forward switching function (bit 4 of parameter No.2214 is 1).

[Series and editions of applicable servo software]

- Series 90J0 / 04.0 and subsequent editions
- Series 90K0 / 04.0 and subsequent editions

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
1680								HDCx

[Input type] Parameter input

NOTE

When this parameter is set, the power must be turned off before operation is continued.

#0 HDCx Canned cycle overlap for drilling is :
0: Invalid.
1: valid.

	#7	#6	#5	#4	#3	#2	#1	#0
1681			DZL	DQL	DFW	DRV	DRL	DPS

[Input type] Parameter input
[Data type] Bit path

#0 DPS In canned cycle overlap for drilling, for "between the rapid traverse block to the hole position and the rapid traverse block to point R level" and "between the return block to point R level / initial level and the rapid traverse block to the next hole position", the overlap is:
0: Valid.
1: Invalid.

#1 DRL In canned cycle overlap for drilling, for "between the rapid traverse block to point R level and the hole machining block" and "between the retraction block to point R level and the return block to initial level", overlap is:

0: Valid.
1: Invalid.

#2 DRV In canned cycle overlap for drilling, for "between the retraction block and the hole machining block for (high-speed) peck drilling cycle", overlap is:
0: Valid.
1: Invalid.

#3 DFW In canned cycle overlap for drilling, for "between the hole machining (rapid traverse) block and the hole machining (cutting feed) block for peck drilling cycle", overlap is:
0: Valid.
1: Invalid.

#4 DQL In canned cycle overlap for drilling, for "between the hole machining block and the retraction block for (high-speed) peck drilling cycle", overlap is:
0: Valid.
1: Invalid.

#5 DZL In canned cycle overlap for drilling, for the bottom of a hole, overlap is:
0: Valid.
1: Invalid.

1682	Time constant T2 used for acceleration/deceleration of rapid traverse for each axis in canned cycle for drilling

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 512

In canned cycle overlap for drilling, set the time constant T2 used for acceleration/deceleration of rapid traverse for each axis in canned cycle for drilling.

1683	Time constant T1 used for acceleration/deceleration of cutting feed for each axis in canned cycle for drilling

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 4000

In canned cycle overlap for drilling, set the time constant T1 used for acceleration/deceleration of cutting feed for each axis in canned cycle for drilling.

1684	Time constant used for acceleration/deceleration of rapid traverse for each axis in canned cycle for drilling (Time constant used for acceleration/deceleration after interpolation of rapid traverse in acceleration/deceleration before interpolation mode)

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 4000

In canned cycle overlap for drilling, set the time constant used for acceleration/deceleration after interpolation of rapid traverse for each axis in acceleration/deceleration before interpolation mode (AI contour control I and AI contour control II) and canned cycle for drilling.

1685	**Time constant used for acceleration/deceleration of cutting feed for each axis in canned cycle for drilling (Time constant used for acceleration/deceleration after interpolation of cutting feed in acceleration/deceleration before interpolation mode)**

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 4000

In canned cycle overlap for drilling, set the time constant used for acceleration/deceleration after interpolation of cutting feed for each axis in acceleration/deceleration before interpolation mode (AI contour control I and AI contour control II) and canned cycle for drilling.

1686	**Time constant 1 of acceleration/deceleration after interpolation in Canned cycle overlap for drilling for each axis**

[Input type] Parameter input
[Data type] word axis
[Unit of data] msec
[Valid data range] 0 to 64

Set the time constant 1 of acceleration/deceleration after interpolation in Canned cycle overlap for drilling for each axis.

> **NOTE**
> When both parameter No.1686 and No.1687 are set to 0, parameters No.11248 and No.11249 are valid for the time constant of acceleration/deceleration after interpolation in Canned cycle overlap for drilling.

1687	**Time constant 2 of acceleration/deceleration after interpolation in Canned cycle overlap for drilling for each axis**

[Input type] Parameter input
[Data type] word axis
[Unit of data] msec
[Valid data range] 0 to 64

Set the time constant 2 of acceleration/deceleration after interpolation in Canned cycle overlap for drilling for each axis.

> **NOTE**
> When both parameter No.1686 and No.1687 are set to 0, parameters No.11248 and No.11249 are valid for the time constant of acceleration/deceleration after interpolation in Canned cycle overlap for drilling.

11248	**Time constant 1 of acceleration/deceleration after interpolation in Smart overlap / Canned cycle overlap for drilling for each axis**

[Input type] Parameter input
[Data type] word axis
[Unit of data] msec
[Valid data range] 0 to 64

Set the time constant 1 of acceleration/deceleration after interpolation in Smart overlap / Canned cycle overlap for drilling for each axis.

> **NOTE**
> When either parameter No.1686 or No.1687 is set to other than 0, parameters No.1686 and No.1687 are valid for the time constant of acceleration/deceleration after interpolation in Canned cycle overlap for drilling.

11249	Time constant 2 of acceleration/deceleration after interpolation in Smart overlap / Canned cycle overlap for drilling for each axis

[Input type] Parameter input
[Data type] word axis
[Unit of data] msec
[Valid data range] 0 to 64

Set the time constant 2 of acceleration/deceleration after interpolation in Smart overlap / Canned cycle overlap for drilling for each axis.

> **NOTE**
> When either parameter No.1686 or No.1687 is set to other than 0, parameters No.1686 and No.1687 are valid for the time constant of acceleration/deceleration after interpolation in Canned cycle overlap for drilling.

OPERATOR'S MANUAL (B-64694EN)	Canned cycle overlap for drilling

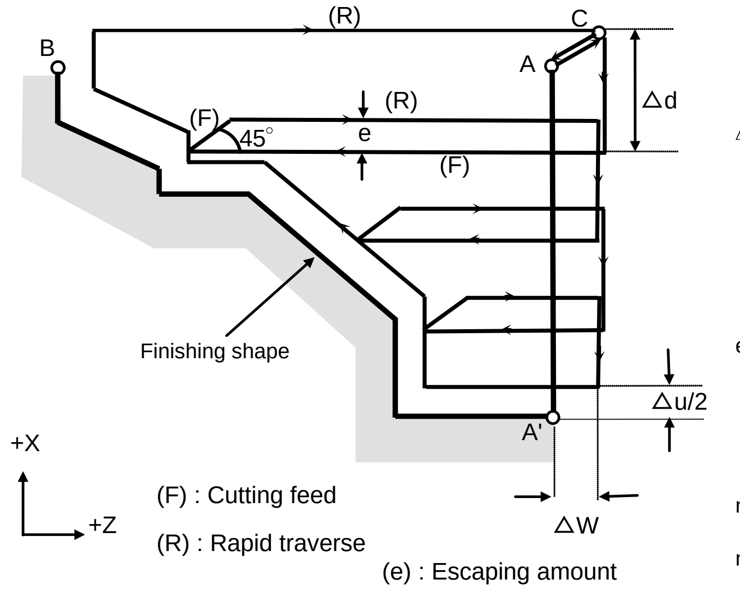
12.8 CANNED CYCLE / MULTIPLE REPETITIVE CANNED CYCLE

12.8.1 CANNED CYCLE / MULTIPLE REPETITIVE CANNED CYCLE

T

Overview

This function provides several predetermined canned cycles to make CNC programming easy. For instance, the intermediate tool path for rough machining is determined automatically by specifying the data of only the finish work shape. And also, a canned cycle for the thread cutting is available.
The following example shows stock removals in turning type I.
If a finished shape of A→A'→B is given by a program as in the figure below, the specified area is removed by Δd (depth of cut), with finishing allowance Δu/2 and Δw left.



G71 U(Δd) R(e);
G71 P(ns) Q(nf) U(Δu) W(Δw) F(f) S(s) T(t);
N(ns). . . .
. . . .
F_
S_
T_
N(nf) . . . . ;

The move command of a finished shape of A→A'→B is specified in the blocks from sequence number ns to nf.

- Δd : Depth of cut (radius designation)
  Designate without sign. The cutting direction depends on the direction AA'. This designation is modal and is not changed until the other value is designated. Also this value can be specified by the parameter (No. 5132), and the parameter is changed by the program command.
- e : Escaping amount
  This designation is modal and is not changed until the other value is designated. Also this value can be specified by the parameter (No. 5133), and the parameter is changed by the program command.
- ns : Sequence number of the first block for the program of finishing shape.
- nf : Sequence number of the last block for the program of finishing shape.
- Δu : Distance and direction of finishing allowance in X direction (diameter / radius designation).
- Δw : Distance and direction of finishing allowance in Z direction.
- f,s,t : Any F , S, or T function contained in blocks ns to nf in the cycle is ignored, and the F, S, or T function in this G71 block is effective.

Signal

Chamfering signal *CDZ<Gn053.7>

[Classification] Input signal

[Function] Executes chamfering in a threading cycle (G92 (T series), or G76 (T series)). Specify the chamfering distance in parameter No. 5130.

[Operation] When the signal is set to 1, chamfering is not executed in the threading cycle.
When the signal is set to 0, chamfering is executed in the threading cycle.

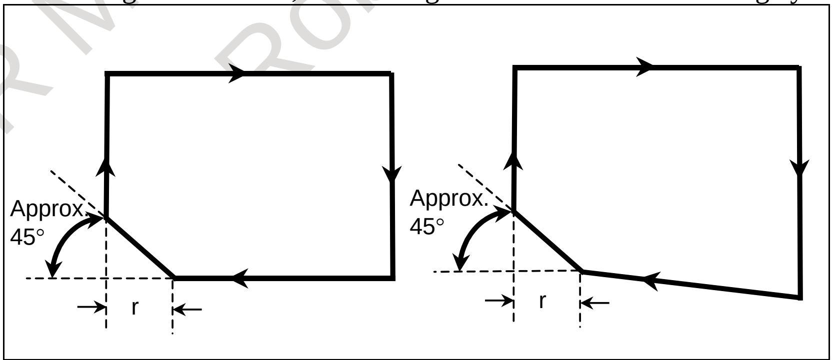


Fig. 12.8.1 (a) Straight threading and taper threading

Set the chamfering distance r to the parameter No. 5130. When the multiple repetitive canned cycle is enabled (bit 3 (NMR) of parameter No.8137 is 0), the chamfering distance can be specified in G76 or G76.7.

The chamfering angle is made smaller than 45° by the remaining pulses in the automatic acceleration/ deceleration circuit and servo system. In addition, the angle can be changed to other than 45° by setting an angle for parameter No. 5131.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn053	*CDZ							

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
0001							FCV	

[Input type] Setting input
[Data type] Bit path

#1 FCV Program format
0: Series 16 standard format
1: Series 15 format

NOTE
1 Programs created in the Series 15 program format can be used for operation on the following functions:
  1 Subprogram call M98
  2 Thread cutting G32 (T series)
  3 Canned cycle G90, G92, G94 (T series)
  4 Multiple repetitive canned cycle
    G71 to G76 (T series) / G71.7 to G71.6 (M series)
  5 Canned cycle for drilling
    G83.1, G80 to G89 (T series) / G73, G74, G76, G80 to G89 (M series)
2 When the program format used in the Series 15 is used for this CNC, some limits may be added to the range of command values etc. Refer to the Operator's Manual.

	#7	#6	#5	#4	#3	#2	#1	#0
1403	RTV			ROC				

[Input type] Parameter input
[Data type] Bit path

#4 ROC In the threading cycles G92 (T series), G76 (T series), and G76.7 (M series), rapid traverse override for retraction after threading is finished is:
0: Effective
1: Not effective (Override of 100%)

#7 RTV Rapid traverse override while the tool is retracting in threading
0: Effective.
1: Not effective.

1466	Feedrate for retraction in threading cycle G92 or G76
	Feedrate for retraction in threading cycle G76.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis

[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
When threading cycle G92, G76 or G76.7 is specified, retraction is performed after threading. Set a feedrate for this retraction.

> ⚠ **WARNING**
> When the manual handle interruption is valid, set the same value as the parameter No.1430 to the parameter No.1466.

> **NOTE**
> When this parameter is set to 0 or bit 1 (CFR) of parameter No. 1611 is set to 1, the rapid traverse rate set in parameter No. 1420 is used.

	#7	#6	#5	#4	#3	#2	#1	#0
1610			THLx				CTBx	CTLx

[Input type] Parameter input
[Data type] Bit axis

#0 CTLx Acceleration/deceleration in cutting feed or dry run during cutting feed
0: Exponential acceleration/deceleration is applied.
1: Linear acceleration/deceleration after interpolation is applied.

#1 CTBx Acceleration/deceleration in cutting feed or dry run during cutting feed
0: Exponential acceleration/deceleration or linear acceleration/ deceleration is applied. (Depending on the setting in bit 0 (CTLx) of parameter No. 1610)
1: Bell-shaped acceleration/deceleration is applied.

#5 THLx Acceleration/deceleration in threading cycles
0: Exponential acceleration/deceleration is applied.
1: The same acceleration/deceleration as for cutting feedrate is applied.
(Depending on the settings of bits 1 (CTBx) and 0 (CTLx) of parameter No. 1610)
As the time constant and FL rate, however, the settings of parameters Nos. 1626 and 1627 for threading cycles are used.

	#7	#6	#5	#4	#3	#2	#1	#0
1611								CFR

[Input type] Parameter input
[Data type] Bit path

#0 CFR For retraction after threading in the threading cycles G92 (T series), G76 (T series), and G76.7 (M series):
0: The type of acceleration/deceleration after interpolation for threading is used together with the threading time constant (parameter No. 1626) and FL rate (parameter No. 1627).
1: The type of acceleration/deceleration after interpolation for rapid traverse is used together with the rapid traverse time constant.

NOTE

If this parameter is set to 1, a check is made before a retraction to see that the specified feedrate has become 0 (the delay in acceleration/deceleration has become 0). For retraction, the rapid traverse rate (parameter No. 1420) is used, regardless of the setting of parameter No. 1466. When this parameter is set to 0, parameter No. 1466 is used as the feedrate for retraction. As acceleration/deceleration used for retraction, only acceleration/deceleration after interpolation is used. Rapid traverse acceleration/deceleration before interpolation and optimum torque acceleration/deceleration are disabled.

1626	Acceleration/deceleration time constant in threading cycles for each axis

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 4000

Set a time constant for acceleration/deceleration after interpolation in the threading cycles G92 (T series), G76 (T series), and G76.7 (M series) for each axis.

1627	FL rate for acceleration/deceleration in threading cycles for each axis

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

Set an FL rate for acceleration/deceleration after interpolation in the threading cycles G92 (T series), G76 (T series), and G76.7 (M series) for each axis. Set 0 at all times except in a special case. The FL rate is valid only for exponential acceleration/deceleration after interpolation.

	#7	#6	#5	#4	#3	#2	#1	#0
5102						QSR		

[Input type] Parameter input
[Data type] Bit path

#2 QSR Before a multiple repetitive canned cycle (G70 (T series), G70.7 (M series) to G73 (T series), G73.7 (M series)) is started, a check to see if the program contains a block that has the sequence number specified in address Q is:
0: Not made.
1: Made.
When 1 is set in this parameter and the sequence number specified in address Q is not found, the alarm PS0063 is issued and the canned cycle is not executed.

	#7	#6	#5	#4	#3	#2	#1	#0
5104						FCK		

[Input type] Parameter input
[Data type] Bit path

#2 FCK In a multiple repetitive canned cycle (G71 (T series), G71.7 (M series), G72 (T series), G72.7 (M series)), the machining profile is:

0: Not checked.
1: Checked.

The target figure specified by G71, G71.7, G72, or G72.7 is checked for the following before machining operation:

- If the start point of the canned cycle is less than the maximum value of the machining profile even when the plus sign is specified for a finishing allowance, the alarm PS0322 is issued.
- If the start point of the canned cycle is greater than the minimum value of the machining profile even when the minus sign is specified for a finishing allowance, the alarm PS0322 is issued.
- If an unmonotonous command of type I is specified for the axis in the cutting direction, the alarm PS0064 or PS0329 is issued.
- If an unmonotonous command is specified for the axis in the roughing direction, the alarm PS0064 or PS0329 is issued.
- If the program does not include a block that has a sequence number specified by address Q, the alarm PS0063 is issued. This check is made, regardless of bit 2 (QSR) of parameter No. 5102.
- If a command (G41/G42) on the blank side in tool nose radius compensation is inadequate, the alarm PS0328 is issued.

	#7	#6	#5	#4	#3	#2	#1	#0
5105						RF2	RF1	

[Input type] Parameter input
[Data type] Bit path

#1 RF1 In a multiple repetitive canned cycle (G71 (T series), G71.7 (M series), G72 (T series), G72.7 (M series)) of type I, roughing is:

0: Performed.
1: Not performed.

> **NOTE**
> When a roughing allowance (Δi/Δk) is specified using the Series 15 program format, roughing is performed, regardless of the setting of this parameter.

#2 RF2 In a multiple repetitive canned cycle (G71 (T series), G71.7 (M series), G72 (T series), G72.7 (M series)) of type II, roughing is:

0: Performed.
1: Not performed.

> **NOTE**
> When a roughing allowance (Δi/Δk) is specified using the Series 15 program format, roughing is performed, regardless of the setting of this parameter.

	#7	#6	#5	#4	#3	#2	#1	#0
5106					NT2	NT1		GFX
					NT2	NT1		

[Input type] Parameter input

[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 GFX When the function of multiple respective canned cycle and grinding canned cycle are both active, G71/G72/G73/G74 commands are:
0: Multiple respective canned cycle.
1: Grinding canned cycle.

#2 NT1 In the multiple repetitive cycle G71/G72/G73 (G-code system A), when the tool nose radius compensation G40/G41/G42 is commanded in the target figure program:
0: The alarm PS0325 is occurred.
1: No alarm is occurred. However, the tool nose radius compensation command in the target figure program is ignored.

#3 NT2 In the multiple repetitive cycle G70 (G-code system A), when the tool nose radius compensation G40/G41/G42 is commanded in the target figure program:
0: The alarm PS0325 is occurred.
1: No alarm is occurred. The tool nose radius compensation command is valid.

> **NOTE**
> Make the program by following ways to enable the tool nose radius compensation in the finishing cycle G70 by commanded the tool nose radius compensation in the target figure program.
> - The tool nose radius compensation cancel G40 is selected as the modal when the finishing cycle G70 is commanded.
> - Command G41/G42 at the first block of the target figure program (commanded by P address).
> - Command G40 at the last block of the target figure program (commanded by Q address).

	#7	#6	#5	#4	#3	#2	#1	#0
5107						OCM	ASC	ASU

[Input type] Parameter input
[Data type] Bit path

#0 ASU For G71 (T series), G71.7 (M series), G72 (T series), or G72.7 (M series), movement to the last turning start position is performed by:
0: Cutting feed.
1: Rapid traverse.

For two-cycle operation to move toward the current turning start position, this parameter selects the feed in the first cycle (movement to the last turning start position). The feed in the second cycle (movement from the last turning start position to the current turning start position) follows the feed in the first block of the shape program.
This parameter is valid to both of type-I and type-II commands.

#1 ASC The G71 (T series), G71.7 (M series), G72 (T series), or G72.7 (M series) TYPE1 commands execute the movement toward the current turning start position in:
0: Two cycles.

1: One cycle.

You can change the two-cycle operation to move to the current turning start position from two cycles to one cycle. The feed mode follows the mode (G00, G01) in the first block of the shape program. This parameter is valid only to type-I commands.

#2 OCM In G70-G73 (G-code system A), the cycle operation is executed by :
0: Conventional method.
1: Improved method.

	#7	#6	#5	#4	#3	#2	#1	#0
5108			NIC		NSP		DTP	R16
			NIC		NSP		DTP	R16

[Input type] Parameter input
[Data type] Bit path

#0 R16 In the cutting up movement of the multiple repetitive cycle G71/G72 (G-code system A) of type II, if there is the block that commands just the movement of the first axis on the plane in the finishing shape program:
0: The cutting up movement is executed before the cutting of the first axis on the plane.
1: The cutting up movement is not executed and the cutting is continued along the finishing shape of the first axis on the plane.

#1 DTP In the multiple repetitive cycle G71/G72 (G-code system A) of type I, after rough cutting of the finishing shape program is finished, the tool return to the cycle start point:
0: After the tool moves to (cycle start point + distance of the finishing allowance) in order X-axis, Z-axis.
1: Directly from the end point of the finishing program.

#3 NSP In the multiple repetitive cycle G71/G72 (G-code system A) of type II, the cutting is executed:
0: By conventional path. (The same cutting path might be executed.)
1: Not to repeat the same cutting path.

> **NOTE**
> This parameter is Automatic setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

#5 NIC In Multiple repetitive cycle G71/G72 (G-code system A), in-position check between cutting blocks is:
0: Executed.
1: Not executed.

[Input type] Parameter input
[Data type] Bit path

#0 DSA When an axis, which is not included in the specified plane, is commanded in the multiple repetitive cycle(G70-G76 (T series),G70.7-G76.7 (M series)) :
0: An alarm does not occur.
1: An alarm PS0021,"ILLEGAL PLANE SELECT" occurs.

#1 CCI In the canned cycle for turning(G90,G92,G94) (T series), the address of the taper amount :
0: Is dependent on the setting of bit 1 (FCV) of parameter No.0001.
1: Can be specified with I,J,K and R.

The address for the taper amount is dependent on the setting of the parameter of the table below.

Bit 1 (FCV) of parameter No.0001	Bit 1 (CCI) of parameter No.5109	Address for the taper amount
0	0	R
1	0	I,J,K
0	1	I,J,K and R
1	1	I,J,K and R

#2 TAE When the Series 15 format is used (with bit 1 (FCV) of parameter No.0001 set to 1), address E of threading is :
0: Inch threading (The number of threads per inch).
1: Thread lead.

NOTE
1 This parameter setting is valid when bit 1 (FCV) of parameter No.0001 is set to 1.
2 This parameter setting is available for the following G codes.

G code in the Machining system	G code In the lathe system			Function
	A	B	C	
G33	G32	G33	G33	Threading
G34	G34	G34	G34	Variable lead threading
G35	G35	G35	G35	Circular threading CW
G36	G36	G36	G36	Circular threading CCW
G76.7	G76	G76	G78	Multiple-thread cutting cycle
-	G92	G78	G21	Threading cycle

#3 TFH Behavior of feed hold in the threading cycles and multiple threading cycle is:
0: Conventional specification.
1: FS16*i* compatible specification.

	#7	#6	#5	#4	#3	#2	#1	#0
5124								CBR

[Input type] Parameter input
[Data type] Bit path

#0 CBR In a TYPE-1 of multiple repetitive canned cycle (G71 (T series), G71.7 (M series), G72 (T series), G72.7 (M series)), escape after rough cutting is performed by
0: Cutting feed.
1: Rapid traverse.(The tool path follows the setting in bit 1 (LRP) of parameter No. 1401.)

	#7	#6	#5	#4	#3	#2	#1	#0
5125						PRS		
						PRS		

[Input type] Parameter input
[Data type] Bit path

#2 PRS In Pattern repeating cycle G73 (G-code system A), the stop positions of single block operation are:
0: The end point of each cycles and the end point of each blocks in the finishing shape.
1: The end point of each cycles and the end point of escape from the cycle start point. (FS16i compatible specification)

5130	Cutting value (chamfering value) in thread cutting cycles G92 and G76
	Cutting value (chamfering value) in thread cutting cycle G76.7

[Input type] Parameter input
[Data type] Byte path
[Unit of data] 0.1
[Valid data range] 0 to 127

This parameter sets a cutting value (chamfering value) in the thread cutting cycle (G76/G76.7) of a multiple repetitive canned cycle and in the thread cutting cycle (G92) of a canned cycle.
Let L be a lead. Then, a cutting value range from 0.1L to 12.7L is allowed.
To specify a cutting value of 10.0L, for example, specify 100 in this parameter.

5131	Cutting angle in thread cutting cycles G92 and G76
	Cutting angle in thread cutting cycle G76.7

[Input type] Parameter input
[Data type] Byte path
[Unit of data] deg
[Valid data range] 1 to 89

This parameter sets a thread cutting angle in a thread cutting cycle (G92/G76/G76.7).
When 0 is set, an angle of 45 degrees is specified.

5132	Depth of cut in multiple repetitive canned cycles G71 and G72
	Depth of cut in multiple repetitive canned cycles G71.7 and G72.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)

This parameter sets the depth of cut in multiple repetitive canned cycles G71 and G72 or G71.7 and G72.7.
This parameter is not used with the Series 15 program format.

NOTE
Specify a radius value at all times.

5133	Escape in multiple repetitive canned cycles G71 and G72
	Escape in multiple repetitive canned cycles G71.7 and G72.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)
This parameter sets the escape in multiple repetitive canned cycles G71 and G72 or G71.7 and G72.7.

> **NOTE**
> Specify a radius value at all times.

5134	Clearance value in multiple repetitive canned cycles G71 and G72
	Clearance value in multiple repetitive canned cycles G71.7 and G72.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)
This parameter sets a clearance value up to the cutting feed start point in multiple repetitive canned cycles (G71/G72 or G71.7/G72.7).

> **NOTE**
> Specify a radius value at all times.

5135	Retraction distance in the multiple repetitive canned cycle G73 (second axis on the plane)
	Retraction distance in the multiple repetitive canned cycle G73.7 (second axis on the plane)

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets a retraction distance along the second axis on the plane in the multiple repetitive canned cycle G73 or G73.7. This parameter is not used with the Series 15 program format.

> **NOTE**
> Specify a radius value at all times.

5136	Retraction distance in the multiple repetitive canned cycle G73 (first axis on the plane)
	Retraction distance in the multiple repetitive canned cycle G73.7 (first axis on the plane)

[Input type] Parameter input
[Data type] Real path

[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets a retraction distance along the first axis on the plane in the multiple repetitive canned cycle G73 or G73.7. This parameter is not used with the Series 15 program format.

> **NOTE**
> Specify a radius value at all times.

5137	Number of divisions in the multiple repetitive canned cycle G73
	Number of divisions in the multiple repetitive canned cycle G73.7

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] Cycle
[Valid data range] 1 to 99999999
This parameter sets the number of divisions in the multiple repetitive canned cycle G73 or G73.7.
This parameter is not used with the Series 15 program format.

5139	Return in multiple repetitive canned cycles G74 and G75
	Return in multiple repetitive canned cycles G74.7 and G75.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)
This parameter sets the return in multiple repetitive canned cycles G74 and G75 or G74.7 and G75.7.

> **NOTE**
> Specify a radius value at all times.

5140	Minimum depth of cut in the multiple repetitive canned cycle G76
	Minimum depth of cut in the multiple repetitive canned cycle G76.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)
This parameter sets a minimum depth of cut in the multiple repetitive canned cycle G76 or G76.7 so that the depth of cut does not become too small when the depth of cut is constant.

> **NOTE**
> Specify a radius value at all times.

5141	Finishing allowance in the multiple repetitive canned cycle G76
	Finishing allowance in the multiple repetitive canned cycle G76.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)
This parameter sets the finishing allowance in multiple repetitive canned cycle G76 or G76.7.

> **NOTE**
> Specify a radius value at all times.

5142	Repetition count of final finishing in multiple repetitive canned cycle G76
	Repetition count of final finishing in multiple repetitive canned cycle G76.7

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] Cycle
[Valid data range] 1 to 99999999
This parameter sets the number of final finishing cycle repeats in the multiple repetitive canned cycle G76 or G76.7.
When 0 is set, only one final finishing cycle is executed.

5143	Tool nose angle in multiple repetitive canned cycle G76
	Tool nose angle in multiple repetitive canned cycle G76.7

[Input type] Parameter input
[Data type] Byte path
[Unit of data] deg
[Valid data range] 0, 29, 30, 55, 60, 80
This parameter sets the tool nose angle in multiple repetitive canned cycle G76 or G76.7.
This parameter is not used with the Series 15 program format.

5145	Allowable value 1 in multiple repetitive canned cycles G71 and G72
	Allowable value 1 in multiple repetitive canned cycles G71.7 and G72.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)

If a monotonous command of type I or II is not specified for the axis in the roughing direction, the alarm PS0064 or PS0329 is issued. When a program is created automatically, a very small unmonotonous figure may be produced. Set an unsigned allowable value for such an unmonotonous figure. By doing so, G71 and G72 or G71.7 and G72.7 cycles can be executed even in a program including an unmonotonous figure.

[Example] Suppose that a G71 or G71.7 command where the direction of the cutting axis (X-axis) is minus and the direction of the roughing axis (Z-axis) is minus is specified. In such a case, when an unmonotonous command for moving 0.001 mm in the plus direction along the Z-axis is specified in a target figure program, roughing can be performed according to the programmed figure without an alarm by setting 0.001 mm in this parameter.

NOTE

A check for a monotonous figure is made at all times during G71 and G72 or G71.7 and G72.7 cycles. A figure (programmed path) is checked. When tool nose radius compensation is performed, a path after compensation is checked. When bit 2 (FCK) of parameter No. 5104 is set to 1, a check is made before G71, G72, G71.7, or G72.7 cycle operation. In this case, not a path after tool nose radius compensation but a programmed path is checked. Note that no alarm is issued when an allowable value is set.
Use a radius value to set this parameter at all times.

5146	**Allowable value 2 in multiple repetitive canned cycles G71 and G72**
	Allowable value 2 in multiple repetitive canned cycles G71.7 and G72.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 to cut of depth

If a monotonous command of type I is not specified for the axis in the cutting direction, the alarm PS0064 or PS0329 is issued. When a program is created automatically, a very small unmonotonous figure may be produced. Set an unsigned allowable value for such an unmonotonous figure. By doing so, G71 and G72 or G71.7 and G72.7 cycles can be executed even in a program including an unmonotonous figure.
The allowable value is clamped to the depth of cut specified by a multiple repetitive canned cycle.

[Example] Suppose that a G71 or G71.7 command where the direction of the cutting axis (X-axis) is minus and the direction of the roughing axis (Z-axis) is minus is specified. In such a case, when an unmonotonous command for moving 0.001 mm in the minus direction along the X-axis is specified in a target figure program for moving from the bottom of cutting to the end point, roughing can be performed according to the programmed figure without an alarm by setting 0.001 mm in this parameter.

NOTE

A check for a monotonous figure is made at all times during G71 and G72 or G71.7 and G72.7 cycles. A figure (programmed path) is checked. When tool nose radius compensation is performed, a path after compensation is checked. When bit 2 (FCK) of parameter No. 5104 is set to 1, a check is made before G71, G72, G71.7, or G72.7 cycle operation. In this case, not a path after tool nose radius compensation but a programmed path is checked. Note that no alarm is issued when an allowable value is set. Use a radius value to set this parameter at all times.

Alarm and message

Number	Message	Description
PS0061	P OR Q COMMAND IS NOT IN THE MULTIPLE REPETIVE CYCLES BLOCK	Address P or Q is not specified in multiple repetitive cycle (G70, G71, G72, or G73) command.
PS0062	THE CUTTING AMOUNT IS ILLEGAL IN THE ROUGH CUTTING CYCLE	A zero or a negative value was specified in a multiple repetitive canned rough-cutting cycle (G71 or G72) as the depth of cut.
PS0063	THE BLOCK OF A SPECIFIED SEQUENCE NUMBER IS NOT FOUND	The sequence number specified by addresses P and Q in multiple repetitive cycle (G70, G71, G72, or G73) command cannot be searched.
PS0064	THE FINISHING SHAPE IS NOT A MONOTONOUS CHANGE(FIRST AXES)	In a shape program for the multiple repetitive canned rough-cutting cycle (G71 or G72), the command for the first plane axis was not a monotonous increase or decrease.
PS0065	G00/G01 IS NOT IN THE FIRST BLOCK OF SHAPE PROGRAM	In the first block of the shape program specified by P of the multiple repetitive canned cycle (G70, G71, G72, or G73), G00 or G01 was not specified.
PS0066	UNAVAILABLE COMMAND IS IN THE MULTIPLE REPETIVE CYCLES BLOCK	An unavailable command was found in a multiple repetitive canned cycle (G70, G71, G72, or G73) command block.
PS0067	THE MULTIPLE REPETIVE CYCLES IS NOT IN THE PART PROGRAM STORAGE	A multiple repetitive canned cycle (G70, G71, G72, or G73) command is not registered in a tape memory area.
PS0069	LAST BLOCK OF SHAPE PROGRAM IS AN ILLEGAL COMMAND	In a shape program in the multiple repetitive canned cycle (G70, G71, G72, or G73), a command for the chamfering or corner R in the last block is terminated in the middle.
PS0315	ILLEGAL NOSE ANGLE COMMAND IS IN THE THREAD CUTTING CYCLE	An invalid tool tip angle is specified in a multiple repetitive canned threading cycle (G76).
PS0316	ILLEGAL CUTTING AMOUNT IS IN THE THREAD CUTTING CYCLE	A minimum depth of cut higher than the thread height is specified in a multiple repetitive canned threading cycle (G76).
PS0317	ILLEGAL THREAD COMMAND IS IN THE THREAD CUTTING CYCLE	A zero or a negative value is specified in a multiple repetitive canned threading cycle (G76) as the thread height or the depth of cut.
PS0318	ILLEGAL RELIEF AMOUNT IS IN THE DRILLING CYCLE	Although an escape directions is set in a multiple repetitive canned cutting-off cycle (G74 or G75), a negative value is specified for Δd.
PS0319	THE END POINT COMMAND IS ILLEGAL IN THE DRILLING CYCLE	Although the Δi or Δk travel distance is set to 0 in a multiple repetitive canned cutting-off cycle (G74 or G75), a value other than 0 is specified for a U or W.
PS0320	ILLEGAL MOVEMENT AMOUNT/CUTTING AMOUNT IS IN THE DRILLING CYCLE	A negative value is specified in a multiple repetitive canned cutting-off cycle (G74 or G75) as Δi or Δk (travel distance/the depth of cut).

Number	Message	Description
PS0321	ILLEGAL REPEATED TIME IS IN THE PATTERN REPEATING CYCLE	A zero or a negative value is specified in a multiple repetitive canned closed loop cycle (G73) as a repeated time.
PS0322	FINISHING SHAPE WHICH OVER OF STARTING POINT	An invalid shape which is over the cycle starting point is specified in a shape program for a multiple repetitive canned rough-cutting cycle (G71 or G72).
PS0323	THE FIRST BLOCK OF SHAPE PROGRAM IS A COMMAND OF TYPE II	Type II is specified in the first block of the shape program specified by P in a multiple repetitive canned rough-cutting cycle (G71 or G72). Z (W) command is for G71. X (U) command is for G72.
PS0324	THE INTERRUPTION TYPE MACRO WAS DONE IN THE MULTIPLE REPETIVE CYCLES	An interruption type macro was issued during the multiple repetitive canned cycle (G70, G71, G72, or G73).
PS0325	UNAVAILABLE COMMAND IS IN SHAPE PROGRAM	1) Unusable command was issued in a shape program for a multiple repetitive cycle (G70, G71, G72, or G73). 2) In the multiple repetitive cycle (G70), when the tool nose radius compensation can be commanded in the target figure program (parameter NT2(No.5106#3)=1), G41 or G42 is commanded at the target figure program other than the first block.
PS0326	LAST BLOCK OF SHAPE PROGRAM IS A DIRECT DRAWING DIMENSIONS	In a shape program in the multiple repetitive canned cycle (G70, G71, G72, or G73), a command for direct input of drawing dimensions in the last block is terminated in the middle.
PS0327	MODAL THAT MULTIPLE REPETIVE CYCLES CANNOT BE DONE	A multiple repetitive canned cycle (G70, G71, G72, or G73) was commanded in a modal state in which a multiple repetitive canned cycle could not be commanded.
PS0328	ILLEGAL WORK POSITION IS IN THE TOOL NOSE RADIUS COMPENSATION	The specification for the blank side for a tool nose radius compensation (G41 or G42) is incorrect in a multiple repetitive canned cycle (G71 or G72).
PS0329	THE FINISHING SHAPE IS NOT A MONOTONOUS CHANGE(SECOND AXES)	In a shape program for the multiple repetitive canned rough-cutting cycle (G71 or G72), the command of the second plane axis was not a monotonous increase or decrease.
PS0330	ILLEGAL AXIS COMMAND IS IN THE TURNING CANNED CYCLE	An axis other than the plane is specified n a canned cycle(G90, G92, or G94).

12.8.2 Reducing path for Multiple repetitive canned cycle

T

Overview

In multiple repetitive canned cycle, a path of cycle can be reduced.

Explanation

In stock removal in turning (G71, G71.7) of multiple repetitive canned cycle, conventional path was as follows (Fig. 12.8.2 (a)Fig. 12.8.2 (a)Fig. 12.8.2 (a)).

1. Moving in the direction of the first axis on the plane (Z-axis for the ZX plane)
2. Moving in the direction of the second axis on the plane (X-axis for the ZX plane)

In this function, it directly moves from the retraction end point to the last turning start point (Fig. 12.8.2 (b), Fig. 12.8.2 (c)).
The cycle time can be reduced because moving path is reduced.
To use this function, set bit 6 (RPA) of parameter No. 5125 to 1.

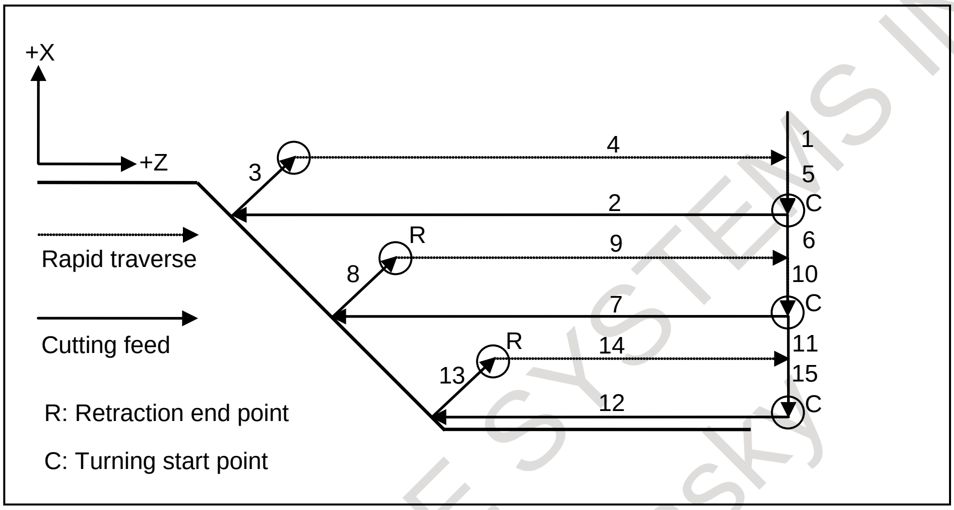

Fig. 12.8.2 (a) Conventional operation

Movement from retraction end point to last turning start point

In a start block in the program for a target figure, the movement from the retraction end point to the last turning start point is changed.

When a start block in the program for a target figure is G00 :
Axes move from the retraction end point to the last turning start point by rapid traverse.

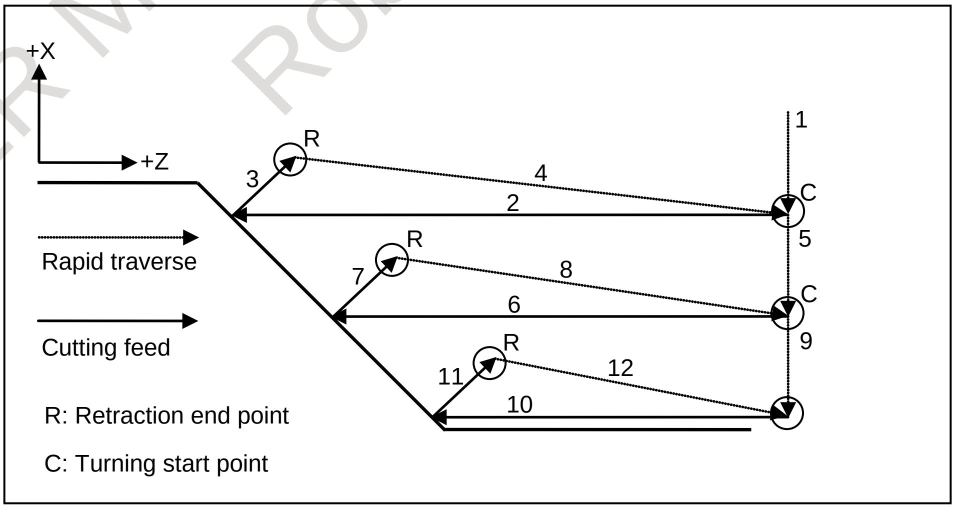

Fig. 12.8.2 (b) Operation when this function is effective (Start block in the program for a target figure is G00.)

When a start block in the program for a target figure is G01 :
Axes move from the retraction end point by rapid traverse until becoming a value that the distance to the last turning start point is set to parameter No.5126. These move from there to the last turning start point

by cutting feed. When 0 is set in parameter No.5126, this parameter is the distance that is 50% of retraction distance.

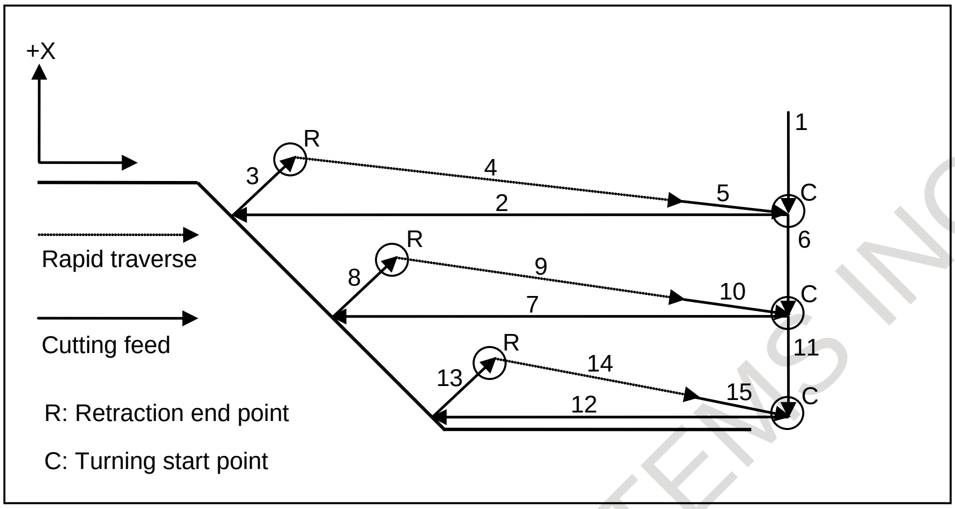

Fig. 12.8.2 (c) Operation when this function is effective (Start block in the program for a target figure is G01.)

> ⚠ **WARNING**
> Specify G01 in a start block in the program for a target figure when turning start point is near the processing surface. The distance of cutting can be adjusted by parameter No.5126.

Effect of reducing cycle time

In this function, it is more effective in reducing cycle time to assume a start block in the program for a target figure to be G00.
Therefore, it is recommended that turning start point is separated from work piece, and it specifies G00 in the start block in the program for a target figure.

Limitation

- This function is valid only when bit 1 (LRP) of parameter No. 1401 is 1.
- This function is valid only in stock removal in turning (G71, G71.7) and stock removal in facing (G72, G72.7) of multiple repetitive canned cycle.
- This function is invalid in type II of multiple repetitive canned cycle.

Parameter

Parameters which are used for this function are as follows.

	#7	#6	#5	#4	#3	#2	#1	#0
5125		RPA						

[Input type] Parameter input
[Data type] Bit path

#6 RPA In type I of G71 (T series), G71.7 (M series), G72 (T series) and G72.7 (M series) of multiple repetitive canned cycle, the axes :
0: Don't move directly from retraction end point to the last turning start point.
1: Move directly from retraction end point to the last turning start point.

> **NOTE**
> When the distance to the last turning start point reaches the value of the parameter No.5126, the movement of the axis changes from rapid traverse to cutting feed.

5126	**Distance in which cutting to the last turning start point in multiple repetitive canned cycles G71 and G72**
	Distance in which cutting to the last turning start point in multiple repetitive canned cycles G71.7 and G72.7

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 to retraction distance

In type I of G71 (T series), G71.7 (M series), G72 (T series) and G72.7 (M series) of multiple repetitive canned cycle, the distance in which cutting to the last turning start point is set to this parameter. When 0 is set in parameter No.5126, this parameter is the distance that is 50% of retraction distance.
When the setting value is out of range, this parameter is the distance in which cutting to the last turning start point is the same distance as retraction distance.

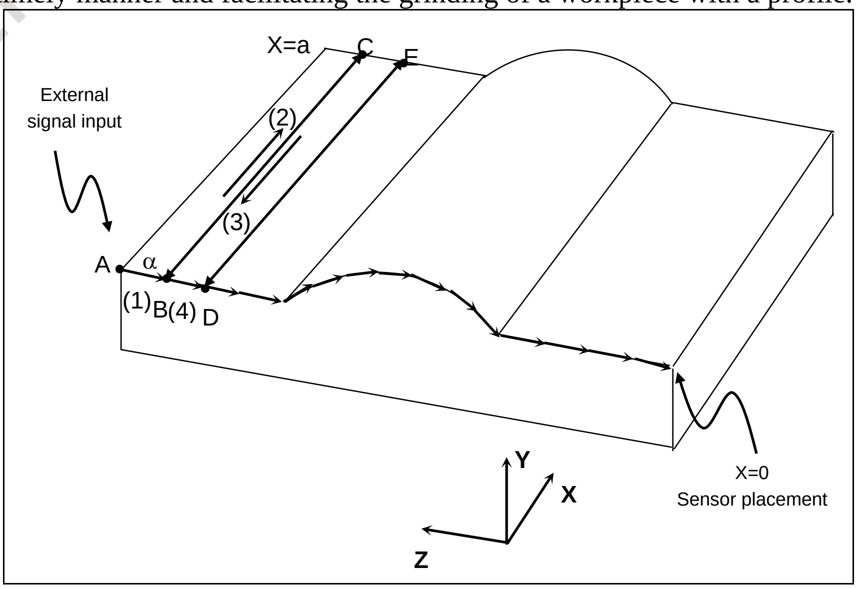
> **NOTE**
> This parameter is valid when bit 6 (RPA) of parameter No. 5125 is set to 1 and start block in the program for a target figure is G01.

12.9 IN-FEED CONTROL (FOR GRINDING MACHINE)

M

Overview

Each time an external signal is input at the table swing end point, a workpiece is cut by a constant depth of cut along a programmed figure on the specified Y-Z plane. This makes it possible to perform grinding and cutting in a timely manner and facilitating the grinding of a workpiece with a profile.



For example, it is possible to machine a workpiece with a profile programmed with linear interpolation, circular interpolation, and linear interpolation on the YZ plane, such as that shown in the figure above.
A sensor is placed at a X = 0 position so that the external signal is input when the sensor detects the grinding wheel. When the program is started at point A, the machine is first placed in the state in which it waits for the input of the external signal. Then, when the sensor detects the grinding wheel, the external signal is input, and the machine makes a cut by the constant amount α along the programmed profile on the specified YZ plane and moves to point B (operation (1)). The machine is then placed in the state in which it waits for the input of the external signal again, and performs a grinding operation along the X-axis. It grinds from point B to point C (operation (2)) and grinds back from point C to point B (operation (3)). When the machine returns to point B, the sensor detects the grinding wheel again, and the external signal is input, so that the machine makes a cut by the amount of α and moves to point D (operation (4)). At point D, the machine performs a grinding operation along the X-axis.
Afterwards, each time the external signal is input, the machine makes a cut by the amount of α along the profile program, so that the workpiece is machined to a profile such as that shown in the figure above.

Signal

In-feed control cut start signal INFD<Gn063.6>

[Classification] Input signal
[Function] Exercises in-feed control.
[Operation] When this signal is set from 0 to 1, the control unit operates as follows:
- A movement is made by a specified depth of cut along a program figure.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn063		INFD						

Alarm and message

Number	Message	Description
PS0230	R CODE NOT FOUND	Cut depth R is not specified in the block including G161. Alternatively, the value specified for R is negative. Modify the program.

12.10 CANNED GRINDING CYCLE (FOR GRINDING MACHINE)

Overview

With the canned grinding cycle, repetitive machining operations that are specific to grinding and are usually specified using several blocks can be specified using one block including a G function. So, a program can be created simply. At the same time, the size of a program can be reduced, and the memory can be used more efficiently. Four types of canned grinding cycles are available:

T

- Traverse grinding cycle
- Traverse direct constant-size grinding cycle
- Oscillation grinding cycle
- Oscillation direct constant-size grinding cycle

M

- Plunge grinding cycle
- Direct constant-dimension plunge grinding cycle
- Continuous-feed surface grinding cycle
- Intermittent-feed surface grinding cycle

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
5101								FXY

[Input type] Parameter input
[Data type] Bit path

#0 FXY The drilling axis in the drilling canned cycle, or cutting axis in the grinding canned cycle is:

0: In case of the Drilling canned cycle:
  Z-axis at all times.
  In case of the Grinding canned cycle:
  - For the Lathe system
    Z-axis at all times.
  - For the Machining Center system
    G75,G77 command :Y-axis
    G78,G79 command :Z-axis

1: Axis perpendicular to a specified plane (G17/G18/G19).

> **NOTE**
> In the case of the T series, this parameter is valid only for the drilling canned cycle in the Series 15 format.

	#7	#6	#5	#4	#3	#2	#1	#0
5105								
		GIJ						

[Input type] Parameter input
[Data type] Bit path

#6 GIJ When a grinding canned cycle in the machining center system is executed, if the signs of I, J, and K are different:

0: An alarm is issued.
1: An operation compatible with the FS16i is performed.

	#7	#6	#5	#4	#3	#2	#1	#0
5106								GFX

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 GFX When the function of multiple respective canned cycle and grinding canned cycle are both active, G71/G72/G73/G74 commands are:
0: Multiple repetitive canned cycle.
1: Grinding canned cycle.

5176	Grinding axis number in Traverse Grinding Cycle(G71)
	Grinding axis number in Plunge Grinding Cycle(G75)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes
For the Lathe system:
Set the Grinding axis number of Traverse Grinding Cycle(G71).
For the Machining Center system:
Set the Grinding axis number of Plunge Grinding Cycle(G75).

NOTE
The axis number except for the cutting axis can be specified. When the axis number which is same to cutting axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0, the alarm PS0456 is also issued.

5177	Grinding axis number of Traverse direct constant-size Grinding cycle(G72)
	Grinding axis number of Direct Constant Dimension Plunge Grinding Cycle(G77)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes
For the Lathe system:
Set the Grinding axis number of Traverse direct constant-size Grinding cycle(G72).
For the Machining Center system:
Set the Grinding axis number of Direct Constant Dimension Plunge Grinding Cycle (G77).

NOTE
The axis number except for the cutting axis can be specified. When the axis number which is same to cutting axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0, the alarm PS0456 is also issued.

5178	Grinding axis number of Oscillation Grinding Cycle(G73)
	Grinding axis number of Continuous feed surface grinding cycle(G78)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes
For the Lathe system:
Set the Grinding axis number of Oscillation Grinding Cycle(G73).
For the Machining Center system:
Set the Grinding axis number of Continuous feed surface grinding cycle(G78).

> **NOTE**
> The axis number except for the cutting axis can be specified. When the axis number which is same to cutting axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0, the alarm PS0456 is also issued.

5179	Grinding axis number of Oscillation Direct Fixed Dimension Grinding Cycle(G74)
	Grinding axis number of Intermittent feed surface grinding cycle(G79)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes

For the Lathe system:
Set the Grinding axis number of Oscillation Direct Fixed Dimension Grinding Cycle(G74).
For the Machining Center system:
Set the Grinding axis number of Intermittent feed surface grinding cycle(G79).

> **NOTE**
> The axis number except for the cutting axis can be specified. When the axis number which is same to cutting axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0, the alarm PS0456 is also issued.

5180	
	Axis number of dressing axis in Plunge grinding cycle(G75)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes

Set the axis number of dressing axis in Plunge grinding cycle(G75).

> **NOTE**
> The axis number except for the cutting axis or grinding axis can be specified. When the axis number which is same to cutting axis or grinding axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0 and address "L" is specified in NC program, the alarm PS0456 is also issued.

5181	
	Axis number of dressing axis in Direct constant dimension plunge grinding cycle(G77)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes

Set the axis number of dressing axis in Direct constant dimension plunge grinding cycle(G77).

> **NOTE**
> The axis number except for the cutting axis or grinding axis can be specified. When the axis number which is same to cutting axis or grinding axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0 and address "L" is specified in NC program, the alarm PS0456 is also issued.

5182	Axis number of dressing axis in Continuous feed surface grinding cycle(G78)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes

Set the axis number of dressing axis in Continuous feed surface grinding cycle(G78).

> **NOTE**
> The axis number except for the cutting axis or grinding axis can be specified. When the axis number which is same to cutting axis or grinding axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0 and address "L" is specified in NC program, the alarm PS0456 is also issued.

5183	Axis number of dressing axis in Intermittent feed surface grinding cycle(G79)

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes

Set the axis number of dressing axis in Intermittent feed surface grinding cycle(G79).

> **NOTE**
> The axis number except for the cutting axis or grinding axis can be specified. When the axis number which is same to cutting axis or grinding axis is specified, an alarm PS0456 is issued at the time of execution. The Grinding Cycle is executed when this parameter value is 0 and address "L" is specified in NC program, the alarm PS0456 is also issued.

Alarm and message

Number	Message	Description
PS0370	G31P/G04Q ERROR	1) The specified address P value for G31 is out of range. The address P range is 1 to 4 in a multistage skip function. 2) The specified address Q value for G04 is out of range. The address Q range is 1 to 4 in a multistage skip function. 3) P1-4 for G31, or Q1-4 for G04 was commanded without a multistage skip function. 4) <T series > The specified value of address P of G72 or G74 falls outside the range. Address P ranges from 1 to 4 in the multistage skip function. P1-4 was specified in G72 or G74 even though the multistage skip function is not present.

Number	Message	Description
PS0455	ILLEGAL COMMAND IN GRINDING	In grinding canned cycles: 1) <M series> The signs of the I, J, and K commands do not match. 2) <M series/T series > The amount of travel of the grinding axis is not specified.
PS0456	ILLEGAL PARAMETER IN GRINDING	Parameters related to grinding canned cycles are incorrectly set. Probable causes are given below. 1) <M series/T series> The axis number of the grinding axis is incorrectly set (parameters Nos. 5176 to 5179). 2) <M series> The axis number of the dressing axis is incorrectly set (parameters Nos. 5180 to 5183). 3) <M series/T series> The axis numbers of the cut axis, grinding axis, and dressing axis (only for the M series) overlap.

12.11 MIRROR IMAGE FOR DOUBLE TURRET

T

Overview

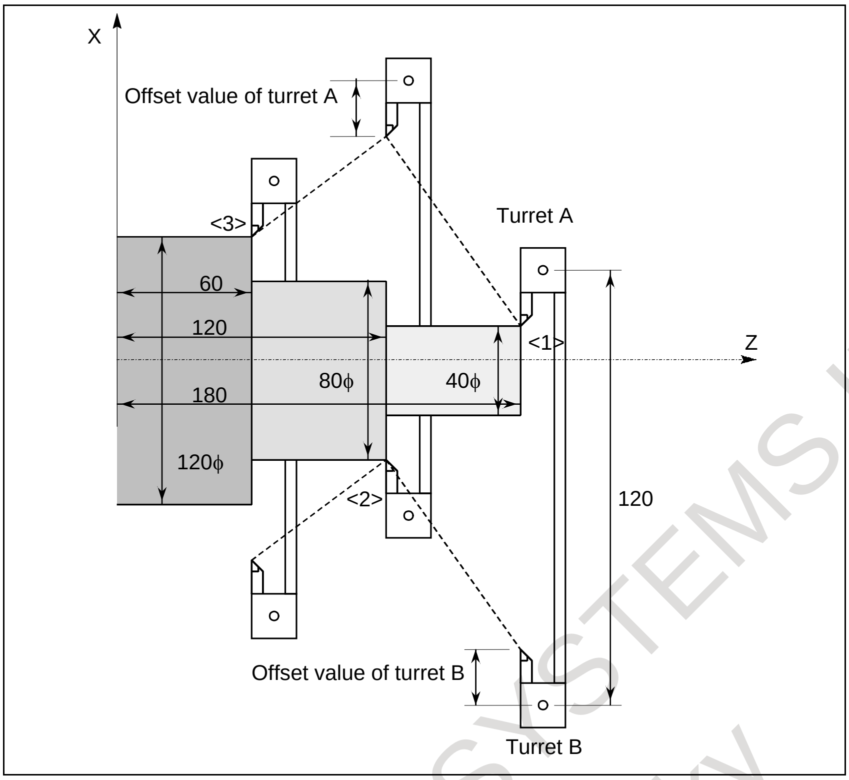
In a machine having double turrets comprising two facing turrets placed on the same control axis, a machining program for facing turrets can be created using G codes as if it existed on the same coordinate system for symmetric cutting by creating a mirror image relative to the X-axis.

G68 : Start double turret mirror image
G69 : Mirror image cancel

Explanation

A mirror image can be created using G codes relative to the X-axis of basic three axes set by parameter No. 1022. When G68 is active, the coordinate system is shifted to the other turret, and the X-axis sign is reversed from the programmed command. To use this function, set the distance between the two turrets in a parameter No. 1290.

Example) Program for double turrets



X40.0 Z180.0 T0101 ;	Position turret A at <1>
G68 ;	Shift the coordinate system by the distance A to B (120mm), and turn mirror image on.
X80.0 Z120.0 T0202 ;	Position turret B at,<2>
G69 ;	Shift the coordinate system by the distance B to A, and cancel mirror image.
X120.0 Z60.0 T0101 ;	Position turret A at <3>

* X axis is programmed diameter command.

Parameter

1290	Distance between two opposite tool posts in mirror image

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (input unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)
Set the distance between two opposite tool posts in mirror image.

Note

NOTE

1 When the G68 command based on this function is enabled, the X-coordinate value that can be read with the custom macro system variables #5041 and up or #100101 and up (current specified position (in the workpiece coordinate system)) is a position with mirror image applied.

2 This function and the balance cut function cannot be used at the same time. If both functions are active, this function is enabled or disabled depending on the system combination.
This function is enabled in:
- One path system
This function is disabled in:
- Two or more path system

3 In the following cases, an alarm is issued:
(1) When instructing of mirror image for double turret (G68) in the polar coordinate interpolation mode (alarm PS0146, "ILLEGAL USE OF G-CODE")
(2) When instructing of mirror image for double turret (G68) in the cylindrical interpolation mode (alarm PS0176, "ILLEGAL G-CODE USE(G07.1 MODE)")

Reference item

Manual name	Item name
OPERATOR'S MANUAL (For Lathe System) (B-64694EN-1)	Mirror image for double turret

12.12 INDEX TABLE INDEXING

M

Overview

By specifying indexing positions (angles) for one rotation axis (usually referred to as axis A, B, or C), the index table of the machining center can be indexed.
Before and after indexing, the index table is automatically unclamped or clamped.

NOTE
To use this function, enable Index table indexing function (bit 3 (IXC) of parameter No.8132 is 1).

Explanation

- Basic Procedure

The control axis (a rotation axis) used for index table indexing (hereafter called the index table indexing axis) is usually referred to as axis A, B, or C.
In the explanation below, the index table indexing axis is axis B. If the axis name in the actual machine is not B, the user should read axis B as referring to that axis name.
The positioning angle for the index table is commanded by the numeric following "B" in the program command, which is an independent block. Both absolute and incremental commands are possible, but the value after "B" is the integer times the numeric set by the parameter:

(Example)	G00G90B100000;	Absolute command	(Positioning angle 10 degrees)
	G00G91B20.0;	Incremental command	(Move distance 20 degrees)

There are two variations of the procedure (type A and type B) to set the index table position; the difference is in the ON/OFF timing of the position control servo. The sequence of events and the difference between the variations are described below.

(1) Assume Bbbbb is ordered by the command program.
(2) The CNC turns the B axis unclamp signal BUCLP <Fn061.0> to “1”. (Type B -- When BUCLP is turned to " 1 ", the position control servo for the B axis is turned ON.)
(3) On the PMC side, the clamp of the B axis is released with the signal BUCLP <Fn061.0> turns to "1"; when completed, the B axis unclamp completion signal *BEUCP <Gn038.6> turns to “0”.
(4) The CNC then turns the B axis unclamp signal BUCLP to “0” with the signal *BEUCP turns to "0", to indicate it received the *BEUCP signal.
(5) When the PMC is notified that BUCLP has been turned to 0, the PMC should turn *BEUCP to “1”. In type A, B-axis unclamp signal BUCLP is turned to “0”, B-axis position control is made in servo-on state, B-axis is rotated, and the B axis is stopped at the specified position. B axis always moves at rapid traverse.
(6) When the B axis stops at the specified position, CNC turns B-axis clamp signal BCLP <Fn061.1> to “1”. In type A, signal BCLP is set to “1” and B-axis position control is made in servo-off state.
(7) When BCLP is turned to “1” on the PMC side, the B axis is clamped mechanically. When the clamp is completed, the B axis clamp completion signal *BECLP <Gn038.7> is turned to “0”.
(8) When *BECLP is turned to “0”, the CNC then turns BCLP to “0”, informing it received the *BECLP signal. (Type B -- When BCLP turns to 0, the B axis position control servo is turned off.)
(9) On the PMC side, when BCLP changes to “0”, *BECLP is turned to “1”.

This completes the sequence.
The time charts for these operations are shown in the Fig. 12.12 (a) and Fig. 12.12 (b).

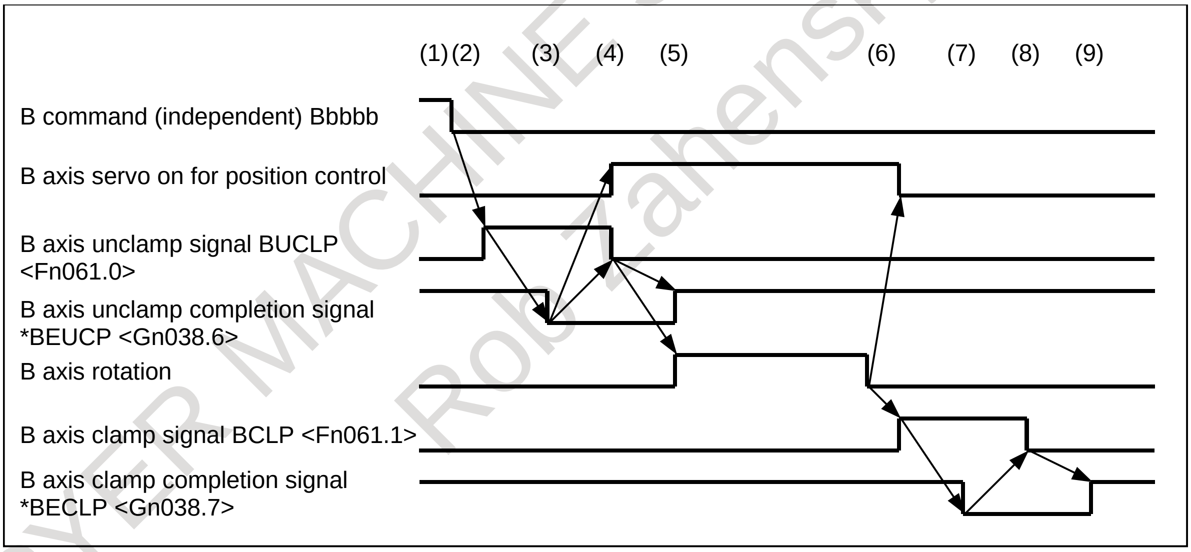


Fig. 12.12 (a) Time chart for positioning index table (type A)

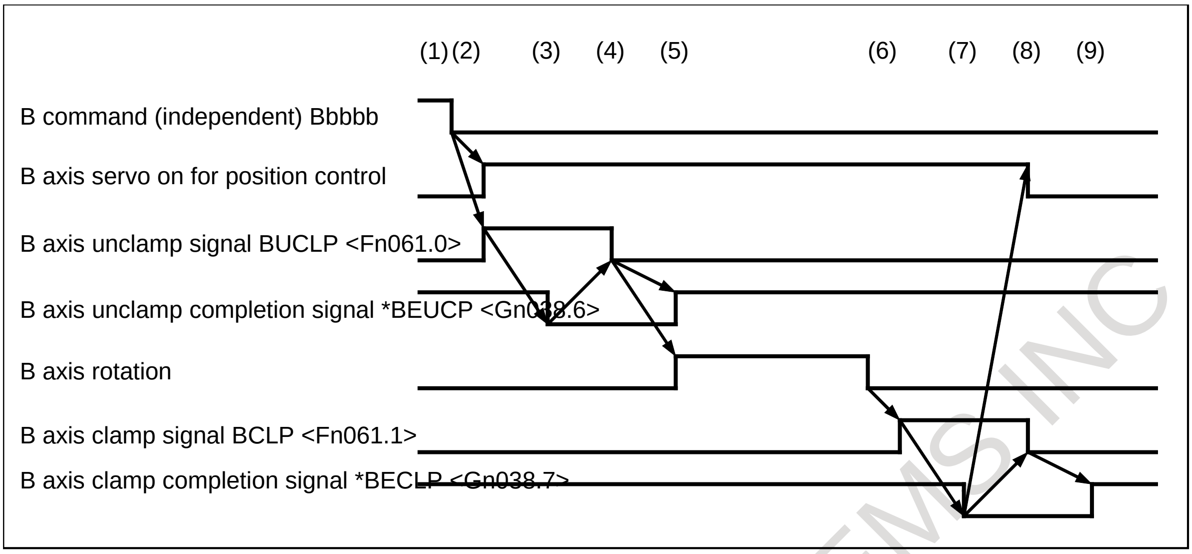

Fig. 12.12 (b) Time chart for positioning index table (type B)

The Fig. 12.12 (c) shows the timing chart for type-A manual reference position return of the B axis.

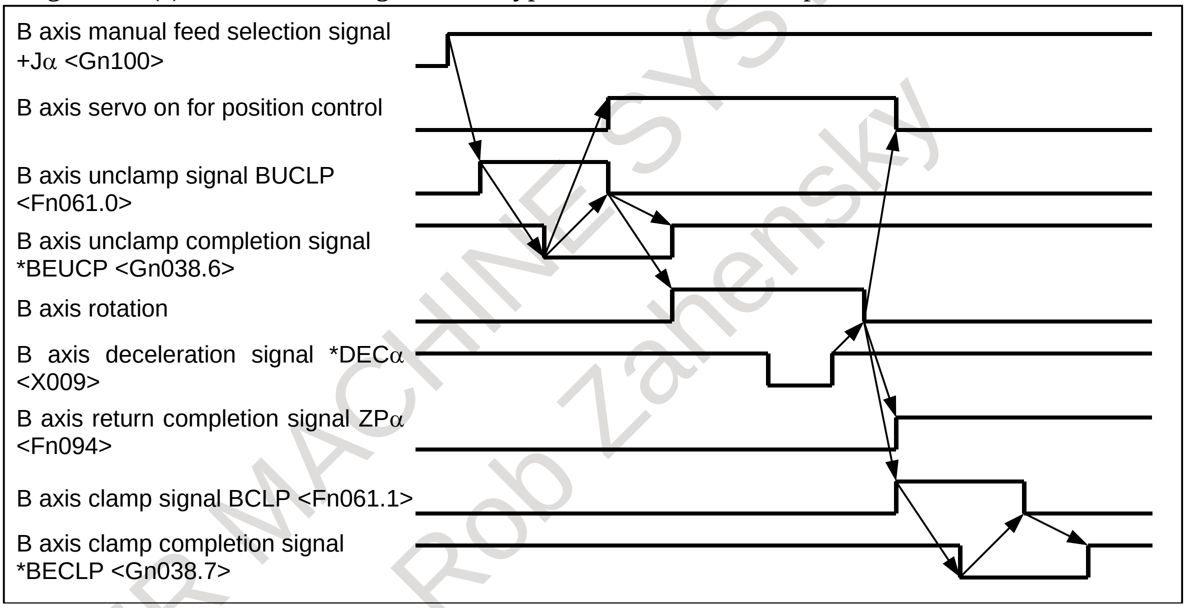

Fig. 12.12 (c) Manual reference position return of B axis time chart (type A)

- Type A and Type B

As described in the basic procedure, type A differs from type B in that the servo used for B-axis position control is turned on or off at the different timing.
Type A is suitable for a system in which the B-axis is clamped at some decided angles with the one like shot pins.
Type B is suitable for a system in which the B-axis is clamped at arbitrary angles with the one like a clutch.

- Minimum indexing angle

The minimum index table indexing angle set in parameter No. 5512 is used. An integral multiple of a set value can be specified as an indexing angle. If a value other than an integral multiple is specified, an alarm PS1561 is issued.

- Setting of an index table indexing axis

Be sure to set a rotation axis (A type) as an index table indexing axis.
(Set bit 0 (ROTx) of parameter No. 1006 to 1 and set bit 1 (ROSx) of parameter No. 1006 to 0.)

Be sure to set a non roll-over invalidity axis as an index table indexing axis.
(Set bit 0 (ROAx) of parameter No. 1008 to 0.)

- Absolute/incremental programming

Setting bit 4 (G90) of parameter No .5500, specifies absolute programming, and override the G90/G91 G-codes.

- Rotation direction

If a value other than 0 is set in the M code for specifying negative direction rotation (parameter No. 5511), movement in the negative direction is made only when a move command is specified together with the M code. In this case, movement is performed in the negative direction, regardless of whether absolute/incremental programming is used.
If 0 is set in the M code for specifying negative direction rotation (parameter No. 5511), the rotation direction in G90 mode is determined by bit 3 (INC) of parameter No. 5500, to short-cut the rotation.

- Feedrate

The table is always rotated around the indexing axis in rapid traverse mode.
Dry run cannot be executed for the indexing axis.

- Reset

If a reset is performed in the clamp or unclamp completion wait state, the clamp or unclamp signal is cleared, and the CNC exits from the completion wait state.

- Index table indexing function and other functions

Item	Explanation
Relative position display	This value can be rounded by setting bit 1 (REL) of parameter No. 5500.
Absolute position display	This value can be rounded by setting bit 2 (ABS) of parameter No. 5500.
Single direction positioning (G60)	Not specifiable
Skip function (G31)	Not specifiable
Second auxiliary function	Ensure that a second auxiliary function axis name does not duplicate an indexing axis name.
Operation during index table indexing axis movement	Unless otherwise processed by the machine, feed hold, interlock, and emergency stop can be executed during index table indexing axis movement. Machine lock can be executed after indexing has been completed.
Servo-off signal	Disable the servo-off signal for the index table indexing axis. That is, set bit 0 (FUPx) of parameter No. 1819 to 1. Usually, the index table indexing axis is in the servo-off state.
Incremental command for the index table indexing axis	When incremental programming is used for index table indexing (when bit 4 (G90) of parameter No. 5500 is set to 0), the workpiece origin offset of the index table indexing axis must always be 0. That is, there must always be a match between the workpiece coordinate system and machine coordinate system of an index table indexing axis.
Operation for an index table indexing axis	Operation in JOG/INC/HANDLE mode for an index table indexing axis is disabled. However, manual reference position return is possible. If the axis selection signal is set to 0 during manual reference position return, the movement stops immediately, and the clamp command is not executed.

NOTE

Setting for an index table indexing axis is set by parameter No. 5500 and over described as "Parameter - Setting for positioning the index table" later.

Limitation

- Simultaneous specification together with other controlled axes

If an index table indexing axis and other controlled axes are specified in the same block:

- When the command is to be executed with all axes:
  Set bit 6 (SIM) of parameter No. 5500 to 1.
- When axes for which the command is executed are to be selected:
  Set bit 6 (SIM) of parameter No. 5500 to 0. Next, set bit 0 (IXS) of parameter No. 5502 to 1 for other controlled axes to be selected in the same block.

If an index table indexing axis and other controlled axes are specified in the same block in a case other than the above, alarm PS1564 is issued.

Simultaneous specification together with other controlled axes (when G00, G28, or G30 (or G00 mode) is set)

	SIM = 0	SIM = 1
Axis with IXS = 0	Alarm PS1564	The command is executed for all axes.
Axis with IXS = 1	The command is executed.	

If an index table indexing axis and other controlled axes are specified in the same block when a command other than G00, G28, and G30 (or G00 mode) is specified, alarm PS1564 is issued.

- Command specifying zero move amount

When the amount of movement is 0, a clamp/unclamp operation is not performed.

- Look-ahead acceleration/deceleration before interpolation

In a block specifying an index table indexing axis, look-ahead acceleration/deceleration before interpolation is disabled.

- Functions that cannot be used at the same time

An axis used with any of the following functions is uncontrollable as an index table indexing axis:

- PMC axis control
- Pole position detection function
- Tilted working plane indexing
- Cs contour control
- Polar coordinate interpolation
- Cylindrical Interpolation
- Spindle control with servo motor
- High precision oscillation function
- Polygon Turning
- Electronic Gear Box

The following function cannot be used for the index table indexing axis.

- Reference position setting with mechanical stopper
- Real-time custom macro
- Retrace
- Program restart

> **NOTE**
> Functions that cannot be used at the same time might be changed or added by adding new CNC function.

Caution

⚠ CAUTION

1. While the index table is being positioned, input signals that reset the CNC, such as emergency stop signal *ESP <X008.4>, (external reset signal) ERS <Gn008.7>, and reset & rewind signal RRW <Gn008.6>, are functional.
   When reset is applied to the CNC, indexing stops. Further, if automatic operation stop signal *SP <Gn008.5> turns to 0, axis movement is stopped and the equipment enters the automatic operation stop state.
   If a stop at any position is not suitable for the machine, appropriate processing is required on the machine.
2. If the axis selection signal is set to 0 during manual reference position return, movement is stopped immediately, and the clamp command is not executed. If this proves inconvenient, measures must be taken on the machine side so that, after the axis selection signal is set to 1, it is not set to 0 until reference position return is completed.
3. When an incremental command is used for indexing the index table, the workpiece origin offset for the index table indexing axis must always be 0. This means that the workpiece coordinate system and machine coordinate system of the index table indexing axis must always match.
4. If a reset is made during indexing of the index table, a reference position return must be made before the index table is indexed subsequently.
5. The secondary auxiliary function can be used, but its address must be different from that of the indexing axis.
6. For a path on which the index table indexing function is not to be used, disable the index table indexing function (set bit 0 (ITI) of parameter No. 5501 to 0).

Note

NOTE

For positioning on an index table indexing axis, the dry run signal DRN <Gn046.7> has no effect.

Signal

B axis clamp signal BCLP <Fn061.1>

[Classification] Output signal
[Function] Instructs the PMC side to clamp the B axis mechanically.
[Output cond.] The output condition and procedure are the same as those described in the basic procedure for positioning the index table.

B axis clamp completion signal *BECLP <Gn038.7>

[Classification] Input signal
[Function] Notifies the CNC of completion of the B axis clamp operation.
[Operation] The output condition and procedure are the same as those described in the basic procedure for positioning the index table.

B axis unclamp signal BUCLP <Fn061.0>

[Classification] Output signal
[Function] Instructs the PMC side to release the B axis from the mechanical clamp.
[Output cond.] The output condition and procedure are the same as those described in the basic procedure for positioning the index table.

B axis unclamp completion signal *BEUCP <Gn038.6>

[Classification] Input signal

[Function] Notifies the CNC of completion of the release of the B axis from the mechanical clamp.

[Operation] The output condition and procedure are the same as those described in the basic procedure for positioning the index table.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn038	*BECLP	*BEUCP						

	#7	#6	#5	#4	#3	#2	#1	#0
Fn061							BCLP	BUCLP

Parameter

- Setting linear or rotation axis

	#7	#6	#5	#4	#3	#2	#1	#0
1006							ROSx	ROTx

[Input type] Parameter input

[Data type] Bit axis

NOTE
When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 ROTx Setting linear or rotation axis.
#1 ROSx

ROSx	ROTx	Meaning
0	0	Linear axis (1) Inch/metric conversion is done. (2) All coordinate values are linear axis type. (Is not rounded in 0 to 360°) (3) Stored pitch error compensation is linear axis type (Refer to parameter No. 3624)
0	1	Rotary axis (A type) (1) Inch/metric conversion is not done. (2) Machine coordinate values are rounded in 0 to 360°. Absolute coordinate values are rounded or not rounded by bits 0 (ROAx) and 2 (RRLx) of parameter No. 1008. (Bits 2 (ABS) and 1 (REL) of parameter No. 5500 are used for an index table indexing axis.) (3) Stored pitch error compensation is the rotation type. (Refer to parameter No. 3624) (4) Automatic reference position return (G28, G30) is done in the reference position return direction and the move amount does not exceed one rotation.
1	1	Rotary axis (B type) (1) Inch/metric conversion is not done. (2) Machine coordinate values, absolute coordinate values and relative coordinate values are linear axis type. (Is not rounded in 0 to 360°). (3) Stored pitch error compensation is linear axis type (Refer to parameter No. 3624) (4) Cannot be used with the rotary axis roll-over function and the index table indexing function (M series)
Except for the above.		Setting is invalid (unused)

- Setting for positioning the index table

	#7	#6	#5	#4	#3	#2	#1	#0
5500	IDX	SIM		G90	INC	ABS	REL	DDP

[Input type] Parameter input
[Data type] Bit path

#0 DDP As the method for inputting a decimal point in a command for the index table indexing axis:
0: The conventional method is used.
1: The pocket calculator method is used.

#1 REL The position display of the index table indexing axis in the relative coordinate system is:
0: Not rounded by one rotation.
1: Rounded by one rotation.

#2 ABS The position display of the index table indexing axis in the absolute coordinate system is:
0: Not rounded by one rotation.
1: Rounded by one rotation.

NOTE
Be sure to set this parameter to 1.
If an absolute programming is commanded to the index table indexing axis when this parameter is set to 0, the position display of the absolute coordinate system may be not corresponding to the absolute programming value like the following example.

Example) When indexing by rotating in a positive direction :
N10 G90 B20.;
N20 B10.; ← It rotates in a positive direction by 350 degree. At this time, 370.0 is displayed to the position display of the absolute coordinate system.

#3 INC When the M code that specifies rotation in the negative direction (parameter No. 5511) is not set, rotation in the G90 mode is:
0: Not set to the shorter way around the circumference.
1: Set to the shorter way around the circumference.

#4 G90 A command for the index table indexing axis is:
0: Assumed to be an absolute or incremental programming according to the mode.
1: Always assumed to be an absolute programming.

#6 SIM When the same block includes a command for the index table indexing axis and a command for another controlled axis:
0: The setting of bit 0 (IXS) of parameter No. 5502 is followed.
1: The commands are executed.

NOTE
Even when this parameter is set to 1, an alarm PS1564, “INDEX TABLE AXIS - OTHER AXIS SAME TIME” is issued if the block is neither G00, G28, nor G30 (nor the G00 mode).

#7 IDX Operation sequence of the index table indexing axis:
0: Type A
1: Type B

	#7	#6	#5	#4	#3	#2	#1	#0
5501							ISP	ITI

[Input type] Parameter input
[Data type] Bit path

#0 ITI The index table indexing function is:
0: Enabled.
1: Disabled.

#1 ISP Servo-off for an index table indexing axis at the completion of clamping is:
0: Processed by the CNC.
1: Not processed by the CNC. (The CNC follows the status of the servo-off signal SVF1 to SVF8<Gn0126> input from the PMC.)

	#7	#6	#5	#4	#3	#2	#1	#0
5502								IXSx

[Input type] Parameter input
[Data type] Bit axis

#0 IXSx When a command is specified in a block that contains a command for the index table indexing axis:
0 : An alarm PS1564, “INDEX TABLE AXIS - OTHER AXIS SAME TIME” is issued.
1 : The command is executed.

If bit 6 (SIM) of parameter No. 5500 is set to 1, a simultaneous operation with all axes except the index table indexing axis can be performed regardless of the setting of this parameter.
To set an axis that allows simultaneous operation for each axis, set SIM to 0, and set this parameter.

> **NOTE**
> Even when this parameter is set to 1, an alarm PS1564, “INDEX TABLE AXIS - OTHER AXIS SAME TIME” is issued if the block is neither G00, G28, nor G30 (nor the G00 mode).

- Setting of an index table indexing axis

5510	Controlled axis number of the index table indexing axis

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte path

[Valid data range] 0 to Number of controlled axes

This parameter sets the number of a controlled axis to be used as the index table indexing axis.

When 0 is set, the fourth axis is assumed.

If the system does not have the fourth axis or the index table indexing function is not used, set bit 0 (ITI) of parameter No. 5501 to 1 to disable the function.

- Setting of a negative direction rotation command M code

5511	M code that specifies rotation in the negative direction for index table indexing

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 99999999

0: The rotation direction for the index table indexing axis is determined according to the setting of bit 3 (INC) of parameter No. 5500 and a command.

1 to 99999999:
The rotation for the index table indexing axis is always performed in the positive direction. It is performed in the negative direction only when a move command is specified together with the M code set in this parameter.

> **NOTE**
> Be sure to set bit 2 (ABS) of parameter No. 5500 to 1.

- Setting of a minimum positioning angle for index table indexing

5512	Minimum positioning angle for the index table indexing axis

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

This parameter sets the minimum positioning angle (travel distance) for the index table indexing axis. The travel distance specified in the positioning command must always be an integer multiple of this setting. When 0 is set, the travel distance is not checked.

The minimum positioning angle is checked not only for the command, but also for the coordinate system setting and workpiece origin offset.

Alarm and message

Number	Message	Contents
PS1508	DUPLICATE M-CODE (INDEX TABLE REVERSING)	The M code value (parameter No. 5511) for specifying negative direction rotation is already used by other functions. (Index table indexing)
PS1561	ILLEGAL INDEXING ANGLE	The specified angle of rotation is not an integer multiple of the minimum indexing angle.
PS1564	INDEX TABLE AXIS – OTHER AXIS SAME TIME	The index table indexing axis and another axis have been specified in the same block.
PS1567	INDEX TABLE AXIS DUPLICATE AXIS COMMAND	Index table indexing was specified during axis movement or on an axis for which the index table indexing sequence was not completed.

Note

NOTE

If an index table indexing axis and other controlled axes are specified in the same block, G00 performs nonlinear positioning. So, if rapid traverse based on look-ahead acceleration/deceleration before interpolation is set, the setting is switched automatically to acceleration/deceleration after interpolation.

12.13 SCALING

M

Overview

A programmed figure can be magnified or reduced (scaling).
One scaling method multiples the same magnification rate and the other scaling method (axis-by-axis scaling) multiples the different magnification rate for each axis.
The magnification rate can be specified in the program or by a parameter.

NOTE

To use this function, set bit 5 (SCL) of parameter No.8132 to 1.

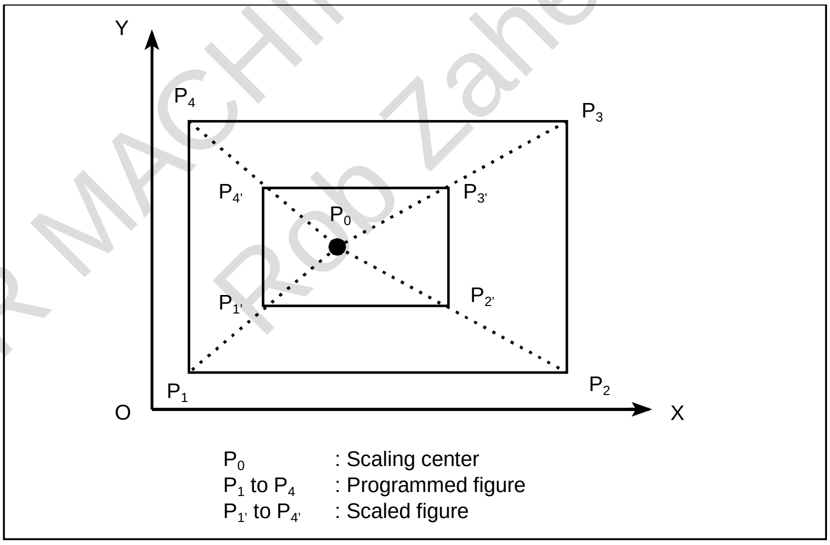

Fig. 12.13 (a) Scaling

Format

Scaling up or down along all axes at the same rate of magnification
(When the bit 6 (XSC) of parameter No. 5400 is set to 0)

Format		Meaning of command
G51 IP_P_ ;	Scaling start	IP_ : Absolute command for center coordinate value of scaling P_ : Scaling magnification
: **:**	Scaling is effective. (Scaling mode)	
G50 ;	Scaling cancel	

Scaling along each axes at a different rate of magnification (mirror image) (When the bit 6 (XSC) of parameter No. 5400 is set to 1)

Format	Meaning of command
G51 IP_ I_J_K_ ; Scaling start : } Scaling is effective. : } (Scaling mode) **G50 ;** Scaling cancel	IP_ : Absolute command for center coordinate value of scaling I_J_K_ : Scaling magnification for basic 3 axes (X, Y, and Z axes) respectively

> ⚠ **CAUTION**
> 1 Specify G51 in a separate block.
> 2 After the figure is enlarged or reduced, specify G50 to cancel the scaling mode.

> **NOTE**
> 1 Entering pocket calculator decimal point input mode (bit 0 (DPI) of parameter No. 3401 = 1) does not cause the units of the magnification rates P, I, J, and K to change.
> 2 Setting the least input increment equal to 10 times the least command increment (bit 7 (IPR) of parameter No. 1004 = 1) does not cause the units of the magnification rates P, I, J, and K to change.
> 3 An attempt to specify 0 as a magnification rate causes alarm PS0142, “ILLEGAL SCALE RATE”, to occur in a G51 block.

Explanation

- Axis for which scaling is to be enabled

For the axis for which scaling is to be enabled, set bit 0 (SCL) of parameter No. 5401 to 1.

- Minimum unit of scaling magnification

Least input increment of scaling magnification is: 0.001 or 0.00001.
It is 0.00001 (one hundred thousandth) if bit 7 (SCR) of parameter No. 5400 is 0 and 0.001 if it is 1.

- Scaling center

Even in incremental command (G91) mode, the scaling center coordinates IP_ specified in the G51 block are assumed those of an absolute position.
If the scaling center coordinates are omitted, the position assumed when G51 is specified is assumed the scaling center.

> ⚠ **CAUTION**
> With the move command subsequent to the G51 block, execute an absolute (G90 mode) position command.
> If no absolute position command is executed after the G51 block, the position when G51 is specified is assumed the scaling center. Once an absolute position command is executed, after that block, the scaling center is assumed the coordinates specified in the G51 block.

- Scaling along each axis at the same rate of magnification

Set bit 6 (XSC) of parameter No. 5400 to 0.
If the scaling magnification P is not specified, the magnification set in parameter No. 5411 is used.
Decimal point input is not accepted as the magnification P. If decimal point input is made, alarm PS0007, “ILLEGAL USE OF DECIMAL POINT”, will occur.
A negative value cannot be specified as the magnification P. If a negative value is specified, alarm PS0006, “ILLEGAL USE OF MINUS SIGN”, will occur.
The allowable magnification range is from 0.00001 to 9999.99999.

- Scaling of each axis, programmable mirror image (negative magnification)

Each axis can be scaled by different magnifications. Also when a negative magnification is specified, a mirror image is applied. The axis subject to the mirror image is the one that contains the scaling center.
Set a bit 6 (XSC) of parameter No. 5400 to 1 to validate each axis scaling (mirror image).
Using I, J, and K, specify the scaling magnifications for the basic 3 axes (X to Z axes). Use parameter No. 1022 to specify which axes to use as the basic 3 axes.
For those of the X to Z axes for which I, J, and K are not specified and for axes other than the basic 3 axes, the magnification set with parameter No. 5421 is used.
A value other than 0 must be set to parameter No. 5421.
Decimal point programming can not be used to specify the rate of magnification (I, J, K).
Magnification can be set within the range ±0.00001 ±9999.99999.

> ⚠ **CAUTION**
>
> Specifying the following commands at the same time causes them to be executed in the order indicated below:
>
> <1> Programmable mirror image (G51.1)
> <2> Scaling (G51) (including a mirror image with a negative magnification)
> <3> Mirror image due to the external switch of the CNC or the settings of the CNC
>
> In this case, the programmable mirror image is effective to the scaling center and magnification as well.
> To specify G51.1 and G51 at the same time, specify them in this order; to cancel them, specify them in the reverse order.

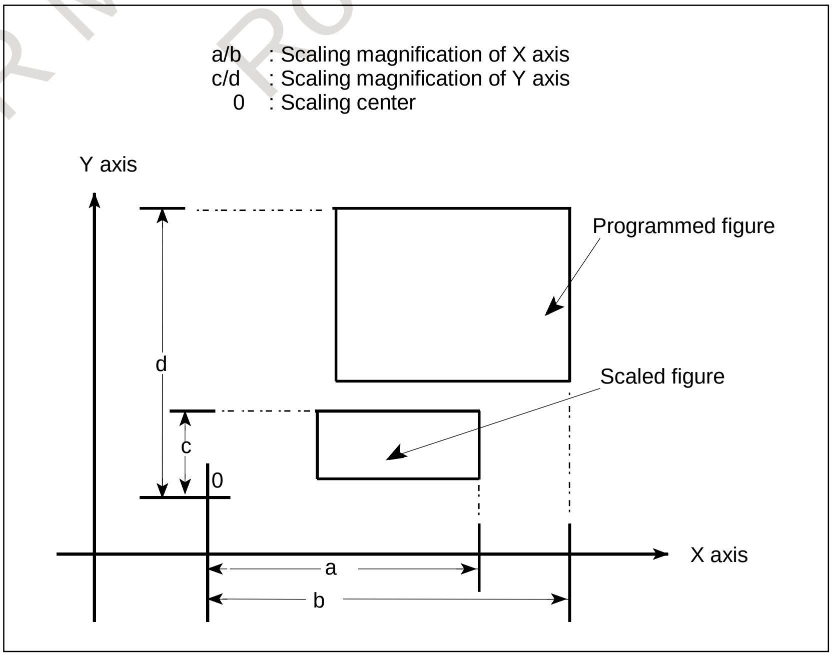

Fig. 12.13 (b) Scaling of each axis

- Scaling of circular interpolation

Even if different magnifications are applied to each axis in circular interpolation, the tool will not trace an ellipse.

G90 G00 X0.0 Y100.0 Z0.0;
G51 X0.0 Y0.0 Z0.0 I2000 J1000; (A magnification of 2 is applied to the X direction and a magnification of 1 is applied to the Y direction.)
G02 X100.0 Y0.0 I0 J–100.0 F500;

Above commands are equivalent to the following command:

G90 G00 X0.0 Y100.0 Z0.0;
G02 X200.0 Y0.0 I0 J–100.0 F500;
(Because the end point is not on an arc, spiral interpolation is assumed.)

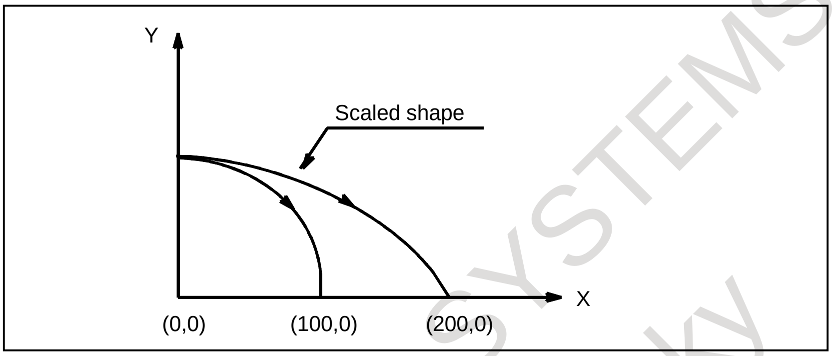

Fig. 12.13 (c) Scaling for circular interpolation1

Even for an R-specified arc, scaling is applied to each of I, J, and K after the radius value (R) is converted into a vector in the center direction of each axis.
If, therefore, the above G02 block contains the following R-specified arc, the operation will be same as that in which I and J are specified.

G02 X100.0 Y0.0 R100.0 F500 ;

- Scaling and coordinate system rotation

If both scaling and coordinate system rotation are specified at the same time, scaling is performed first, followed by coordinate system rotation. In this case, scaling is effective to the rotation center as well.
To specify both of them, specify scaling first and then coordinate system rotation. To cancel them, specify them in the reverse order.

Example

Main program
O1
G90 G00 X20.0 Y10.0 ;
M98 P1000 ;
G51 X20.0 Y10.0 I3000 J2000 ; (× 3 in the X direction and × 2 in the Y direction)
M98 P1000 ;
G17 G68 X35.0 Y20.0 R30.0 ;
M98 P1000 ;
G69 ;
G50 ;
M30 ;

Subprogram
O1000 ;
G01 X20.0 Y10.0 F500 ;
G01 X50.0 ;
G01 Y30.0 ;

```
G01 X20.0 ;
G01 Y10.0 ;
M99 ;
```

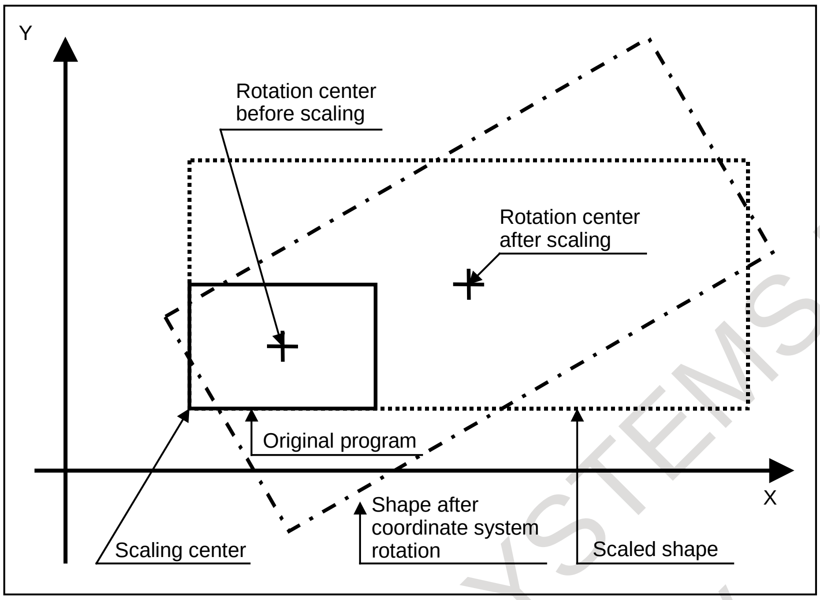

Fig. 12.13 (d) Scaling and coordinate system rotation

- Scaling and optional-angle chamfering/corner rounding

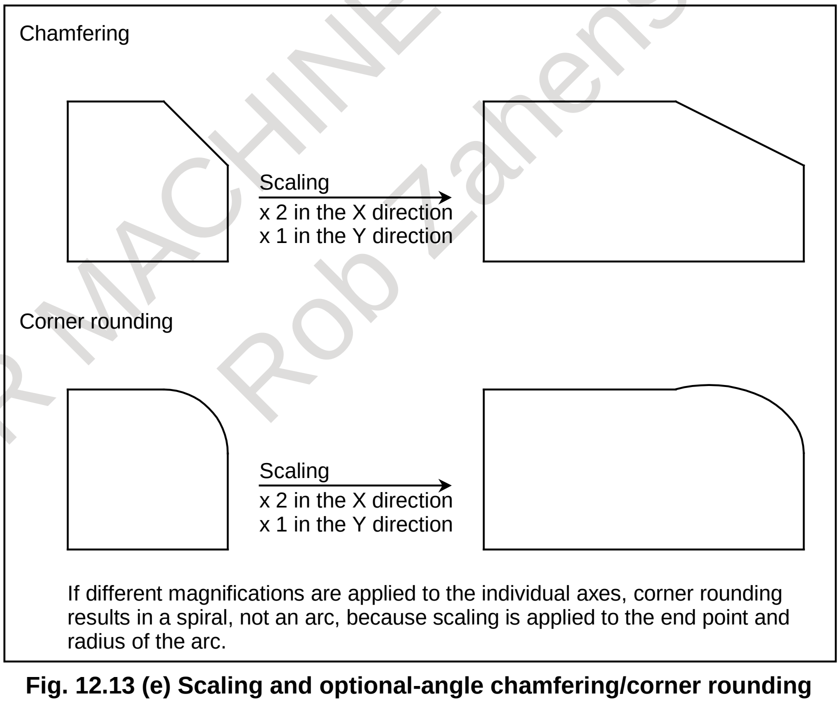

Fig. 12.13 (e) Scaling and optional-angle chamfering/corner rounding

Limitation

- Tool compensation

This scaling is not applicable to cutter/tool nose radius compensation values, tool length offset values, and tool offset values (Fig. 12.13 (f)).

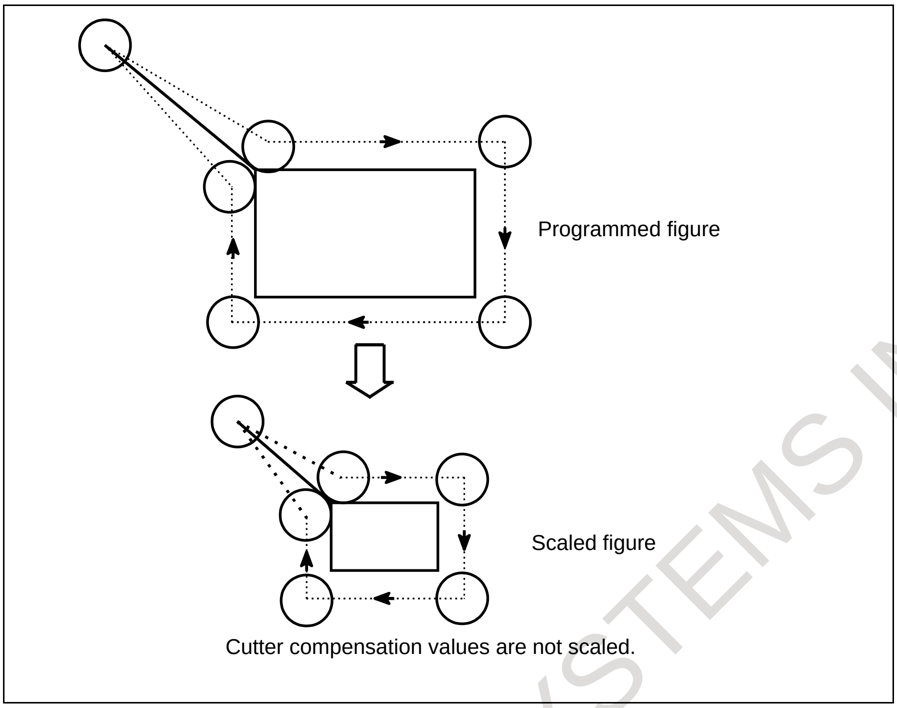

Fig. 12.13 (f) Scaling during cutter compensation

- Invalid scaling

Scaling is not applicable to the Z-axis movement in case of the following canned cycle.

- Cut-in value Q and retraction value d of peck drilling cycle (G83, G73).
- Fine boring cycle (G76)
- Shift value Q of X and Y axes in back boring cycle (G87).

Caution

⚠ **CAUTION**

1 If a parameter setting value is employed as a scaling magnification without specifying P, the setting value at G51 command time is employed as the scaling magnification, and a change of this value, if any, is not effective.
2 Before specifying the G code for reference position return (G27, G28, G29, G30) or coordinate system setting (G52 to G59, G92), cancel the scaling mode. If any of them is specified during scaling, alarm PS0412, “AN UNUSABLE G CODE WAS USED”, will occur.
3 If scaling results are rounded by counting fractions of 5 and over as a unit and disregarding the rest, the move amount may become zero. In this case, the block is regarded as a no movement block, and therefore, it may affect the tool movement by cutter compensation. See the description of cutter compensation.
4 Refrain from scaling on a rotation axis for which the rollover function is enabled. Otherwise, the tool may rotate in a short-cut manner, possibly resulting in unexpected movement.

Note

NOTE

1 The position display represents the coordinate value after scaling.
2 When a mirror image was applied to one axis of the specified plane, the following results:

(1) Circular command	Direction of rotation is reversed.
(2) Cutter/tool nose radius compensation	Offset direction is reversed.
(3) Coordinate system rotation	Rotation angle is reversed.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
5400	SCR	XSC						

[Input type] Parameter input
[Data type] Bit path

#6 XSC The setting of a scaling magnification (axis-by-axis scaling) is:
0: Disabled.
1: Enabled.

#7 SCR Scaling (G51) magnification unit:
0: 0.00001 times (1/100,000)
1: 0.001 times

	#7	#6	#5	#4	#3	#2	#1	#0
5401								SCLx

[Input type] Parameter input
[Data type] Bit axis

#0 SCLx Scaling on this axis:
0: Invalidated
1: Validated

5411	Scaling (G51) magnification

[Input type] Setting input
[Data type] 2-word path
[Unit of data] 0.001 or 0.00001 times (Selected using bit 7 (SCR) of parameter No. 5400)
[Valid data range] 1to999999999

This parameter sets a scaling magnification when axis-by-axis scaling is disabled (with bit 6 (XSC) of parameter No. 5400 set to 0). If no scaling magnification (P) is specified in the program, the setting of this parameter is used as a scaling magnification.

NOTE
When bit 7 (SCR) of parameter No. 5400 is set to 1, the valid data range is 1 to 9999999.

5421	Scaling magnification for each axis

[Input type] Setting input
[Data type] 2-word axis
[Unit of data] 0.001 or 0.00001 times (Selected using bit 7 (SCR) of parameter No. 5400)

[Valid data range] -999999999 to -1, 1 to 999999999

This parameter sets a scaling magnification for each axis when axis-by-axis scaling is enabled (with bit 6 (XSC) of parameter No. 5400 set to 1). For the first spindle to the third spindle (X-axis to Z-axis), the setting of this parameter is used as a scaling magnification if scaling magnifications (I, J, K) are not specified in the program.

NOTE
When bit 7 (SCR) of parameter No. 5400 is set to 1, the valid data ranges are -9999999 to -1 and 1 to 9999999.

Alarm and message

- Alarms common to lathe systems and machining center systems

Number	Message	Description
PS0006	ILLEGAL USE OF MINUS SIGN	A minus sign (–) was specified at an NC instruction word or system variable where no minus signal may be specified.
PS0007	ILLEGAL USE OF DECIMAL POINT	A decimal point (.) was specified at an address where no decimal point may be specified, or two or more decimal points were specified.
PS0142	ILLEGAL SCALE RATE	The scaling rate is 0 times or 10000 times or more. Modify the setting of the scaling rate. (G51P_ . . . or G51I_J_K_ . . . or parameter No. 5411 or 5421)
PS0412	ILLEGAL G CODE	During scaling, the G code for reference position return (G27, G28, G29, G30) or coordinate system setting (G52 to G59, G92), is specified. Before specifying any of them, cancel the scaling mode.
PS5007	TOO LARGE DISTANCE	Due to compensation, point of intersection calculation, interpolation or similar reasons, a movement distance that exceeds the maximum permissible distance was specified. Check the programmed coordinates or compensation amounts.

- Alarms only for lathe systems

Number	Message	Description
PS0300	ILLEGAL COMMAND IN SCALING	An illegal G code was specified during scaling. Modify the program.
PS0509	TOOL OFFSET COMMAND IS NOT AVAILABLE	- Tool offset (for the lathe system) was specified in the thread cutting block. - Tool offset was specified (lathe system) in the coordinate system rotation mode, or programmable mirror image mode.

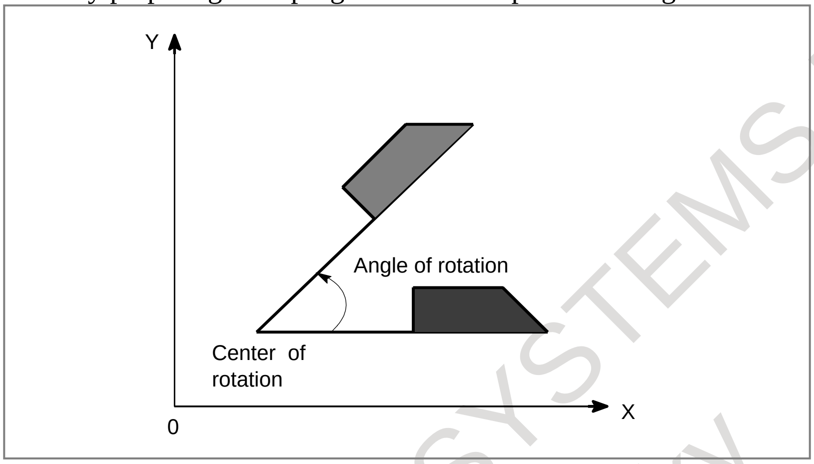
Manual name	Item name
OPERATOR'S MANUAL (B-64694EN)	Scaling

12.14 COORDINATE SYSTEM ROTATION

Overview

A programmed shape can be rotated. By using this function, it becomes possible, for example, to correct the position of a mounted workpiece using a rotation command when the workpiece is placed with some angle rotated from the machine coordinates. Further, when there is a pattern comprising some identical shapes in the positions rotated from a shape, the time required for programming and the length of the program can be reduced by preparing a subprogram of the shape and calling it after rotation.



Parameter

- Angle specification method of coordinate system rotation

	#7	#6	#5	#4	#3	#2	#1	#0
5400								RIN

[Input type] Parameter input
[Data type] Bit path

#0 RIN Coordinate rotation angle command (R) :
0: Specified by an absolute method
1: Specified by an absolute method (G90) or incremental method (G91)

> **NOTE**
> When G code system A of the lathe system is used, it is specified by an absolute method regardless of the setting of this parameter.

- Angular displacement used when no angular displacement is specified for coordinate system rotation

5410	Angular displacement used when no angular displacement is specified for coordinate system rotation

[Input type] Setting input
[Data type] 2-word path
[Unit of data] 0.001 deg
[Valid data range] -360000 to 360000

This parameter sets the angular displacement for coordinate system rotation. When the angular displacement for coordinate system rotation is not specified with address R in the block where G68 is specified, the setting of this parameter is used as the angular displacement for coordinate system rotation.

NOTE

Write this parameter in the rotation cancel (G69) state when it is written by using the applications (such as PMC window, FOCAS2, and C language executor) or the programmable parameter input (G10).
Even if this parameter is written in the rotation mode, it is not immediately enabled.
When the rotation start (G68) that doesn't include the rotation angle (R_) is specified again, it is enabled.

	#7	#6	#5	#4	#3	#2	#1	#0
11600			AX1					

[Input type] Parameter input
[Data type] Bit path

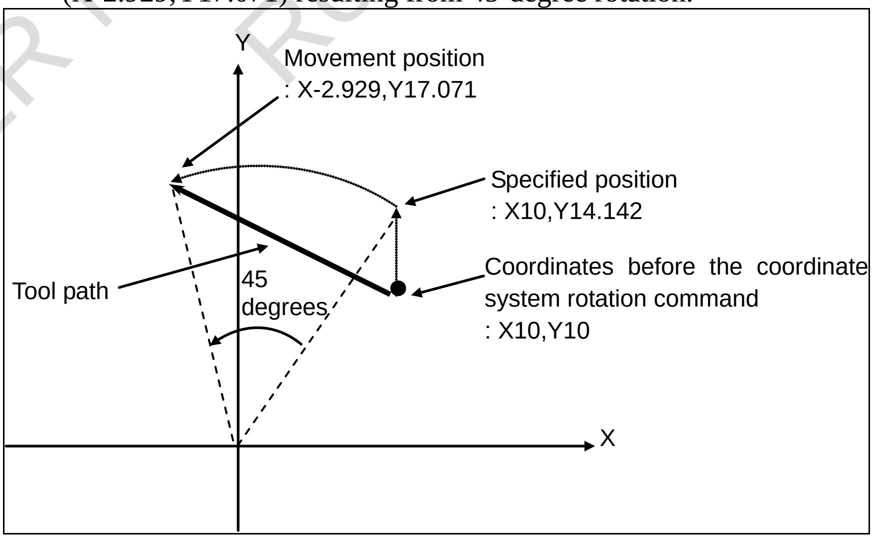
#5 AX1 If, in coordinate system rotation mode, a 1-axis command is issued in absolute mode,

0: First, the specified position is calculated in the coordinate system before rotation, and then the coordinate system is rotated.
1: First, the coordinate system is rotated, and then the tool moves to the specified position in the coordinate system.
(FS16*i*/18*i*/21*i* compatible specification)

[Example] G90 G0 X0 Y0
G01 X10. Y10. F6000
G68 X0 Y0 R45. ....Coordinate system rotation command
Y14.142 ....1-axis command (1)
G69

When the bit 5 (AX1) of parameter No. 11600 is set to 0:

In the coordinate system (XY) before rotation, the specified position is calculated, and then the coordinate system is rotated. Thus, for the command in (1), the position on the X-axis that is not specified is assumed to be X10, so that the specified position is (X10,Y14.142). Then, the tool moves to the movement position (X-2.929,Y17.071) resulting from 45-degree rotation.



When the bit 5 (AX1) of parameter No. 11600 is set to 1:
The command in (1) converts the coordinates before the coordinate system rotation command, (X10,Y10), into the coordinates (X'14.142,Y'0) in the coordinate system rotated by 45 degrees (X'Y'). Then, the tool moves to the specified position (X'14.142,Y'14.142), i.e., the movement position (X0,Y20).

	#7	#6	#5	#4	#3	#2	#1	#0
11630								FRD

[Input type] Parameter input
[Data type] Bit path

#0 FRD The minimum command unit of the rotation angles of coordinate rotation and 3-dimensional coordinate system conversion is:
0: 0.001 degree.
1: 0.00001 degree. (1/100,000)

Alarm and message

Number	Message	Description
PS0144	ILLEGAL PLANE SELECTED	The coordinate rotation plane and arc or tool radius·tool nose radius compensation plane must be the same. Modify the program.
PS0412	ILLEGAL G CODE	During coordinate system rotation, the G code for reference position return (G27, G28, G29, G30) or coordinate system setting (G52 to G59, G92), is specified. Before specifying any of them, cancel the coordinate system rotation mode.
PS0509	TOOL OFFSET COMMAND IS NOT AVAILABLE	- Tool offset (for the lathe system) was specified in the thread cutting block. - Tool offset was specified (lathe system) in the coordinate system rotation mode, or programmable mirror image mode.

Reference item

Manual name	Item name
OPERATOR’S MANUAL (B-64694EN)	Coordinate system rotation

Limitation

- R-specified arc

When an R-specified arc is specified after beginning the coordinate system rotation mode, please specify the command to the start point by the absolute commands in the previous block.

- Specifying during AI high-precision contour control mode or 3-dimensional coordinate system conversion mode

Coordinate system rotation can always be specified for the M series and can be specified for the T series only when the G code system B or C is used.

- Tool offset

T

If tool offset by shifting the coordinate system is specified (by setting bit 2 (LWT) of parameter No. 5002 to 1 or bit 4 (LGT) of parameter No. 5002 to 0) in the coordinate system rotation mode, alarm PS0509, "TOOL OFFSET COMMAND IS NOT AVAILABLE", will occur.
The same alarm will occur if a tool compensation value is modified by setting bit 6 (EVO) of parameter No. 5001.

Caution

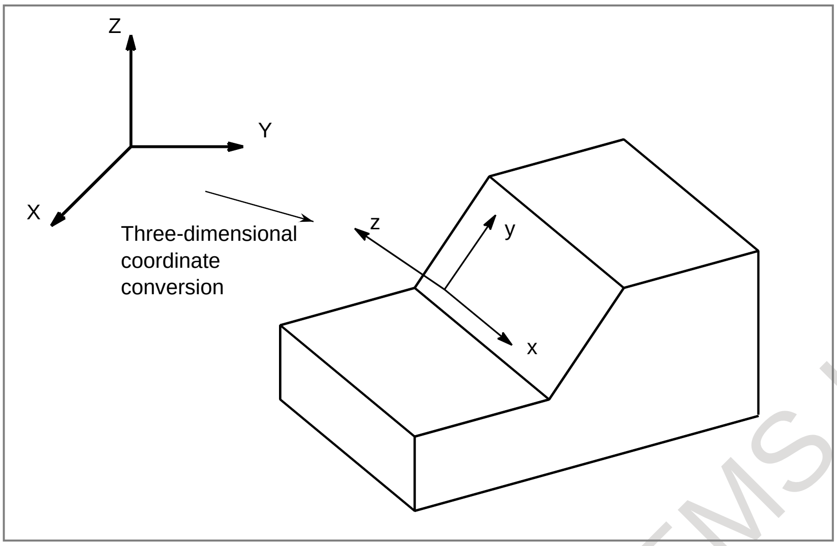
⚠ **CAUTION**

Before specifying the G code for reference position return (G27, G28, G29, G30) or coordinate system setting (G52 to G59, G92), cancel the coordinate system rotation mode. If any of them is specified during coordinate system rotation mode, alarm PS0412, "AN UNUSABLE G CODE WAS USED", will occur.

12.15 3-DIMENSIONAL COORDINATE CONVERSION

Overview

The coordinate system can be rotated about an arbitrary axis by specifying the center of rotation, direction of the axis of rotation, and angular displacement.
This coordinate conversion function is quite useful for 3-dimensional machining on a diesinking machine. By applying this conversion to a program generated for machining on the XY plane, identical machining can be executed on the desired plane.
When rigid tapping is commanded in 3-dimensional coordinate conversion mode, tapping can be done at the angle specified by a 3-dimensional coordinate conversion command. (This is called 3-dimensional rigid tapping.)



Explanation

- Rapid traverse in a canned cycle for drilling

By using bit 1 (D3R) of parameter No. 11221, rapid traverse in the drilling direction in a canned cycle for drilling in the tilted working plane indexing mode or 3-dimensional coordinate conversion mode can be selected and the rapid traverse mode for shift operation in fine boring (G76) or back boring (G87) for the M system can also be selected. When D3R is set to 0, the cutting feed mode is selected; when it is set to 1, the rapid traverse mode is selected. For positioning to the initial level at the start of a canned cycle for drilling, however, the rapid traverse mode is used, regardless of whether D3R is set to 0 or 1. Rapid traverse override can be applied in the rapid traverse mode, and cutting feed override can be applied in the cutting feed mode. D3R can also be used to change the mode of rapid traverse in the rigid tapping direction.

For acceleration/deceleration after interpolation

When bit 1 (D3R) of parameter No. 11221 is set to 1 (for the rapid traverse mode), rapid traverse in the drilling direction in a canned cycle for drilling in the tilted working plane indexing mode or 3-dimensional coordinate conversion mode is accelerated/decelerated along each axis independently according to the time constants specified in parameters Nos. 1620 and 1621. So, when performing positioning of linear interpolation type with D3R set to 1, make the following settings:

Bit 1 of (LRP) of parameter No. 1401=1	Selects positioning of linear interpolation type.
Bit 1 of (PRT) of parameter No. 1603=1	Selects acceleration/deceleration of constant time type.
Parameter No. 1620	Set the same value for all.
Parameter No. 1621	Set the same value for all.

For look-ahead acceleration/deceleration before interpolation

In a canned cycle for drilling, linear rapid traverse in the drilling direction is performed at all times.

Feedrate

When bit 1 (D3R) of parameter No. 11221 is set to 1 (for the rapid traverse mode), the rapid traverse rate in the drilling direction in a canned cycle for drilling in the tilted working plane indexing mode or 3-dimensional coordinate conversion mode is clamped to a parameter value indicated below if the rapid traverse override is 100%. In the rapid traverse override F0 mode, however, the rapid traverse rate is clamped to the value of parameter No. 1421 or a parameter value listed in Table 12.15 (a), whichever smaller.

Table 12.15 (a) Feedrate in the rapid traverse mode

Parameter No. 5412=0	Parameter No. 1420
Parameter No. 5412≠0	Value of parameter No. 1420 or value of parameter 5412, whichever smaller

However, when the external deceleration function is enabled, the feedrate is clamped to a parameter value listed in Table 12.15 (a) that is overridden or an external deceleration speed, whichever smaller.

NOTE
1. Set a rapid traverse rate for each axis in parameter No. 1420 and a tangential rapid traverse rate in parameter No. 5412.
2. If rapid traverse of nonlinear interpolation type is performed, the feedrate is clamped to the value of parameter No. 1420, regardless of the setting of parameter No. 5412.
3. When the cutting feed mode is selected (when bit 1 (D3R) of parameter No. 11221 is set to 0), set a tangential rapid traverse rate in parameter No. 5412.

- Cutting feedrate clamp

The cutting feedrate is clamped so that the feedrate of each real axis after the 3-dimensional coordinate system conversion does not exceed the maximum cutting feedrate（Parameter No.1432 if look-ahead acceleration/deceleration before interpolation is enabled and parameter No.1430 otherwise).

- Interlock signal for each axis direction, interlock signal for each axis, external deceleration signal

When bit 2 (D3IT) of parameter No.11600 is set to 1 and bit 5 (ITM) of parameter No.11223 is set to 1, the following signals are enabled for axis of machine coordinate system.
- Interlock signal for each axis direction during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode
- Interlock signal for each axis during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode
- External deceleration signal during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode
- External deceleration signal during 3-dimensional coordinate conversion

By this setting, all signals of controlled axis type are enabled for axis of machine coordinate system during 3-dimensional coordinate conversion.

Table12.15 (b) Relationship between coordinate system of target axis of each signal during 3-dimensional coordinate conversion (automatic operation) and parameter setting

D3IT	ITM	Interlock for each axis direction	Interlock for each axis	External deceleration
0	-	Programming coordinate system	Interlock all X, Y, Z-axis	Programming coordinate system
1	0	Machine coordinate system	Machine coordinate system	Programming coordinate system
	1	Machine coordinate system	Machine coordinate system	Machine coordinate system

Table12.15 (c) Relationship between coordinate system of target axis of each signal during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode and parameter setting

D3IT	ITM	Interlock for each axis direction	Interlock for each axis	External deceleration
0	-	Programming coordinate system	Programming coordinate system	Programming coordinate system
1	0	Programming coordinate system	Programming coordinate system	Programming coordinate system
	1	Machine coordinate system	Machine coordinate system	Machine coordinate system

- Reset

If a reset occurs during 3-dimensional coordinate system conversion mode, the mode is canceled and the continuous-state G code is changed to G69. Bit 2 (D3R) of parameter No. 5400 determines whether just the G69 code is used to cancel the 3-dimensional coordinate system conversion mode (G68). When this setting is selected, a CNC reset by a reset operation or by an input signal from the PMC will not cancel the 3-dimensional coordinate system conversion mode.

- System variables of skip positions

System variable number and coordinate system of skip are as Table. The coordinate system of #100151- and #151001- changes according to bit 5 (LV3) of parameter No.5400.

Table12.15 (d) Parameter LV3 and coordinate system of skip positions

System variable number	Coordinate system of skip positions	
	Parameter LV3=0	Parameter LV3=1
#100151 -	Workpiece coordinate system	Program coordinate system
#151001 -	Program coordinate system	Workpiece coordinate system
#151101 -	Machine coordinate system	

- Program restart

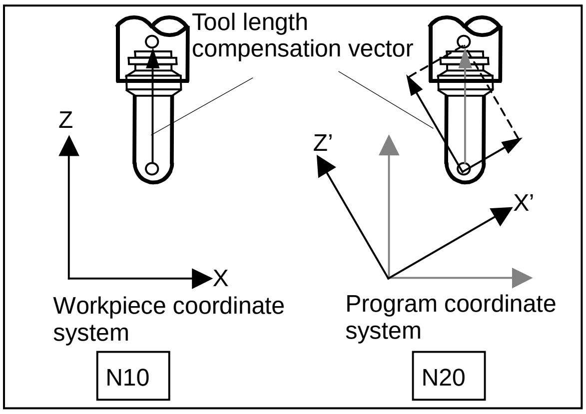
If the block subject to a restart is in 3-dimensional coordinate conversion mode G68 (machining center system)/G68.1 (lathe system), it is possible to select whether the movement of the axes to the restart position should be in the program coordinate system or the workpiece coordinate system, by using bit 1 (3DD) of parameter No.7301. If parameter bit 3DD is 0, the axes move to the restart position one at a time, as seen from the program coordinate system, and if it is 1, they move to the restart position one at a time, as seen from the workpiece coordinate system.
The "DESTINATION" and "DISTANCE TO GO" displays follow the setting of 3DD.
The "ABSOLUTE" display follows the bit 6 (DAK) of parameter No.3106.

- 3-dimensional coordinate system conversion during tool length compensation

By setting bit 3 (TLC) of parameter No. 11221 to 1, 3-dimensional coordinate system conversion can be used during tool length compensation. In this case, the tool length compensation vector is converted to the program coordinate system subject to 3-dimensional coordinate system conversion. This makes machining possible while keeping the tool direction to the Z-axis direction of the workpiece coordinate system.
Tool length compensation and 3-dimensional coordinate system conversion must be nested inside each other.

(Example)

```
----N10 G43 H1 X_ Y_ Z_ ;
        :
  -- N20 G68 X0 Y0 Z0 I0.0 J1.0 K0.0 R-30.0 ;
        :
  -- G69 ;
        :
---- G49 X_ Y_ Z_ ;
```



- Constant surface speed control

Constant surface speed control is exercised by using as the reference the following axis according to bit 6 (3CS) of parameter No.11221. (Refer to the explanation of "CONSTANT SURFACE SPEED CONTROL" for details)

- 3CS=0 : the machine axis specified in address P in a G96 block or the machine axis (in the actually operating workpiece coordinate system) set in parameter No.3770.
- 3CS=1 : the axis in the feature coordinate system

- Angular displacement R

A positive angular displacement R indicates a clockwise rotation along the axis of rotation. Specify angular displacement R in 0.001 degrees within the range of -360000 to 360000.
To specify angular displacement R in 0.00001 degrees (one hundred-thousandth), set bit 0 (FRD) of parameter No.11630 to 1. In this case, angular displacement R is specified within the range of -36000000 to 36000000.

Limitation

- Manual reference position return

An attempt to make a manual reference position return during the 3-dimensional coordinate conversion mode results in alarm PS5324, "REFERENCE RETURN INCOMPLETE", being issued. Before attempting to make a manual reference position return, cancel the 3-dimensional coordinate conversion mode.

- Positioning by optimum accelerations

The function for positioning by optimum accelerations is disabled during the 3-dimensional coordinate system conversion mode.

T

- Relationship between 3-dimensional coordinate system conversion and tool offset

When using a tool offset command, nest the tool offset command within the 3-dimensional coordinate system conversion mode.
(Example)

```
G68.1 X100.0 Y100.0 Z100.0 I0.0 J0.0 K1.0 R45.0 ;
  :
T0101;
  :
T0100;
  :
G69.1 ;
```

When tool geometry and wear compensation with coordinate shift is enabled and it is not canceled by reset, if tool geometry and wear compensation is executed in 3-dimensional coordinate system conversion mode, 3-dimensional coordinate system conversion is not canceled by reset. (Even if it is a setting that 3-dimensional coordinate system conversion is canceled by reset (parameter D3R(No.5400#2)=0), it is not canceled.)

- PMC axis control

If a command related to 3-dimensional coordinate conversion is specified during PMC axis control, the alarm PS5131 is issued.

Signal

3-dimensional coordinate system conversion manual interruption switch signal M3R<Gn031.3>

[Classification] Input signal

[Function] Specifies whether to apply 3-dimensional coordinate system conversion to a manual operation (manual continuous feed, manual incremental feed, or manual handle feed) in the 3-dimensional coordinate conversion mode.

[Operation] When this signal is set to 0, 3-dimensional coordinate system conversion is not applied (the workpiece coordinate system is used).
When this signal is set to 1, 3-dimensional coordinate system conversion is applied (the program coordinate system is used).

3-dimensional coordinate conversion mode signal D3ROT<Fn062.6>

[Classification] Output signal

[Function] Posts whether the 3-dimensional coordinate conversion mode is set.

[Output cond.] When this signal is set to 1, the 3-dimensional coordinate conversion mode is set.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn031					M3R			

	#7	#6	#5	#4	#3	#2	#1	#0

Parameter

- Setting relative position and absolute position

	#7	#6	#5	#4	#3	#2	#1	#0
3104	DAC							
	DAC	DAL		DRL				

[Input type] Parameter input

[Data type] Bit path

#4 DRL Relative position
- 0: The actual position displayed takes into account tool length offset.
- 1: The programmed position displayed does not take into account tool length offset.

#6 DAL Absolute position
0: The actual position displayed takes into account tool length offset.
1: The programmed position displayed does not take into account tool length offset.

> **NOTE**
> In lathe systems, whether to exclude a tool offset when displaying the absolute position is determined by the setting of bit 1 (DAP) of parameter No. 3129.

#7 DAC When an absolute position are displayed:
0: Values not excluding the amount of travel based on cutter compensation and tool nose radius compensation are displayed.
1: Values excluding the amount of travel based on cutter compensation and tool nose radius compensation (programmed positions) are displayed.

> **NOTE**
> When the parameter DAC is set to 1, in a command such as circle interpolation where the cutter compensation vector is changed constantly, an absolute position is not correctly displayed during its interpolation except its start point and its end point.

- Setting absolute coordinates in the 3-dimensional coordinate conversion mode

	#7	#6	#5	#4	#3	#2	#1	#0
3106		DAK						

[Input type] Setting input
[Data type] Bit

#6 DAK Specifies whether to display coordinates in the program coordinate system or workpiece coordinate system as absolute coordinates when the 3-dimensional coordinate conversion mode or the tilted working plane indexing mode is set.
0: Display coordinates in the program coordinate system.
1: Display coordinates in the workpiece coordinate system.

	#7	#6	#5	#4	#3	#2	#1	#0
5007	3OF	3OC						

[Input type] Parameter input
[Data type] Bit path

#6 3OC If tool length compensation is not cancelled before 3-dimensional coordinate conversion is specified, an alarm is:
0: Not raised.
1: Raised. (Alarm (PS0049) “ILLEGAL COMMAND(G68,G69)”)

#7 3OF If 3-dimensional coordinate conversion is not nested with a command for tool length compensation, or if 3-dimensional coordinate conversion is specified during tool length compensation and another command for tool length compensation is specified:
0: No alarm is issued.
1: The alarm (PS0049) “ILLEGAL COMMAND(G68,G69)” is issued.

Example 1) An alarm is raised in the following cases:

```
1) G68 X_ Y_ Z_ I_ J_ K_ R_ ;
     :
   G43 H1 ;
     :
   G69 ;                          ← PS0049 raised
     :
   G49 ;
2) G43 H1 ;
     :
   G68 X_ Y_ Z_ I_ J_ K_ R_ ;
     :
   G49(G43H2,H2 etc.) ;           ← PS0049 raised
     :
   G69 ;
```

Example 2) No alarm is raised in the following cases:

```
3) G68 X_ Y_ Z_ I_ J_ K_ R_ ;
     :
   G43 H1 ;
     :
   G49 ;
     :
   G69 ;
4) G43 H1 ;
     :
   G68 X_ Y_ Z_ I_ J_ K_ R_ ;
     :
   G69 ;
     :
   G49 ;
```

> **NOTE**
> A command to cancel tool length compensation (G28, etc.) will not cause an alarm to be raised. If such a command is specified in the G68 mode, program as indicated in 3) above.
>
> ```
> G43 H1 ;
>   :
> G68 X_ Y_ Z_ I_ J_ K_ R_ ;
>   :
> G28 X_ Y_ Z_ ;                 ← Offset is cancelled.
>   :                              No alarm is raised.
> G69 ;
> ```

	#7	#6	#5	#4	#3	#2	#1	#0
5400			LV3			D3R		

[Input type] Parameter input
[Data type] Bit path

#2 D3R When Reset is done by reset operation or reset signal from PMC, 3-dimensional coordinate system conversion mode and tilted working plane indexing mode is:
0: Canceled.
1: Not canceled.

#5 LV3 When system variables #100101 to #100132 (current position coordinates) and #100151 to #100182 (skip coordinates) are read in the 3-dimensional coordinate conversion mode or tilted working plane indexing mode:
0: Coordinates of the workpiece coordinate system can be read.
1: Coordinates of the program coordinate system after 3-dimensional coordinate conversion or tilted working plane indexing can be read.
This parameter applies also to system variables #5041 to #5060 (current position coordinates) and #5061 to #5080 (skip coordinates).

5412	Rapid traverse rate for canned cycle for drilling in 3-dimensional coordinate conversion mode

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
This parameter sets a rapid traverse rate for canned cycle for drilling in the 3-dimensional coordinate conversion mode or the tilted working plane indexing mode.

	#7	#6	#5	#4	#3	#2	#1	#0
7301							3DD	

[Input type] Parameter input
[Data type] Bit path

#1 3DD In program restart operation, when the restart block is in 3-dimensional coordinate conversion mode G68 (machining center system) or G68.1 (lathe system), the tool moves to the restart point along each axis:
0: According to the program coordinate system in dry run.
1: According to the workpiece coordinate system in dry run.
The restart coordinates and restart travel distance are also displayed in the coordinate system set in this parameter.

NOTE
The change made to this parameter during program restart operation is ignored.

	#7	#6	#5	#4	#3	#2	#1	#0
11216								D3O

[Input type] Parameter input
[Data type] Bit path

#0 D3O When the bit 1 (D3M) of parameter No.11600 set to “1” and Override is 0%, during Tilted working plane indexing or 3-dimensional coordinate system conversion mode, the axis moving signals “MV1 to MV8<Fn102>” :
- 3-dimensional coordinate system conversion
- Tilted working plane indexing
0: becomes 0.
1: maintains the state of “1”.

NOTE
When the manual operation (Jog feed / Incremental feed / Manual handle interrupt)is being executed, the bit 0 (D3O) of parameter No.11216 become invalid. It becomes operation corresponding to D3O=0.

	#7	#6	#5	#4	#3	#2	#1	#0
11221		3CS			TLC	3DW	D3R	

[Input type] Parameter input
[Data type] Bit path

#1 D3R In the 3-dimensional coordinate system conversion mode or tilted working plane indexing mode, rapid traverse in canned cycle for drilling is:
0: Performed in the cutting feed mode.
1: Performed in the rapid traverse mode.

#2 3DW If, in the 3-dimensional coordinate system conversion mode, workpiece coordinate system selection using a G code is specified, the selection:
0: Operates in accordance with conventional specifications. (The workpiece coordinate system difference is reflected in the program coordinate system direction.)
1: Operates in accordance with the same specifications as those of workpiece coordinate system selection (bit 6 (3TW) of parameter No. 1205 = 1) during the tilted working plane indexing command. (The workpiece coordinate system difference is reflected in the workpiece coordinate system direction.)

⚠ **CAUTION**
If this parameter is set to 1, only G54 to G59 and G54.1 can be specified. If G52 and G92 are specified, alarm PS5462, "ILLEGAL COMMAND (G68.2/G69)" is issued.
If G54 to G59 and G54.1 are specified, buffering is suppressed.

#3 TLC During tool length compensation, 3-dimensional coordinate conversion:
0: Cannot be used.
1: Can be used.

#6 3CS The spindle speed calculation of constant surface speed control during the 3-dimensional coordinate system conversion / the tilted working plane indexing is :
0: Based on the workpiece coordinate system.
1: Based on the program coordinate system (3-dimensional coordinate system conversion) / the feature coordinate system (Tilted working plane indexing).

	#7	#6	#5	#4	#3	#2	#1	#0
11223			ITM					

[Input type] Parameter input
[Data type] Bit path

#5 ITM When bit 2 (D3IT) of parameter No.11600 = 1, during 3-dimensional coordinate conversion, the following signals are:
0: Enabled for axis of programming coordinate system.
1: Enabled for axis of machine coordinate system.
(Intended signals)

- Interlock signal for each axis direction during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode
- Interlock signal for each axis during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode
- External deceleration signal during manual intervention / manual handle interrupt in 3-dimensional coordinate system conversion mode
- External deceleration signal during 3-dimensional coordinate conversion

	#7	#6	#5	#4	#3	#2	#1	#0
11600				D3A		D3IT	D3MV	

[Input type] Parameter input
[Data type] Bit path

#1 D3MV In following modes, axis moving signals MV1 to MV8 <Fn102> is:
- 3-dimensional coordinate system conversion
- Tilted working plane indexing

0: The signals for axes on programming coordinate system.
1: The signals for axes on workpiece coordinate system.

#2 D3IT In the 3-dimensional coordinate system conversion mode, the valid interlock signals (interlock signal for each axis (*ITx) or interlock signal for each axis direction (MITx, PITx)) are:

0: The signals for all of the target axes for 3-dimensional coordinate system conversion.
1: The signals for axes along which a movement is made during 3-dimensional coordinate system conversion.

(Example)
In case of this parameter is set to 0:
When interlock signal for each axis (X-axis) is enabled, all axes for 3-dimensional coordinate system conversion are interlocked.
When interlock signal for each axis direction (+X-axis) is enabled, the axis is interlocked in +X direction of programming coordinate system of 3-dimensional coordinate system conversion.
In case of this parameter is set to 1:
When interlock signal for each axis (X-axis) is enabled, the X axis is interlocked in machine coordinate system.

#4 D3A In 3-dimensional coordinate system conversion cancellation, if the compensation vector has not been canceled:

0: Alarm PS5462, "ILLEGAL COMMAND (G68.2/G69)", is issued.
1: No alarm is issued.

	#7	#6	#5	#4	#3	#2	#1	#0
11630								FRD

[Input type] Parameter input
[Data type] Bit path

#0 FRD The minimum command unit of the rotation angles of coordinate rotation and 3-dimensional coordinate system conversion is:

0: 0.001 degree.
1: 0.00001 degree. (1/100,000)

	#7	#6	#5	#4	#3	#2	#1	#0
19602			D3D					

[Input type] Parameter input
[Data type] Bit path

#5 D3D Specifies whether to display the distance to go in the program coordinate system or workpiece coordinate system during the 3-dimensional coordinate system conversion or the tilted working plane indexing.
0: Display the distance to go in the program coordinate system.
1: Display the distance to go in the workpiece coordinate system.

Alarm and message

Number	Message	Description
PS0047	ILLEGAL AXIS SELECT	Two or more parallel axes (in parallel with a basic axis) have been specified upon start-up of 3-dimensional coordinate conversion.
PS0048	BASIC 3 AXIS NOT FOUND	Start-up of 3-dimensional coordinate conversion has been attempted, but the three basic axes used when Xp, Yp, or Zp is omitted are not set in parameter No. 1022.
PS5043	TOO MANY G68 NESTING	3-dimensional coordinate conversion has been specified three or more times. To perform another coordinate conversion, perform cancellation, then specify the coordinate conversion.
PS5044	G68 FORMAT ERROR	Errors for 3-dimensional coordinate conversion command are: (1) No I, J, or K command was issued in 3-dimensional coordinate conversion command block. (2) All of I, J, or K command were 0 in 3-dimensional coordinate conversion command block. (3) No rotation angle R was commanded in 3-dimensional coordinate conversion command block.
PS5131	NC COMMAND IS NOT COMPATIBLE	The PMC axis control and 3-dimensional coordinate conversion or polar coordinate interpolation were specified simultaneously. Modify the program or ladder.
PS5324	REFERENCE RETURN INCOMPLETE	No manual reference position return can be made during 3-dimensional coordinate conversion or tilted working plane indexing execution.

12.16 TILTED WORKING PLANE INDEXING

12.16.1 Tilted Working Plane Indexing

Overview

Programming for creating holes, pockets, and other figures in a datum plane tilted with respect to the workpiece would be easy if commands can be specified in a coordinate system fixed to this plane (called a feature coordinate system). This function enables commands to be specified in the feature coordinate system. The feature coordinate system is defined in the workpiece coordinate system.
For explanations about the relationship between the feature coordinate system and workpiece coordinate system, see Fig. 12.16.1 (a).

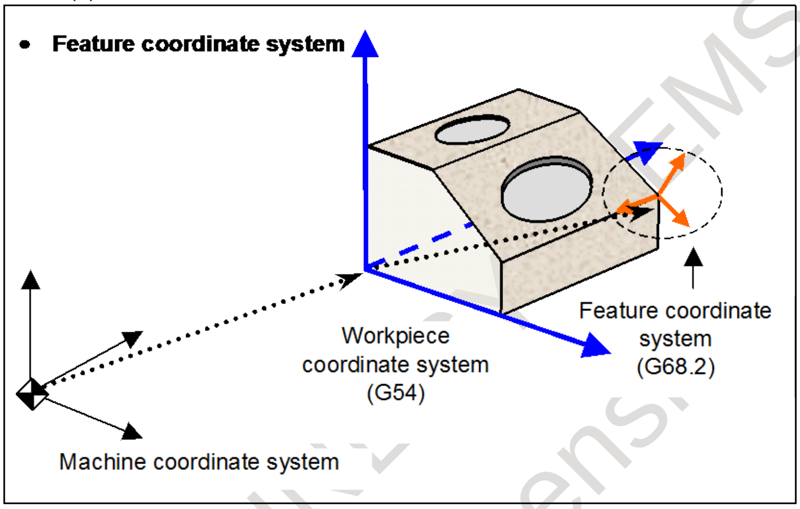

Fig. 12.16.1 (a) Feature coordinate system

The G68.2 command causes the programming coordinate system to switch to the feature coordinate system. The commands in all subsequent blocks are assumed to be specified in the feature coordinate system until G69 appears.
If G68.2 specifies the relationship between the feature coordinate system and the workpiece coordinate system, G53.1 automatically specifies the +Z direction of the feature coordinate system as the tool axis direction even if no angle is specified for the rotation axis. (See Fig. 12.16.1 (c).)
For explanations about the tool axis direction, see Fig. 12.16.1 (b).

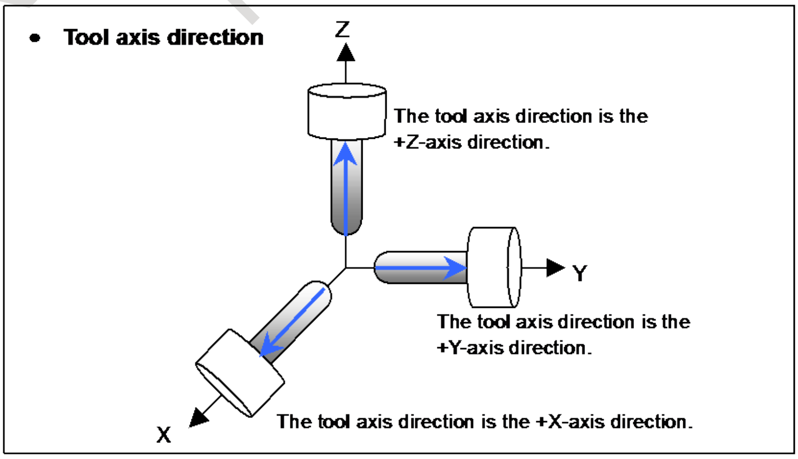

Fig. 12.16.1 (b) Tool axis direction

This function regards the direction normal to the machining plane as the +Z-axis direction of the feature coordinate system. After the G53.1 command, the tool is controlled so that it remains perpendicular to the machining plane.

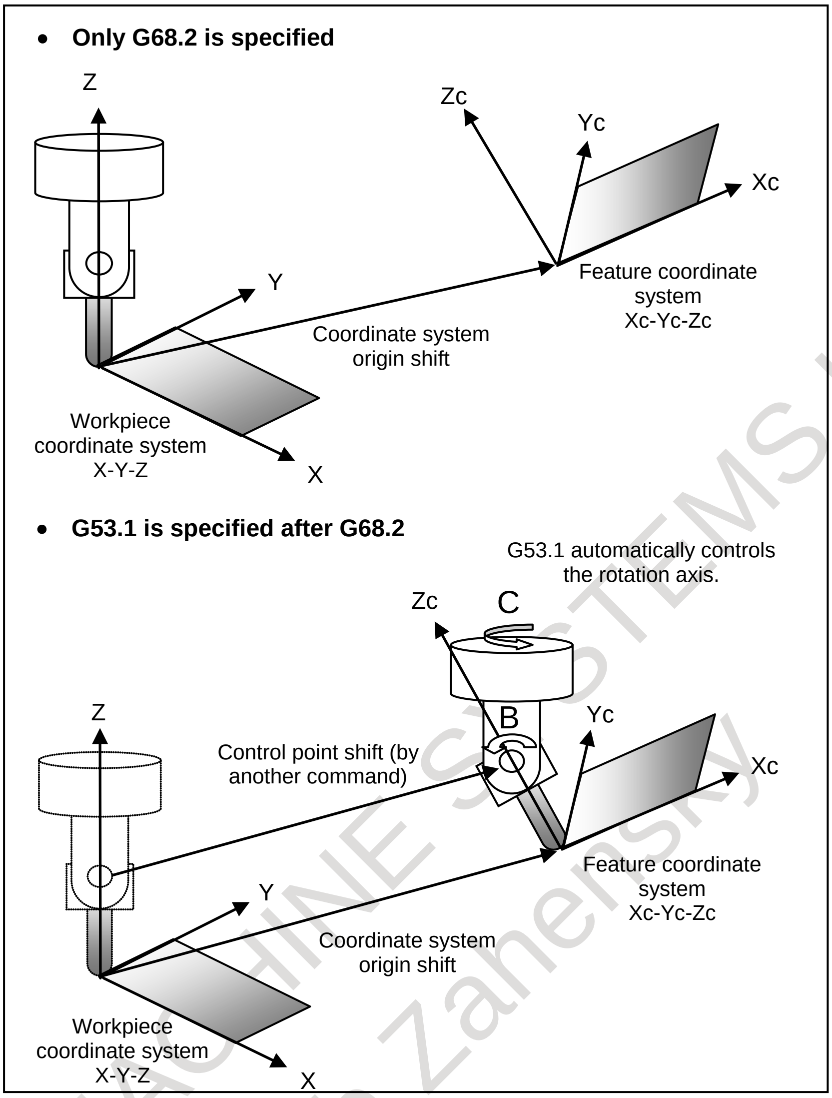

Fig. 12.16.1 (c) G68.2 and G53.1 commands

This function is applicable to the following machine configurations. (See Fig. 12.16.1 (d).)
<1> Tool rotation type machine controlled with two tool rotation axes
<2> Table rotation type machine controlled with two table rotation axes
<3> Composite type machine controlled with one tool rotation axis and one table rotation axis

The function can also be used for a machine configuration in which the rotation axis for controlling the tool does not intersect the rotation axis for controlling the table.

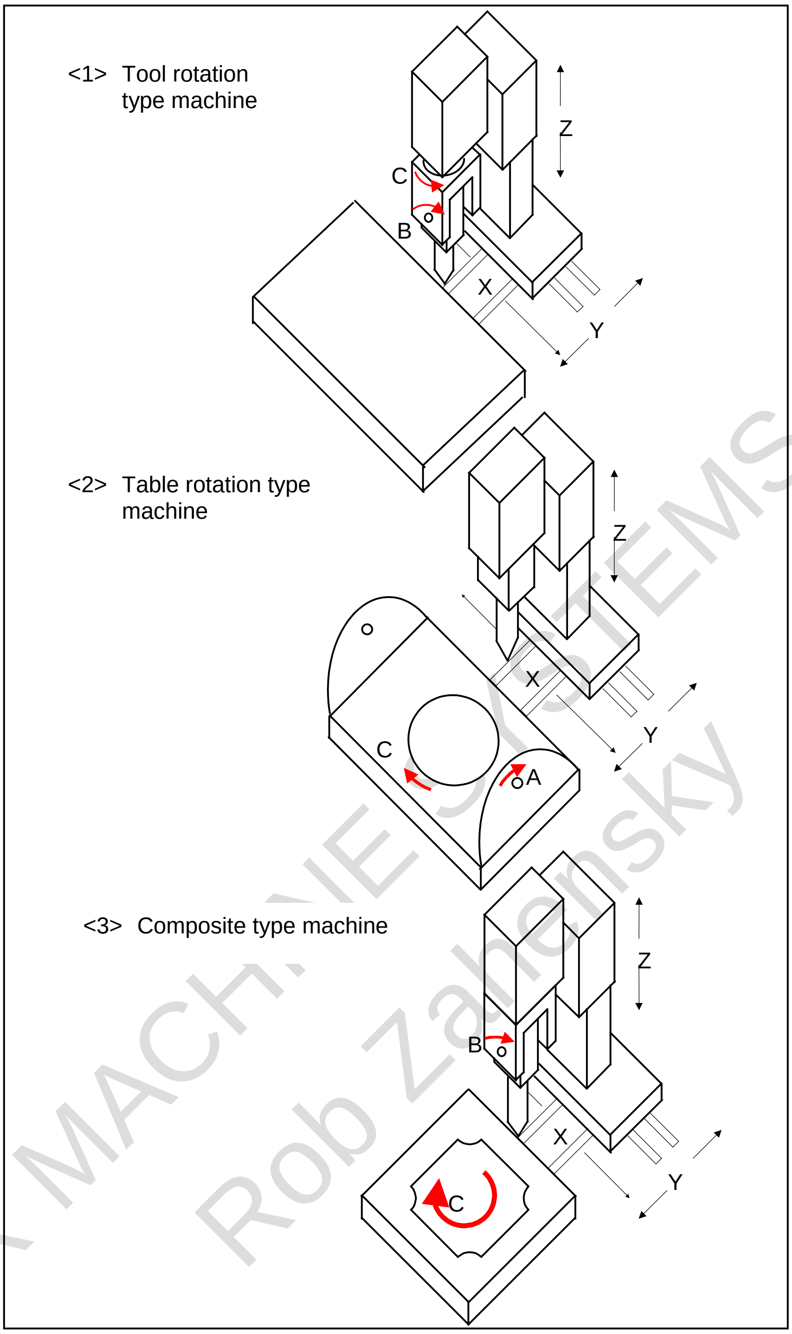

Fig. 12.16.1 (d) Three types of 5-axis machine

12.16.1.1 Tilted working plane indexing based on Eulerian angle

- Coordinate conversion using an Euler's angle

Coordinate conversion by rotation is assumed to be performed around the workpiece coordinate system origin.

Let the coordinate system obtained by rotating the workpiece coordinate system around the Z-axis by an angle of α degrees be coordinate system 1. Similarly, let the coordinate system obtained by rotating coordinate system 1 around the X'-axis by an angle of β be coordinate system 2. The feature coordinate system is the coordinate system obtained by shifting the coordinate system that is obtained by rotating coordinate system 2 around the Z"-axis through an angle of γ degrees from the workpiece coordinate system origin by (Xo, Yo, Zo).

Fig. shows the relationship between the workpiece coordinate system and the feature coordinate system. The figure also gives examples of displacement on the X-Y plane.

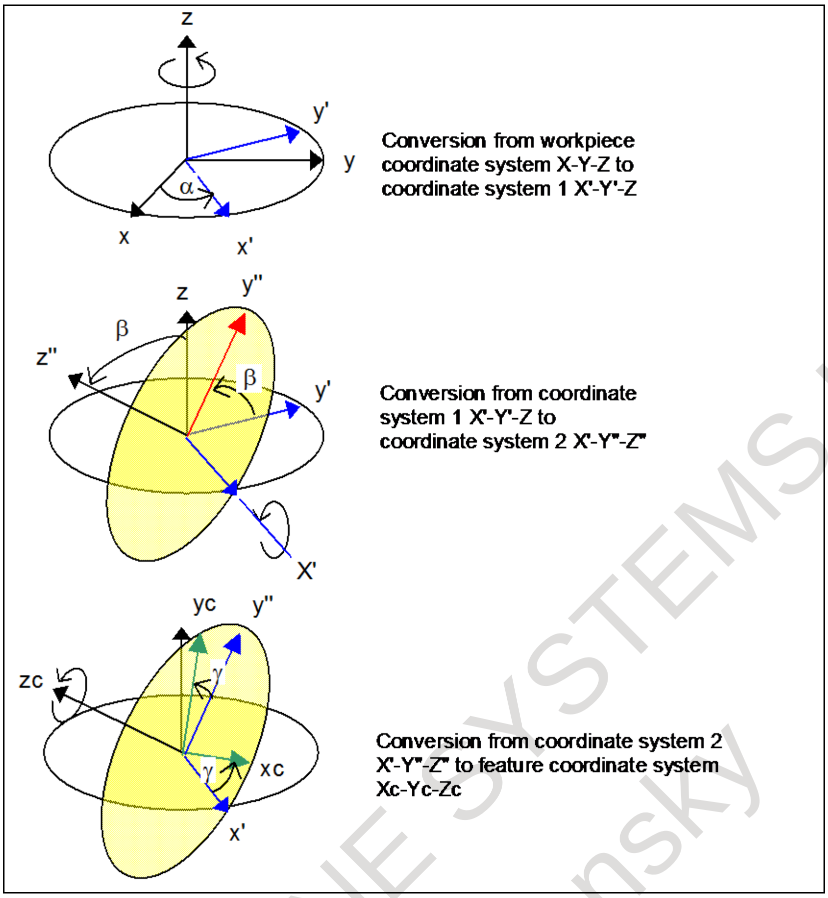

Fig. 12.16.1.1 (a) Coordinate conversion using an Euler's angle

- I0 J0 K0 command

When I0 J0 K0 is specified as an Euler's angle, the alarm PS5457, "G68.2/G68.3 FORMAT ERROR" usually occurs. When bit 1 (ATW) of parameter No. 13451 is set to 1, the feature coordinate system with a tilted angle of 0 degree is used.

12.16.1.2 General specifications of the tilted working plane indexing

- Constant surface speed control

Constant surface speed control is exercised by using as the reference the following axis according to bit 6 (3CS) of parameter No.11221. (Refer to the explanation of "CONSTANT SURFACE SPEED CONTROL" for details)

- 3CS=0 : the machine axis specified in address P in a G96 block or the machine axis (in the actually operating workpiece coordinate system) set in parameter No. 3770.
- 3CS=1 : the axis in the feature coordinate system

- Rapid traverse in a canned cycle for drilling

By using bit 1 (D3R) of parameter No. 11221, rapid traverse in the drilling direction in a canned cycle for drilling during the tilted working plane indexing mode, 3-dimensional coordinate system conversion mode can be selected and the rapid traverse mode for shift operation in fine boring (G76) or back boring (G87) for the M system can also be selected. When parameter D3R is set to 0, the cutting feed mode is selected. When parameter D3R is set to 1, the rapid traverse mode is selected. For positioning to the initial level at the start of a canned cycle for drilling, however, the rapid traverse mode is used, regardless of the setting of parameter D3R. Rapid traverse override is applied during the rapid traverse mode, and cutting feed override is applied during the cutting feed mode. Parameter D3R is also usable to change the mode of rapid traverse in the rigid tapping direction.

For acceleration/deceleration after interpolation

When parameter D3R is set to 1 (for the rapid traverse mode), rapid traverse in the drilling direction in a canned cycle for drilling during the tilted working plane indexing mode, 3-dimensional coordinate system conversion mode is accelerated/decelerated on each axis independently according to the time constants specified in parameter No. 1620 and parameter No. 1621. So, when performing positioning of linear interpolation type with parameter D3R set to 1, make the following settings:

Bit 1 (LRP) of parameter No. 1401=1		Selects positioning of linear interpolation type.
Bit 4 (PRT) of parameter No. 1603=1		Selects acceleration/deceleration of constant time type.
Parameter No. 1620	(Tab)	Set the same value for all.
Parameter No. 1621	(Tab)	Set the same value for all.

For look-ahead acceleration/deceleration before interpolation

In a canned cycle for drilling, linear rapid traverse in the drilling direction is performed at all times.

Feedrate

When parameter D3R is set to 1 (for the rapid traverse mode), the rapid traverse rate in the drilling direction in a canned cycle for drilling during the tilted working plane indexing mode, 3-dimensional coordinate system conversion mode is clamped to a parameter value indicated below if the rapid traverse override is 100%. In the rapid traverse override F0 mode, however, the rapid traverse rate is clamped to the value of parameter No. 1421 or a parameter value in Table , whichever smaller.

Table 12.16.1.2 (a) Feedrate for rapid traverse mode

Parameter No. 5412=0	Parameter No. 1420
Parameter No. 5412≠0	Value of parameter No. 1420 or value of parameter No. 5412, whichever smaller

However, when the external deceleration function is enabled, the feedrate is clamped to a parameter value in Table that is overridden or an external deceleration speed, whichever smaller.

NOTE

1. Set a rapid traverse rate for each axis in parameter No. 1420, and set a tangential rapid traverse rate in parameter No. 5412.
2. If rapid traverse of nonlinear interpolation type is performed, the feedrate is clamped to the value of parameter No. 1420, regardless of the setting of parameter No. 5412.
3. When the cutting feed mode is selected (parameter D3R = 0), set a tangential rapid traverse rate in parameter No. 5412.

- Workpiece coordinate system selection command during the tilted working plane indexing

By executing the workpiece coordinate system selection command (G54 to G59, G54.1) during the tilted working plane indexing when bit 6 (3TW) of parameter No. 1205 is 1, it is possible to change the workpiece coordinate system. In this case, the coordinate system zero point shift of the tilted working plane indexing is maintained.

If an attempt is made to execute the workpiece coordinate system selection command (G54 to G59, G54.1) during the tilted working plane indexing when bit 6 (3TW) of parameter No. 1205 is 0, alarm PS5462, “ILLEGAL COMMAND (G68.2/G69)” is issued.

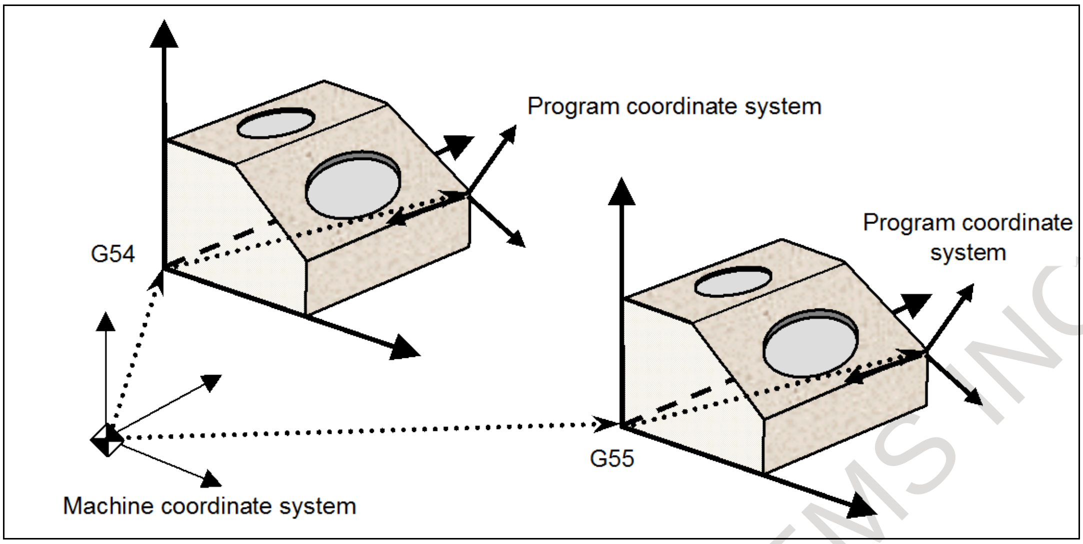

Fig. 12.16.1.2 (a) Workpiece coordinate system selection command during the tilted working plane indexing

- Minimum command unit of rotation angles

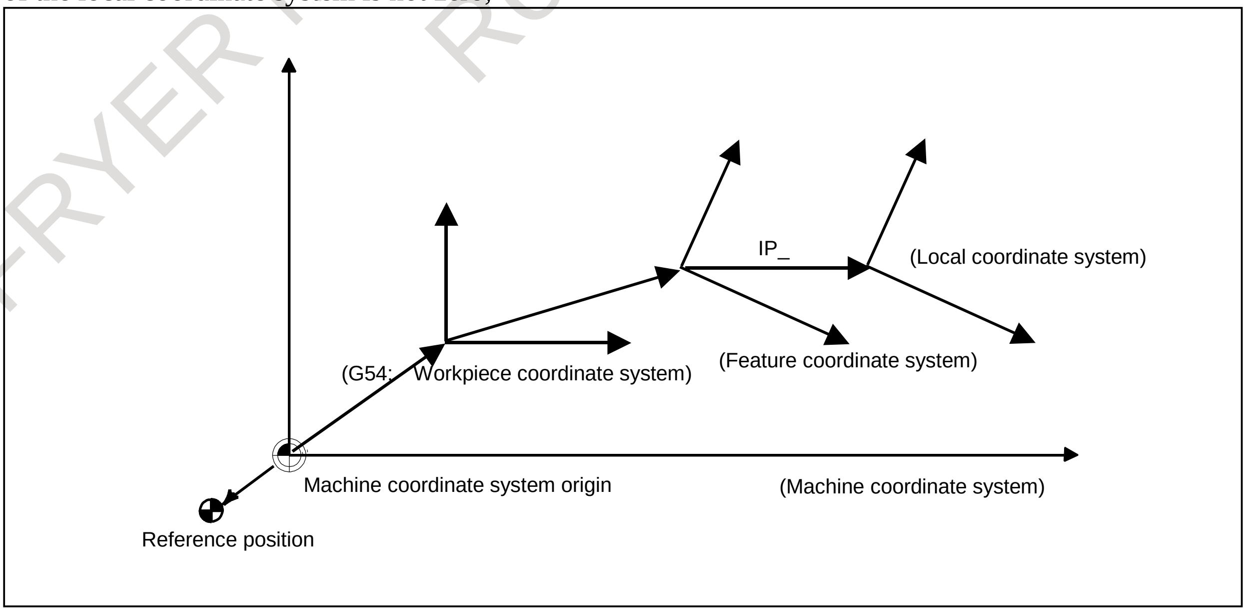
The minimum command unit of the rotation angles (I, J, K, and R) of the tilted working plane indexing is 0.001 degree regardless of the increment system. By setting bit 2 (TFR) of parameter No. 11630 to 1, the minimum command unit of the rotation angles can be set to 0.00001 degree.

- Cutting feedrate clamp

The cutting feedrate is clamped so that the feedrate of each real axis after the conversion by the tilted working plane indexing does not exceed the maximum cutting feedrate (Parameter No.1432 if look-ahead acceleration/deceleration before interpolation is enabled and parameter No.1430 otherwise).

- Local Coordinate System

The local coordinate system is available to the feature coordinate system during the tilted working plane indexing.
X,Y,Z commands of the local coordinate system command block defines a local coordinate system that the feature coordinate system is translated in X,Y,Z direction.
Alarm PS5462 occurs when the tilted working plane indexing is specified on the condition that the offset of the local coordinate system is not zero,



12.16.1.3 Tilted working plane indexing based on roll-pitch-yaw

Overview

With the tilted working plane indexing, coordinate system conversion by rotation about the X-axis, Y-axis, and Z-axis of a workpiece coordinate system in this order can be used (roll-pitch-yaw).
The order of rotary axes can be specified using address Q.

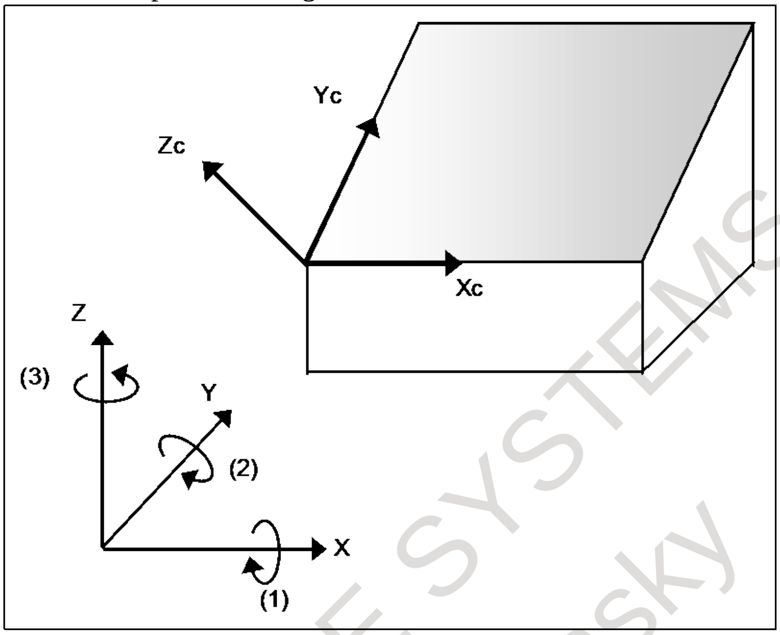


Fig. 12.16.1.3 (a) Tilted working plane indexing based on roll-pitch-yaw

Explanation

Suppose that the coordinate system is rotated about (1) the X-axis, (2) the Y-axis, and (3) the Z-axis in this order.

A "workpiece coordinate system" rotated by angle α about the X-axis is "coordinate system 1".

"Coordinate system 1" rotated by angle β about the Y-axis is "coordinate system 2". "Coordinate system 2" rotated by angle γ about the Z-axis then shifted by (X_0,Y_0,Z_0) from the workpiece coordinate system origin is a "feature coordinate system".

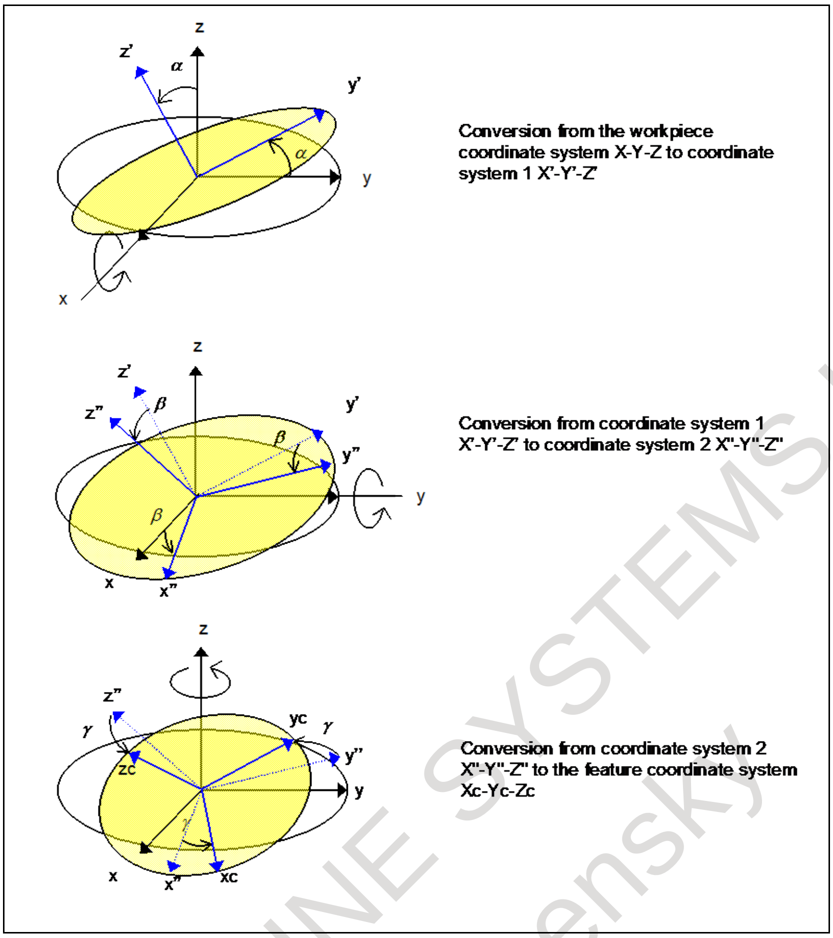

Fig. 12.16.1.3 (b) Determination of a feature coordinate system

12.16.1.4 Tilted working plane indexing based on three points

Overview

With the tilted working plane indexing, a tilted working plane can be specified by specifying three points in a feature coordinate system.

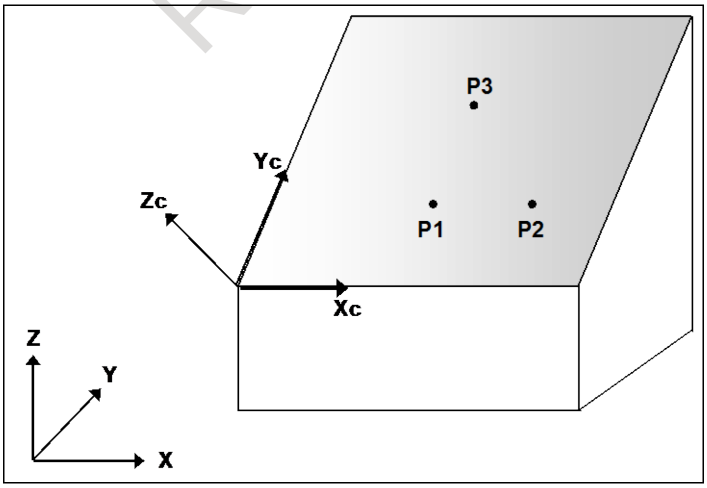

Fig. 12.16.1.4 (a) Tilted working plane indexing based on three points

Explanation

- Determination of a feature coordinate system

Three entered points are named P1, P2, and P3 in the order of entry.
The P1-to-P2 direction is defined as the X-axis of a feature coordinate system. Among the directions that are on the plane containing the three points and are normal to the X-axis of the feature coordinate system, the direction that makes a smaller angle with the P1-to-P3 vector is defined as the Y-axis of the feature coordinate system. The Z-axis of the feature coordinate system is defined according to the right-handed system.

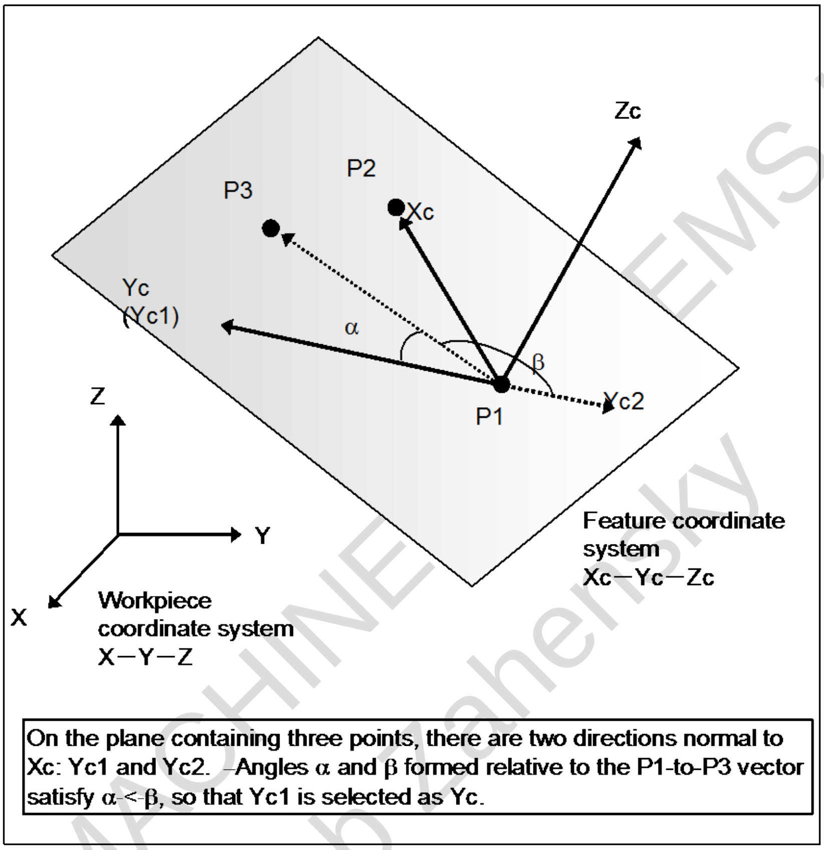

Fig. 12.16.1.4 (b) Determination of a feature coordinate system

- Origin of the feature coordinate system

The origin of the feature coordinate system is the first specified point P1.
By setting an origin shift amount (G68.2 P2 Q0 X_Y_Z_), the origin of the feature coordinate system is shifted by (X,Y,Z) from P1. Specify (X,Y,Z) in the feature coordinate system.

- Angular displacement R

The angular displacement R is positive for clockwise rotation viewed in the Z-axis direction in the feature coordinate system.

12.16.1.5 Tilted working plane indexing based on two vectors

Overview

With the tilted working plane indexing, a tilted working plane can be specified by specifying an X-axis direction vector and a Z-axis direction vector in the feature coordinate system.

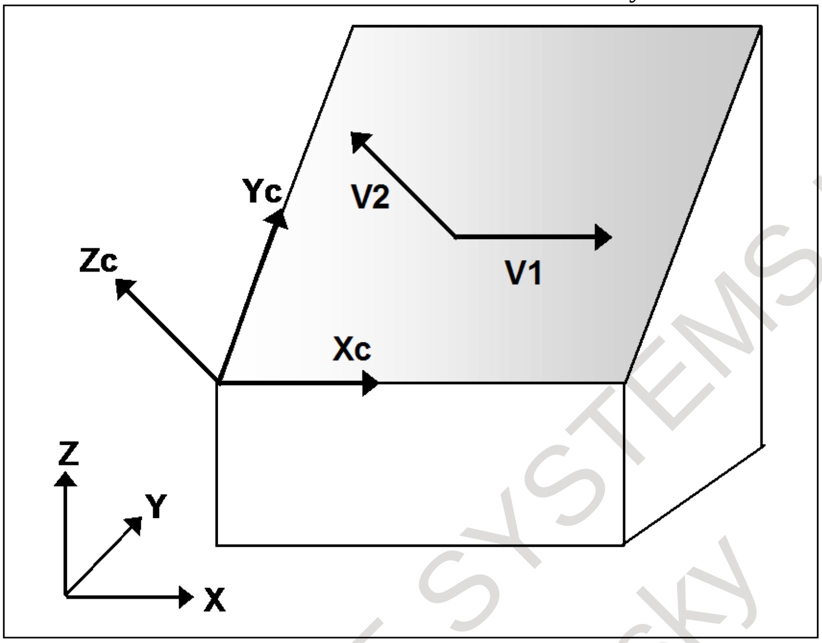

Fig. 12.16.1.5 (a) Tilted working plane indexing based on two vectors

Explanation

- Determination of a feature coordinate system

The first vector is defined as the X-axis of the feature coordinate system, and the second vector is defined as the Z-axis of the feature coordinate system. The Y-axis of the feature coordinate system is defined according to the right-handed system.

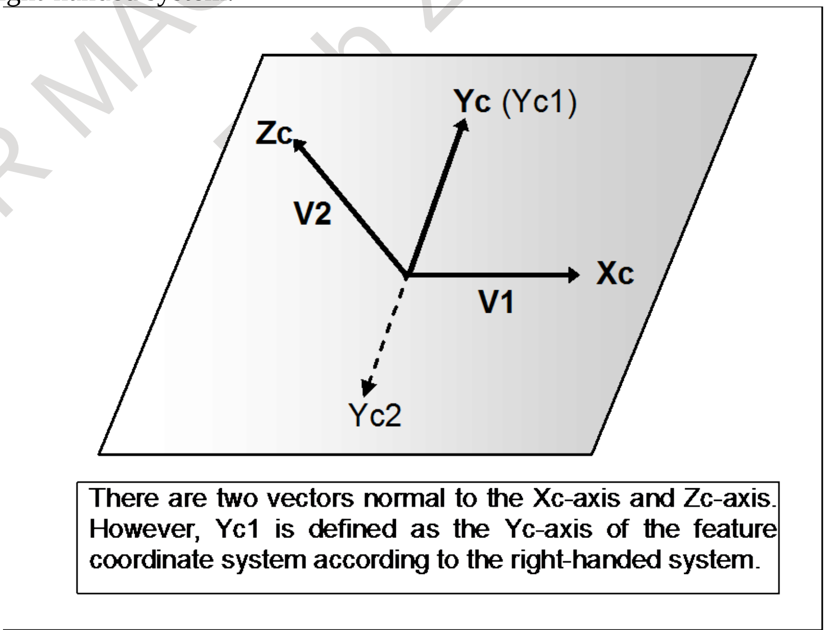

Fig. 12.16.1.5 (b) Determination of a feature coordinate system

- When the first and second vectors are not normal

When the first vector and second vector are not normal, the orthographical vector from the second vector to plane P normal to the first vector is defined as the Z-axis of the feature coordinate system.

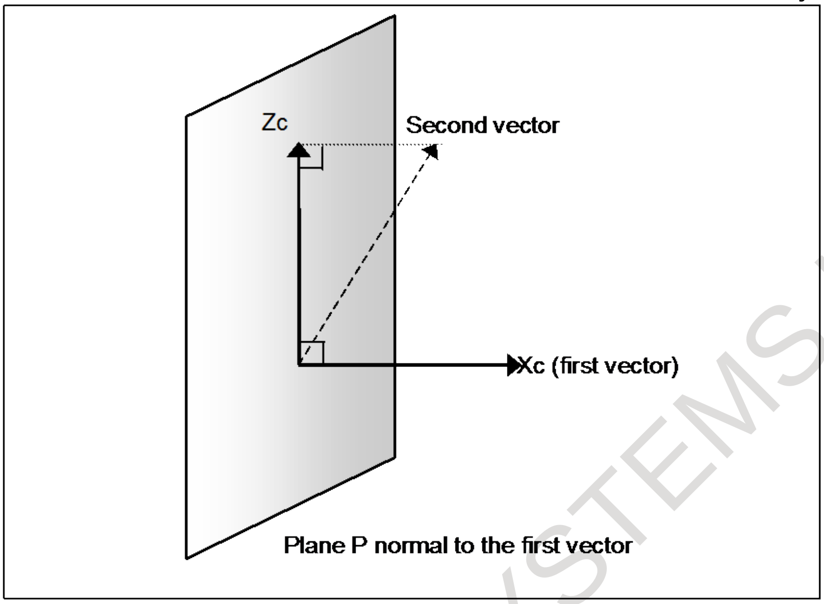

Fig. 12.16.1.5 (c) When the first and second vectors are not normal

12.16.1.6 Tilted working plane indexing based on projection angles

Overview

With the tilted working plane indexing, a tilted working plane can be specified based on projection angles.
A plane determined by vector A and vector B produced by rotating the X-axis vector and Y-axis vector of the workpiece coordinate system is defined to be a tilted working plane.

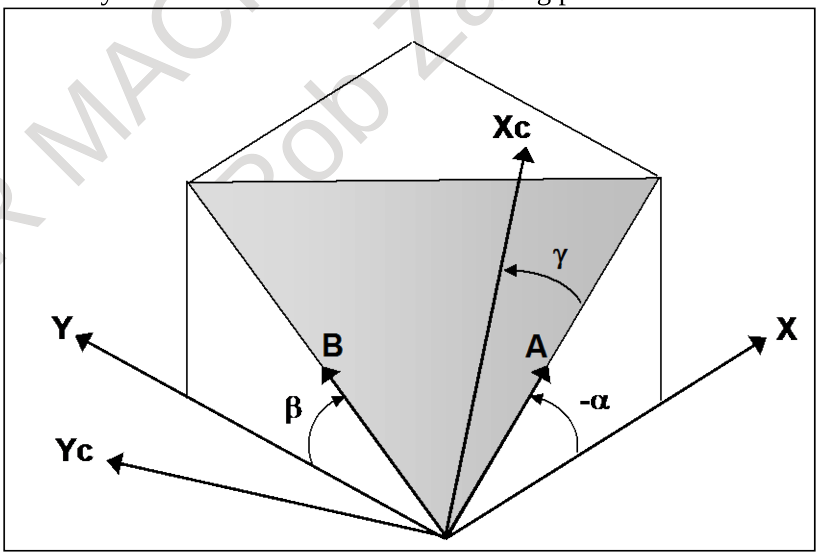

Fig. 12.16.1.6 (a) Tilted working plane indexing based on projection angles

Explanation

- Determination of a feature coordinate system

The X-axis direction vector of the workpiece coordinate system rotated by α about the Y-axis of the workpiece coordinate system is defined as vector A. The Y-axis direction vector of the workpiece coordinate system rotated by β about the X-axis of the workpiece coordinate system is defined to be vector B.

The direction normal to plane P containing vector A and vector B (direction of the outer product of A × B) is defined to be the Z-axis direction of the feature coordinate system.

Vector A rotated by γ about the Z-axis of the feature coordinate system is defined to be the X-axis direction of the feature coordinate system. The Y-axis of the feature coordinate system is defined according to the right-handed system.

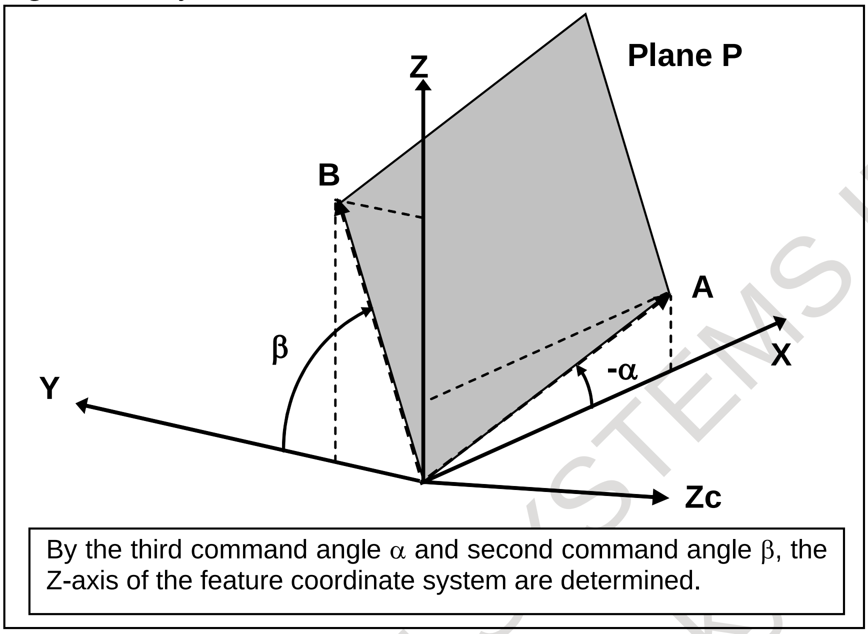

Fig. 12.16.1.6 (b) Determination of a feature coordinate system (Z axis)

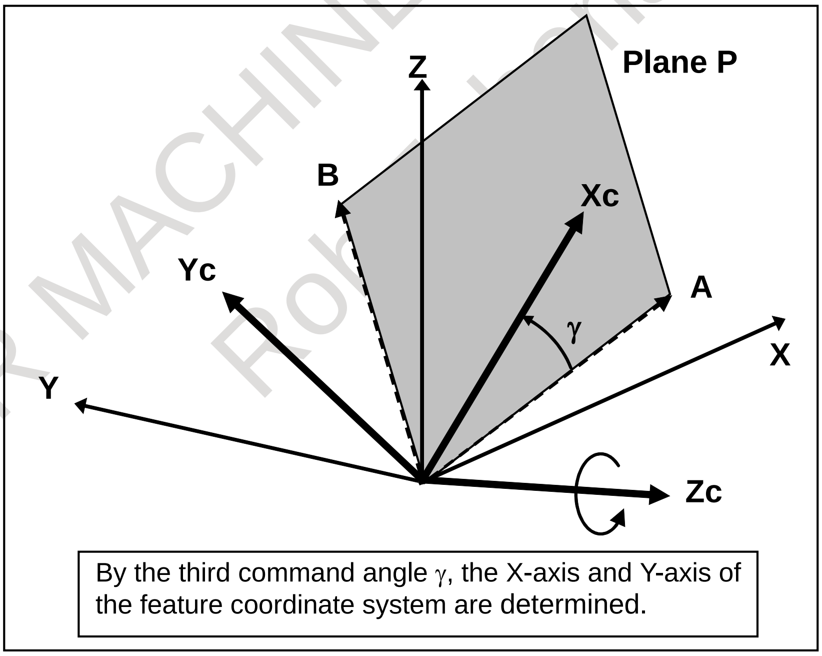

Fig. 12.16.1.6 (c) Determination of a feature coordinate system (X and Y axes)

NOTE

When vector A and vector B are considered to be parallel with each other (when the angle formed by the two vectors is smaller than 1degree), alarm PS5457, "G68.2/G68.3 FORMAT ERROR" is issued.

12.16.1.7 Tilted working plane indexing by tool axis direction

Overview

By specifying G68.3, a coordinate system (feature coordinate system) where the tool axis direction is the +Z-axis direction can be automatically specified. When a feature coordinate system is used, a program for cutting a hole or pocket in a plane tilted relative to the workpiece coordinate system can be made simpler. This function can automatically generate a feature coordinate system that is normal to the tool direction.

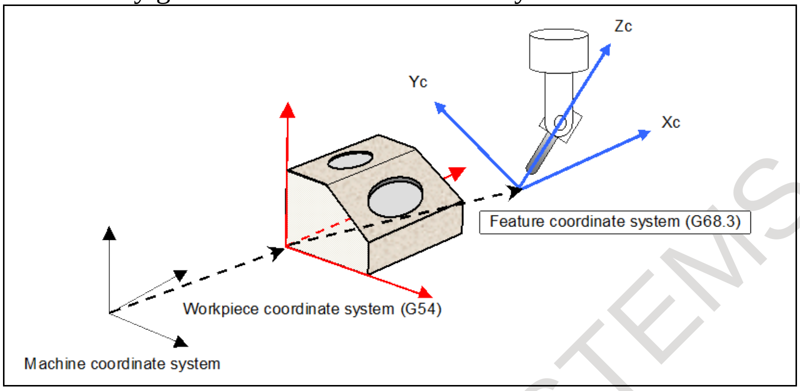

Fig. 12.16.1.7 (a) Feature coordinate system

When G68.3 is specified in a block, the coordinate system for programming is changed to a feature coordinate system. All commands after the block are regarded as commands in the feature coordinate system until G69 is specified.

Explanation

- Feature coordinate system

By specifying G68.3, a feature coordinate system with the tool axis direction being the +Z-axis direction can be created. The tool axis direction means the tool axis direction based on the rotation axis position reached by automatic operation or manual operation.

- Origin of a feature coordinate system

The origin of a feature coordinate system must be specified using an absolute command.
Even in the incremental command mode, the specified origin is regarded as an absolute position.
When 1 address or 2 addresses are omitted in X, Y, or Z, alarm PS5457, "G68.2/G68.3 FORMAT ERROR" is issued.
When the origin of a feature coordinate system is not specified, the position when G68.3 is specified is used as the origin.

- Determination of a feature coordinate system

Determination of a feature coordinate system depends on whether P1 command is present.

(1) When G68.3 block does not include P1 command (G68.3)

When G68.3 is specified, the tool axis direction vector ($\vec{T}$) represents the +Z direction ($\vec{Zc}$) of the feature coordinate system.

The vector normal to a plane formed by the +Z direction ($\vec{Zc}$) of the feature coordinate system and the vertical axis direction vector ($\vec{P}$) (parameter No. 12321) represents the +X direction ($\vec{Xc}$) of the feature coordinate system.

Expression: $\vec{Xc} = \vec{P} \times \vec{Zc}$

The vector normal to the +Z direction ($\vec{Zc}$) of the feature coordinate system and the +X direction ($\vec{Xc}$) of the feature coordinate system represents the +Y direction ($\vec{Yc}$) of the feature coordinate system.

Expression: $\vec{Yc} = \vec{Zc} \times \vec{Xc}$

When R is commanded, a coordinate system rotated by R around Zc axis from the above-mentioned coordinate system is the feature coordinate system.

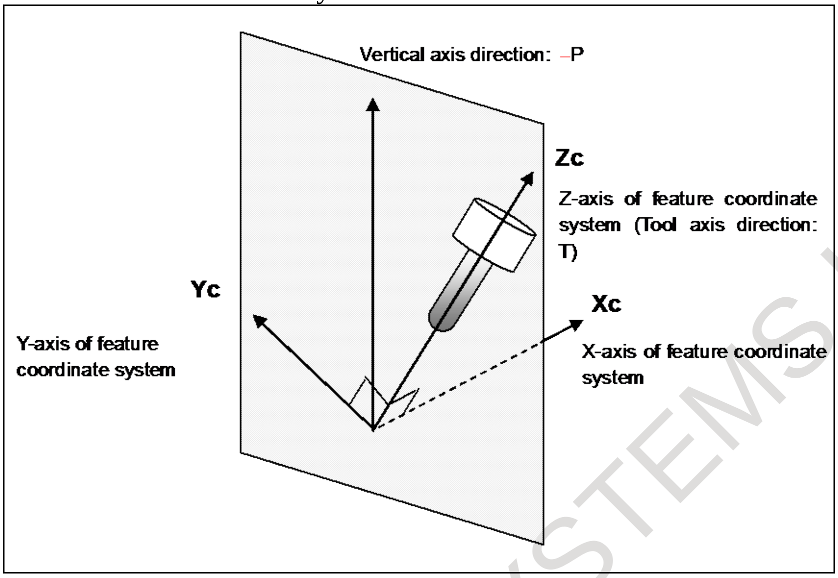

Fig. 12.16.1.7 (b) Determination of a feature coordinate system

When the tool axis direction vector ($\vec{T}$) is parallel with the vertical axis direction vector ($\vec{P}$) (parameter No. 12321) (when the angle between the vector ($\vec{T}$) and the vector ($\vec{P}$) is equal to or less than the value of parameter No. 12322), the feature coordinate system Xc-Yc-Zc is as indicated below. By specifying angular displacement R, a feature coordinate system rotated about the Z-axis of this coordinate system can be specified.

Table 12.16.1.7 (a) Feature coordinate system

Parameter No. 12321	Z-axis of feature coordinate system Zc	X-axis of feature coordinate system Xc	Y-axis of feature coordinate system Yc
1	+X direction	+Y direction	+Z direction
2	+Y direction	+Z direction	+X direction
3	+Z direction	+X direction	+Y direction

When 0 is set in parameter No. 12321, the vertical axis direction is the reference tool axis direction (parameter No. 19697).

If a value other than 0 through 3 is set in parameter No. 12321, the alarm PS5459, "MACHINE PARAMETER INCORRECT" is issued.

NOTE

Tool axis direction is Z-axis direction of feature coordinate system regardless of the reference tool axis direction (parameter No. 19697).

- Angular displacement R

Angular displacement R is positive when a rotation is made clockwise viewed in the Z-axis direction of the feature coordinate system. The range of angular displacement R is: 0.0degree ≤ R ≤ 360.0degree.

(2) When G68.3 block includes P1 command (G68.3 P1)

G68.3 P1 command defines the feature coordinate system corresponding to tool rotation axis position. The direction of the feature coordinate system is the direction of reference coordinate system rotated by tool rotation axes.

The reference coordinate system of feature coordinate system (the feature coordinate system that is defined when absolute coordinate system of tool rotation axes is 0) is as follows by the parameter No.19697 for reference tool axis direction.

The feature coordinate system defined by "G68.3 P1" command is the coordinate system that the reference coordinate system is rotated by tool rotation axis position and reference angle RA (parameter No.19698), RB (parameter No.19699).

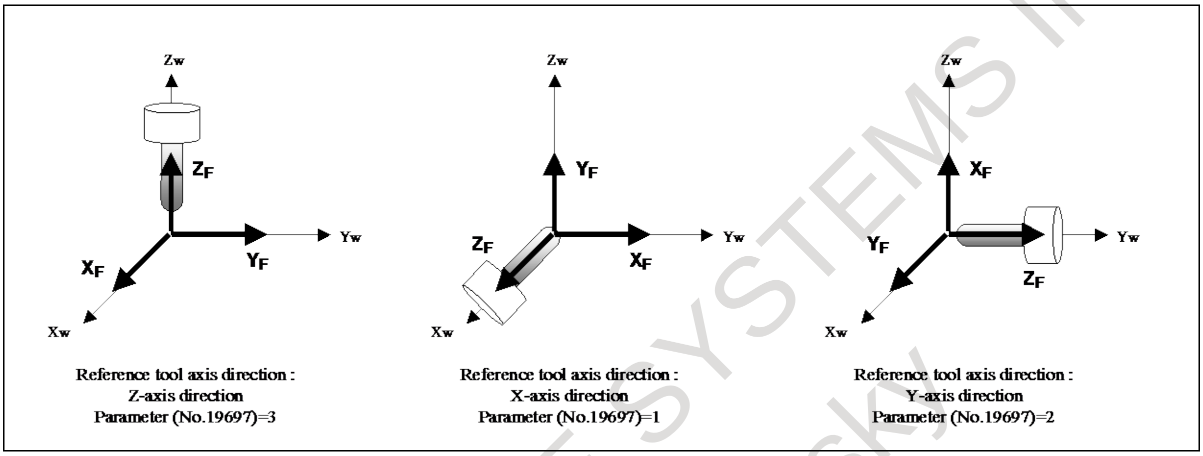

Fig. 12.16.1.7 (c) The reference coordinate system of feature coordinate system (G68.3 P1)

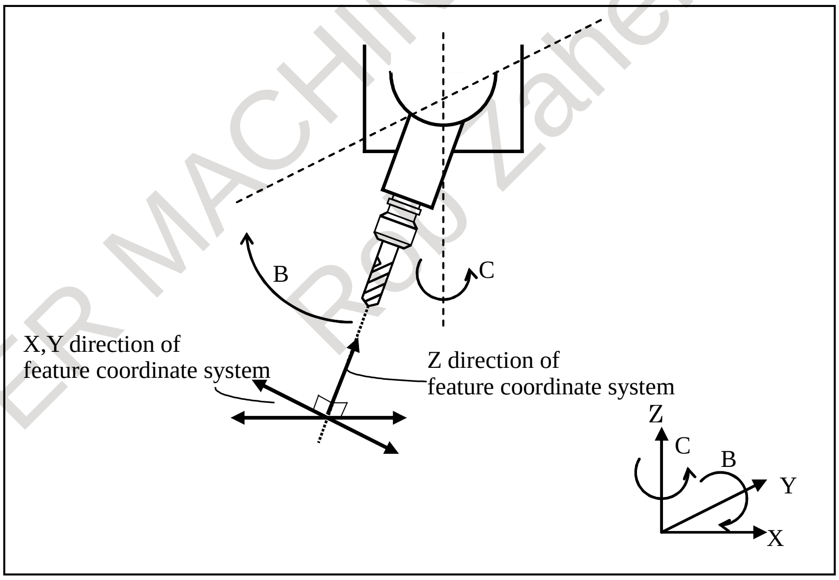

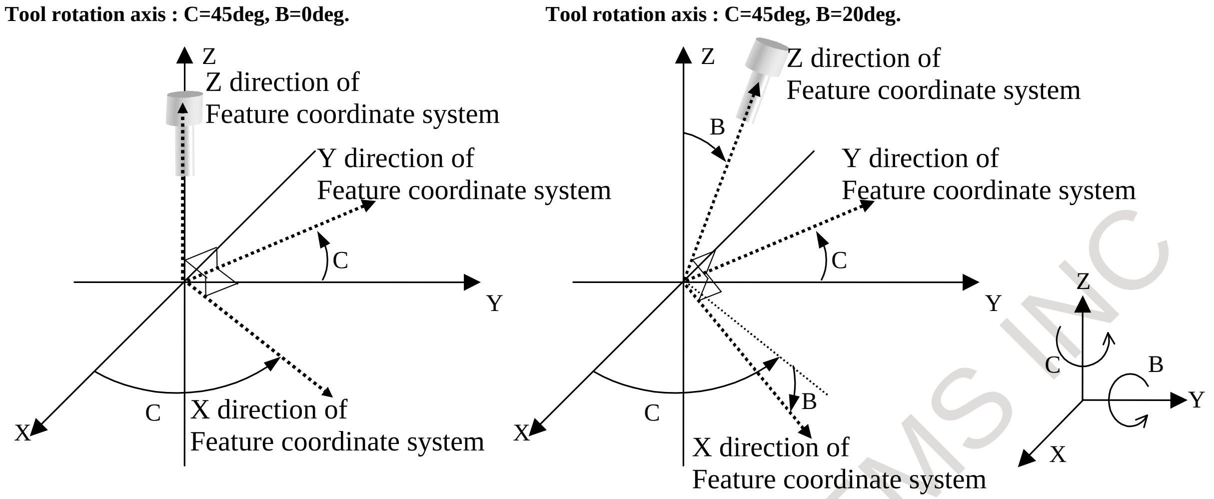

Fig. 12.16.1.7 (d) Example that reference tool axis direction is Z direction

- Machine of table rotation type

On a machine of table rotation type, the tool direction remains unchanged. So, a feature coordinate system based on the reference tool axis direction (parameter No.19697) is set. However, the origin specification of the feature coordinate system and angular displacement R about the Z-axis are valid.

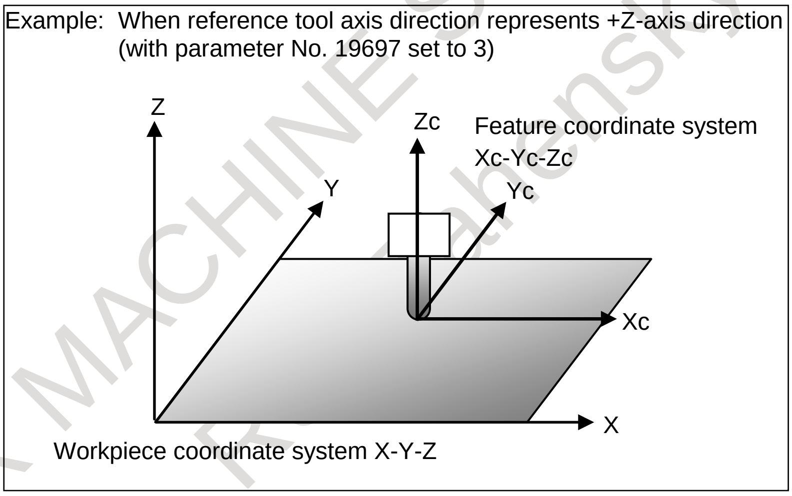

Fig. 12.16.1.7 (e) Machine of table rotation type

- G53.1 / G53.6 command in G68.3 mode

When G53.1 or G53.6 command is executed in G68.3 mode, alarm PS5458 “ILLEGAL USE OF G53.1/G53.6” occurs.

- Use in combination with tool length compensation

The G68.3 command can be specified even during tool length compensation.

- Example of operation

An example of operation on a machine of tool rotation type is given below.
The machine configuration is "BC type reference tool axis Z-axis".

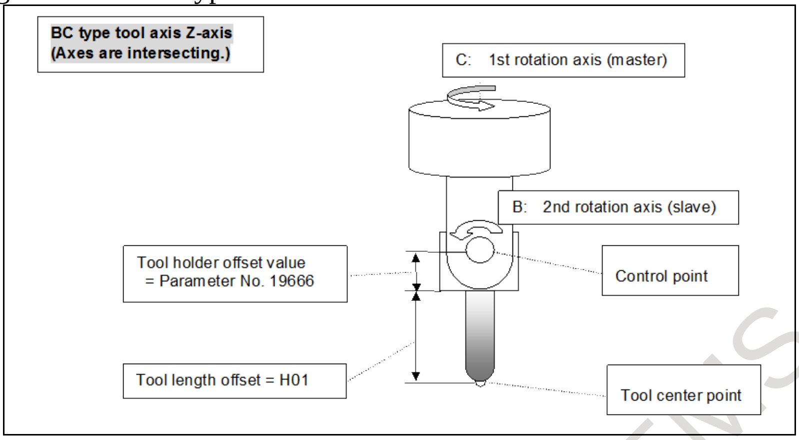

Fig. 12.16.1.7 (f) Example of operation on a machine of tool rotation type

Sample program 1

```

```

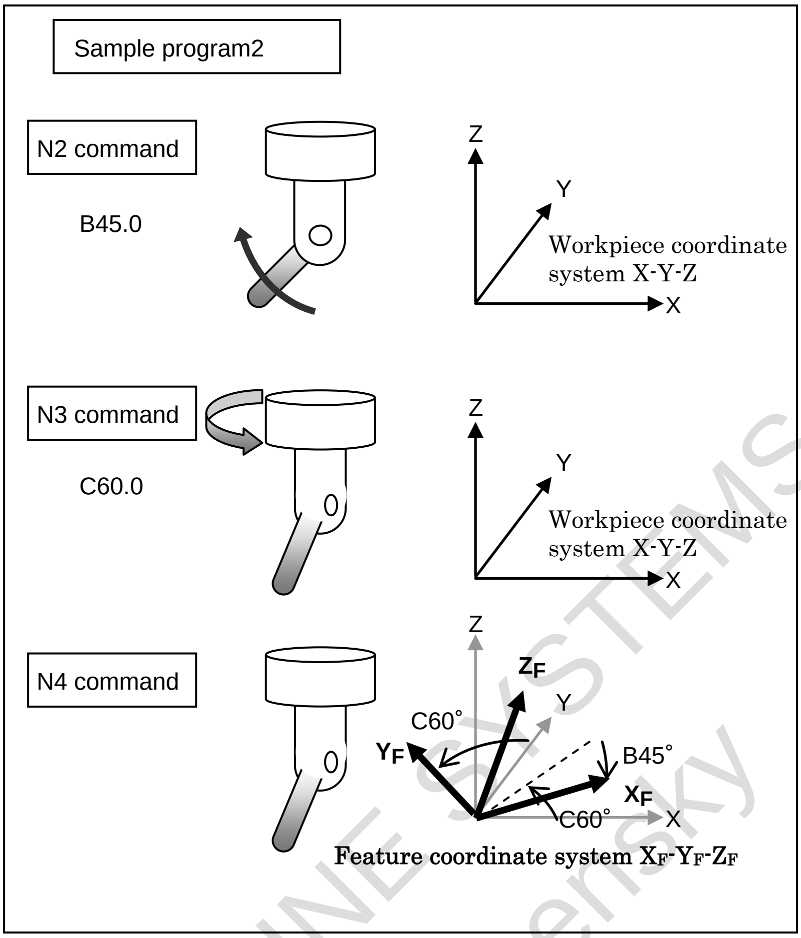

Fig. 12.16.1.7 (h)

N2 block: Tilts the tool. (B45 deg)
N3 block: Tilts the tool. (C60 deg)
N4 block: The direction of the reference coordinate system of feature coordinate system is the direction of workpiece coordinate system because the reference tool axis direction is Z direction. The feature coordinate system is the coordinate system that the reference coordinate system is rotated by 45 deg. around Y direction and 60 deg. around Z direction.

XF : The direction that X direction of workpiece coordinate system is rotated by 60 deg. around Z direction after by 45 deg. around Y direction of workpiece coordinate system.
YF : The direction that Y direction of workpiece coordinate system is rotated by 60 deg. round Z direction of workpiece coordinate system.
ZF : The direction that Z direction of workpiece coordinate system is rotated by 60 deg. around Z direction after by 45 deg. around Y direction of workpiece coordinate system.

- Multiple G68.3

After the tool axis direction is changed in G68.3 mode, by specifying G68.3, a new feature coordinate system where the tool axis direction is the +Z-axis direction can be specified.

Example of operation

An example of operation on a machine of tool rotation type is given below.
The machine configuration is "BC type reference tool axis Z-axis".

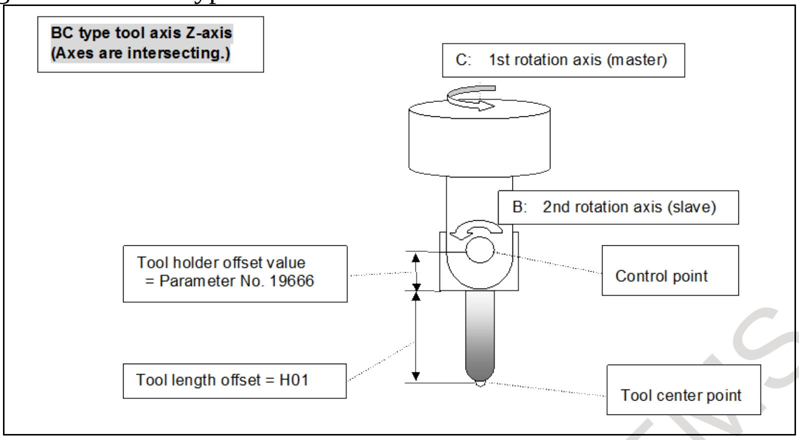

Fig. 12.16.1.7 (i) Example of operation on a machine of tool rotation type

12.16.2 Multiple Command of Tilted Working Plane Indexing

12.16.2.1 Absolute multiple command

By additionally specifying G68.2 in the tilted working plane indexing mode, a feature coordinate system produced by additionally applying coordinate system conversion to the workpiece coordinate system can be set. The workpiece coordinate system is resumed by specifying G69.
This function is enabled by setting bit 0 (MTW) of parameter No. 11221.

Format

The format of the tilted working plane indexing (G68.2) is applicable.
Specify the origin of a feature coordinate system in the workpiece coordinate system.

Example of operation

An example of operation on a tool rotation type machine is explained below.
The machine configuration is "BC type with the reference tool axis being the Z-axis".

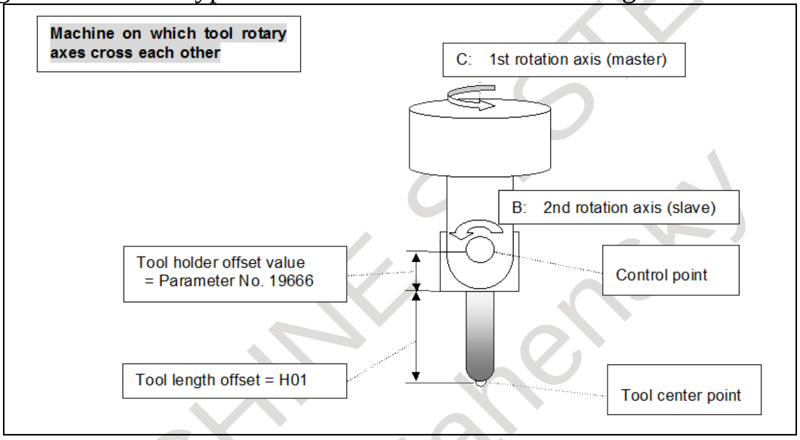

Fig. 12.16.2.1 (a) Example of operation on a machine of tool rotation type

N6 block: Sets a new feature coordinate system.
N7 block: Rotates the tool in the Z-axis direction in the new feature coordinate system.

12.16.2.2 Incremental multiple command

By specifying G68.4, coordinate system conversion can be applied to the currently set feature coordinate system.
This function is enabled by setting bit 0 (MTW) of parameter No. 11221.

Format

The format of the tilted working plane indexing (G68.2) is applicable.
Specify the origin of a feature coordinate system in the immediately preceding feature coordinate system.

Table 12.16.2.2 (a) Incremental multiple command format

Specification method	Incremental multiple command
Eulerian angle	G68.4
Roll-pitch-yaw	G68.4 P1
Three points	G68.4 P2
Two vectors	G68.4 P3
Projection angles	G68.4 P4

Example of operation

An example of operation on a tool rotation type machine is explained below.
Rotary axis C rotates about the Z-axis (master axis).
Rotary axis B rotates about the Y-axis (slave axis).

N6 block: Applies coordinate system conversion to the feature coordinate system based on Eulerian angle to set a new feature coordinate system.
N7 block: Rotates the tool in the Z-axis direction in the new feature coordinate system.

12.16.3 Tool Axis Direction Control

12.16.3.1 Tool axis direction control

G53.1 automatically specifies the +Z direction of the feature coordinate system as the tool axis direction.

Example of operation

The following gives an operation example in the machine configuration below.

- Table rotation type
- Master axis: About the Y-axis (B axis)
- Slave axis: About the Z-axis (C axis)
- Reference tool axis direction: Z direction
- Increment system for the rotation axis: 1/10(IS-C)

Program example 1

G68.2 I90.0 J0.0005 K-90.0 (rotation by 0.0005 degree about the Y-axis)
G53.1
The rotation axis position after the G53.1 command is as follows:

- Bit 2 (TFR) of parameter No. 11630 is set to 0 (minimum command unit of the rotation angles: 0.001 degree):
  B axis: 0.0010 degree
  C axis: 0.0000 degree
- Bit 2 (TFR) of parameter No. 11630 is set to 1 (minimum command unit of the rotation angles: 0.00001 degree):
  B axis: 0.0005 degree
  C axis: 0.0000 degree

Program example 2

G68.2 I90.0 J10 K-90.0 (rotation by (minimum command unit of the rotation angles × 10) about the Y-axis)
G53.1
The rotation axis position after the G53.1 command is as follows:

- Bit 2 (TFR) of parameter No. 11630 is set to 0 (minimum command unit of the rotation angles: 0.001 degree):
  B axis: 0.0100 degree
  C axis: 0.0000 degree
- Bit 2 (TFR) of parameter No. 11630 is set to 1 (minimum command unit of the rotation angles: 0.00001 degree):
  B axis: 0.0001 degree
  C axis: 0.0000 degree

About parameters

(1) Machine configuration

When parameters are set, it is important to determine the target machine configuration for parameter setting.
The following explains the machine configuration.

- Master and slave

When there are two rotation axes for controlling the orientation of a tool or two rotation axes for controlling the orientation of a table, a typical structure is such that a rotation mechanism is on the tip of another rotation mechanism. The former rotation mechanism is called the slave, and the latter is called the master.
The master and slave are sometimes called the first axis and second axis, respectively.

The rotation center axis for the master is called the first rotation axis, while the rotation center axis for the slave is called the second rotation axis. (Fig. 12.16.3.1 (a))

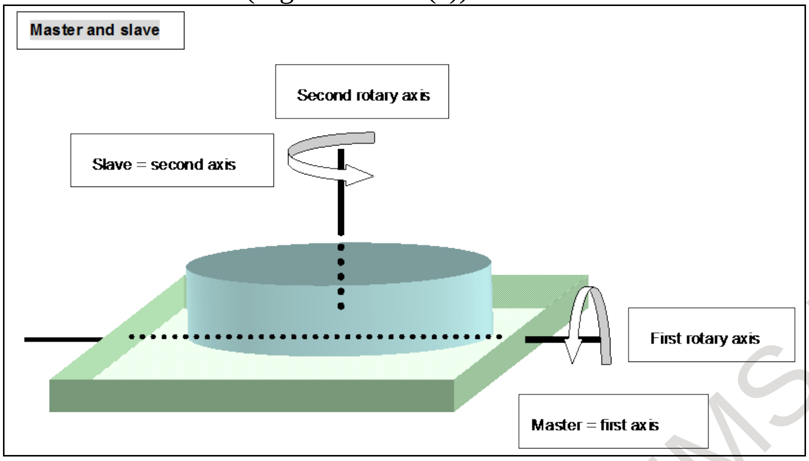

Fig. 12.16.3.1 (a) Relationships between the master and slave

- When the rotation axes of the table do not intersect

Explained below is a mechanism in which the table rotation centers do not intersect.
In the mechanism shown in the following example, the master and slave do not intersect each other. (Fig. 12.16.3.1 (b))
When both the master and slave are at 0 degrees, a vector from the origin of the machine coordinate system to a point on the first rotation axis of the table is set as a rotary table position in parameters Nos. 19700 to 19702.
Similarly, when both the master and slave are at 0 degrees, a vector from the above point to a point on the second rotation axis is set as an intersection offset vector between the first and second rotation axes of the table in parameters Nos. 19703 to 19705.

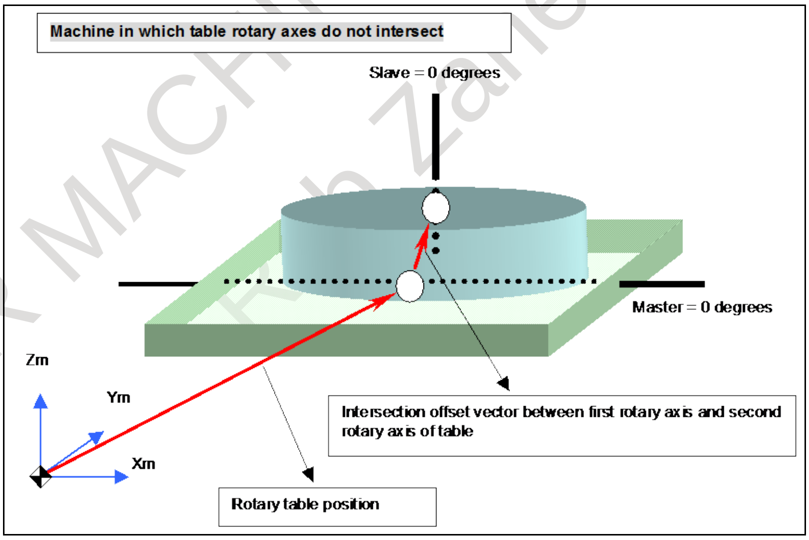

Fig. 12.16.3.1 (b) Mechanism in which the master and slave do not intersect

- When the first rotation axis of the tool and the tool axis do not intersect

Explained below is a mechanism in which the tool axis (spindle rotation center axis) and the first rotation axis of the tool do not intersect.
When both the master and slave are at 0 degrees, a vector from a point at a distance of the tool length compensation value plus the tool holder offset value from the tool center point along the tool axis to a point on the first rotation axis of the tool is set as an intersection offset vector between the tool axis and the first rotation axis of the tool in parameters Nos. 19709 to 19711.

- When the rotation axes of the tool do not intersect

Explained below is a mechanism in which the rotation axes of the tool do not intersect each other.

The Fig. 12.16.3.1 (c) is an example of a mechanism in which the first and second rotation axes of the tool do not intersect.

When both the master and slave are at 0 degrees, a vector from a point on the second rotation axis of the tool to a point on the first rotation axis of the tool is set as an intersection offset vector between the second rotation axis of the tool and the first rotation axis of the tool in parameters Nos. 19712 to 19714.

The controlled point can be shifted by setting a shift vector from the point mentioned above in parameters.

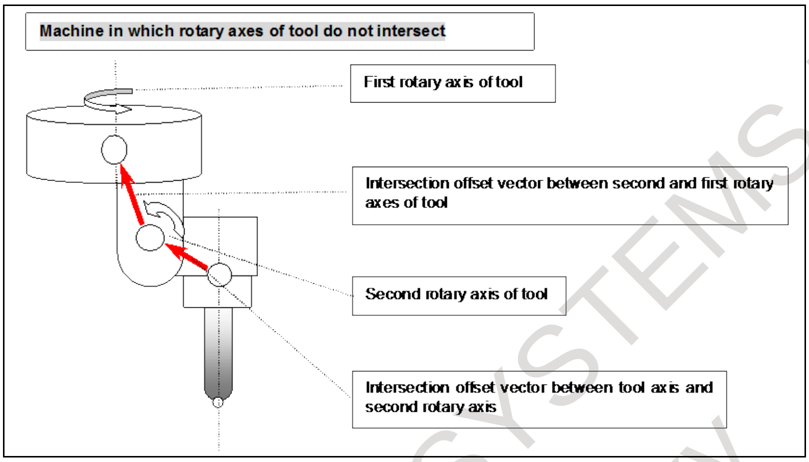

Fig. 12.16.3.1 (c) Mechanism in which the rotation axes of the tool do not intersect

(2) Examples of setting parameters

There are many parameters related to this function.

Therefore, it is recommended that parameters for a target machine be set based on some examples. These examples are given below.

<1> Example of setting parameters for a composite type machine

In the machine explained in this example, the first axis is X, the second axis is Y, the third axis is Z, the fourth axis is A, the fifth axis is B, and the sixth axis is C.

Fig. 12.16.3.1 (d) is an example of setting parameters for a composite type machine.

Rotation axis A is a table rotation axis on the X-axis.

Rotation axis B is a tool rotation axis on the Y-axis.

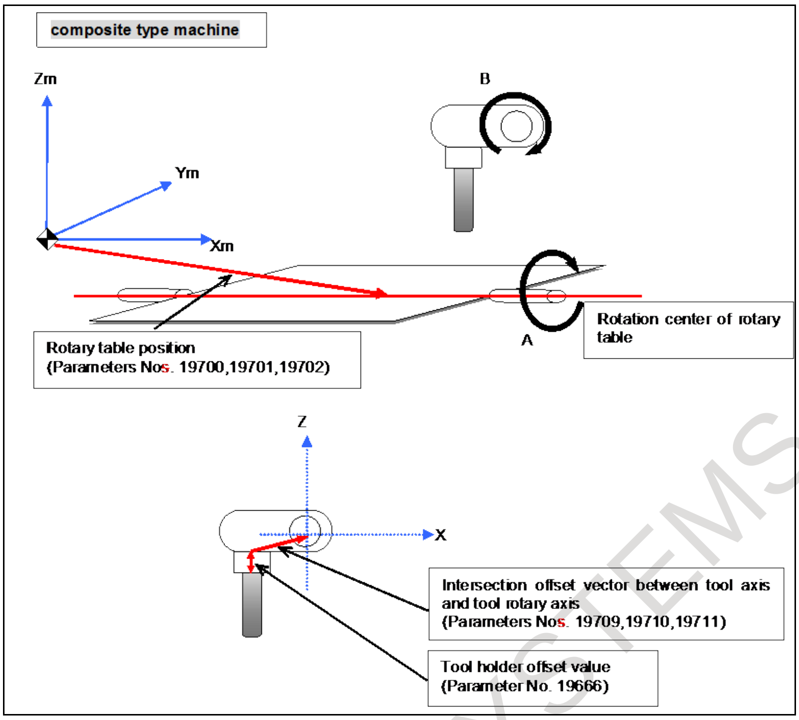

Fig. 12.16.3.1 (d) Composite type machine example

In the above composite type machine (Fig. 12.16.3.1 (d)), if rotation axis B is at 0 degrees, assume the following:
Tool holder offset value = 2.0
Rotary table position = (5.0, 2.0, -15.0)
Intersection offset vector between the tool axis and tool rotation axis = (3.0, 0, 2.0)

Then, the parameters for the above composite type machine are set as follows:

Table 12.16.3.1 (a) Example of setting parameters for a composite type machine

Parameter No.	Setting example	Description
19665#4	0	Automatic calculation for controlled-point shifting
19665#5	0	Controlled-point shift
19666	2.0	Tool holder offset value
19667	X0.0 Y0.0 Z0.0	Controlled-point shift vector
19680	21	Mechanical unit type
19681	5(B)	Controlled axis number for the first rotation axis
19682	2(Y)	Axis direction of the first rotation axis
19684	0	Rotation direction of the first rotation axis
19685	0.0	Rotation angle when the first rotation axis is a hypothetical axis
19686	4(A)	Controlled axis number for the second rotation axis
19687	1(X)	Axis direction of the second rotation axis
19689	1	Rotation direction of the second rotation axis
19690	0.0	Rotation angle when the second rotation axis is a hypothetical axis
19696#0	0	The first rotation axis is an ordinary rotation axis.
19696#1	0	The second rotation axis is an ordinary rotation axis.
19697	3	Direction of the reference tool axis
19700	5.0	Rotary table position (X-axis)
19701	2.0	Rotary table position (Y-axis)
19702	-15.0	Rotary table position (Z-axis)

Parameter No.	Setting example	Description
19703	0.0	Intersection offset vector between the first and second rotation axes of the table (X-axis)
19704	0.0	Intersection offset vector between the first and second rotation axes of the table (Y-axis)
19705	0.0	Intersection offset vector between the first and second rotation axes of the table (Z-axis)
19709	3.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (X-axis)
19710	0.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (Y-axis)
19711	2.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (Z-axis)
19712	0.0	Intersection offset vector between the second and first rotation axes of the tool (X-axis)
19713	0.0	Intersection offset vector between the second and first rotation axes of the tool (Y-axis)
19714	0.0	Intersection offset vector between the second and first rotation axes of the tool (Z-axis)

⚠ **CAUTION (Machine configurations resulting in an alarm)**

In the machine settings shown below, there may be no angle solution when G53.1 is issued.
So, specifying G53.1 results in an alarm.
<1> The table rotation axis and tool rotation axis are on the same axis.
Example: Parameter No. 19682 = parameter No. 19687 = 1 (X)
<2> The tool axis direction and tool rotation axis are in the same axis direction.
Example: Parameter No. 19682 = parameter No. 19697 = 3 (Z)

<2> Example of setting parameters for a tool rotation type machine

Fig. 12.16.3.1 (e) is an example of setting parameters for a tool rotation type machine.
Rotation axis C is a tool rotation axis (master) on the Z-axis.
Rotation axis B is a tool rotation axis (slave) on the Y-axis.

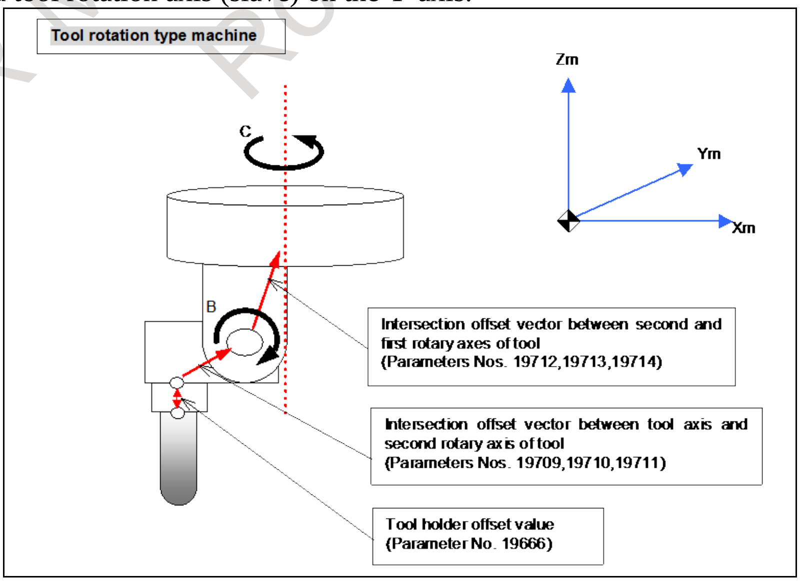

Fig. 12.16.3.1 (e) Tool rotation type machine example

In the above tool rotation type machine (Fig. 12.16.3.1 (e)), if rotation axes B and C are at 0 degrees, assume the following:
Tool holder offset value = 2.0
Intersection offset vector between the tool axis and the second rotation axis of the tool = (5.0,0,3.0)
Intersection offset vector between the second and first rotation axes of the tool = (3.0,3.0,8.0)

Then, the parameters for the above tool rotation type machine are set as follows:

Table 12.16.3.1 (b) Setting parameters for a tool rotation type machine

Parameter No.	Setting example	Description
19665#4	0	Automatic calculation for controlled-point shifting
19665#5	0	Controlled-point shift
19666	2.0	Tool holder offset value
19667	X0.0 Y0.0 Z0.0	Controlled-point shift vector
19680	2	Mechanical unit type
19681	6(C)	Controlled axis number for the first rotation axis
19682	3(Z)	Axis direction of the first rotation axis
19684	0	Rotation direction of the first rotation axis
19685	0.0	Rotation angle when the first rotation axis is a hypothetical axis
19686	5(B)	Controlled axis number for the second rotation axis
19687	2(Y)	Axis direction of the second rotation axis
19689	0	Rotation direction of the second rotation axis
19690	0.0	Rotation angle when the second rotation axis is a hypothetical axis
19696#0	0	The first rotation axis is an ordinary rotation axis.
19696#1	0	The second rotation axis is an ordinary rotation axis.
19697	3	Direction of the reference tool axis
19700	0.0	Rotary table position (X-axis)
19701	0.0	Rotary table position (Y-axis)
19702	0.0	Rotary table position (Z-axis)
19703	0.0	Intersection offset vector between the first and second rotation axes of the table (X-axis)
19704	0.0	Intersection offset vector between the first and second rotation axes of the table (Y-axis)
19705	0.0	Intersection offset vector between the first and second rotation axes of the table (Z-axis)
19709	5.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (X-axis)
19710	0.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (Y-axis)
19711	3.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (Z-axis)
19712	3.0	Intersection offset vector between the second and first rotation axes of the tool (X-axis)
19713	3.0	Intersection offset vector between the second and first rotation axes of the tool (Y-axis)
19714	8.0	Intersection offset vector between the second and first rotation axes of the tool (Z-axis)

> ⚠ **CAUTION (Machine configurations resulting in an alarm)**
> In the machine settings shown below, there may be no angle solution when G53.1 is issued.
> So, specifying G53.1 results in an alarm.
> <1> The first rotation axis (master) and second rotation axis (slave) of the tool are on the same axis.
> Example: Parameter No. 19682 = parameter No. 19687 = 1 (X)
> <2> The tool axis direction and the second rotation axis (slave) of the tool are in the same axis direction.
> Example: Parameter No. 19697 = parameter No. 19687 = 3 (Z)

<3> Example of setting parameters for a table rotation type machine

Fig. 12.16.3.1 (f) is an example of setting parameters for a table rotation type machine.
Rotation axis A is a table rotation axis (master) on the X-axis.
Rotation axis B is a table rotation axis (slave) on the Y-axis.

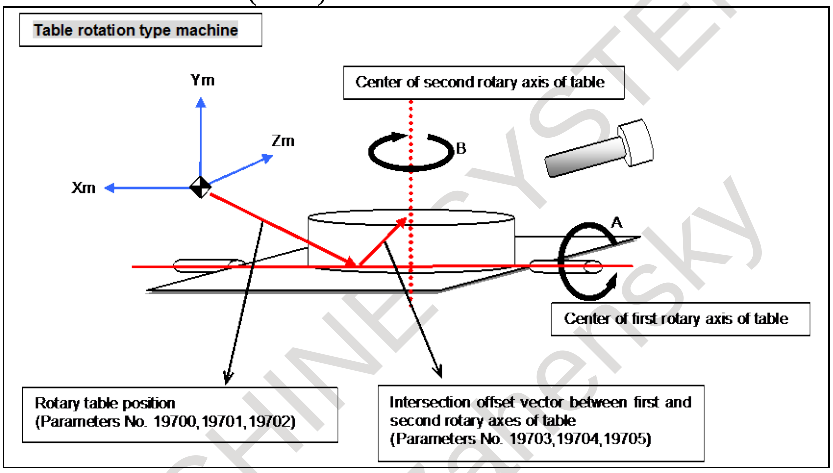

Fig. 12.16.3.1 (f) Table rotation type machine example

In the above table rotation type machine (Fig. 12.16.3.1 (f)), if rotation axes A and B are at 0 degrees, assume the following:
Tool holder offset value = 2.0
Rotary table position = (-10.0,-30.0,0)
Intersection offset vector between the first and second rotation axes of the table = (0,8.0,8.0)

Then, the parameters for the above table rotation type machine are set as follows:

Table 12.16.3.1 (c) Setting parameters for a table rotation type machine

Parameter No.	Setting example	Description
19665#4	0	Automatic calculation for controlled-point shifting
19665#5	0	Controlled-point shift
19666	2.0	Tool holder offset value
19667	X0.0 Y0.0 Z0.0	Controlled-point shift vector
19680	12	Mechanical unit type
19681	4(A)	Controlled axis number for the first rotation axis
19682	1(X)	Axis direction of the first rotation axis
19684	1	Rotation direction of the first rotation axis
19685	0.0	Rotation angle when the first rotation axis is a hypothetical axis
19686	5(B)	Controlled axis number for the second rotation axis

Parameter No.	Setting example	Description
19687	2(Y)	Axis direction of the second rotation axis
19689	1	Rotation direction of the second rotation axis
19690	0.0	Rotation angle when the second rotation axis is a hypothetical axis
19696#0	0	The first rotation axis is an ordinary rotation axis.
19696#1	0	The second rotation axis is an ordinary rotation axis.
19697	3	Direction of the reference tool axis
19700	-10.0	Rotary table position (X-axis)
19701	-30.0	Rotary table position (Y-axis)
19702	0.0	Rotary table position (Z-axis)
19703	0.0	Intersection offset vector between the first and second rotation axes of the table (X-axis)
19704	8.0	Intersection offset vector between the first and second rotation axes of the table (Y-axis)
19705	8.0	Intersection offset vector between the first and second rotation axes of the table (Z-axis)
19709	0.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (X-axis)
19710	0.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (Y-axis)
19711	0.0	Intersection offset vector between the tool axis and the first rotation axis of the tool (Z-axis)
19712	0.0	Intersection offset vector between the second and first rotation axes of the tool (X-axis)
19713	0.0	Intersection offset vector between the second and first rotation axes of the tool (Y-axis)
19714	0.0	Intersection offset vector between the second and first rotation axes of the tool (Z-axis)

⚠ CAUTION (Machine configurations resulting in an alarm)

In the machine settings shown below, there may be no angle solution when G53.1 is issued.
So, specifying G53.1 results in an alarm.

<1>The first rotation axis (master) and second rotation axis (slave) of the tool are on the same axis.
Example: Parameter No. 19682 = parameter No. 19687= 1 (X)

<2>The tool axis direction and the first rotation axis (master) of the table are in the same axis direction.
Example: Parameter No. 19697 = parameter No. 19682 = 3 (Z)

NOTE

1 By setting bit 0 (NSC) of parameter No. 19605 to 1, control point shifting in the tilted working plane indexing of table rotation type can be disabled.

2 The alarm PS5459, "MACHINE PARAMETER INCORRECT" is issued, when tool axis direction control (G53.1/G53.6) is specified on the following condition that parameter is set incorrectly by setting bit 7 (AIR) of parameter No.11221 to 1.
- In case that the movement range of rotation axis (parameter No.19741, 19742, 19743, 19744) is set to the roll-over axis (bit 0 (ROAx) of parameter No.1008 is 1)
- In case that roll-over is set effective (bit 0 (ROAx) of parameter No.1008 is set to 1) for the rotary axis (B type) (bit 0 (ROTx) of parameter No.1006 is set to 1 and bit 1 (ROSx) of parameter No.1006 is set to 1)

Second Rotation Axis Control in Tool Axis Direction Control Where the End Point is a Singular Point

When the end point of tool axis direction control (G53.1/G53.6) during execution of the tilted working plane indexing is a singular point, the second rotation axis is controlled so that the direction of the second feature coordinate system matches that of the workpiece coordinate system.
To enable this function, set bit 4 (CFW) of parameter No. 11221 to 1.

When bit 4 (CFW) of parameter No. 11221 is se to 0, if the end point of tool axis direction control (G53.1/G53.6) is a singular point, the second rotation axis does not operate and only the first rotation axis turns. As a result, the X- and Y-directions of the feature coordinate system depend on the second rotation axis immediately before tool axis direction control. (Fig. 12.16.3.1 (g), Fig. 12.16.3.1 (h))

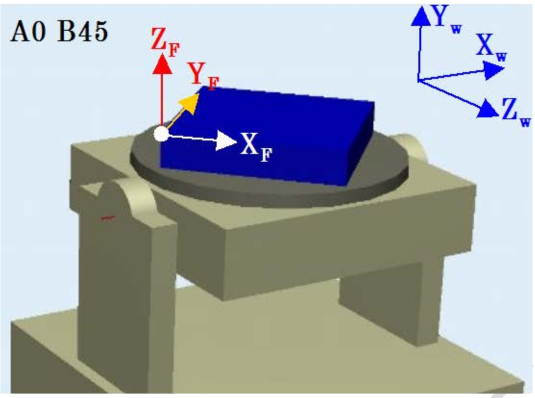

Fig. 12.16.3.1 (g) Before G53.1

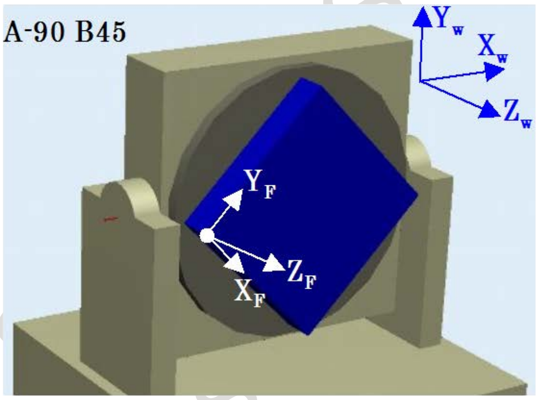

Fig. 12.16.3.1 (h) After G53.1
The second rotation axis (B-axis) does not turn.

When this function is enabled (bit 4 (CFW) of parameter No. 11221 = 1), the second rotation axis is controlled so that the direction of the second feature coordinate system matches that of the workpiece coordinate system. (Fig. 12.16.3.1 (i), Fig. 12.16.3.1 (j))

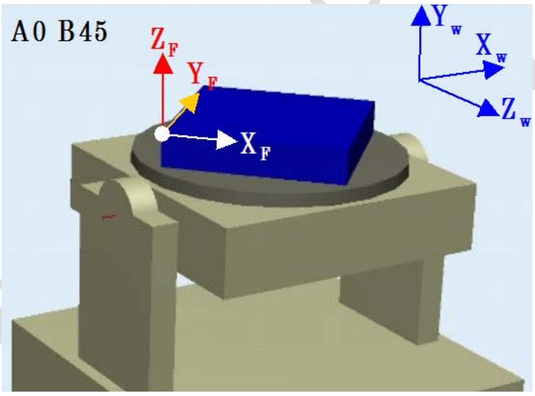

Fig. 12.16.3.1 (i) Before G53.1

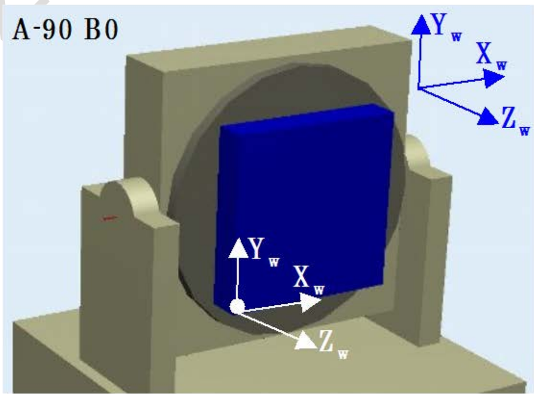

Fig. 12.16.3.1 (j) After G53.1
The second rotation axis (B-axis) moves so that the direction of the second feature coordinate system matches that of the workpiece coordinate system.

12.16.3.2 Tool center point retention type tool axis direction control

In tilted working plane indexing, tool center point retention type tool axis direction control (G53.6) can be specified so that tool can be perpendicular to the tilted plane with the tool center point maintained on the workpiece. In tool center point retention type tool axis direction control, end point of tool center point can be specified. Then tool center point moves on the feature coordinate system fixed on the workpiece. The cycle time can be shortened by moving tool axis direction and tool center point simultaneously.
By specifying the distance between the tool center point to the rotation center with R, it is possible to move the tool so that it is perpendicular to the titled plane while retaining the rotation center shifted from the tool center point.

Explanation

Fig. 12.16.3.2 (a) and Fig. 12.16.3.2 (b) show tool center point retention type tool axis direction control with R not specified. The tool moves so that it is perpendicular to the tilted plane while retaining the tool center point on the workpiece.
This function can be used by specifying G53.6 and specifying a tool length offset number with H (D for the T series). (If H (D) has the modal information for the currently used tool, this function can be used without specifying H (D).)

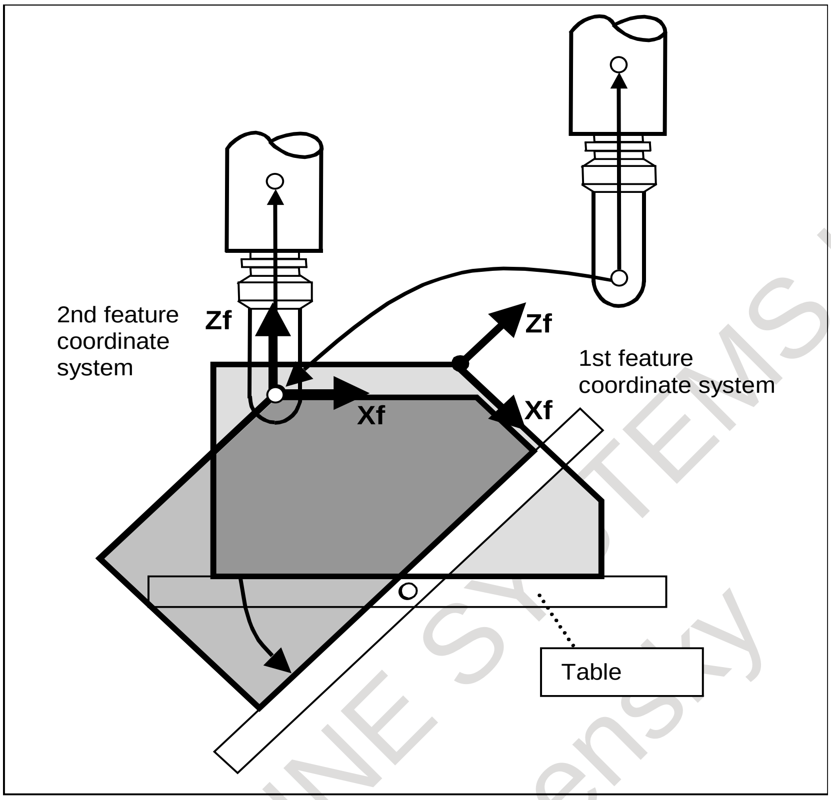

Fig. 12.16.3.2 (d) Operation of tool center point retention type tool axis direction control specified with end point of tool center point (table rotation type)

Rotation center compensation with the tool center point retention type

In tool center point retention type tool axis direction control, the rotation center can be shifted from the tool center point by specifying R.
Fig. 12.16.3.2 (e) and Fig. 12.16.3.2 (f) show cases in which the rotation center is shifted by specifying the distance from the tool center point to the workpiece with R.
By specifying this, the tool moves so that it is perpendicular to the titled plane while retaining the rotation center on the workpiece.
This function can be used by specifying G53.6 and specifying a tool length offset number with H (D for the T series) and specifying the distance from the tool center point to the rotation center with R.

12.16.4 Tilted Working Plane Indexing in Tool Length Compensation

Overview

In tool length compensation (G43), G68.2/G68.4 (tilted working plane indexing) and G53.1 (tool axis direction control)/G53.6 (tool center point retention type tool axis direction control) can be specified.
Accordingly, the G68.2/G68.4 and G53.1/G53.6 commands can be used without canceling tool length compensation.

Explanation

- G68.2/G68.4 command in tool length compensation

The G68.2/G68.4 command can be executed in tool length compensation.
Absolute coordinates after the G68.2/G68.4 command are based on the position of the tool center point on the feature coordinate system.
When the tilted working plane indexing is executed with the tool or table tilted on the rotation axis, absolute coordinates are based on the position of the tool center point with the position of the rotation axis considered.
Accordingly, machining is allowed even when the tool axis direction is not the Z-axis direction on the feature coordinate system.

Example of operation 1

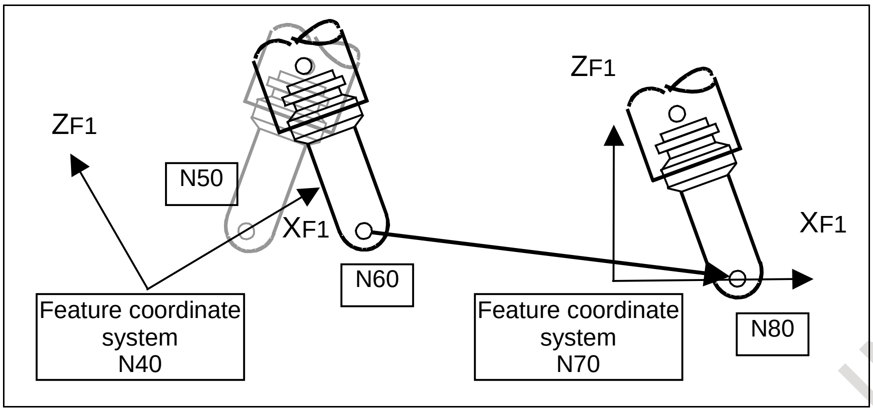

Fig. 12.16.4 (d) Example of operation 3 (tool rotation type)

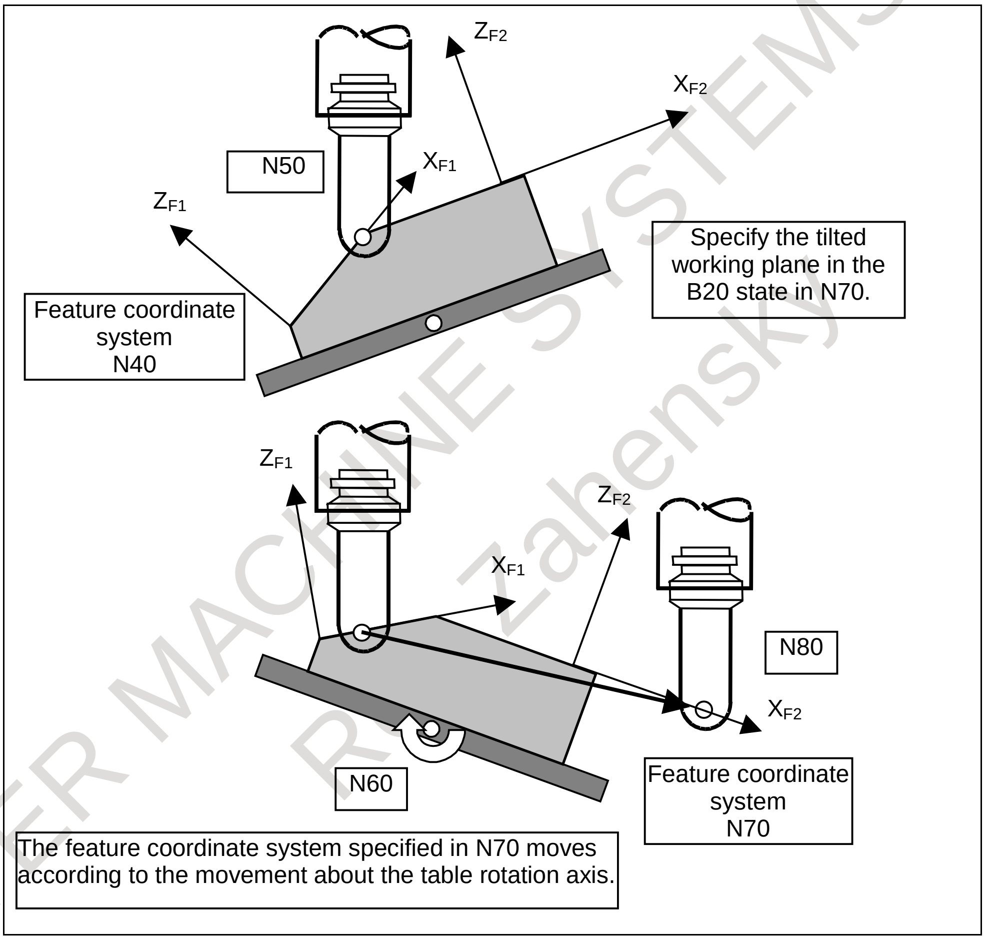

Fig. 12.16.4 (e) Example of operation 3 (table rotation type)

G53.1 command in tool length compensation

The G53.1 command can be executed in tool length compensation.

G53.1 operation in tool length compensation is performed in the same way as in the tool length compensation cancel mode.

Absolute coordinates after the G53.1 command are based on the position of the tool center point on the feature coordinate system after the G53.1 command is specified.

Example of operation 4

N10 G54 **G43** H1 X_ Y_ Z_ ;
N20 **G68.2** X_ Y_ Z_ I90.0 J-30.0 K-90.0 ; (rotation by -30 degrees about the Y-axis)
N30 **G53.1** ;
N40 X100.0 Y0 Z0 ;

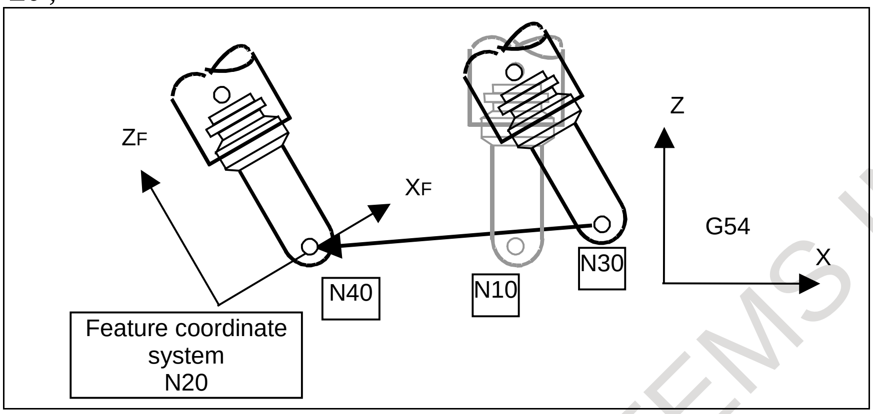

Fig. 12.16.4 (f) Example of operation 4 (tool rotation type)

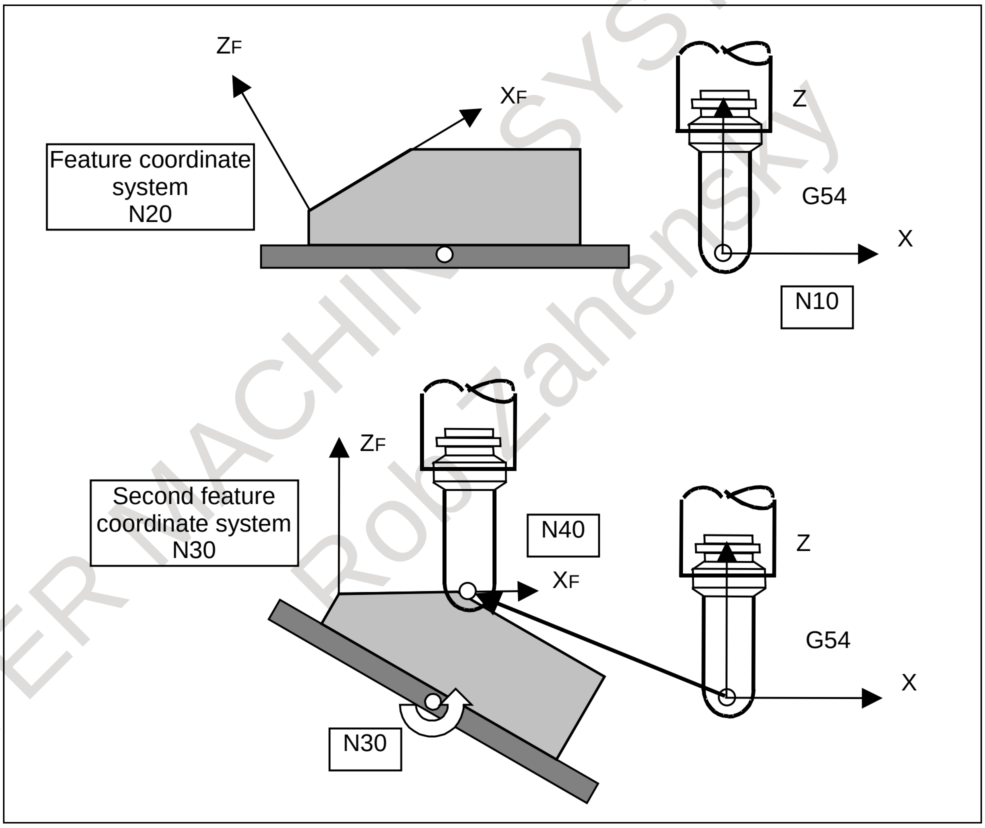

Fig. 12.16.4 (g) Example of operation 4 (table rotation type)

G53.6 command in tool length compensation

The G53.6 command can be executed in tool length compensation.
G53.6 operation in tool length compensation is performed in the same way as in the tool length compensation cancel mode.

G69 command in tool length compensation

The G69 command can be executed in tool length compensation.
After G69 operation in tool length compensation, the tool length compensation vector represents the Z direction of the workpiece coordinate system regardless of the position of the rotation axis.

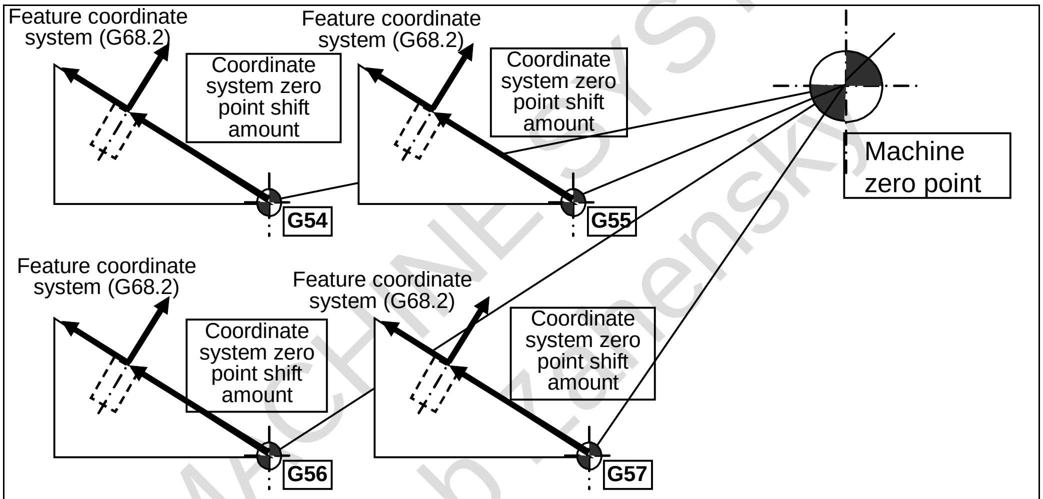
Parameter

		#7	#6	#5	#4	#3	#2	#1	#0
1205			3TW						

[Input type] Parameter input
[Data type] Bit path

#6 3TW When workpiece coordinate system selection is specified with G code in tilted working plane indexing mode:
0: The alarm PS5462, "ILLEGAL COMMAND (G68.2/G69)" is issued.
1: Workpiece coordinate system selection is executed.

> ⚠ **CAUTION**
> When this parameter is 1, only G54 to G59 or G54.1 can be specified. Specifying G52 or G92 causes alarm PS5462. Specifying G54 to G59 or G54.1 suppresses buffering.



Program example
G90 G17
G54
G68.2 X_Y_Z_ I_ J_ K_
G53.1
G43H_
G55 X_Y_Z_
G56 X_Y_Z_
G57 X_Y_Z_
G49
G69

X_Y_Z_: Coordinate system zero point shift amount

		#7	#6	#5	#4	#3	#2	#1	#0
3106			DAK						

[Input type] Setting input
[Data type] Bit

#6 DAK Specifies whether to display coordinates in the program coordinate system or workpiece coordinate system as absolute coordinates when the 3-dimensional coordinate conversion mode, the tilted working plane indexing mode is set.
0: Display coordinates in the program coordinate system.

1: Display coordinates in the workpiece coordinate system.

	#7	#6	#5	#4	#3	#2	#1	#0
5400			LV3					

[Input type] Parameter input
[Data type] Bit path

#5 LV3 When system variables #100101 to #100132 (current position coordinates) and #100151 to #100182 (skip coordinates) are read in the 3-dimensional coordinate system conversion mode or tilted working plane indexing mode:

0: Coordinates of the workpiece coordinate system can be read.

1: Coordinates of the program coordinate system after 3-dimensional coordinate system conversion or tilted working plane indexing can be read.

This parameter applies also to system variables #5041 to #5060 (current position coordinates) and #5061 to #5080 (skip coordinates).

5412	Rapid traverse rate for canned cycle for drilling in 3-dimensional coordinate system conversion mode

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

This parameter sets a rapid traverse rate for canned cycle for drilling in the 3-dimensional coordinate system conversion mode, the tilted working plane indexing mode.

	#7	#6	#5	#4	#3	#2	#1	#0
11216								D3O

[Input type] Parameter input
[Data type] Bit path

#0 D3O When the bit 1 (D3M) of parameter No.11600 set to "1" and Override is 0%, during Tilted working plane indexing or 3-dimensional coordinate system conversion mode, the axis moving signals "MV1 to MV8<Fn102>" :

- 3-dimensional coordinate system conversion
- Tilted working plane indexing

0: becomes 0.

1: maintains the state of "1".

> **NOTE**
> When the manual operation (Jog feed / Incremental feed / Manual handle interrupt)is being executed, the bit 0 (D3O) of parameter No.11216 become invalid. It becomes operation of corresponding D3O=0.

11220	Minimum distance used for determining a plane when a tilted working plane indexing with three points is specified

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm, inch (input unit)

[Min. unit of data] Depend on the increment system of the applied axis

[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))

(When the increment system is IS-B, 0.0 to +999999.999)

When a tilted working plane indexing with three points is specified, if the distance (used for determining a place) between a straight line passing two points and the remaining one point is short, the plane is unstable. In this parameter, set the minimum distance used for determining a plane. If the distance is shorter than the value set in this parameter, an alarm PS5457, “G68.2/G68.3 FORMAT ERROR” is issued.

	#7	#6	#5	#4	#3	#2	#1	#0
11221	AIR			CFW			D3R	MTW

[Input type] Parameter input

[Data type] Bit path

#0 MTW Multiple commands of tilted working plane indexing are:

0: Not used.

1: Used.

#1 D3R In the 3-dimensional coordinate system conversion mode, tilted working plane indexing mode, rapid traverse in canned cycle for drilling is:

0: Performed in the cutting feed mode.

1: Performed in the rapid traverse mode.

#4 CFW When the end point of tool axis direction control (G53.1/G53.6) during execution of the tilted working plane indexing is a singular point:

0: The second rotation axis is not operated.

1: The second rotation axis is controlled so that the direction of the second feature coordinate system matches that of the workpiece coordinate system.

#7 AIR If the movement range of rotation axis (parameter No.19741, 19742, 19743, 19744) is set to the roll-over axis, or roll-over function is set to rotary axis (B type), when tool axis direction control is executed:

0: The alarm PS5459, "MACHINE PARAMETER INCORRECT" is not issued.

1: The alarm PS5459, "MACHINE PARAMETER INCORRECT" is issued.

	#7	#6	#5	#4	#3	#2	#1	#0
11304							GGD	

[Input type] Parameter input

[Data type] Bit

NOTE

When this parameter is set, the power must be turned off before operation is continued.

#1 GGD The G code guidance screen is:

0: Not displayed.

1: Displayed.

	#7	#6	#5	#4	#3	#2	#1	#0
11600							D3MV	

[Input type] Parameter input
[Data type] Bit path

#1 D3MV In following modes, axis moving signals MV1-MV8 <Fn0102> is:
- 3-dimensional coordinate system conversion
- Tilted working plane indexing

0: The signals for axes on programming coordinate system.
1: The signals for axes on workpiece coordinate system.

	#7	#6	#5	#4	#3	#2	#1	#0
11630						TFR		

[Input type] Parameter input
[Data type] Bit path

#2 TFR The minimum command unit of the rotation angles of the tilted working plane indexing is:
0: 0.001 degree.
1: 0.00001 degree.

	#7	#6	#5	#4	#3	#2	#1	#0
13451							ATW	

[Input type] Parameter input
[Data type] Bit path

#1 ATW When I, J, and K are all set to 0 in a block that specifies a feature coordinate system setup command (G68.2), which is a tilted working plane indexing:
0: An alarm PS5457 "G68.2/G68.3 FORMAT ERROR" is issued.
1: A feature coordinate system with a tilted plane angle of 0 degrees is assumed for operation.

	#7	#6	#5	#4	#3	#2	#1	#0
19602			D3D					

[Input type] Parameter input
[Data type] Bit path

#5 D3D Specifies whether to display the distance to go in the program coordinate system or workpiece coordinate system during the 3-dimensional coordinate system conversion or the tilted working plane indexing.
0: Display the distance to go in the program coordinate system.
1: Display the distance to go in the workpiece coordinate system.

	#7	#6	#5	#4	#3	#2	#1	#0
19605								NSC

[Input type] Parameter input
[Data type] Bit path

#0 NSC For the machine type that has no rotation axis for rotating the tool (when parameter No. 19680 is set to 12 to specify the table rotation type), control point shifting in the tilted working plane indexing is:

0: Enabled.
Set bit 4 (SPR) and bit 5 (SVC) of parameter No. 19665.

1: Disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
19608			PRI					

[Input type] Parameter input
[Data type] Bit path

#5 PRI Among multiple end point candidates that exist when a movement is made on a rotation axis by a command such as I, J, and K when a slanted surface machining command is specified under 3-dimensional tool compensation (type 2):

0: A combination in which the master (first rotation axis) makes a smaller angular movement is selected for a machine of tool rotation type or table rotation type. A combination in which the table (second rotation axis) makes a smaller angular movement is selected for a machine of composite type.

1: A combination in which the slave (second rotation axis) makes a smaller angular movement is selected for a machine of tool rotation type or table rotation type. A combination in which the tool (first rotation axis) makes a smaller angular movement is selected for a machine of composite type.

	#7	#6	#5	#4	#3	#2	#1	#0
19665			SVC	SPR				

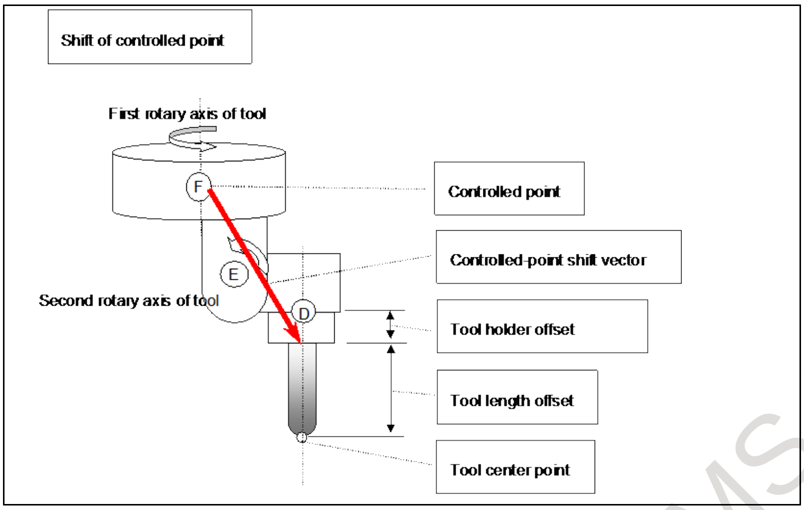
[Input type] Parameter input
[Data type] Bit path

#4 SPR The controlled point is shifted by:

0: Automatic calculation.

1: Using parameter No. 19667.

Bit 5 (SVC) of parameter No. 19665	Bit 4 (SPR) of parameter No. 19665	Shift of controlled point
0	-	Shift is not performed as not done conventionally.
1	0	The controlled point is shifted according to the result of the following automatic calculation: - (Intersection offset vector between the tool axis and the first rotation axis of the tool + intersection offset vector between the second and first rotation axes of the tool + tool holder offset (parameter No. 19666)) (See the figure next.)
1	1	The controlled point is shifted. As the shift vector, the vector set in parameter No. 19667 is used.



[Controlled-point shift vector when automatically calculated]

#5 SVC The controlled point is:
0: Not shifted.
1: Shifted.
The method of shifting is specified by bit 4 (SPR) of parameter No. 19665.

> **NOTE**
> When the machine has no rotation axis for rotating the tool (when parameter No. 19680 is set to 12 to specify the table rotation type), the controlled point is not shifted regardless of the setting of this parameter.

19666	Tool holder offset value

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

Set an offset value (tool holder offset value) specific to the machine from the control point to the tool attachment position in tool length compensation (after specification of G53.1 in the tilted working plane indexing mode). In tool length compensation (not in the tilted working plane indexing mode), however, tool holder offset can be enabled or disabled with bit 7 (ETH) of parameter No. 19665.

> **NOTE**
> Set a radius value.

19667	Controlled-point shift vector

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

Set the shift vector for the controlled point. This value becomes valid when bit 5 (SVC) of parameter No. 19665 is set to 1, and bit 4 (SPR) of parameter No. 19665 is set to 1.

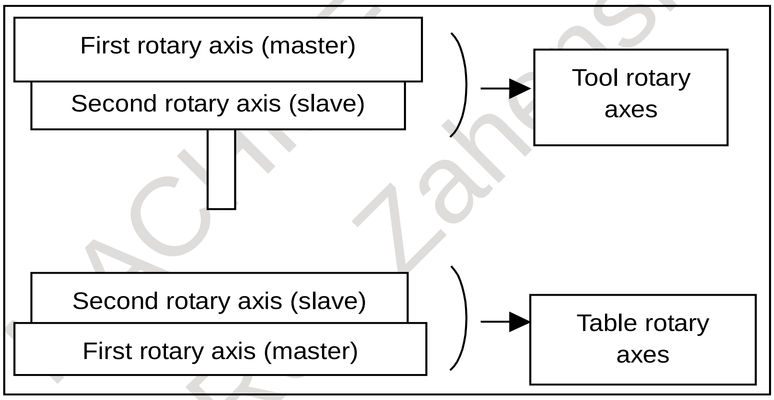
> **NOTE**
> Set a radius value.

19680	Mechanical unit type

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 21

Specify the type of the mechanical unit.

Parameter No. 19680	Mechanical unit type	Controlled rotation axis	Master and slave
0		Mechanism having no rotation axis	
2	Tool rotation type	Two rotation axes of the tool	The first rotation axis is the master, and the second rotation axis is the slave.
12	Table rotation type	Two rotation axes of the table	The first rotation axis is the master, and the second rotation axis is the slave.
21	Mixed type	One rotation axis of the tool + one rotation axis of the table	The first rotation axis is the tool rotation axis, and the second rotation axis is the table rotation axis.



> **NOTE**
> A hypothetical axis is also counted as a controlled rotary axis.
> <Hypothetical axis>
> In some cases, it is convenient to use an imaginary rotary axis whose angle is fixed to a certain value. For example, suppose that a tool is mounted in a tilted manner through an attachment. In such a case, the rotary axis considered hypothetically is a hypothetical axis. Bits 0 (IA1) and 1 (IA2) of parameter No. 19696 determine whether each rotary axis is an ordinary rotary axis or a hypothetical axis.

19681	Controlled-axis number for the first rotation axis

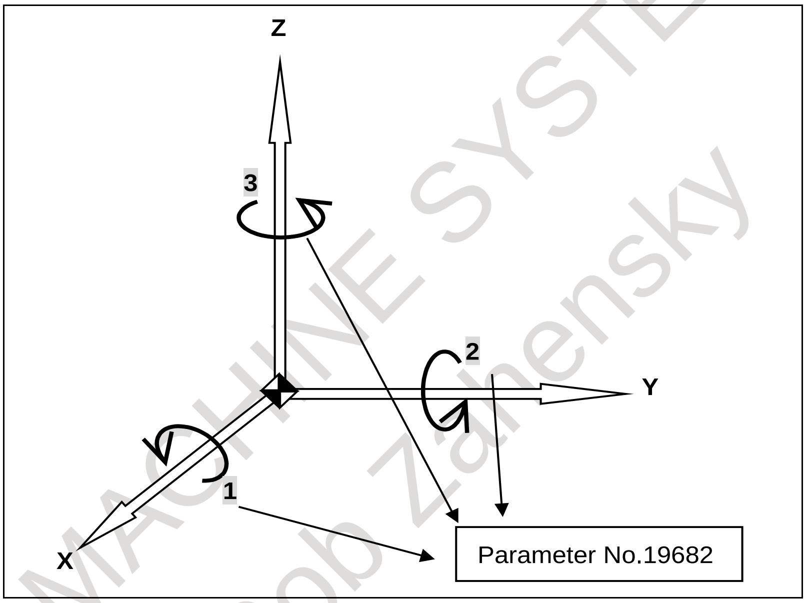
[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes

Set the controlled-axis number for the first rotation axis.
For a hypothetical axis (when bit 0 (IA1) of parameter No. 19696 is 1), set 0.
Example)
Assuming that the axis configuration in path 1 is X,Y,Z,B,C and the axis configuration in path 2 is X,Z,C,Y,B, set the parameter to 5 in path 1 and to 3 in path 2 if C is the first rotation axis in each path.

19682	Axis direction of the first rotation axis

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 3

Specify the axis direction of the first rotation axis.
1: On X-axis
2: On Y-axis
3: On Z-axis



19684	Rotation direction of the first rotation axis

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 1

Set the direction in which the first rotation axis rotates as a mechanical motion when a positive move command is issued.
0: Clockwise direction as viewed from the negative to positive direction of the axis specified in parameter No. 19682 (right-hand thread rotation)
1: Counterclockwise direction as viewed from the negative to positive direction of the axis specified in parameter No. 19682 (left-hand thread rotation)

Normally, 0 is set for a tool rotation axis, and 1 is set for a table rotation axis.

19685	Rotation angle when the first rotation axis is a hypothetical axis

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis

[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
When the first rotation axis is a hypothetical axis (bit 0 (IA1) of parameter No. 19696 is 1), set the rotation angle.

19686	Controlled-axis number for the second rotation axis

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to Number of controlled axes
Set the controlled-axis number for the second rotation axis.
For a hypothetical axis (bit 1 (IA2) of parameter No. 19696 is 1), set 0.
[Example] Assuming that the axis configuration in path 1 is X,Y,Z,B,C and the axis configuration in path 2 is X,Z,C,Y,B, set the parameter to 4 in path 1 and to 5 in path 2 if B is the second rotation axis in each path.

19687	Axis direction of the second rotation axis

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 3
Specify the axis direction of the second rotation axis.
1: On X-axis
2: On Y-axis
3: On Z-axis
When the second rotation axis is the slave axis, the direction when the master axis is at 0 degrees must be set.

19689	Rotation direction of the second rotation axis

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 1
Set the direction in which the second rotation axis rotates as a mechanical motion when a positive move command is issued.
0: Clockwise direction as viewed from the negative to positive direction of the axis specified in parameter No. 19687 (right-hand thread rotation)
1: Counterclockwise direction as viewed from the negative to positive direction of the axis specified in parameter No. 19687 (left-hand thread rotation)
Normally, 0 is set for a tool rotation axis, and 1 is set for a table rotation axis.

19690	Rotation angle when the second rotation axis is a hypothetical axis

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
When the second rotation axis is a hypothetical axis (bit 1 (IA2) of parameter No. 19696 is 1), set the rotation angle.

	#7	#6	#5	#4	#3	#2	#1	#0
19696							IA2	IA1

[Input type] Parameter input
[Data type] Bit path

#0 IA1

0: The first rotation axis is an ordinary rotation axis.
1: The first rotation axis is a hypothetical axis.

If IA1 is 1, set 0 as the controlled-axis number for the first rotation axis (parameter No. 19681).
Also, set parameters Nos. 19682 to 19685 on the assumption that there is a rotation axis.

#1 IA2

0: The second rotation axis is an ordinary rotation axis.
1: The second rotation axis is a hypothetical axis.

If IA2 is 1, set 0 as the controlled-axis number for the second rotation axis (parameter No. 19686).
Also, set parameters Nos. 19687 to 19690 on the assumption that there is a rotation axis.

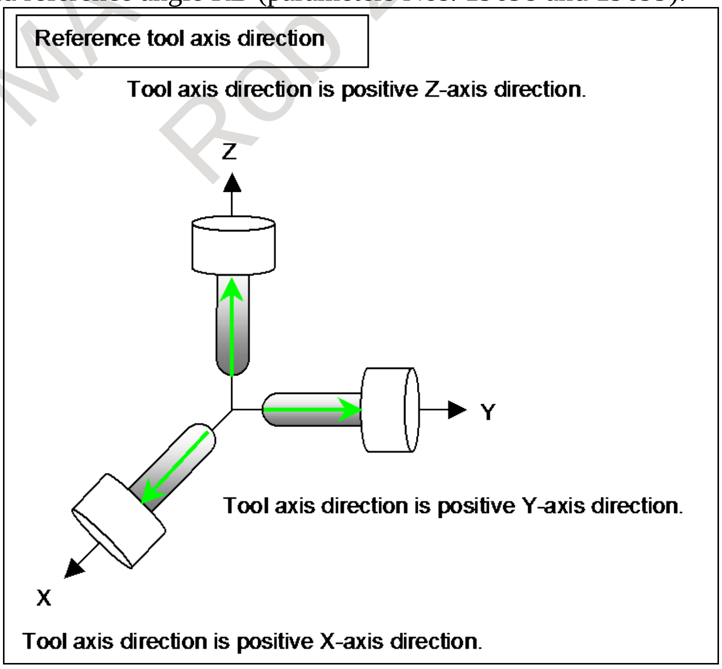
19697	Reference tool axis direction

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 3

Set the tool axis direction in the machine coordinate system when the rotation axes for controlling the tool are all at 0 degrees. Also, set the tool axis direction in the machine coordinate system in a mechanism in which only the rotation axes for controlling the table are present (there is no rotation axis for controlling the tool).

1: Positive X-axis direction
2: Positive Y-axis direction
3: Positive Z-axis direction

When the reference tool axis direction is neither the X-, Y-, nor Z-axis direction, set the reference direction in this parameter, then set appropriate angles as the reference angle RA and reference angle RB (parameters Nos. 19698 and 19699).

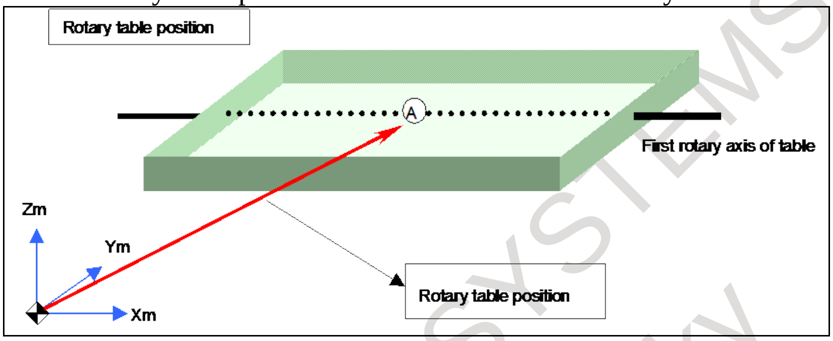


19700	Rotary table position (X-axis of the basic three axes)

19701	**Rotary table position (Y-axis of the basic three axes)**

19702	**Rotary table position (Z-axis of the basic three axes)**

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
Set these parameters when parameter No. 19680 is set to 12 or 21. The vector from the origin of the machine coordinate system to point A on the first rotation axis of the table is set as the rotary table position in the machine coordinate system.



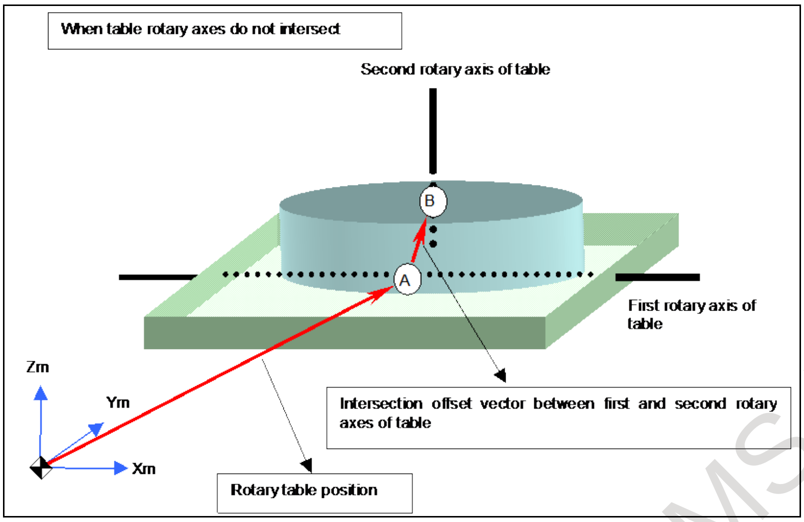
> **NOTE**
> As point A, set a position that is easy to measure on the first rotary axis of the table.
> Set a radius value.
> If the rotary table is moved along the X-, Y-, or Z-axis or all of these axes, set the position of the rotary table when the machine coordinates of the X-, Y-, and Z-axes are all set to 0.

19703	**Intersection offset vector between the first and second rotation axes of the table (X-axis of the basic three axes)**

19704	**Intersection offset vector between the first and second rotation axes of the table (Y-axis of the basic three axes)**

19705	**Intersection offset vector between the first and second rotation axes of the table (Z-axis of the basic three axes)**

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
Set these parameters when the first rotation axis and second rotation axis of the table do not intersect. These parameters are valid when parameter No. 19680 is set to 12. When the rotation axes for controlling the table are all at 0 degrees, the vector from point A to point B on the second rotation axis of the table is set as the intersection offset vector in the machine coordinate system.

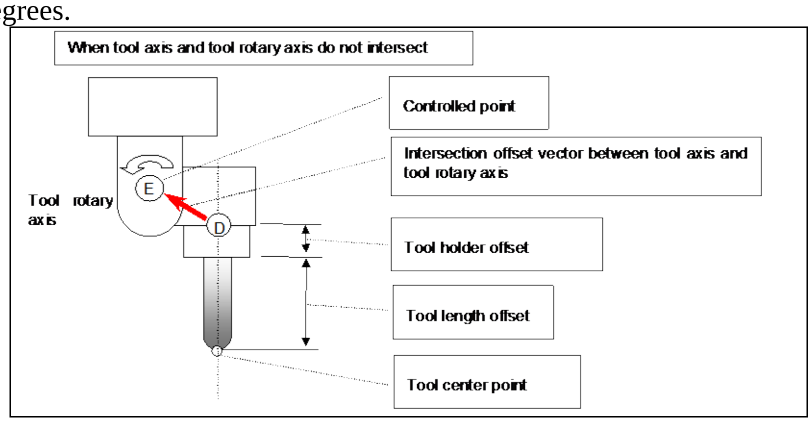


> **NOTE**
> As point B, set a position that is easy to measure on the second rotary axis of the table.
> Set a radius value.

19709	Intersection offset vector between the tool axis and tool rotation axis (X-axis of the basic three axes)
19710	Intersection offset vector between the tool axis and tool rotation axis (Y-axis of the basic three axes)
19711	Intersection offset vector between the tool axis and tool rotation axis (Z-axis of the basic three axes)

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

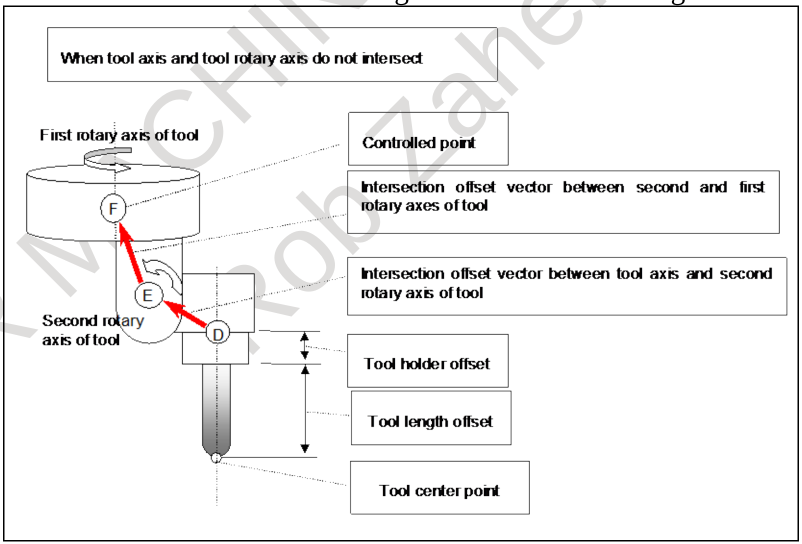
Set these parameters when the tool axis and tool rotation axis do not intersect.
These parameters are valid when parameter No. 19680 is set to 2 or 21.
If parameter No. 19680 is 21, set the vector from point D on the tool axis to point E determined on the tool rotation axis as the intersection offset vector in the machine coordinate system when the rotation axes for controlling the tool are all at 0 degrees.
If parameter No. 19680 is 2, set the vector from point D on the tool axis to point E determined on the second rotation axis of the tool as the intersection offset vector in the machine coordinate system when the rotation axes for controlling the tool are all at 0 degrees.



> **NOTE**
> Point D is determined by adding the tool length offset and tool holder offset (parameter No. 19666) to the tool tip. As point E, set a position that is easy to measure.
> Set a radius value.

19712	**Intersection offset vector between the second and first rotation axes of the tool (X-axis of the basic three axes)**
19713	**Intersection offset vector between the second and first rotation axes of the tool (Y-axis of the basic three axes)**
19714	**Intersection offset vector between the second and first rotation axes of the tool (Z-axis of the basic three axes)**

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
Set these parameters when the rotation axes of the tool do not intersect.
These parameters are valid when parameter No. 19680 is set to 2.
Set the vector from point E on the second rotation axis of the tool to point F on the first rotation axis of the tool as the intersection offset vector in the machine coordinate system when the rotation axes for controlling the tool are all at 0 degrees.



> **NOTE**
> As point F, set a position that is easy to measure.
> Set a radius value.

19741	**Upper limit of the movement range of the first rotation axis**

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis

[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets the upper limit of the movement range of the first rotation axis in tool axis direction control of the tilted working plane indexing (G53.1). When the movement range of the first rotation axis is not specified or the first rotation axis is the roll-over axis, this parameter and parameter No. 19742 must both be set to 0.

19742	Lower limit of the movement range of the first rotation axis

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets the lower limit of the movement range of the first rotation axis in tool axis direction control of the tilted working plane indexing (G53.1). When the movement range of the first rotation axis is not specified or the first rotation axis is the roll-over axis, this parameter and parameter No. 19741 must both be set to 0.

19743	Upper limit of the movement range of the second rotation axis

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets the upper limit of the movement range of the second rotation axis in tool axis direction control of the tilted working plane indexing (G53.1). When the movement range of the second rotation axis is not specified or the second rotation axis is the roll-over axis, this parameter and parameter No. 19744 must both be set to 0.

19744	Lower limit of the movement range of the second rotation axis

[Input type] Parameter input
[Data type] Real path
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting
(When the increment system is IS-B, -999999.999 to +999999.999)
This parameter sets the lower limit of the movement range of the second rotation axis in tool axis direction control of the tilted working plane indexing (G53.1). When the movement range of the second rotation axis is not specified or the second rotation axis is the roll-over axis, this parameter and parameter No. 19743 must both be set to 0.

12.16.5 Restrictions of Tilted Working Plane Indexing

- Basic restrictions

The restrictions imposed on 3-dimensional coordinate conversion also apply to the tilted working plane indexing.
The following presents the restrictions to bear in mind in particular:

- Increment system

The same increment system must be used for the basic three axes used by this function.

- Rapid traverse command

Linear rapid traverse (bit 1 (LRP) of parameter No. 1401=1) must be set for the rapid traverse command.

- 3-dimensional coordinate system conversion

If an attempt is made to set a new coordinate system by performing 3-dimensional coordinate conversion in a feature coordinate system, an alarm is also raised.

- Positioning in the machine coordinate system

Positioning commands in the machine coordinate system such as G28, G30, and G53 operate in the machine coordinate system rather than the feature coordinate system.

- External mirror image

If an attempt is made to use this function and an external mirror image function simultaneously, this function takes effect before the external mirror image function.

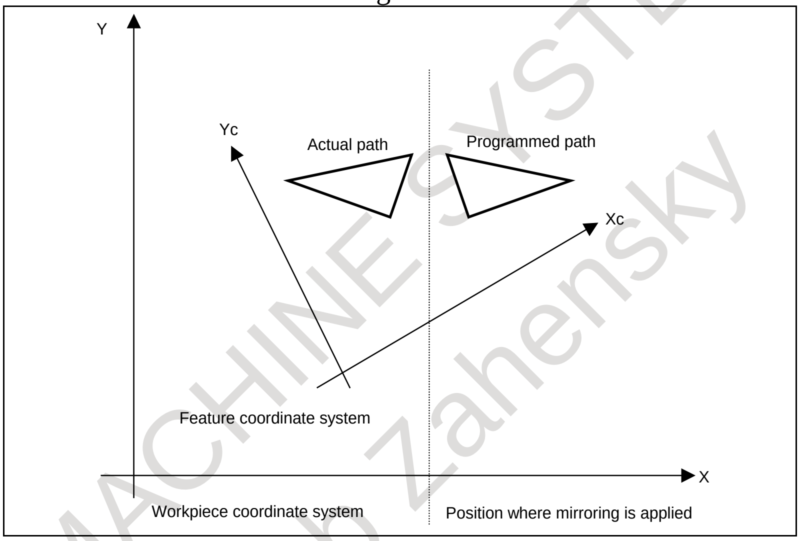


Fig. 12.16.5 (a)

- Tool center point retention type tool axis direction control

Reset

Performing a reset during tool center point retention type tool axis direction control results in the operation to be performed when the following parameters are set regardless of whether the reset is performed in the foreground or background. Thus, do not use the background during tool center point retention type tool axis direction control.

(1) Bit 2 (D3R) of parameter No. 5400 = 0: Clears the tilted working plane indexing.
(2) Bit 6 (CLR) of parameter No. 3402 = 1: Clears with a reset.
(3) Bit 0 (C08) of parameter No. 3407 = 0: Clears the G code in group 08.
(4) Bit 7 (C23) of parameter No. 3408 = 0: Clears the G code in group 23.
(5) Bit 7 (CFH) of parameter No. 3409 = 0: Clears the F, H, D, and T codes.
(6) Bit 6 (LVK) of parameter No. 5003 = 0: Clears the tool length compensation vector.

Look-ahead acceleration/deceleration before interpolation

When using tool center point retention type tool axis direction control, use acceleration/deceleration before look ahead interpolation at the same time. If acceleration/deceleration before look ahead interpolation is not used, a shock may result. Furthermore, be sure to set the following parameters:

(1) Bit 1 (LRP) of parameter No. 1401 = 1:
Linear rapid traverse

(2) Bit 5 (FRP) of parameter No. 19501 = 1:
For rapid traverse, uses look-ahead acceleration/deceleration before interpolation.
(3) Parameter No. 1671:
Acceleration of acceleration/deceleration for rapid traverse.
(4) Parameter No. 1672:
Acceleration change time of look-ahead bell-shaped acceleration/deceleration before interpolation for rapid traverse.
(5) Parameter No. 1660:
Maximum permissible acceleration of look-ahead acceleration/deceleration before interpolation.

If any of these settings is not made, alarm PS5458, "ILLEGAL USE OF G53.1/G53.6", occurs.

- Relationships with other modal commands

G41, G42, and G40 (cutter compensation), G43, G49 (tool length compensation), G51.1 and G50.1 (programmable mirror image), and canned cycle commands must have nesting relationships with G68.2.
In other words, first issue G68.2 when the modes mentioned above are off, turn the modes on and off, then issue G69.

- Manual reference position return

Execution of manual reference position return in the tilted working plane indexing mode issues alarm PS5324, “REFERENCE RETURN INCOMPLETE”. Before performing manual reference position return, cancel the tilted working plane indexing mode.

- Hypothetical axis of a table rotation axis

When a table rotation axis is set as a hypothetical axis, tilted working plane indexing is performed on the assumption that the table rotation axis is at 0 degrees.

- Specifiable G codes

The G codes that can be specified in the tilted working plane indexing mode are listed below.
Specifying a G code other than these codes results in alarm PS5462 “ILLEGAL COMMAND (G68.2/G69)”.

- Positioning (G00)
- Linear interpolation (G01)
- Circular interpolation / helical interpolation (G02/G03)
- Dwell (G04)
- AI contour control(G05.1 Q0/Q1)
- Exact stop (G09)
- Programmable data input (G10)
- Tool retract and recover (G10.6)
- Programmable data input mode cancel (G11)
- Plane selection (G17/G18/G19)
- Automatic return to reference position (G28)
- Movement from reference position (G29)
- 2nd, 3rd and 4th reference position return (G30)
- Skip function (G31)
- Cutter compensation : cancel (G40)
- Tool radius or tool nose radius compensation (G41/G42)
- Tool length compensation + (G43)
- Tool length compensation - (G44)
- Tool length compensation cancel (G49,G49.1)
- Programmable mirror image cancel (G50.1)
- Local coordinate system (G52)
- Machine coordinate system setting (G53)
- Tool axis direction control (G53.1)
- Workpiece coordinate system selection (G54 to G59, G54.1)

- Exact stop mode (G61)
- Tapping mode (G63)
- Cutting mode(G64)
- Macro call (G65)
- Macro modal call A (G66)
- Macro modal call B (G66.1)
- Macro modal call A/B cancel (G67)
- Canned cycle for drilling (G73, G74, G76, G80 to G89)
- Absolute programming (G90)
- Incremental programming (G91)
- Constant surface speed control (G96)
- Constant surface speed control cancel (G97)
- Canned cycle : return to initial level (G98)
- Canned cycle : return to R point level (G99)

M

- Tool offset increase (G45)
- Tool offset decrease (G46)
- Tool offset double increase (G47)
- Tool offset double decrease (G48)
- Scaling cancel (G50)
- Scaling (G51)
- Programmable mirror image (G51.1)
- Automatic corner override (G62)
- Mode off of coordinate system rotation or 3-dimensional coordinate system conversion (G69)
- Inverse time feed (G93)
- Feed per minute (G94)
- Feed per revolution (G95)

T

- Mode off of coordinate system rotation or 3-dimensional coordinate system conversion (G69.1)
- Feed per minute (G98 (G94))
- Feed per revolution (G99 (G95))

- Modal G codes that allow specification of a tilted working plane indexing

A tilted working plane indexing can be specified in the modal G code states listed below.
In a modal state other than the following modal G codes, specifying the tilted working plane indexing results in alarm PS5462 “ILLEGAL COMMAND (G68.2/G69)”:

- Positioning (G00)
- Linear interpolation (G01)
- Programmable data input mode cancel (G11)
- Plane selection (G17/G18/G19)
- Polar coordinates command cancel (G15)
- Input in inch (G20 (G70))
- Input in mm (G21 (G71))
- Stored stroke check function (G22/G23)
- Cutter compensation : cancel (G40)
- Tool length compensation cancel (G49,G49.1)
- Programmable mirror image cancel (G50.1)
- Workpiece coordinate system selection (G54 to G59, G54.1)
- Exact stop mode (G61)
- Tapping mode (G63)
- Cutting mode (G64)
- Macro modal call A/B cancel (G67)

- Canned cycle cancel (G80)
- Absolute programming (G90)
- Incremental programming (G91)
- Constant surface speed control cancel (G97)
- Canned cycle : return to initial level (G98)
- Canned cycle : return to R point level (G99)

M

- Scaling cancel (G50)
- Automatic corner override (G62)
- Mode off of coordinate system rotation or 3-dimensional coordinate system conversion (G69)
- Inverse time feed (G93)
- Feed per minute (G94)
- Feed per revolution (G95)

T

- Polar coordinate interpolation mode cancel (G13.1)
- Polygon turning cancel (G50.2)
- Mirror image for double turret off/balanced cutting mode cancel (G69)
- Mode off of coordinate system rotation or 3-dimensional coordinate system conversion (G69.1)
- Feed per minute (G98 (G94))
- Feed per revolution (G99 (G95))
- Polar coordinate interpolation mode cancel (G113)

Alarm and message

Number	Message	Description
PS0438	ILLEGAL PARAMETER IN TOOL DIRC CMP	If on a 5-axis machine, a case below applies, a parameter is illegal. Tool center point retention type tool axis direction control (G53.6) is performed. Parameter settings - Look-ahead acceleration/deceleration before interpolation is disabled. Set parameter No. 1660. - Rapid traverse acceleration/deceleration before interpolation is disabled. Set bit 1 of parameter No. 1401, bit 5 of parameter No. 19501, and parameter No. 1671. - Any of machine configuration parameters Nos. 19680 to 19714 is illegal. - The axis set in parameter No. 19681 or 19686 is not a rotation axis. - The basic three axes are not set in parameter No. 1022.
PS5324	REFERENCE RETURN INCOMPLETE	Manual reference position return cannot be performed during three-dimensional coordinate conversion, execution of the tilted working plane indexing.
PS5456	TOO MANY G68.2 NESTING	Tilted working plane indexing G68.2 was specified more than once. To perform another coordinate conversion, perform cancellation, then specify the coordinate conversion.
PS5457	G68.2/G68.3 FORMAT ERROR	A G68.2/G68.3 format error occurred.
PS5458	ILLEGAL USE OF G53.1/G53.6	- G53.1/G53.6 is specified before a G68.2 command. - G53.1/G53.6 is not specified alone. - No tool is specified with a G53.6 command.

Number	Message	Description
PS5459	MACHINE PARAMETER INCORRECT	- A machine configuration parameter (parameters Nos. 19665 to 19667, 19680 to 19714, or 12321) is incorrect. - The axis set in parameter No. 19681 or 19686 is not a rotation axis. - The basic three axes are not set in parameter No. 1022. - A rotary axis end point found by the NC with the tilted working plane indexing is not within the range set by parameters No 19741 to 19744. - When tool axis direction control (G53.1/G53.6) is specified on the following condition that parameter is set incorrectly if bit 7 (AIR) of parameter No.11221 is set 1. - In case that the movement range of rotation axis is set to the roll-over axis - In case that roll-over function is set to rotary axis (B type)
5462	ILLEGAL COMMAND (G68.2/G69)	(1) The modal setting used when G68.2 or G69 is specified is incorrect. (2) An unspecifiable G code was specified in the G68.2 mode. (3) The offset vector of tool radius/tool nose radius compensation is not canceled when G68.2 or G69 is specified.

12.17 MACRO COMPILER/MACRO EXECUTER

Overview

The macro executor function converts custom macros created by machine tool builders to executable programs, registers them in the FLASH ROM module, and executes them to solve problems as described below.
NC programs are divided into two types: Programs that are hardly modified after created (programs created using custom macros) and programs that differ depending on the workpiece (machining programs). Since different types of programs are processed in the same way, a custom macro may be destroyed due to a battery failure or operator error.

Features

- Since the program is stored in executable form program, the execution speed is high. Machine time is then reduced, and precision is improved.
- Since the program is stored in FLASH ROM, there is no lost of data of battery failure or corruption. Reliability is improved.
- Stored programs are not displayed on the program screen, so know-how of the machine tool builders is kept protected.
- Since custom macros are stored in FLASH ROM, the program editing memory can be used effectively.
- The user can call the macro without knowing the stored program. A custom macro can be created and executed in the program edit memory.
- An original screen can be created by using the graphic display or by selecting screens by the soft key. The machine tool builder can extend the control function by using such functions as machine program creation and edit control, RS-232C interface control, and PMC data read/write functions.

Macro Executor PROGRAMMING MANUAL (B-63943EN-2)

12.18 OPTIONAL ANGLE CHAMFERING AND CORNER ROUNDING

M

Overview

Chamfering and corner rounding blocks can be inserted automatically between the following:

- Between linear interpolation and linear interpolation blocks
- Between linear interpolation and circular interpolation blocks
- Between circular interpolation and linear interpolation blocks
- Between circular interpolation and circular interpolation blocks

It is possible to use this function with AI contour control.

Limitation

- Macro executer

Optional angle chamfering and corner rounding specified in the execution macro is disabled.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
5105								SBC

[Input type] Parameter input
[Data type] Bit path

#0 SBC In a drilling canned cycle, chamfer cycle, or corner rounding cycle:
0: A single block stop is not performed.
1: A single block stop is performed.

Alarm and message

Number	Message	Description
PS0050	CHF/CNR NOT ALLOWED IN THRD BLK	Chamfering or corner R is commanded in the thread cutting block. Modify the program.
PS0051	MISSING MOVE AFTER CNR/CHF	Improper movement or the move distance was specified in the block next to the chamfering or corner R block. Modify the program.
PS0055	MISSING MOVE VALUE IN CHF/CNR	In chamfering or corner R block, the move distance is less than chamfer or corner R amount. Modify the program.

12.19 CHAMFERING AND CORNER ROUNDING

T

Overview

A chamfering or corner rounding block can automatically be inserted between linear interpolation (G01) along a single axis and that along a single axis normal to that single axis.
Chamfering or corner rounding is inserted for a command to move the tool along two axes on the plane determined by the plane selection (G17, G18, or G19) command.

Format

- Chamfering
First axis on the selected plane → second axis on the selected plane
(G17 plane: $X_P \rightarrow Y_P$, G18 plane: $Z_P \rightarrow X_P$, G19 plane: $Y_P \rightarrow Z_P$)

Format	
G17 plane:	**G01 X_P(U)_ J(C)±j ;**
G18 plane:	**G01 Z_P(W)_ I(C)±i ;**
G19 plane:	**G01 Y_P(V)_ K(C)±k ;**

Explanation		**Tool movement**
X_P(U)__ **Y_P(V)__** **Z_P(W)__**	Specifies movement from point a to point b with an absolute or incremental programming in the figure on the right. X_P is the address of the X-axis of the three basic axes or an axis parallel to the X-axis. Y_P is the address of the Y-axis of the three basic axes or an axis parallel to the Y-axis. Z_P is the address of the Z-axis of the three basic axes or an axis parallel to the Z-axis.	I(C)±i **J(C)±j** **K(C)±k**	Specify the distance between points b and c in the figure shown at right with a sign following address I, J, K, or C. (Use I, J, or K when bit 4 (CCR) of parameter No. 3405 is set to 0 or C when the bit is set to 1.)	Moves from a to d and c. (Positive direction along the second axis on the selected plane when a plus sign is specified at I, J, K, or C or negative direction when a minus sign is specified at I, J, K, or C)

- Chamfering
Second axis on the selected plane → first axis on the selected plane
(G17 plane: $Y_P \rightarrow X_P$, G18 plane: $X_P \rightarrow Z_P$, G19 plane: $Z_P \rightarrow Y_P$)

Format	
G17 plane:	**G01 Y_P(V)_ I(C)±i ;**
G18 plane:	**G01 X_P(U)_ K(C)±k ;**
G19 plane:	**G01 Z_P(W)_ J(C)±j ;**

Explanation		**Tool movement**
X_P(U)__ **Y_P(V)__** **Z_P(W)__**	Specifies movement from point a to point b with an absolute or incremental programming in the figure on the right. X_P is the address of the X-axis of the three basic axes or an axis parallel to the X-axis. Y_P is the address of the Y-axis of the three basic axes or an axis parallel to the Y-axis. Z_P is the address of the Z-axis of the three basic axes or an axis parallel to the Z-axis.	Moves from a to d and c. (Positive direction along the first axis on the selected plane when a plus sign is specified at I, J, K, or C or negative direction when a minus sign is specified at I, J, K, or C)
I(C)±i **J(C)±j** **K(C)±k**	Specify the distance between points b and c in the figure shown at right with a sign following address I, J, K, or C. (Use I, J, or K when bit 4 (CCR) of parameter No. 3405 is set to 0 or C when the bit is set to 1.)	
- Corner R
First axis on the selected plane → second axis on the selected plane
(G17 plane: $X_P \rightarrow Y_P$, G18 plane: $Z_P \rightarrow X_P$, G19 plane: $Y_P \rightarrow Z_P$)

Format
G17 plane: G01 X_P(U)_ R±r ; **G18 plane: G01 Z_P(W)_ R±r ;** **G19 plane: G01 Y_P(V)_ R±r ;**

Explanation		Tool movement
X_P(U)__ **Y_P(V)__** **Z_P(W)__**	Specifies movement from point a to point b with an absolute or incremental programming in the figure on the right. X_P is the address of the X-axis of the three basic axes or an axis parallel to the X-axis. Y_P is the address of the Y-axis of the three basic axes or an axis parallel to the Y-axis. Z_P is the address of the Z-axis of the three basic axes or an axis parallel to the Z-axis.	R±r	Specify the radius of the arc connecting points d and c in the figure shown at right with a sign following address R.	Moves from a to d and c. (Positive direction along the second axis on the selected plane when +r is specified at R or negative direction when -r is specified at R)

- Corner R
Second axis on the selected plane → first axis on the selected plane
(G17 plane: $Y_P \rightarrow X_P$, G18 plane: $X_P \rightarrow Z_P$, G19 plane: $Z_P \rightarrow Y_P$)

Format
G17 plane: G01 Y_P(V)_ R±r ; **G18 plane: G01 X_P(U)_ R±r ;** **G19 plane: G01 Z_P(W)_ R±r ;**

Explanation		Tool movement
X_P(U)__ **Y_P(V)__** **Z_P(W)__**	Specifies movement from point a to point b with an absolute or incremental programming in the figure on the right. X_P is the address of the X-axis of the three basic axes or an axis parallel to the X-axis. Y_P is the address of the Y-axis of the three basic axes or an axis parallel to the Y-axis. Z_P is the address of the Z-axis of the three basic axes or an axis parallel to the Z-axis.	Moves from a to d and c. (Positive direction along the first axis on the selected plane when +r is specified at R or negative direction when -r is specified at R)
R±r	Specify the radius of the arc connecting points d and c in the figure shown at right with a sign following address R.	
Explanation

By G01 specified for chamfering or corner R, the tool must be moved only along one of the two axes on the selected plane. The command in the next block must move the tool only along the other axis on the selected plane.

Example:

When the A-axis is set as an axis parallel to the basic X-axis (by setting parameter No. 1022 to 5), the following program performs chamfering between cutting feed along the A-axis and that along the Z-axis:

```
G18 A0 Z0
G00 A100.0 Z100.0
G01 A200.0 F100 K30.0
Z200.0
```

The following program causes an alarm. (Because chamfering is specified in the block to move the tool along the X-axis, which is not on the selected plane)

```
G18 A0 Z0
G00 A100.0 Z100.0
G01 X200.0 F100 K30.0
Z200.0
```

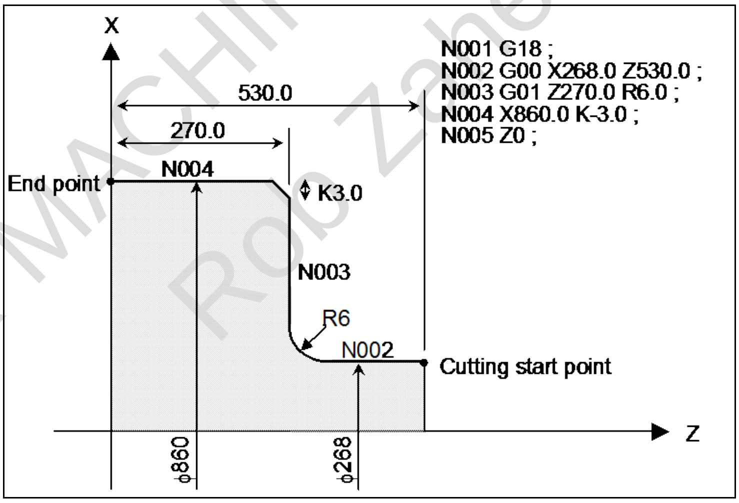
The following program also causes an alarm. (Because the block next to the chamfering command moves the tool along the X-axis, which is not on the selected plane)

```
G18 A0 Z0
G00 A100.0 Z100.0
G01 Z200.0 F100 I30.0
X200.0
```

A radius value is specified at I, J, K, R, and C.

In an incremental programming, use point b in the figure in "Format" as the start point in the block next to a chamfering or corner R block. That is, specify the distance from point b. Do not specify the distance from point c.

Example



Limitation

- Alarms

In the following cases, an alarm is issued:

1) Chamfering or corner R is specified in a block for threading (alarm PS0050, “CHF/CNR NOT ALLOWED IN THRD BLK”).

2) G01 is not specified in the block next to the G01 block in which chamfering or corner R is specified (alarm PS0051, “MISSING MOVE AFTER CNR/CHF” or PS0052, “CODE IS NOT G01 AFTER CHF/CNR”).

3) An axis which is not on the selected plane is specified as a move axis in the block in which chamfering or corner R is specified or the next block (alarm PS0051 or PS0052).

4) A plane selection command (G17, G18, or G19) is specified in the block next to the block in which chamfering or corner R is specified (alarm PS0051).

5) When bit 4 (CCR) of parameter No. 3405 is set to 0 (to specify chamfering at I, J, or K), two or more of I, J, K, and R are specified in G01 (alarm PS0053, "TOO MANY ADDRESS COMMANDS").

6) Chamfering or corner R is specified in the G01 block to move the tool along more than one axis (alarm PS0054, "NO TAPER ALLOWED AFTER CHF/CNR").

7) The travel distance along an axis specified in the block in which chamfering or corner R is specified is smaller than the amount of chamfering or corner R (alarm PS0055, "MISSING MOVE VALUE IN CHF/CNR"). (See the Fig. 12.19 (a).)

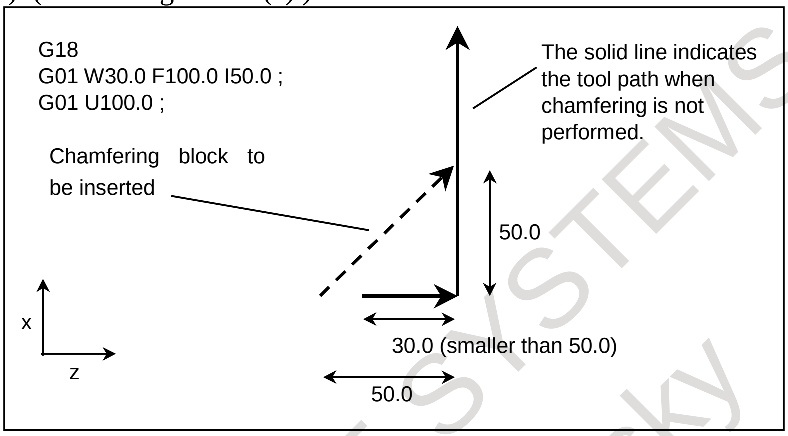


Fig. 12.19 (a) Example of machining which causes alarm PS0055

8) An invalid combination of a move axis and I, J, or K is specified for chamfering (alarm PS0306, "MISMATCH AXIS WITH CNR/CHF").

9) An invalid sign is specified at I, J, K, R, or C (chamfering or corner R in the direction opposite to the movement in the next block is specified) (alarm PS0051). (See the Fig. 12.19 (b).)

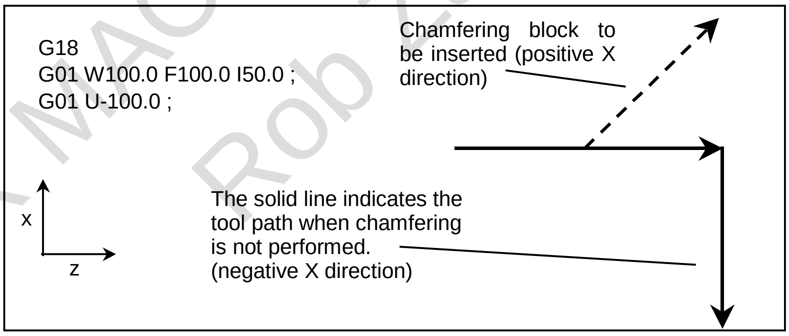

Fig. 12.19 (b) Example of machining which causes alarm PS0051

10) In a shape program in the multiple repetitive canned cycle (G70, G71, G72, or G73), a command for the chamfering or corner R in the last block is terminated in the middle (alarm PS0069, "LAST BLOCK OF SHAPE PROGRAM IS AN ILLEGAL COMMAND").

- Single block operation

When the block in which chamfering or corner R is specified is executed in the single block mode, operation continues to the end point of the inserted chamfering or corner R block and the machine stops in the feed hold mode at the end point. When bit 0 (SBC) of parameter No. 5105 is set to 1, the machine stops in the feed hold mode also at the start point of the inserted chamfering or corner R block.

- Macro executer

Chamfering and corner rounding specified in the execution macro is disabled.

- Cutter compensation or tool nose radius compensation

When applying cutter or tool nose radius compensation, note the following points:

1. If the amount of inner chamfering or corner R is too small as compared with compensation and cutting is generated, alarm PS0041, “INTERFERENCE IN CUTTER COMPENSATION” is issued. (See the Fig. 12.19 (c).)

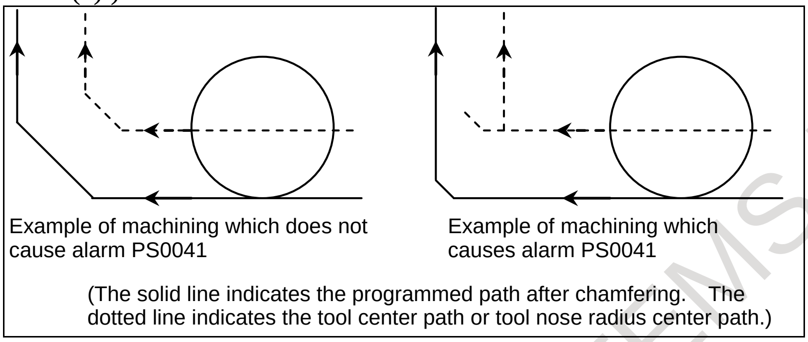

Fig. 12.19 (c)

2. A function is available which intentionally changes the compensation direction by specifying the I, J, or K command in the G01 block in the cutter or tool nose radius compensation mode (see the explanations of cutter or tool nose radius compensation). To use this function when the chamfering and corner R function is used, set bit 4 (CCR) of parameter No. 3405 to 1 so that I, J, and K are not used for specifying chamfering. Operation to be performed under each condition is explained below.

   (1) When the chamfering and corner R function is not used
   In the G01 block in the cutter or tool nose radius compensation mode, the cutter or tool nose radius compensation direction can be specified at address I, J, or K.
   No chamfering is performed.

   (2) When the chamfering and corner R function is used
   (2-1) When bit 4 (CCR) of parameter No. 3405 is set to 0
   In the G01 block in the cutter or tool nose radius compensation mode, chamfering can be specified at address I, J, or K. Corner R can also be specified at address R.
   The cutter or tool nose radius compensation direction cannot be specified.
   (2-2) When bit 4 (CCR) of parameter No. 3405 is set to 1
   In the G01 block in the cutter or tool nose radius compensation mode, the cutter or tool nose radius compensation direction can be specified at address I, J, or K.
   Chamfering or corner R can also be specified at address C or R.

> **NOTE**
> The chamfering and corner R function and direct drawing dimension programming function cannot be used simultaneously. When bit 0 (CRD) of parameter No. 3453 is set to 0, chamfering and corner R is enabled. (At this time, direct drawing dimension programming is disabled.)

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3405				CCR				

[Input type] Parameter input
[Data type] Bit path

#4 CCR Addresses used for chamfering

0: Address is “I”, “J”, or “K”.
In direct drawing dimension programming, addresses ",C", ",R", and ",A" (with comma) are used in stead of "C", "R", and "A".

1: Address is “C”.
Addresses used for direct drawing dimension programming are "C", "R", and "A" without comma.

> **NOTE**
> If this bit (CCR) is set to 0, the function for changing the compensation direction by specifying I, J, or K in a G01 block in the cutter compensation/ tool nose radius compensation mode cannot be used.
> If this bit (CCR) is set to 1 when address C is used as an axis name, the chamfer function cannot be used.

#0 SBC In a drilling canned cycle, chamfer cycle, or corner rounding cycle:

0: A single block stop is not performed.
1: A single block stop is performed.

Alarm and message

Number	Message	Description
PS0050	CHF/CNR NOT ALLOWED IN THRD BLK	Chamfering or corner R is commanded in the thread cutting block. Modify the program.
PS0051	MISSING MOVE AFTER CNR/CHF	Improper movement or the move distance was specified in the block next to the chamfering or corner R block. Modify the program.
PS0052	CODE IS NOT G01 AFTER CHF/CNR	The block next to the chamfering or corner R block is not G01 (or vertical line). Modify the program.
PS0053	TOO MANY ADDRESS COMMANDS	In the chamfering and corner R commands, two or more of I, J, K and R are specified.
PS0054	NO TAPER ALLOWED AFTER CHF/CNR	A block in which chamfering or the corner R was specified includes a taper command. Modify the program.
PS0055	MISSING MOVE VALUE IN CHF/CNR	In chamfering or corner R block, the move distance is less than chamfer or corner R amount. Modify the program.

Number	Message	Description
PS0069	LAST BLOCK OF SHAPE PROGRAM IS AN ILLEGAL COMMAND	In a shape program in the multiple repetitive canned cycle (G70, G71, G72, or G73), a command for the chamfering or corner R in the last block is terminated in the middle.
PS0306	MISMATCH AXIS WITH CNR/CHF	The correspondence between the moving axis and the I, J, or K command is incorrect in a block in which chamfering is specified.

12.20 DIRECT DRAWING DIMENSIONS PROGRAMMING

T

Overview

Angles of straight lines, chamfering value, corner rounding values, and other dimensional values on machining drawings can be programmed by directly inputting these values. In addition, the chamfering and corner rounding can be inserted between straight lines having an optional angle.
This programming is only valid in memory operation mode.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3405			DDP	CCR				

[Input type] Parameter input
[Data type] Bit path

#4 CCR Addresses used for chamfering

0: Address is "I", "J", or "K".
In direct drawing dimension programming, addresses ",C", ",R", and ",A" (with comma) are used in stead of "C", "R", and "A".

1: Address is "C".
Addresses used for direct drawing dimension programming are "C", "R", and "A" without comma.

> **NOTE**
> If this bit (CCR) is set to 0, the function for changing the compensation direction by specifying I, J, or K in a G01 block in the cutter compensation/ tool nose radius compensation mode cannot be used.
> If this bit (CCR) is set to 1 when address C is used as an axis name, the chamfer function cannot be used.

#5 DDP Angle commands by direct drawing dimension programming

0: Normal specification
1: A supplementary angle is given.

3458	CRC							

[Input type] Parameter input
[Data type] Bit path

#7 CRC In Direct drawing dimension programming function, when a minus value is commanded as a chamfering value / corner R value:
0: Alarm PS0055 “MISSING MOVE VALUE IN CHF/CNR” is issued.
1: Alarm is not issued. A minus value is converted to a plus value.

Alarm and message

Number	Message	Description
PS0055	MISSING MOVE VALUE IN CHF/CNR	In chamfering or corner R block, the move distance is less than chamfer or corner R amount. Modify the program.
PS0056	NO END POINT & ANGLE IN CHF/CNR	In direct dimension drawing programming, both an end point and an angle were not specified in the block next to the block in which only an angle was specified (Aa). Modify the program.
PS0057	NO SOLUTION OF BLOCK END	Block end point is not calculated correctly in direct dimension drawing programming. Modify the program.
PS0058	END POINT NOT FOUND	Block end point is not found in direct dimension drawing programming. Modify the program.
PS0312	ILLEGAL COMMAND IN DIRECT DRAWING DIMENSIONS PROGRAMMING	Direct input of drawing dimensions was commanded in an invalid format. An attempt was made to specify an invalid G code during direct input of drawing dimensions. There exist two or more blocks not to be moved in consecutive commands that specify direct input of drawing dimensions. Although non-use of commas (,) (bit 4 of parameter No. 3405 = 1) was specified for direct input of drawing dimensions, a comma was specified.

OPERATOR’S MANUAL (B-64694EN)	Direct drawing dimensions programming

12.21 PATTERN DATA INPUT

Overview

In the program of the fixed form processing with the custom macro, the operator select the processing pattern on the menu screen and specified the size, number and so on to the variable on the custom macro screen. As above mentioned, this function enables users to perform programming simply without programming using an existing NC language.
With the aid of this function, a machine tool builder can prepare the program of a hole machining cycle (such as a boring cycle or tapping cycle) using the custom macro function, and can store it into the program memory.
This cycle is assigned pattern names, such as BOR1, TAP3, and DRL2.
An operator can select a pattern from the menu of pattern names displayed on the screen.
Data (pattern data) which is to be specified by the operator should be created in advance with variables in a drilling cycle.
The operator can identify these variables using names such as DEPTH, RETURN RELIEF, FEED, MATERIAL or other pattern data names. The operator assigns values (pattern data) to these names.
The operator selects the pattern on the menu screen, and the selected pattern number is assigned to the system variable. The custom macro of the selected pattern can be started by starting a program then referring to the system variable in the program.

Explanation

This function consists of Pattern menu screen and Custom macro screen.
The process pattern is selected on the pattern screen.
Then the process pattern is selected, the custom macro screen is displayed.
On this custom macro screen, the variable with the name and comment is displayed according to the selected process pattern.
The process data can be input by referring to the variable name with the numerical value on the drawing.

A sample pattern menu screen and custom macro screens are shown below.

(1) Pattern menu screen

Fig. 12.21 (a) Pattern menu screen

(2) Custom macro screen

The name of variable and comment can be displayed on the usual custom macro screen.

The menu title and pattern name on the pattern menu screen and the variable name on the custom macro screen can be defined

The position of the comment displayed on the custom macro screen can be selected whether the lower size or the right side by setting bit 0 (POC) of parameter No. 11318.

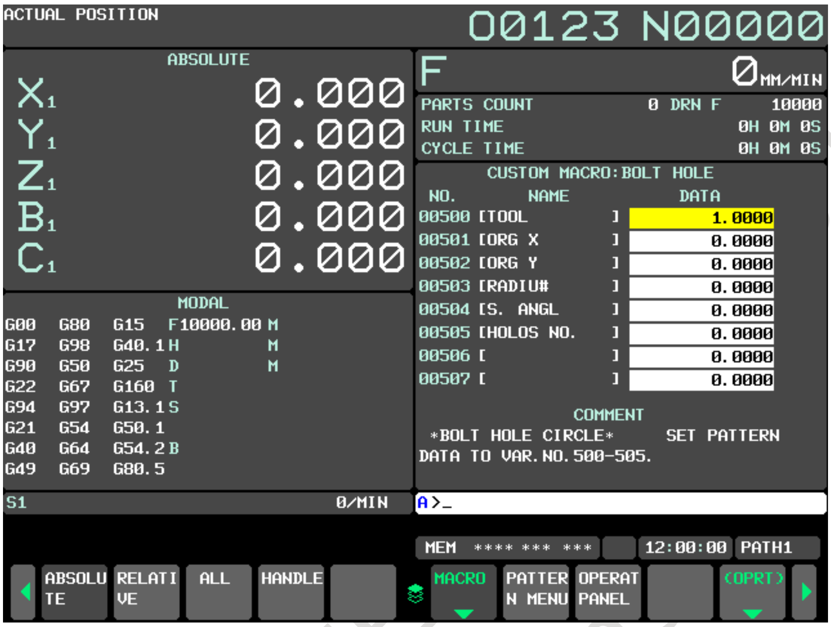

Fig. 12.21 (b) Custom macro screen (parameter No. 11318#0=0)

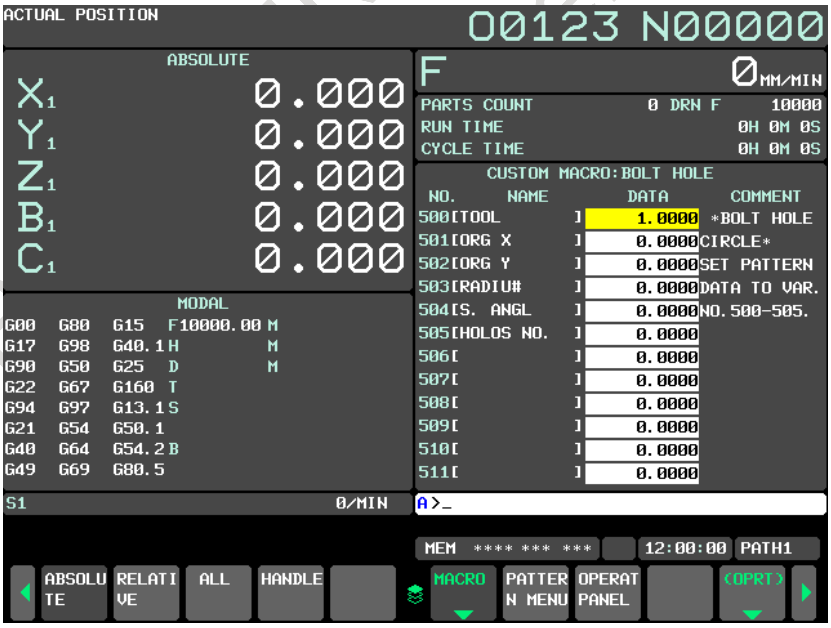

Fig. 12.21 (c) Custom macro screen (parameter No. 11318#0=1)

Explanation of operation

The following steps 1-3 explain how to display the pattern menu screen.

1 Press function key .

2 Press continuous menu key .

3 Press soft key [PATTERN MENU].

- Pattern menu screen

The pattern menu in the Fig. 12.21 (d) is displayed.

Fig. 12.21 (d) Pattern menu screen

Select the pattern on this screen
The next two methods are effective.

- Selection by cursor

  Move the cursor to the pattern name with the cursor move keys , and press the soft key [SELECT] or key.

- Selection by setting of pattern number

  Enter the number on the left of the pattern name, and press the soft key [SELECT] or key.

The selected pattern number is registered to system variable #5900. The custom macro of the selected pattern can be started by starting a fixed program (external program No. search) with an external signal. This program refers to the system variable #5900 in the program. This system variable #5900 is kept after power-off.

- Custom macro variable screen

The custom macro screen in the Fig. 12.21 (e) is displayed.

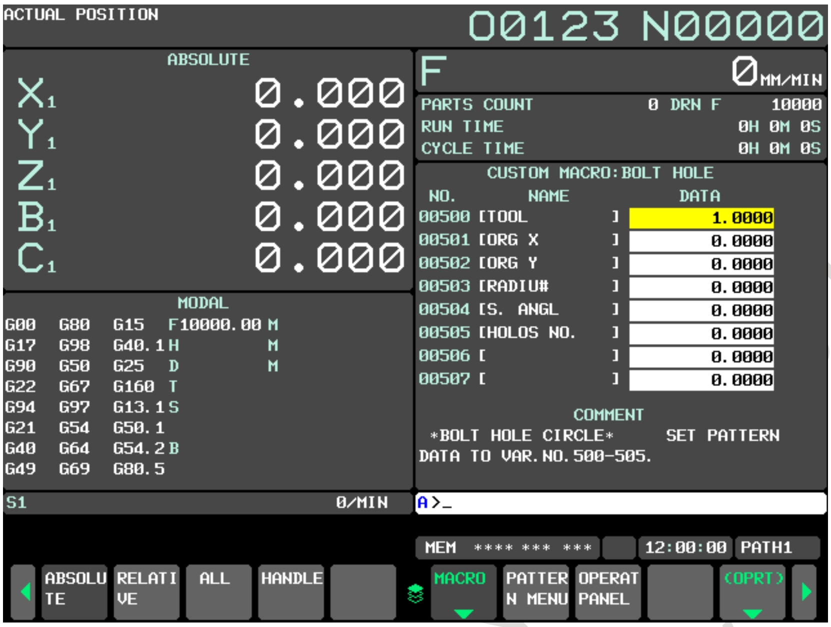

Fig. 12.21 (e) Custom macro screen when the pattern data is input

When the screen is changed to the custom macro screen, the macro variable number that is selected first is specified with the parameters Nos.6101 to 6110. The macro variables that variable name is not defined can be input, too.

> **NOTE**
> 1 The variable name that is displayed cannot be used as the common variable name of the NC program.
> 2 When the common variable name is defined by SETVN command, the variable name defined by pattern data input function is given priority.
> 3 When the bit 0 (POC) of parameter No. 11318 is set to 1, The variable number is three digit display.
> And the value of 12 digits or more is input, 11 digits from head of value are displayed.
> Example)
> Input: -123456789.123 → Display: -123456789.1

Parameter

6101	Macro variable number selected first when pattern menu 1 is selected
6102	Macro variable number selected first when pattern menu 2 is selected
6103	Macro variable number selected first when pattern menu 3 is selected
6104	Macro variable number selected first when pattern menu 4 is selected
6105	Macro variable number selected first when pattern menu 5 is selected
6106	Macro variable number selected first when pattern menu 6 is selected
6107	Macro variable number selected first when pattern menu 7 is selected
6108	Macro variable number selected first when pattern menu 8 is selected

6109	Macro variable number selected first when pattern menu 9 is selected
6110	Macro variable number selected first when pattern menu 10 is selected

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0,100 to 199,500 to 999

Set the macro variable number to be selected first when a pattern menu is selected on the custom macro screen.
If 0 is specified, 500 is assumed.
If a value beyond the above range is entered, 100 is assumed.

	#7	#6	#5	#4	#3	#2	#1	#0
11318								POC

[Input type] Parameter input
[Data type] Bit

#0 POC When the pattern data input function is used, on the custom macro screen a comment is:
0: Displayed in the lower part of the screen.
1: Displayed on the right side of the screen.

> **NOTE**
> This parameter is not used when a 15-/19-inch display unit is used.

Definition of the screen

The definition of the screen is performed by NC program.

- Program configuration

This function is consist of one program for the definition of pattern menu screen and maximum ten programs for the definition of custom macro screen.
Register the macro program for the pattern data input function to the following folder.
//CNC_MEM/USER/LIBRARY/PATH1 to PATH[n]
* [n] is the maximum path number of the system
* The PATH1 to PATH[n] should be made by the machine tool builder.

The program number is as follows

Table 12.21 (a) Program Number and screen

Program No.	Screen
O9500	Program to specify character strings displayed on the pattern menu screen.
O9501	Program to specify character string displayed on the custom macro screen for pattern No.1
O9502	Program to specify character string displayed on the custom macro screen for pattern No.2
O9503	Program to specify character string displayed on the custom macro screen for pattern No.3
O9504	Program to specify character string displayed on the custom macro screen for pattern No.4
O9505	Program to specify character string displayed on the custom macro screen for pattern No.5
O9506	Program to specify character string displayed on the custom macro screen for pattern No.6
O9507	Program to specify character string displayed on the custom macro screen for pattern No.7
O9508	Program to specify character string displayed on the custom macro screen for pattern No.8

Program No.	Screen
O9509	Program to secify character string displayed on the custom macro screen for pattern No.9
O9510	Program to secify character string displayed on the custom macro screen for pattern No.10

Table 12.21 (b) Macro commands used in the pattern data input function

G code	H code	Function
G65	H90	Specifies the menu title.
G65	H91	Specifies the pattern name.
G65	H92	Specifies the pattern data title.
G65	H93	Specifies the variable name.
G65	H94	Specifies the comment.

Table 12.21 (c) System variables used in the pattern data input function

System variable	Description
#5900	Pattern No. selected by user.

> **NOTE**
> The pattern menu screen and the custom macro screen are defined only by preserving programs O9500 to O9510 in the above-mentioned folder, and these programs need not be executed. If these programs are executed, alarm (PS0074), "ILLEGAL PROGRAM NUMBER" is issued.

Definition of the pattern menu screen

Menu title and pattern name are defined as follows.

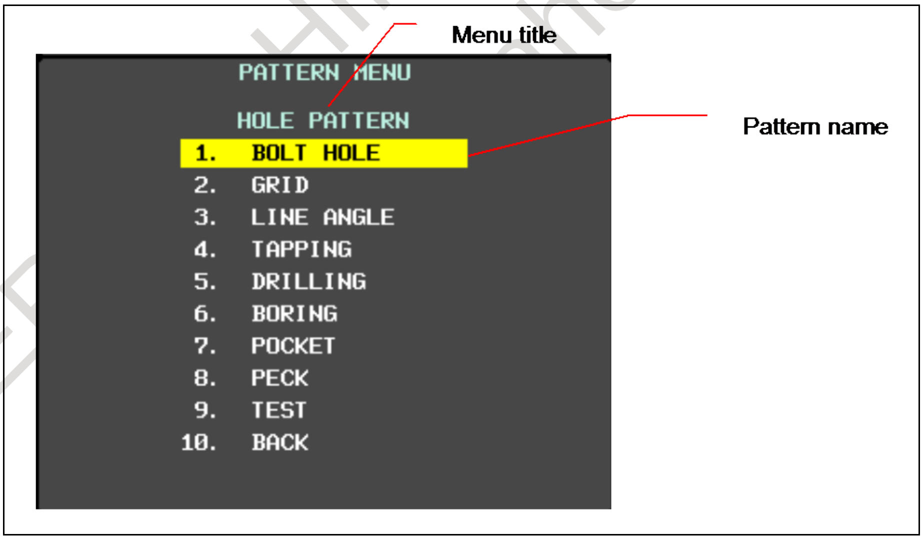

Fig. 12.21 (f) Pattern menu screen

Definition of menu title

The character string displayed in the menu title of the pattern menu screen is defined.

The menu title is specified up to 12 characters in a half size letter and up to 6 characters in a full size letter.

- Format

G65 H90 P_ Q_ R_ I_ J_ K_ ;

H90	:	Specifies the menu title
P_	:	The code of 1st and 2nd characters of title
Q_	:	The code of 3rd and 4th characters of title
R_	:	The code of 5th and 6th characters of title
I_	:	The code of 7th and 8th characters of title
J_	:	The code of 9th and 10th characters of title
K_	:	The code of 11th and 12th characters of title

As for the way of setting the character-code, refer to the Subsection, "Setting the Character-codes".

Definition of pattern name

The character string displayed in the pattern name which becomes a menu item is defined.
The pattern name is specified up to 10 characters in a half size letter and up to 5 characters in a full size letter.

- Format

G65 H91 P_ Q_ R_ I_ J_ K_ ;

H91	:	Specifies the pattern name
P_	:	Specifies the menu number of the pattern name The menu number = 1 to 10
Q_	:	The code of 1st and 2nd characters of pattern name
R_	:	The code of 3rd and 4th characters of pattern name
I_	:	The code of 5th and 6th characters of pattern name
J_	:	The code of 7th and 8th characters of pattern name
K_	:	The code of 9thd and 10th characters of pattern name

As for the way of setting the character-code, refer to the Subsection, "Setting the Character-codes".

Example

The following is example for pattern menu screen.

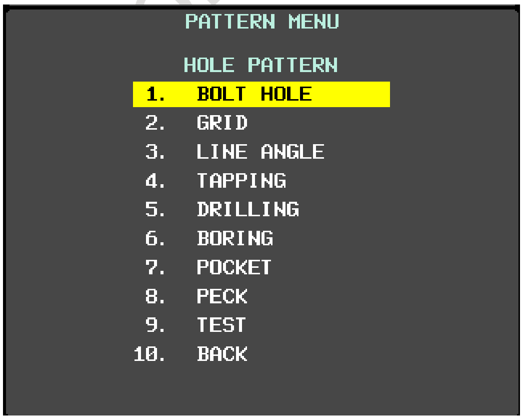

Fig. 12.21 (g) Pattern menu screen

```

Definition of the custom macro screen

The title, variable name and comment are defined as follows.

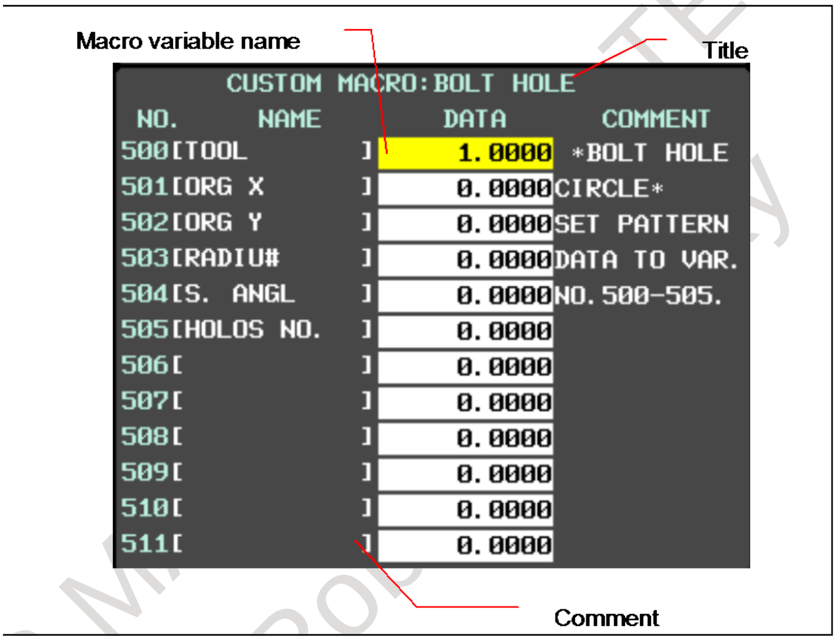

Fig. 12.21 (h) Custom macro screen

Definition of title

The character string displayed in the title of the custom macro screen is defined.
The title is specified up to 12 characters in a half size letter and up to 6 characters in a full size letter.

- Format

G65 H92 P_ Q_ R_ I_ J_ K_ ;

H92	:	Specifies the menu title
P_	:	The code of 1st and 2nd characters of the menu title
Q_	:	The code of 3rd and 4th characters of the menu title
R_	:	The code of 5th and 6th characters of the menu title
I_	:	The code of 7th and 8th characters of the menu title
J_	:	The code of 9th and 10th characters of the menu title
K_	:	The code of 11th and 12th characters of the menu title

As for the way of setting the character-code, refer to the Subsection, "Setting the Character-codes".

Definition of macro variable

The character string displayed in the macro variable name is defined.
The macro variable is specified up to 10 characters in a half size letter and up to 5 characters in a full size letter.

The following macro variable numbers can be used:
#100 to 199 (100 variables)
#500 to 999 (500 variables), 600 variables in total

- Format

G65 H93 P_ Q_ R_ I_ J_ K_ ;

H93	:	Specifies the variable name
P_	:	Specifies the variable number Specifies 100 to 199 or 500 to 999
Q_	:	The code of 1st and 2nd characters of the variable name
R_	:	The code of 3rd and 4th characters of the variable name
I_	:	The code of 5th and 6th characters of the variable name
J_	:	The code of 7th and 8th characters of the variable name
K_	:	The code of 9th and 10th characters of the variable name

As for the way of setting the character-code, refer to the Subsection, "Setting the Character-codes".

Definition of a comment

The character string of the comment displayed on the custom macro screen is defined.
The comment is specified by up to 12 characters in a half size letter and up to 6 characters in a full size letter per one block.

- When the comment is displayed at the bottom（bit 0 of parameter No. 11318=0）
  The number of blocks is defined up to maximum 9 blocks.
  One line is composition of 3 blocks and maximum 3 lines can be displayed.

  The comment is displayed in the order specified by program as the Fig. 12.21 (i).
  The block is arranged in defined order.

Block 1	Block 2	Block 3
Block 4	Block 5	Block 6
Block 7	Block 8	Block 9

Fig. 12.21 (i) Block layout of comment

- When the comment is displayed at the right (bit 0 of parameter No. 11318=1)
  1 line is composed by 1 blocks, the maximum number of lines is 8 on the 8.4-inch display unit or 12 on the 10.4-inch display unit.

- Format

G65 H94 P_ Q_ R_ I_ J_ K_ ;

H94	:	Specifies the comment
P_	:	The code of 1st and 2nd characters of comment
Q_	:	The code of 3rd and 4th characters of comment
R_	:	The code of 5th and 6th characters of comment
I_	:	The code of 7th and 8th characters of comment
J_	:	The code of 9th and 10th characters of comment
K_	:	The code of 11th and 12th characters of comment

As for the way of setting the character-code, refer to the Subsection, "Setting the Character-codes".

Example

The Fig. 12.21 (j) and Fig. 12.21 (k) are example of the custom macro screen.

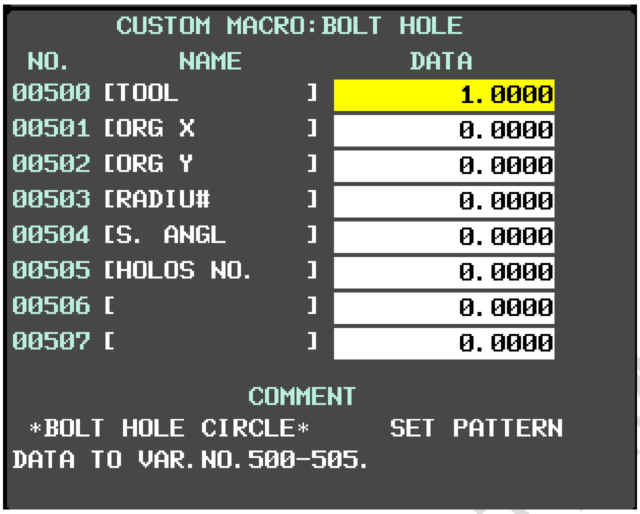

Fig. 12.21 (j) Custom macro screen（No. 11318#0=0）

Setting the character-codes

The character cannot be used to specify the NC program.
Therefore, the code corresponding to the character is specified.
One character is consist of three figures in a half size letter and six figures in a full size letter.
The character code is specified for each address of the G65 instruction by six digits.

Refer to the table for the character code for the character code.
Example)
When "ABCDEFGH" is specified, the description of the code is as follows.
Encoded character string : 065 066 067 068 069 070 071 072

<u>P065066</u> <u>Q067068</u> <u>R069070</u> <u>I071072</u> ;
AB CD EF GH

> **NOTE**
> 1 Space (032) is added ahead of the character-code, when the character-code of three digits or less is specified.
> Example)
> P065066 Q067; → " AB C "
> 032(space) is put at the end, when "ABC" is displayed.
> P065066 Q067032; → " ABC "
> 2 It is assumed in that the space of two characters was defined in the address when there is an address not defined.
> Example)
> P065066 I067068; → "AB   CD"
> 3 The character string corresponding to the block where G code other than G65 is instructed or where undefined character code is specified is not displayed.

Characters and codes to be used for the pattern data input function

Character	Code	Comment	Character	Code	Comment
A	065		6	054	
B	066		7	055	
C	067		8	056	
D	068		9	057	
E	069			032	Space
F	070		!	033	Exclamation mark
G	071		”	034	Quotation mark
H	072		#	035	Hash sign
I	073		$	036	Dollar sign
J	074		%	037	Percent
K	075		&	038	Ampersand
L	076		’	039	Apostrophe
M	077		*	042	Asterisk
N	078		+	043	Plus sign
O	079		,	044	Comma
P	080		-	045	Minus sign
Q	081		.	046	Period
R	082		/	047	Slash
S	083		:	058	Colon
T	084		;	059	Semicolon
U	085		<	060	Left angle bracket
V	086		=	061	Equal sign
W	087		>	062	Right angle bracket
X	088		?	063	Question mark

Character	Code	Comment	Character	Code	Comment
Y	089		@	064	At mark
Z	090		[	091	Left square bracket
0	048		¥	092	Yen sign
1	049		]	093	Right square bracket
2	050		^	094	
3	051		_	095	Underscore
4	052				
5	053				

The characters and the codes of the katakana is as follows.

Character	Code	Comment	Character	Code	Comment
ア	177		ム	209	
イ	178		メ	210	
ウ	179		モ	211	
エ	180		ヤ	212	
オ	181		ユ	213	
カ	182		ヨ	214	
キ	183		ラ	215	
ク	184		リ	216	
ケ	185		ル	217	
コ	186		レ	218	
サ	187		ロ	219	
シ	188		ワ	220	
ス	189		ヲ	166	
セ	190		ン	221	
ソ	191		ァ	167

12.22 G CODE PREVENTING BUFFERING

Overview

By specifying G04.1, buffering of the following block from the block of G04.1 is prevented until finishing the block of G04.1. (At the following, preventing buffering by G04.1 is called non-buffering command by G code. On the other hand, preventing buffering by M codes, command of only G31, command of only G53 and etc. are called non-buffering commands of normal.)

The processing time of non-buffering command by G code is reduced compared with non-buffering commands of normal. Also, the position of releasing preventing buffering can be specified by the distance to go in the previous movement block. Therefore, the cycle time of automatic operation can be reduced by using non-buffering command by G code instead of non-buffering commands of normal.

Specification

By specifying G04.1, the block which includes G04.1 becomes the prevented block of buffering.

Format

G04.1 (P_) ;

P_ : The operation mode of G04.1.
Compatible operation to preventing buffering by command of only G31 or G53 is possible when P1 or P2 is specified with G04.1 in the same block.
P1: Compatible operation to preventing buffering by command of only G31.
P2: Compatible operation to preventing buffering by command of only G53.

However, alarm PS2085, "G04.1 FORMAT ERROR" occurs when P code except P1 and P2 is specified.

I_ : Distance to go for releasing preventing buffering (Synthetic distance to go in all axis)

However, alarm (PS2085) occurs when the address I is specified in the state of setting the bit 5 (MRR) of parameter No.11279 to 0.

NOTE

1. When P1 is specified, the system variables (#100151 to #100182) of skip position are updated by executed position of the block that includes G04.1. (When the system up to 20 axes, the system variables (#5061 to #5080) compatible with FS16 is uploaded too.)
2. About preventing buffering by M codes or command of only G31 or command of only G53, those behaviors are different respectively. When each preventing buffering is exchanged for G04.1, it is necessary to use the compatible operation mode.
3. Unit system as for the address I depends on the reference axis.
4. The address I is commanded by radius value regardless of diameter/radius specification of the reference axis.
5. Positive value should be specified as for the address I. If negative value is specified, the command of the address I is invalid.
6. The command of address I is invalid when the previous block of G04.1 is not the movement command.

Explanation

About G04.1

G04.1 is a one-shot G code. When the commands except sequence number, P codes and comment are specified with G04.1 in the same block, alarm PS2085, “G04.1 FORMAT ERROR” occurs.

About processing time

Because the processing time of non-buffering command by G code is reduced compared with non-buffering commands of normal, the execution time of the block which includes non-buffering command is reduced.

Speed-up of non-buffering command by G code invalid signal NHSW<G0579.6>

Speed-up of non-buffering command by G code is invalid when Speed-up of non-buffering command by G code invalid signal NHSW<G0579.6> is set to “1”. And the processing time of non-buffering command by G code is equal with non-buffering commands of normal.

Suppressing single block stop

Single block stop is not performed in G04.1 block when bit 6 (MSB) of parameter No.11279 is set to 1.
In this case, the function of preventing buffering in G04.1 block is not invalid.

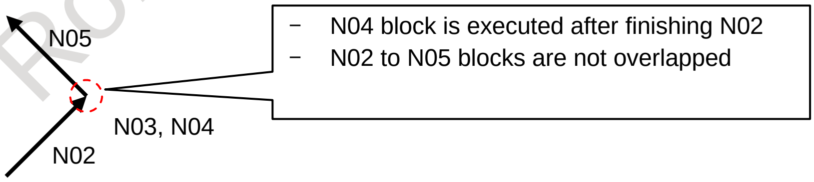
> **NOTE**
> Single block stop is not performed in G04.1 block regardless of the state of #3003 when bit 6 (MSB) of parameter No.11279 is set to 1.

When parameter MMR is set to 0

If G04.1 is specified just behind the movement block, the buffering of the block behind G04.1 is started when the movement block finishes and each axis reaches to in-position.

Example)
In case of the following program, the buffering of the block behind N03 is started when the movement command of N02 finishes and each axis reaches to in-position (N02 block finishes).
Therefore, the macro statement of N04 is executed after finishing N02.

```
O0001
N01 G90 G00 X0 Y0
N02 G01 X100.0 Y100.0 F1000.0
N03 G04.1
N04 #100=#101+#102
N05 G01 X0.0 Y200.0 F1000.0
…
```



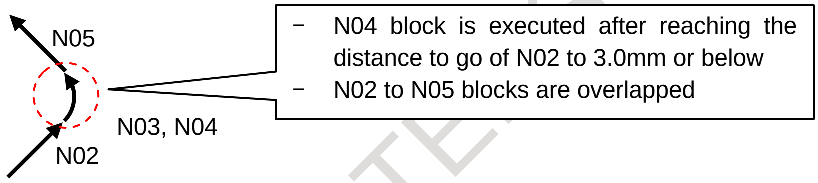
And, even if the following command is specified in the blocks which are ahead or behind G04.1 block, the movement commands are not overlapped.
- Cutting feed – Cutting feed block
- Rapid traverse – Rapid traverse block with rapid traverse block overlap
- Movement block – Movement block with smart overlap

When parameter MMR is set to 1

If G04.1 is specified just behind the movement block, the buffering of the block behind G04.1 is started when the distance to go of the previous movement block reaches to the specified distance to go (distance to go is specified by address I).

Example)
In case of the following program is executed, the buffering of the block behind N03 is started when the distance to go of the movement command of N02 reaches to the distance to go (distance to go is specified by address I).
Therefore, the macro statement of N04 is executed after reaching the distance to go of N02 to 3.0mm or below.

```
O0002
N01 G90 G00 X0 Y0
N02 G01 X100.0 Y100.0 F1000.0
N03 G04.1 I3.0
N04 #100=#101+#102
N05 G01 X0.0 Y200.0 F1000.0
…
```



And, if the following command is specified in the blocks which are ahead or behind G04.1 block, the movement commands are overlapped.

- Cutting feed – Cutting feed block
- Rapid traverse – Rapid traverse block with rapid traverse block overlap
- Movement block – Movement block with smart overlap

NOTE
1. The delay occurs from starting the buffering of the block behind G04.1 to executing it. And, the delay time is uneven.
2. When the distance to go by the address I is short, the movement command might be not overlapped.

Limitation

Display of the currently executing program

The block of non-buffering command by G code is not displayed in the currently executing program.
However, the block of non-buffering command by G code is displayed in the currently executing program when speed-up is invalid by the condition which is described in “Condition to treat non-buffering command by G code as non-buffering commands of normal”.

Condition to treat non-buffering command by G code as non-buffering commands of normal

When one of the following conditions is satisfied, speed-up of non-buffering command by G code is invalid, and the processing time of non-buffering command by G code is equal with non-buffering commands of normal. Moreover, non-buffering command by G code is treated as non-buffering commands of normal.

- Speed-up of non-buffering command by G code invalid signal is set to “1”.
- The single-block operation is enabled.
- Non-buffering command by G code is specified in the same block as the program number.
- In manual handle retrace function, the checking mode synchronizing an operation with a manual handle pulse is selected.
- Animation or path drawing of dynamic graphic display is operated.
- Bit 7(HMA) of parameter No.11279 is set to 1, and non-buffering command by G code is specified during Relation of cutter compensation, Multiple repetitive canned cycle G70 to G73.

Manual handle retrace function

In Manual handle retrace function, a backward movement cannot be executed while the block of non-buffering command by G code is executing except the checking mode synchronizing with a manual handle pulse. The backward movement ends when an operation enters the next block of non-buffering command by G code during the backward movement. And ‘RVED’ is displayed.
However, in the checking mode synchronizing with a manual handle pulse, the backward movement can be executed when non-buffering command by G code was executed once during forward movement, because the non-buffering command by G code is treated as non-buffering commands of normal in this case.

Retrace

The backward movement cannot be executed by Retrace function in the block of non-buffering command by G code. The backward movement ends when the next block of non-buffering command by G code just starts executing during the backward movement. And ‘RVED’ is displayed.

Relation of cutter compensation

Non-buffering command by G code cannot be specified during the following cutter compensation functions. Alarm PS0010, “IMPROPER G-CODE” occurs when such a command is specified. Use non-buffering commands of normal during the following cutter compensation functions, or set bit 7 (HMA) of parameter No.11279 to 1.

- Cutter compensation and tool nose radius compensation

> **NOTE**
> Non-buffering command by G code cannot be specified just after the cancel command of cutter compensation, tool nose radius compensation. Moreover, non-buffering command by G code cannot be specified while the vector of cutter compensation is being held.

T

Multiple repetitive canned cycle

Non-buffering command by G code cannot be specified during Multiple repetitive canned cycle G70 to G73. Alarm PS0010 occurs when such a command is specified. Use non-buffering commands of normal during Multiple repetitive canned cycle G70 to G73, or set bit 7 (HMA) of parameter No.11279 to 1.

Chamfering and corner R, Optional chamfering and corner R and Direct drawing dimension programming

In the condition to treat non-buffering command by G code as non-buffering commands of normal, alarm PS0051, “MISSING MOVE AFTER CNR/CHF” occurs when non-buffering command by G code is specified during Chamfering and corner R or Optional chamfering and corner R. And alarm PS0312, “ILLEGAL COMMAND IN DIRECT DRAWING DIMENSIONS PROGRAMMING”occurs when non-buffering command by G code is specified during Direct drawing dimension programming.

Block start interlock signal

Block start interlock signal *BSL<Gn008.3> is invalid for non-buffering command by G code. However, block start interlock signal *BSL<Gn008.3> is valid in the condition to treat non-buffering command by G code as non-buffering commands of normal.

When the speed-up is invalid

When the speed-up for G04.1 is invalid, the address I is ignored even if the address I is specified.
Example for the ignoring)

- Speed-up of non-buffering command by G code invalid signal NHSW<G0579.6> is set to “1”
- Single block operation

Feed hold stop

When a feed hold stop is operated in the previous block of G04.1, the operation of G04.1 after restart is changed according to the number of blocks read ahead.

<When the number of blocks read ahead is 1>

The address I is ignored.

<When the number of blocks read ahead is more than 2>

The address I is not ignored.

When a feed hold stop is operated in the previous block of G04.1, and the number of blocks read ahead is 1, the address I in the block of G04.1 is ignored.

Synchronous, composite, and superimposed control, Axis synchronous control, Flexible synchronization control

When the target axis of Synchronous control, Superimposed control, Axis synchronous control or Flexible synchronization control exists in the path, release of preventing buffering by distance to go is operated as follows.

Table 12.22 (a) Movement of master and slave axis

Command	Movement of master axis	Movement of slave axis
Synchronous control	Added for distance to go	Excluded from distance to go
Superimposed control		
Axis synchronous control		
Flexible synchronization control		

And, the movement of the target axis of Composite control is added for distance to go.

The functions that cannot be specified

Release of preventing buffering by distance to go cannot be used when the movement commands (rapid traverse (G00), linear interpolation (G01), circular interpolation (G02, G03), helical interpolation (G02, G03)) are not specified behind G04.1 block.

However, even if the above movement command is specified, release of preventing buffering by distance to go cannot be used in the state as follows.

- G04.1 block is specified on just behind the commands of following table.
- G04.1 block is specified on the mode of the commands of following table.

When release of preventing buffering by distance to go cannot use, the address I is ignored even if the address I is specified.

Table 12.22 (b) The commands that release of preventing buffering by distance to go cannot be used

- : Nothing

Command	Just behind	mode
Dwell (G04)	Cannot use	-
Exact stop (G09)	Cannot use	-
Exact stop mode (G61)	Cannot use	Cannot use
Programmable data input (G10)	Cannot use	Cannot use
Programmable parameter input (G10)	Cannot use	Cannot use
Polar coordinates command (G15, G16)	Cannot use	Cannot use
Inch/metric conversion (G20, G21)	Cannot use	-
Reference position return check (G27)	Cannot use	-
Reference position return (G28)	Cannot use	-
2nd Reference position return (G30P2)	Cannot use	-
3rd and 4th Reference position return (G30P3, G30P4)	Cannot use	-
In-position check disable reference position return (G28.2, G30.2P2, G30.2P3, G30.2P4)	Cannot use	-

Command	Just behind	mode
Skip function (G31)	Cannot use	-
Multi-step skip (G31P1 to P4)	Cannot use	-
High-speed skip (G31)	Cannot use	-
Continuous high-speed skip function (G31P90)	Cannot use	-
Torque limit skip (G31P99)	Cannot use	-
Threading (G32)	Cannot use	Cannot use
Continuous threading (G32)	Cannot use	Cannot use
Multi threading (G32)	Cannot use	Cannot use
Variable lead thread cutting (G34)	Cannot use	Cannot use
Circular thread cutting (G35, G36)	Cannot use	Cannot use
Circular thread cutting B (G02.1, G03.1)	Cannot use	Cannot use
Arbitrary speed threading (G31)	Cannot use	Cannot use
Automatic tool length measurement, Automatic tool offset (G36, G37)	Cannot use	-
Normal direction control (G41.1, G42.1, G40.1)	Cannot use	Cannot use
Synchronous, composite, and superimposed control by program command (G50.4, G51.4, G50.5, G51.5, G50.6, G51.6)	Cannot use	Cannot use
Polygon turning (G51.2, G50.2)	Cannot use	Cannot use
Polygon machining with two spindles (G51.2, G50.2)	Cannot use	Cannot use
Setting a workpiece coordinate system (G92(M) / G50(T))	Cannot use	-
Workpiece coordinate system preset (G92.1(M) / G50.3(T))	Cannot use	-
Local coordinate system (G52)	Cannot use	-
Flexible path axis assignment (G52.1, G52.2, G52.3)	Cannot use	-
Workpiece coordinate system (G54～G59)	Cannot use	-
3-dimensional coordinate system conversion (G68, G69)	Cannot use	Cannot use
Tilted working plane indexing (G68.2, G69)	Cannot use	Cannot use
Electronic gear box (G80, G81)	Cannot use	Cannot use
Electronic gear box 2 pair (G80.5, G81.5)	Cannot use	Cannot use
Rigid tapping (G84)	Cannot use	Cannot use
Torch swing	-	Cannot use

Signal

Speed-up of non-buffering command by G code invalid signal NHSW<G0579.6>

[Classification] Input signal

[Function] Speed-up of non-buffering command by G code is invalidated.

[Operation] When this signal becomes “1”:

Speed-up of non-buffering command by G code is invalidated, and non-buffering command by G code is treated as non-buffering commands of normal.

When this signal becomes “0”:

Speed-up of non-buffering command by G code is validated.

> **NOTE**
> This signal cannot be changed during operating a program. The state of signal at cycle start is kept.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0579		NHSW						

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11279	HMA	MSB	MRR					

[Input type] Parameter input
[Data type] Bit

#5 MRR In G code preventing buffering (G04.1), the position of releasing preventing buffering:
0: Cannot be specified by the distance to go in the previous movement block.
1: Can be specified by the distance to go in the previous movement block.

#6 MSB When single block signal SBK <Gn046.1> is set to "1", single block stop in G code preventing buffering (G04.1) is:
0: performed.
1: not performed.

NOTE
Single block stop is not performed in G04.1 block regardless of the state of #3003 when bit 6 (MSB) of parameter No.11279 is set to 1.

#7 HMA When non-buffering command by G code is specified during Relation of cutter compensation, Multiple repetitive canned cycle G70 to G73, :
0: alarm occurs.
1: alarm not occurs.

NOTE
1 Processing time of non-buffering command by G code during Relation of cutter compensation, Multiple repetitive canned cycle G70 to G73 is equal with non-buffering commands of normal when setting this parameter to 1.
2 Non-buffering command by G code during " Relation of cutter compensation, Multiple repetitive canned cycle G70 to G73" is treated with non-buffering commands of normal when setting this parameter to 1. Please note enough about the function which changes operation by the non-movement block (For example, Cutter compensation and Tool nose radius compensation or etc.)

Alarm and message

Number	Message	Description
PS0010	IMPROPER G-CODE	Non-buffering command by G code was specified during/just behind the command of relation of cutter compensation.
PS0051	MISSING MOVE AFTER CNR/CHF	Improper movement or the move distance was specified in the block next to the chamfering or corner R block. Modify the program.
PS0312	ILLEGAL COMMAND IN DIRECT DRAWING DIMENSIONS PROGRAMMING	Direct input of drawing dimensions was commanded in an invalid format. An attempt was made to specify an invalid G code during direct input of drawing dimensions. Two or more blocks not to be moved exist in consecutive commands that specify direct input of drawing dimensions. Although non-use of commas (,) (bit 4 of parameter No. 3405 = 1) was specified for direct input of drawing dimensions, a comma was specified.
PS2085	G04.1 FORMAT ERROR	G04.1 block is not specified singly.

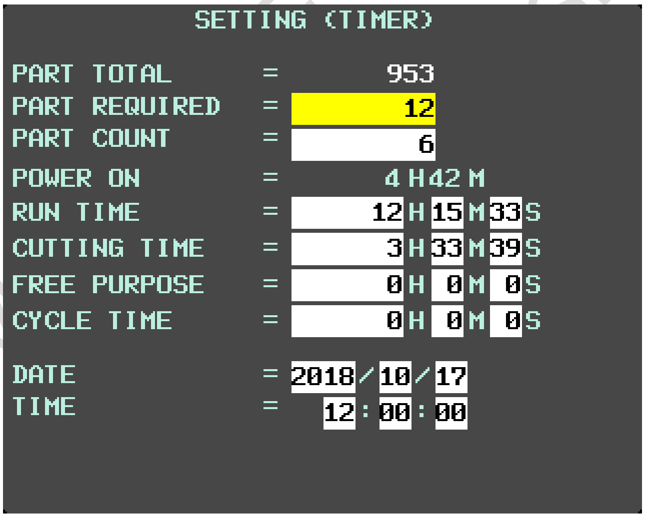
13 DISPLAY/SET/EDIT

13.1 DISPLAY/SET

13.1.1 Run Hour and Parts Count Display

Overview

This function displays the integrated power-on time, the integrated cycle operation time, the integrated cutting time and timer (started by an input signal from PMC) on the screen. The integrated cycle operation time, the integrated cutting time and timer can be altered and preset, by the operator.
In addition to the above, this function displays the count of the total number of parts machined, the number of parts required and the number of completed parts on the screen. Each time M02, M30 or a parameter set M code is executed, the count of the total number of parts machined and the number of parts completed is incremented by 1.
If a program is prepared so as to execute M02, M30 or a parameter set M code each time one part machining is completed, the number of parts machined can be counted automatically.
If the count of the number of parts machined reaches the number of parts required, a signal is output to the PMC side.
It is possible for the operator to change and preset the number of parts required and the number of parts completed.



Signal

General-purpose integrating meter start signal TMRON<Gn053.0>

[Classification] Input signal

[Function] The each path of CNC has an meter which is started by an input signal from the PMC. Additionally, there are meters for counting the automatic operation time and counting cutting time. The count for these meter can be displayed on the screen. The count can be preset by the operator.

[Operation] When the signal is set to 1, the meter starts counting.

Target part count reached signal PRTSF<Fn062.7>

[Classification] Output signal

[Function] Reports to the PMC that the specified number of parts have been machined.

[Output cond.] The PRTSF signal is set to 1 when:

- The number of parts machined counts up and reaches the required number of parts when M02, M30, or the M code set in parameter No. 6710 is executed.
  When the required number of parts is zero, this signal is not set.

The PRTSF signal is set to 0 when:

- Machining of the specified number of parts has not yet been completed.
- The system is reset.
  When PRT (bit 1 (PRT) of parameter No. 6700) is set to 1, however, the PRTSF signal is not set to 0 even if the system is reset.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn053								TMRON
Fn062	PRTSF							

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
6700							PRT	PCM

[Input type] Parameter input
[Data type] Bit path

#0 PCM M code that counts the total number of machined parts and the number of machined parts

0: M02, or M30, or an M code specified by parameter No. 6710
1: Only M code specified by parameter No. 6710

#1 PRT Upon reset, the required parts count arrival signal PRTSF <Fn062.7> is:

0: Set to 0.
1: Not set to 0.

6710	M code that counts the number of machined parts

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to 999999999

The total number of machined parts and the number of machined parts are counted (+1) when the M code set is executed.

> **NOTE**
> The setting of 0 is invalid (no count operation is performed with M00.) Moreover, M98, M99, M198 (external device subprogram calling), and M codes used for subprogram calling and macro calling cannot be set as M codes for count-up operation. (Even when such an M code is set, count-up operation is not performed, ignoring the M code.)

6711	Number of machined parts

[Input type] Setting input
[Data type] 2-word path
[Valid data range] 0 to 999999999

The number of machined parts is counted (+1) together with the total number of machined parts when the M02, M30, or a M code specified by parameter No. 6710 is executed.

> **NOTE**
> The number of parts is not counted for M02, M30 when bit 0 (PCM) of parameter No. 6700 is set to 1.

6712	Total number of machined parts

[Input type] Setting input
[Data type] 2-word path
[Valid data range] 0 to 999999999

This parameter sets the total number of machined parts.
The total number of machined parts is counted (+1) when M02, M30, or an M code specified by parameter No. 6710 is executed.

> **NOTE**
> The number of parts is not counted for M02, M30, when bit 0 (PCM) of parameter No. 6700 is set to 1.

6713	Number of required parts

[Input type] Setting input
[Data type] 2-word path
[Valid data range] 0 to 999999999

This parameter sets the number of required machined parts.
Required parts finish signal PRTSF <F0062.7> is output to PMC when the number of machined parts reaches the number of required parts. The number of parts is regarded as infinity when the number of required parts is zero. The PRTSF signal is then not output.

6750	Integrated value of power-on period

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] min
[Valid data range] 0 to 999999999

This parameter displays the integrated value of power-on period.

6751	Operation time (integrated value of time during automatic operation) 1

[Input type] Setting input
[Data type] 2-word path
[Unit of data] msec
[Valid data range] 0 to 59999

6752	Operation time (integrated value of time during automatic operation) 2

[Input type] Setting input
[Data type] 2-word path
[Unit of data] min
[Valid data range] 0 to 999999999

This parameter displays the integrated value of time during automatic operation (neither stops nor hold time included).
The actual time accumulated during operation is the sum of this parameters Nos. 6751 and 6752.

6753	Integrated value of cutting time 1

[Input type] Setting input
[Data type] 2-word path
[Unit of data] msec
[Valid data range] 0 to 59999

6754	Integrated value of cutting time 2

[Input type] Setting input
[Data type] 2-word path
[Unit of data] min
[Valid data range] 0 to 999999999

This parameter displays the integrated value of a cutting time that is performed in cutting feed such as linear interpolation (G01) and circular interpolation (G02 or G03).
The actual time accumulated during cutting is the sum of this parameters Nos. 6753 and 6754.

6755	Integrated value of general-purpose integrating meter drive signal (TMRON) ON time 1

[Input type] Setting input
[Data type] 2-word path
[Unit of data] msec
[Valid data range] 0 to 59999

For details, see the description of parameter No. 6756.

6756	Integrated value of general-purpose integrating meter drive signal (TMRON) ON time 2

[Input type] Setting input
[Data type] 2-word path
[Unit of data] min
[Valid data range] 0 to 999999999

This parameter displays the integrated value of time during which General-purpose integrating meter start signal TMRON <Gn053.0> from PMC is “1”.
The actual integrated time is the sum of this parameters Nos. 6755 and 6756.

6757	Operation time (integrated value of one automatic operation time) 1

[Input type] Setting input
[Data type] 2-word path
[Unit of data] msec
[Valid data range] 0 to 59999

For details, see the description of parameter No. 6758.

6758	Operation time (integrated value of one automatic operation time) 2

[Input type] Setting input
[Data type] 2-word path
[Unit of data] min
[Valid data range] 0 to 999999999

This parameter displays the one automatic operation drive time (neither stop nor hold state included). The actual time accumulated during operating is the sum of this parameters Nos. 6757 and 6758. The operation time is automatically preset to 0 during the power-on sequence and the cycle start from the reset state.

	#7	#6	#5	#4	#3	#2	#1	#0
11651	DCO							

[Input type] Parameter input
[Data type] Bit path

#7 DCO During dry run, the cutting time is:
0: Not counted.
1: Counted.

Reference item

Manual name	Item name
OPERATOR'S MANUAL (B-64694EN)	Displaying and setting run time, parts count, and time

13.1.2 Software Operator's Panel

Overview

The MDI unit can replace the switches on the machine operator's panel. That is, the MDI unit can select a mode or jog feed override, omitting the corresponding switches on the machine operator's panel.

The control switches for the functions listed in the following table can be replaced with soft switches. Also available are 16 general-purpose soft switches which can be assigned by the machine tool builder. These 16 general-purpose soft switches can be optionally named by the machine tool builder. For control switches in groups 1 to 7, parameter can be used to select whether the control switches on the machine operator's panel or soft switches on the MDI of the control unit are used.

Group1 : Mode selection
Group2 : Selection of jog feed axis, manual rapid traverse
Group3 : Selection of manual pulse generator feed axis, selection of manual pulse magnification
Group4 : Jog feedrate override, feedrate override, rapid traverse override
Group5 : Optional block skip, single block, machine lock, dry run
Group6 : Protect key
Group7 : Feed hold
Group8 : General purpose

The states of all soft switches are input to the PMC by output signals. Based on these output signals, the PMC should turn 1 or 0 input signals related to the soft switch functions.
When the soft switch provided for single block operation is turned on, for instance, the control unit does not select the single block operation internally. The single block operation is selected just when the PMC sets the input signal for single block operation to 1.

Signal

Group	Function	Output signal		Related input signal
1	Mode selection	MD1O MD2O MD4O ZRNO	<Fn073.0> <Fn073.1> <Fn073.2> <Fn073.4>	MD1 MD2 MD4 ZRN

#4 IOV Override-related signal logic is:

0: Used without modification
(A signal of negative logic is used as a negative logic signal, and a signal of positive logic is used as a positive logic signal.)

1: Inverted
(A signal of negative logic is used as a positive logic signal, and a signal of positive logic is used as a negative logic signal.)

The signals indicated below are affected.

Signal of negative logic:
- Feedrate override signals *FV0 to *FV7<Gn012>
- Second feedrate override signals*AFV0 to *AFV7<Gn013>
- Feedrate override signals (for PMC axis control)
  *EFOV0g to *EFOV7g<G0151/G0163/G0175/G0187>
- Software operator’s panel signals *FV0O to *FV7O<Fn078>

Signals of positive logic:
- Rapid traverse override signals ROV1,ROV2<Gn014.0, Gn014.1>
- Software operator’s panel signals ROV1O,ROV2O<Fn076.4, Fn076.5>
- Rapid traverse override signals (for PMC axis control)
  EROV1g,EROV2g<G0150.0, G0150.1/G0162.0, G0162.1/G0174.0, G0174.1/G0186.0, G0186.1>

The signals indicated below are not affected.
- 1% step rapid traverse override selection signal HROV <Gn096.7>
- 1% step rapid traverse override signals *HROV0 to *HROV6 <Gn096.0 to Gn096.6>
- 0.1% step rapid traverse override selection signal FHROV <Gn353.7>
- 0.1% step rapid traverse override signals *FHRO0 to *FHRO9 <Gn352.0 to Gn352.7, Gn353.0 to Gn353.1>

7210	**Jog-movement axis and its direction on software operator's panel “↑”**
7211	**Jog-movement axis and its direction on software operator's panel “↓”**
7212	**Jog-movement axis and its direction on software operator's panel “→”**
7213	**Jog-movement axis and its direction on software operator's panel “←”**
7214	**Jog-movement axis and its direction on software operator's panel “↙”**
7215	**Jog-movement axis and its direction on software operator's panel “↗”**
7216	**Jog-movement axis and its direction on software operator's panel “⤴”**
7217	**Jog-movement axis and its direction on software operator's panel “↷”**

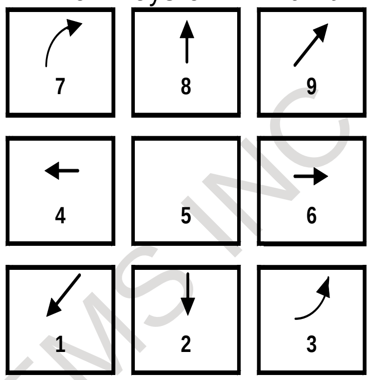
[Input type] Parameter input
[Data type] Byte path

[Valid data range] 0 to 8

On software operator's panel, set a feed axis corresponding to an arrow key on the MDI unit when jog feed is performed.

Setting value	Feed axis and direction
0	Not moved
1	First axis, positive direction
2	First axis, negative direction
3	Second axis, positive direction
4	Second axis, negative direction
5	Third axis, positive direction
6	Third axis, negative direction
7	Fourth axis, positive direction
8	Fourth axis, negative direction

Arrow keys on MDI unit



[Example] Under X, Y, and Z axis configuration, to set arrow keys to feed the axes in the direction specified as follows, set the parameters to the values given below. <8↑> to the positive direction of the Z axis, <2↓> to the negative direction of the Z axis, <6→> to the positive direction of the X axis <4←> to the negative direction of the X axis, <1↙> to the positive direction of the Y axis, <9↗> to the negative direction of the Y axis

Parameter No. 7210 = 5 (Z axis, positive direction)
Parameter No. 7211 = 6 (Z axis, negative direction)
Parameter No. 7212 = 1 (X axis, positive direction)
Parameter No. 7213 = 2 (X axis, negative direction)
Parameter No. 7214 = 3 (Y axis, positive direction)
Parameter No. 7215 = 4 (Y axis, negative direction)
Parameter No. 7216 = 0 (Not used)
Parameter No. 7217 = 0 (Not used)

7220 **Name of general-purpose switch 1 on software operator's panel (first half-size character)**
to **to**
7283 **Name of general-purpose switch 8 on software operator's panel (eighth half-size character)**

7284 **Name of general-purpose switch 9 on software operator's panel (first half-size character)**
to **to**
7299 **Name of general-purpose switch 10 on software operator's panel (eighth half-size character)**

7352 **Name of general-purpose switch 11 on software operator's panel (first half-size character)**
to **to**
7399 **Name of general-purpose switch 16 on software operator's panel (eighth half-size character)**

[Input type] Parameter input
[Data type] Byte path
[Valid data range] -128 to 127

Each of these parameters sets the name of a general-purpose switch on the software operator's panel with the following character codes.

When bit 0 (JPC) of parameter No. 7201 is set to 0, the character codes in the “Half-size character code list” can be specified.
When bit 0 (JPC) of parameter No. 7201 is set to 1, the character codes in the “Half-size character code list” and the “Full-size character code list (a) to (f)” can be specified. The full-size character which uses two characters of the half-size can be specified by the high-code and the low-code.

A switch name consists of up to eight half-size characters (or four full-size characters).

Parameters Nos. 7220 to 7227 : Name of general-purpose switch 1
Parameters Nos. 7228 to 7235 : Name of general-purpose switch 2
Parameters Nos. 7236 to 7243 : Name of general-purpose switch 3
Parameters Nos. 7244 to 7251 : Name of general-purpose switch 4
Parameters Nos. 7252 to 7259 : Name of general-purpose switch 5
Parameters Nos. 7260 to 7267 : Name of general-purpose switch 6
Parameters Nos. 7268 to 7275 : Name of general-purpose switch 7
Parameters Nos. 7276 to 7283 : Name of general-purpose switch 8
Parameters Nos. 7284 to 7291 : Name of general-purpose switch 9
Parameters Nos. 7292 to 7299 : Name of general-purpose switch 10
Parameters Nos. 7352 to 7359 : Name of general-purpose switch 11
Parameters Nos. 7360 to 7367 : Name of general-purpose switch 12
Parameters Nos. 7368 to 7375 : Name of general-purpose switch 13
Parameters Nos. 7376 to 7383 : Name of general-purpose switch 14
Parameters Nos. 7384 to 7391 : Name of general-purpose switch 15
Parameters Nos. 7392 to 7399 : Name of general-purpose switch 16

Ex) Setting of the name of general-purpose switch 1 on the software operator's panel
The name of general-purpose switch 1 on the software operator's panel can be set to "OVR信号1", in the following setting of the parameters Nos. 7220 to 7227.
(When bit 0 (JPC) of parameter No. 7201 is set to 1)

NOTE

1 The character can be displayed up to the character code just before the parameter Nos. 7220 to 7399 is set to 0, in the name of a general-purpose switch on the software operator's panel. Therefore, if using the space, specify the character code “32” (the space of the half-size character).

Ex1) When the parameter is set to 0 in the half-size character

Parameter	Setting value	Character
7220	3	回
7221	0	
7222	3	転
7223	2	
7224	0	
7225	49	1
7226	50	2
7227	51	3

The character string of display : “回転”

Ex2) When the parameter is set to 32 (the space of the half-size character) in the half-size character

Parameter	Setting value	Character
7220	3	回
7221	0	
7222	3	転
7223	2	
7224	32	(space)
7225	49	1
7226	50	2
7227	51	3

The character string of display : “回転 123”

2 Do not specify the character codes of the blank in the “Full-size character code list”. When it is specified, the space of the full-size character or an invalid character is displayed.

3 Please specify two spaces of the half-size character to display a space of the full-size character.

Note

NOTE

1 Only the modes shown below can be selected by soft switches. When the mode for DNC operation is to be required, then, all control switches for mode selection should be on the machine operator's panel or a general-purpose soft switch should be used to select the mode for DNC operation.
<u>Soft switches available for mode selection</u>
- Manual data input
- Automatic operation
- Memory edit
- Manual handle feed / incremental feed
- Jog feed
- Manual reference position return

2 Only one soft switch is available for the protection key. But, four input signals are available for protection key (KEY1, KEY2, KEY3 and KEY4).
Generally, four input signals are simultaneously turned to 1 or 0 according to the state of the protection soft switch.
For a multi-path system, the signals are as follows. These signals are common to all paths.
- KEYO<F0075.6>
- KEY1 to KEY4<G0046.3 to G0046.6>

3 When the soft switch for feed hold is turned on, output signal SPO is turned to 1, and the PMC turns feed hold signal *SP to 0.
In contrast to the above, when the soft switch for feed hold is turned off, output signal SPO is turned 0 and the PMC turns signal *SP to 1. For soft switches other than feed hold and general soft switches, when an output signal corresponding to a soft switch is turned to 1, the corresponding input signal is turned to 1.

The Table 13.1.2 (a) lists the jog feedrate override values which can be selected by soft switches.

Table 13.1.2 (a)

OPERATOR'S MANUAL (B-64694EN)	Display and setting of the software operator's panel

13.1.3 8-Level Data Protection Function

Overview

Eight operation levels can be set for CNC and PMC operation and eight protection levels can be set for various types of CNC and PMC data.
When various types of CNC and PMC data are changed or output externally, the system compares the operation level with the protection level to determine whether change or external output is allowed.

Explanation

- Operation level

Eight operation levels can be set for CNC and PMC operation.
Operation levels 0 to 3 are selected by the memory protection key signal.
Operation levels 4 to 7 are selected by a password.

Operation level	Setting method	Sample classification
7 (High)	Password	-
6	Password	MTB
5	Password	Dealer, Integrator
4	Password	End user
3	Memory protection key signal	User level (Level 1)
2	Memory protection key signal	User level (Level 2)
1	Memory protection key signal	User level (Level 3)
0 (low)	Memory protection key signal	User level (Level 4)

NOTE
1 Once any of operation levels 4 to 7 is set, it is retained (even when the power is turned off) until clear operation is performed by the corresponding password.
2 The initial values of the passwords for operation levels 4 to 6 are shown below.
- Operation level 4: "HC3V9ZEP"
- Operation level 5: "J72WB8YA"
- Operation level 6: "VLR6T92M"
3 Operation level 7 is reserved for the maintenance of the CNC and PMC.

⚠ **CAUTION**
When this function is provided, the conventional memory protection function is disabled.
When this function is added, the programmer protection function of the PMC is disabled. However, the sequence program password function can be used in combination with this function.

- Data protection level

A data protection level can be set for each of the following types of data. There are two data protection levels as shown below.

- Change protection level
  Protection level used for changing data
- Output protection level
  Protection level used for externally outputting data.

Protection levels 0 (low) to 7 (high) can be set.

CNC data protection level setting items

Data type	Initial value of protection level	
	Change	Output
Custom macro conversion data (including variable data specific to the macro executor)	0	0
Periodical maintenance information data	0	0
Tool management data	0	0
Tool offset data (for each type when classification is performed by figure and figure/wear)	0	0
Clock data	0	0
Workpiece origin shift data	0	0
Workpiece origin offset data	0	0
Ethernet setting data	0	0
Parameter data	4	0
Setting data	0	0
Power Mate CNC Manager function parameter data	0	0
Each part program	0	0
Part program editing	0	0
Presetting an absolute coordinate	0	0

PMC data protection level setting items

Data type	Initial value of protection level	
	Change	Output
Configuration parameter	0	0
Setting (online)	0	0
Setting (for each path)	0	0
Sequence parameter	0	0
PMC parameter	0	0
Timer	0	0
Counter	0	0
Keep relay	0	0
Keep relay (system)	0	0
Data table	0	0
Data table control	0	0
PMC memory	0	0
I/O configuration	0	0
I/O Link group selection	0	0
Registration of I/O device	0	0

- Changing or externally outputting of data

When various types of CNC and PMC data is changed or output externally, the change protection level or output protection level set for the target data is compared with its current operation level.
If the operation level is equal to or higher than the protection level set for the target data (operation level ≥ protection level), it is assumed that the target data can be changed or output externally and the data is allowed to be changed or output externally.
The operation level must be changed according to the purpose as needed.
The protection level must be set according to the confidentiality and severity of data.

[Example of application]

(1) Set the change protection level as follows.
- Parameter (Change protection level 4)
- Tool offset data (Change protection level 0)

(2) The changeable data can be restricted by changing the operation level during CNC and PMC operation.
- Operation level 4
  Parameters and tool offset data can be changed.
- Operation level 0
  Tool offset data can be changed.
  Parameters cannot be changed.

Data / Operation level	Parameter	Tool offset data
4	Changeable	Changeable
0	Not changeable	Changeable

Notes

- Tool management data

NOTE
Data related to tool information on the individual tool data screen of the tool management function is protected on the tool offset data protection level.

- Tool offset data

NOTE
1 Valid types of tool offset data vary depending on the tool offset memory used. See the tables below when setting a data protection level.
2 When a type of data that is not permitted to be changed or externally output is found during tool offset data input/output, the following operation takes place.
- Input : Data of other than the data type that is not permitted to be changed is changed.
- Output : Data of other than the data type that is not permitted to be changed is output.

M

Data type/tool offset memory	Tool offset memory A	Tool offset memory B	Tool offset memory B
Tool offset data	Applicable	Not applicable	Not applicable
Tool offset data (geometry)	Not applicable	Applicable	Not applicable
Tool offset data (wear)	Not applicable	Applicable	Not applicable
Tool offset data (tool radius, geometry)	Not applicable	Not applicable	Applicable
Tool offset data (tool radius, wear)	Not applicable	Not applicable	Applicable
Tool offset data (tool length, geometry)	Not applicable	Not applicable	Applicable
Tool offset data (tool length, wear)	Not applicable	Not applicable	Applicable

Data type/tool offset memory	Virtual tool tip direction
Tool offset data	Applicable

T

Data type/tool offset memory	Without tool geometry and wear compensation	With tool geometry and wear compensation
Tool offset data	Applicable	Not applicable
Tool offset data (geometry)	Not applicable	Applicable
Tool offset data (wear)	Not applicable	Applicable

Data type/tool offset memory	Tool radius compensation Y-axis offset (without tool geometry and wear compensation)	Tool radius compensation Y-axis offset (with tool geometry and wear compensation)
Tool offset data	Applicable	Not applicable
Tool offset data (geometry)	Not applicable	Applicable
Tool offset data (wear)	Not applicable	Applicable

Data type/tool offset memory	Virtual tool tip direction
Tool offset data	Applicable

Data type/tool offset memory	Second geometry tool offset data
Tool offset data (geometry)	Applicable

- Part programs and part program editing

NOTE

1. When changing the protection level of a part program, use the program list screen instead of the protection level setting screen. See the description of "Operation/setting screen".
2. Part program editing involves editing of programs for the MDI mode.

- Absolute coordinate preset operation

NOTE

When absolute coordinates are preset, workpiece coordinate system presetting is protected.

- Other notes

NOTE

1. For some data, the output function is not provided.
2. When a higher protection level than the current operation level is set for data, that protection level cannot be changed.
3. The protection level of data cannot be changed to a protection level higher than the current operation level.
4. Part program editing involves editing of programs for the MDI mode.
5. For details of the protection level of PMC data, refer to "PMC Programming Manual (B-64513EN)".
6. In principle, the data change protection check is performed for changes made by MDI. Changes made by machine operations and so on are not checked.
   For example, a programmable parameter input by specifying G10L50 may be changed regardless of the operation level and parameter change protection level.
   To protect data from illegal programmed commands, take appropriate measures; for example, set an appropriate change protection level for program edit operations not to create illegal programs.

Signal

Memory protection signals KEY1 to KEY4<G0046.3 to G0046.6>

[Classification] Input signal

[Function] These signals select the operation level for the 8-level data protection function.
The correspondence between signals and operation levels is shown below.

Operation level	KEY4	KEY3	KEY2	KEY1
3	0	1	0	0
2	0	0	1	0
1	0	0	0	1
0	0	0	0	0

NOTE
When a combination other than the above is set, operation level 0 is assumed.

[Caution] When the 8-level data protection function is not used, these signals are used as memory protection keys.
Note that what these signals indicate changes depending on whether the 8-level data protection function is used.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0046		KEY4	KEY3	KEY2	KEY1			

Diagnosis data

1004	Current level of 8-Level Data Protection Function

[Data type] Word

[Unit of data] None

[Valid data range] 0 to 7

Current operation level of 8-Level Data Protection Function

Operation/setting screen

Various settings or display about operation levels or protection levels can be performed on the following screens.

- Password change screen
- Operation level setting screen
- Protection level setting screen
- Program list screen

- Password change screen

On the password change screen, the following display or operations can be performed.

(1) Displaying the current operation level

(2) Changing the passwords of operation levels 4 to 7

NOTE
1 A password consists of 3 to 8 characters including the following.
- Uppercase letter
- Numeric

NOTE

2 When a password is entered, * is displayed instead of each of input characters.
3 The following shows whether passwords can be changed at the current operation level.
  - Password having a higher operation level than the current operation level
    Cannot be changed.
  - Password having the same operation level as the current operation level
    Can be changed.
  - Password having a lower operation level than the current operation level
    Can be changed (reverting to the initial password can only be performed).

⚠ CAUTION

The set password is not displayed.
Be careful not to forget the password.

- Operation level setting screen

On the operation level setting screen, the following display or operations can be performed.

(1) Displaying the current operation level
(2) Entering the password and then selecting one of operation levels 4 to 7
(3) Canceling the entered password and then selecting the operation level other than operation levels 4 to 7

NOTE

When a password is entered, * is displayed instead of each character.

- Protection level setting screen

On the protection level setting screen, the following display or operations can be performed.

(1) Displaying the current operation level
(2) Displaying the change protection level and output protection level of each data
(3) Changing the change protection level and output protection level of each data

NOTE

1 For data whose protection level is higher than the operation level, the protection level cannot be changed.
2 The protection level cannot be changed to a protection level that is higher than the current operation level.

- Program list screen

On the program list screen, the following display and operations can be performed.

(1) Displaying the change protection level and output protection level of each part program
(2) Changing the change protection level and output protection level of each part program

NOTE

1 For data whose protection level is higher than the operation level, the protection level cannot be changed.
2 The protection level cannot be changed to a protection level that is higher than the current operation level.

13.1.4 Touch Panel Control

⚠ **WARNING**

FANUC's touch panel is an analog resistive film type. When two or more points are pressed at the same time, there is a possibility that it behaves as if the center of these points was pressed, and this wrong output or malfunction may cause an accident. Do not create a virtual machine operator's panel screens on which two or more points are pressed at the same time for touch panel operation.

On the virtual machine operator panel screen, never support safety-related operations that may lose human life or may cause serious damage, or real-time operations such as emergency stop, program start, program stop, axis movements, etc. If there is a failure in the CNC, peripheral units, or cable, wrong outputs or malfunctions may cause an accident. In addition, real-time operation is not guaranteed on the touch panel screen.

Overview

A display unit with a touch panel enables you to operate soft keys by touching the screen.

Moreover, an application using a touch panel can be created with the C Language Executor.

NOTE

1. With a CNC of LCD-mounted type, RS-232C serial port 2 (JD36A) is occupied.
2. With a CNC of stand-alone type, a serial port dedicated to a touch panel is used.
3. Touch panel pressing information is read at intervals of 32 msec.
4. A positional precision of ±2.5 mm is provided.

Explanation

- C Language Executor

With the C Language Executor, touch panel functions can be used. For the specifications of the functions, refer to "C Language Executor Operator's Manual".

- Calibration

When replacing the touch panel or clearing all memory (SRAM) data, set data for calibrating the positional relation between the touch panel and LCD according to the procedure below.

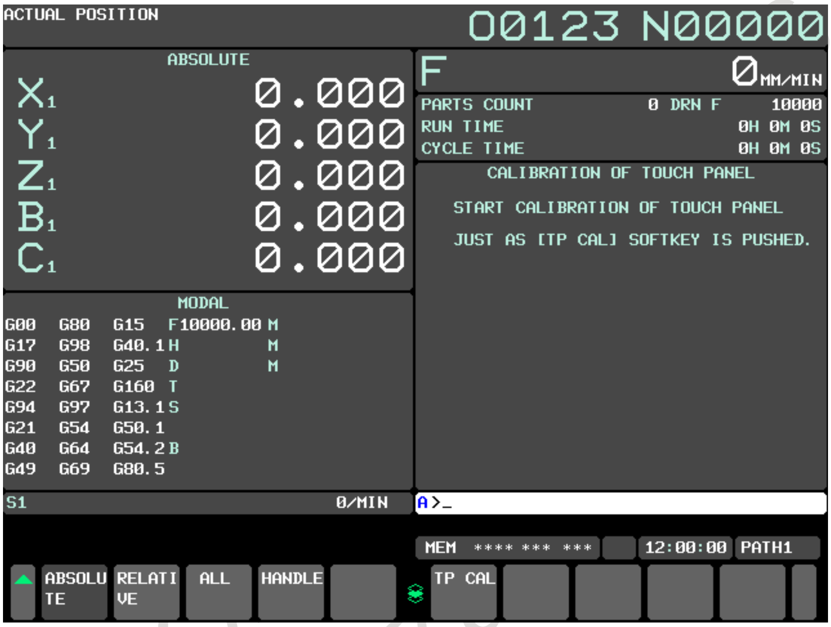
Calibration procedure

1 Enable the touch panel calibration screen.(Set bit 5 (DCL) of parameter No. 3113 to 1.)

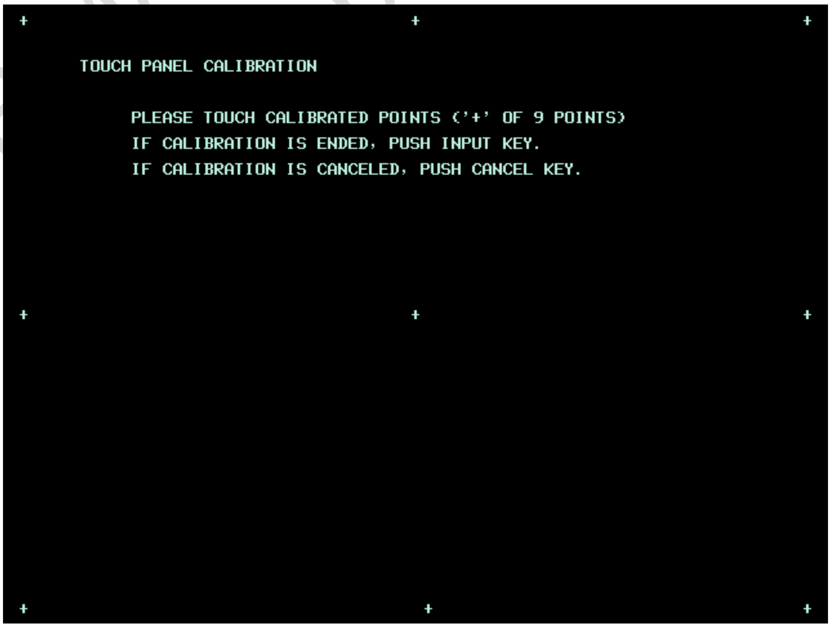
2 Press function key SYSTEM.

3 Press the continuous menu key several times. The [TOUCH PANEL] soft key is displayed.

4 Press the [TOUCH PANEL] soft key then the [(OPRT)] soft key. The [TP CAL] soft key is displayed.



5 Pressing the [TP CAL] soft key displays the touch panel calibration screen for all screens.



6 Press the calibration points (9 points) with a dedicated pen. When a point is pressed correctly, the "+" mark changes to the "O" mark. If a "+" mark is not pressed accurately, the message "CALIBRATION POINT DOES NOT MATCH. PLEASE PUSH AGAIN." is displayed.

7 After entering the calibration points (9 points), press INPUT key to complete calibration. To cancel calibration or retry, press CAN key. The screen display returns to the previous screen. If INPUT key is pressed before entering the calibration points (9 points), calibration operation is cancelled.

8 When calibration is terminated normally, the message "CALIBRATION WAS ENDED." is displayed.

9 Upon completion of calibration, disable the touch panel calibration screen to protect against operation errors. (Set bit 5 (DCL) of parameter No. 3113 to 0.)

NOTE
1 If the screen display is switched from the touch panel calibration screen to another screen such as the alarm screen by the automatic screen switching function, calibration is automatically cancelled.
2 Calibration operation can be performed in any mode.
3 After system startup, perform calibration operation swiftly before starting operation.

- Operation when two points are pressed

When the touch panel is pressed at two or more points, the position of the gravity center is obtained by considering how each of these points is pressed, and the touch panel is assumed to be pressed at this gravity center position. At this time the coordinates that can be obtained can be set by setting bit 1 (T2P) of parameter No. 3192.

NOTE
When two points are pressed in a row in a short time interval, the touch panel may react as if the center of the two points was pressed, even though parameter T2P (No. 3192#1) is set to 1.

(1) Suppose that in Fig. 13.1.4 (a), as soon as point A is pressed, point B is pressed.

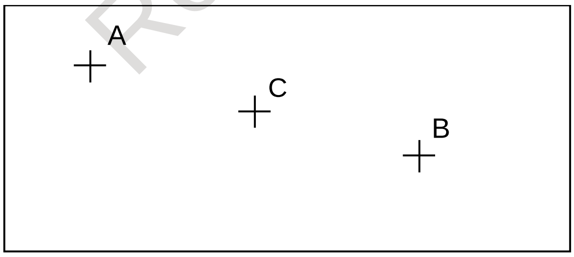


Fig. 13.1.4 (a) Pressed points on the touch panel

(2) The coordinates that can be obtained change as shown in Fig. 13.1.4 (b).

On	Cont'd	. . .	Cont'd	Cont'd	Cont'd	. . .	Off
A	A		A	C	C		

Fig. 13.1.4 (b) Coordinates when parameter T2P = 0

(3) If bit T2P is set to 1, A is assumed to be held pressed even after the pressed point changes from point A to point C (Fig. 13.1.4 (c)).

On	Cont'd	. . .	Cont'd	Cont'd	Cont'd	. . .	Off
A	A		A	A	A		

Fig. 13.1.4 (c) Coordinates when parameter T2P = 1

- Operation when dragging is performed

When dragging (continuously pressing the touch panel while making a movement) is performed on the touch panel, the system response varies depending on the setting of bit 1 (T2P) of parameter No. 3192. When the drag function is used in C Language Executor applications, set T2P to 0.

1) Suppose that in Fig. 13.1.4 (d), point A is pressed first and then dragging is performed from point A to B to C.

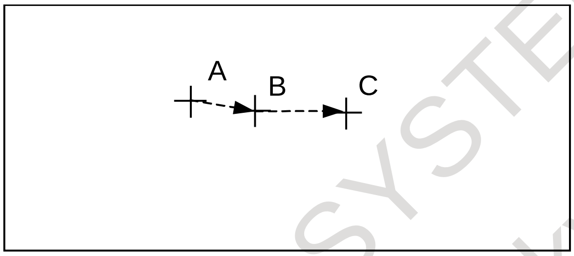

Fig. 13.1.4 (d) Dragging on the touch panel

2) The coordinates that can be obtained change as shown in Fig. 13.1.4 (e).

On	Cont'd	Cont'd
A	B	C

Fig. 13.1.4 (e) Coordinates when parameter T2P = 0

3) If bit T2P is set to 1, A is assumed to be kept pressed even after the pressed point moves from point A to point C (Fig. 13.1.4 (f)).

On	Cont'd	Cont'd
A	A	A

Fig. 13.1.4 (f) Coordinates when parameter T2P = 1

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3113			DCL					

[Input type] Parameter input
[Data type] Bit

#5 DCL The touch panel compensation screen is:
0: Disabled.
1: Enabled.
Set this parameter to 0 usually. Touch panel compensation becomes necessary only when the panel is replaced or memory all clear operation is performed. Set this parameter to 1 only when performing touch panel compensation. Upon completion of compensation, set this parameter to 0.

	#7	#6	#5	#4	#3	#2	#1	#0
3119						DDS		

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#2 DDS The touch panel is:
0: Enabled.
1: Disabled.
Set this parameter to 1 when disabling the touch panel temporarily, for example, at start-up time.

	#7	#6	#5	#4	#3	#2	#1	#0
3192						TRA	T2P	

[Input type] Parameter input
[Data type] Bit

#1 T2P When more than one point is pressed on the touch panel:
0: The position at the center of gravity is obtained.
1: The point pressed first is obtained.

> **NOTE**
> 1 When two points are pressed in a row in a short time interval, the touch panel may react as if the center of the two points was pressed, even though parameter T2P (No. 3192#1) is set to 1.
> 2 If a C executer application or the like has a touch panel drag (move in pressed state) function, set parameter T2P to 0.

#2 TRA If a point on the touch panel is kept pressed for a time specified in parameter No. 3197 or longer,
0: An alarm is not raised.
1: An alarm SR5303, “TOUCH PANEL ERROR” is raised.

> **NOTE**
> 1 If an C executer application or the like has a touch panel repeat (continue pressing) function, set parameter TRA to 0.
> 2 In personal computer functions, the parameter is valid just for the CNC screen display function.

3197	Detection time of continuous pressing on touch panel

[Input type] Parameter input
[Data type] Word
[Unit of data] sec
[Valid data range] 0 to 255
Set a period of continuous pressing on the touch panel which causes alarm SR5303, “TOUCH PANEL ERROR” to be raised. When 0 is set, it is equivalent to 20.

> **NOTE**
> This parameter is valid when bit 2 (TRA) of parameter No. 3192 is set to 1.

Alarm and message

Number	Message	Description
SR5303	TOUCH PANEL ERROR	The touch panel is not connected correctly, or the touch panel cannot be initialized when the power is turned on. If bit 2 (TRA) of parameter No. 3192 is set to 1, this message is issued also when the touch panel is being kept pressed. Correct the cause then turn on the power again.

Caution

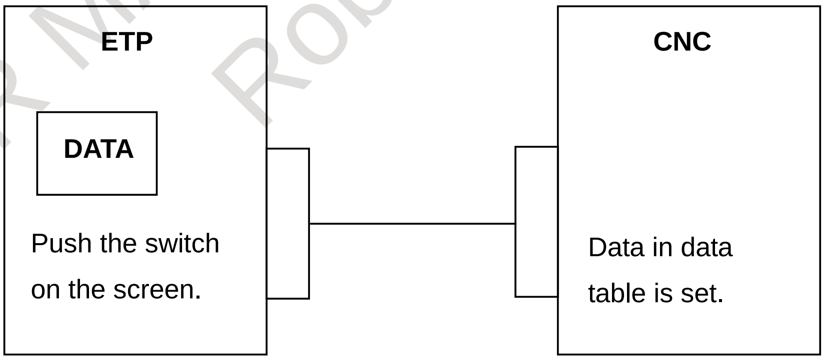
> ⚠ **CAUTION**
> When all memory (SRAM) data is cleared, the soft keys on the touch panel are not made usable yet. In this case, the MDI keys (such as the cursor keys and page keys) need to be used for setting.

13.1.5 External Touch Panel Interface

Outline

External Touch Panel (called "ETP" below) of SNP-X protocol can be connected with Series 30*i*.
ETP has functions that can read out/ write in from/to PMC such control signals as input signal(X), output signal(Y), internal relay(R), keep relay(K), data table(D), extra relay(E), timer(T), counter(C), and the function is almost the same as operating panel of machine.

The remarkable function of ETP is drawing function.
Assignment between drawing and address (signal) can be specified freely.
For example, the data in data table can be set with the switch on the screen which is designed to assign the setting of data table.

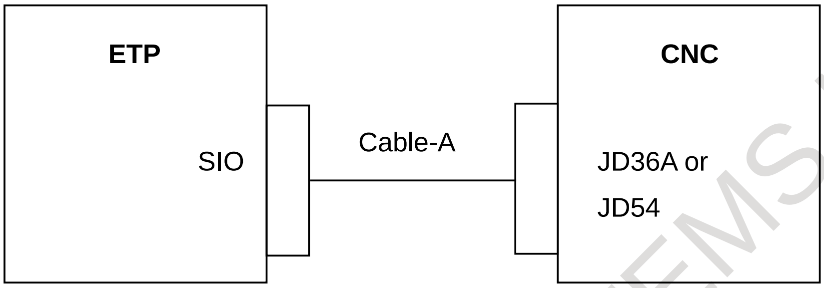


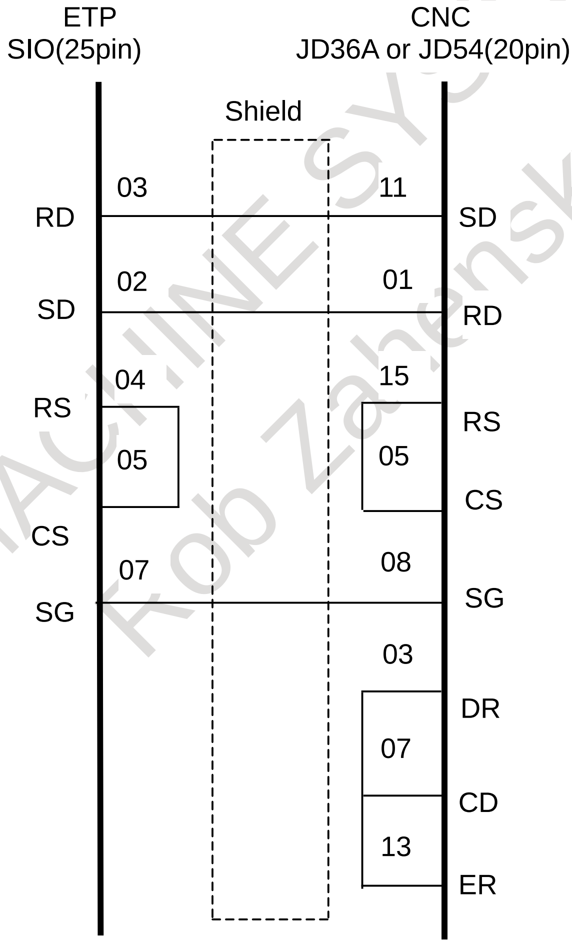
Explanation

- Connection

RS-232C serial port 2(JD36A; for the 15”/19” LCD-mounted type CNC and LCD-mounted type CNC with the is functions, JD54) on main CPU board is used in CNC.
Cable-A must be based on RS-232C standard, and are prepared by customer.

(1) Cable-A (connection diagram between JD36A or JD54 on CNC and SIO on ETP.)





Cables must be shielded by cable clamp made of metal.

> **NOTE**
> For the 15”/19” LCD-mounted type CNC and LCD-mounted type CNC with the is functions, use pin 04 as SG for cabling. Leave pin 08 open.

- Power On sequence

Please turn on the power supply on ETP side first.

- Data of CNC, read / write from ETP

The following CNC data can be read and written on the ETP side:

Signal type	30*i*/31*i*/32*i*- B PMC		
	First PMC	Second PMC	Third PMC
Input signal to the PMC from the machine Note 1	X0 to X127 X200 to X327 X400 to X527 X600 to X727 X1000 to X1127	X0 to X127 X200 to X327 X400 to X527 X600 to X727 X1000 to X1127	X0 to X127 X200 to X327 X400 to X527 X600 to X727 X1000 to X1127
Output signal from the PMC to the machine	Y0 to Y127 Y200 to Y327 Y400 to Y527 Y600 to Y727 Y1000 to Y1127	Y0 to Y127 Y200 to Y327 Y400 to Y527 Y600 to Y727 Y1000 to Y1127	Y0 to Y127 Y200 to Y327 Y400 to Y527 Y600 to Y727 Y1000 to Y1127
Internal relay - User area	R0 to R7999	R0 to R1499	R0 to R1499
Keep relay - User area	K0 to K99	K0 to K19	K0 to K19
Data table	D0 to D9999	D0 to D2999	D0 to D2999
Extra relay	E0 to E9999 Note 2	E0 to E9999 Note 2	E0 to E9999 Note 2
Timer - Variable timer	T0 to T499	T0 to T79	T0 to T79
Counter - Variable counter - Fixed counter	C0 to C399 C5000 to C5199	C0 to C79 C5000 to C5039	C0 to C79 C5000 to C5039

NOTE

1 These addresses are for read only.
2 Shared memory of the multi-path PMC. Programs can read and write the same value from/to this memory.

- Protocol

Only direct command on SNP-X protocol is available in CNC.
ETP also must use the same protocol and the same command only.
The process required for writing data more than 3 bytes is the same as that lass than 2bytes.
Please refer the documents of SNP-X protocol for the detail of SNP-X protocol.

- Combined use of the touch panel on the LCD of the CNC and External Touch Panel

ETP cannot be used together with the touch panel on the LCD (excluding Windows CE compatibles) of the LCD-mounted type CNC.
ETP can be used together with the touch panel on the LCD (excluding Windows CE-enabled compatibles) of the stand-alone type CNC.

> **NOTE**
> To use ETP together with the touch panel on the LCD (excluding Windows CE compatibles) of the stand-alone type CNC, it is necessary to specify the function for the function for touch panel control, and the function for external touch panel interface.

Limitation

(1) Only addresses for the PMC set in parameter No. 11310 can be read and written. It is impossible to perform reading from and writing to more than one PMC at the same time.

(2) ETP is Touch Panel made by DIGITAL Co. Ltd. ETPs which can be connected with CNC are as follows.
- GP-450E
- GP-550T
- GP-550S
- GP-2000 SERIES
- GP-3000 SERIES

Parameters

	#7	#6	#5	#4	#3	#2	#1	#0
3119					TPA			

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#3 TPA When the function for the external touch panel interface is selected, the external touch panel interface connection is:

0: Valid.
1: Invalid.

For an external touch panel (called ETP hereinafter), the RS-232C serial port 2 (JD36A or JD54) on the main board of the CNC is used.
When using ETP, set bit 3 (TPA) of parameter No. 3119 to 0.
By this setting, JD36A or JD54 is used for ETP, regardless of the setting of I/O CHANNEL (I/O device selection) of the existing parameters Nos. 0021 to 0023.
For other I/O devices, use JD56A and so forth.
By the setting above, the settings of the existing parameters Nos. 0100 and 0121 to 0123 become invalid for channel 2 (JD36A or JD54), and the following settings are applied at all times:

- Baud rate : 19200 bps
- Stop bit : 1 bit
- Parity check : Even parity

	#7	#6	#5	#4	#3	#2	#1	#0
13101							TPB	

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#1 TPB Baud rate used with the external touch panel
0: 19200 bps is always used.
1: The baud rate with the baud rate number set in parameter No. 0123 for channel 2 is used.

As mentioned in the description of bit 3 (TPA) of parameter No. 3119, when TPA is set to 0, the baud rate is always set to 19200 bps.
To allow the baud rate to be changed, set bit 1 (TPB) of parameter No. 13101 to 1.
This allows the baud rate number set in parameter No. 0123 for channel 2 to be used.

> **NOTE**
> Baud rates that can be set may vary depending on the ETP used.

11310	Selection of a PMC that performs read and write operations with an external touch panel

[Input type] Parameter input
[Data type] Byte
[Valid data range] 0 to 3

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

This parameter selects an PMC for read and write operations among three PMCs, which are the first PMC, second PMC, and third PMC.
0, 1 : First PMC
2 : Second PMC
3 : Third PMC

> **NOTE**
> It is impossible to perform read and write operations with more than one PMC at the same time.

13.1.6 Parameter Check Sum Function

Overview

Standard check sum of CNC parameter can be calculated previously and be saved in CNC. In the other hand, a parameter check sum is calculated at CNC power-on. This value is compared with the standard check sum to check whether there is difference between two values.
If there are changed parameters, an alarm will occur at next power-on. So the CNC can be averted from miss operation such as miss setting of parameter and forgetting to correct the parameters changed temporarily.

Explanation

When bit 0 (CKS) of parameter No. 13730 is changed from 0 to 1, the standard check sum is calculated. In the other hand at CNC power-on, a parameter check sum is calculated and its value is compared with standard check sum. If two values are different, alarm DS5340," PARAMETER CHECK SUM ERROR", occurs.

This alarm is canceled by the operation pressing RESET and CAN, but if parameters are not corrected to original value, alarm DS5340 will occur again at next check sum comparison at CNC power-on.
By parameter setting, some parameters can be excluded from check sum. Moreover, there are many parameters that CNC system excludes from check sum. (Refer to excluded parameters in this section)

> **NOTE**
> If bit 7 (CSR) of parameter No. 13730 is 1, alarm DS5340 can be canceled only by RESET key.

Parameter check sum information screen

The parameter check sum information screen shows the value of the standard check sum, the time and date when the standard check sum was calculated, and the value of a check sum calculated at power-on.

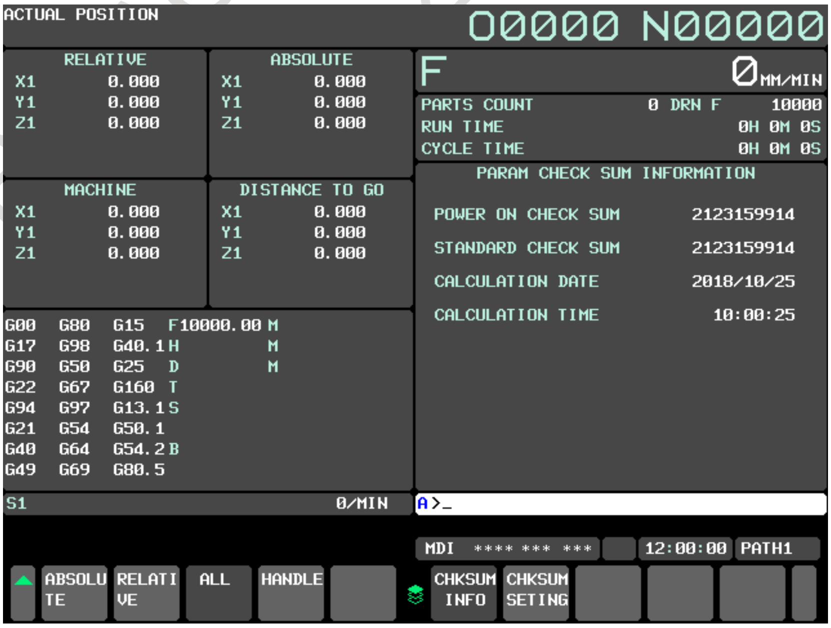


Fig. 13.1.6 (a) Parameter check sum information screen (10.4")

Parameter check sum setting screen

- Setting parameters to be excluded

Setting the number of parameter excluded from check sum on this screen.
A brief explanation about setting data is shown on the bottom of this frame.

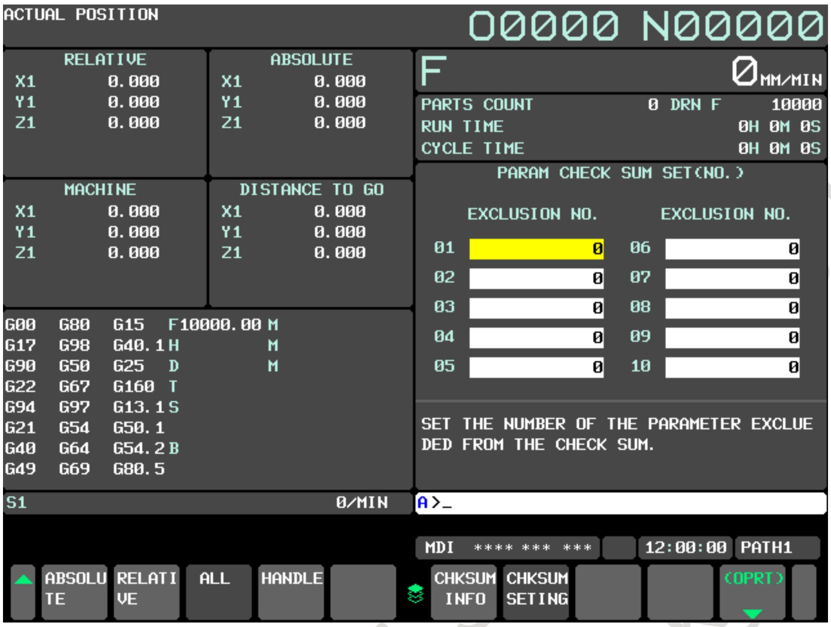

Fig. 13.1.6 (b) Parameter check sum setting (No.) screen (10.4”)

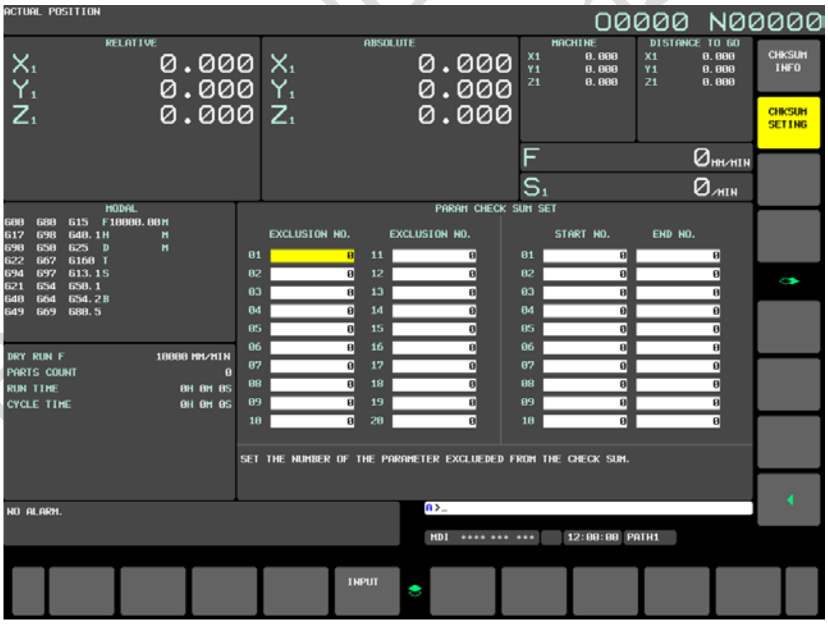

Fig. 13.1.6 (c) Parameter check sum setting screen: number setting (15”)

- Range of excluded parameters

Setting the range of parameters excluded from check sum.
A brief explanation about setting data is shown on the bottom of this frame.

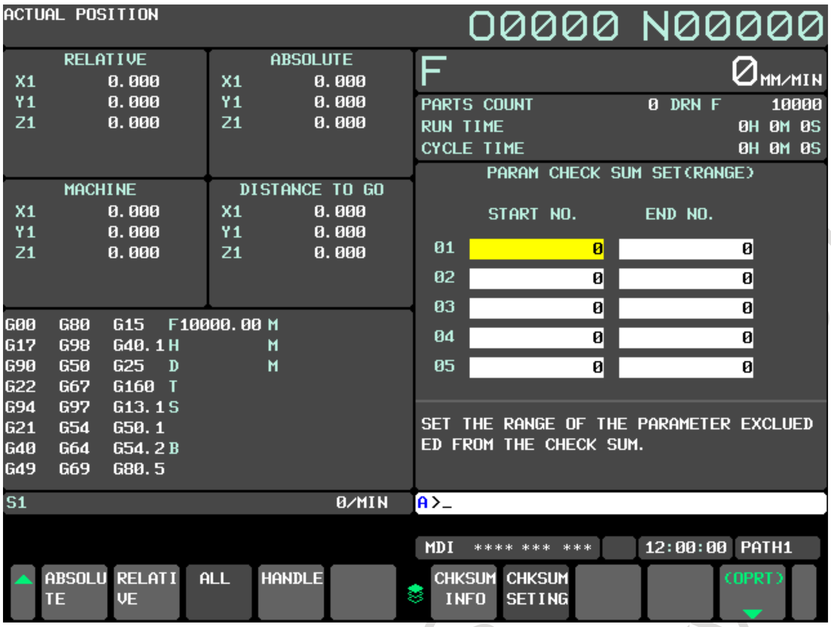

Fig. 13.1.6 (d) Parameter check sum setting (range) screen (10.4”)

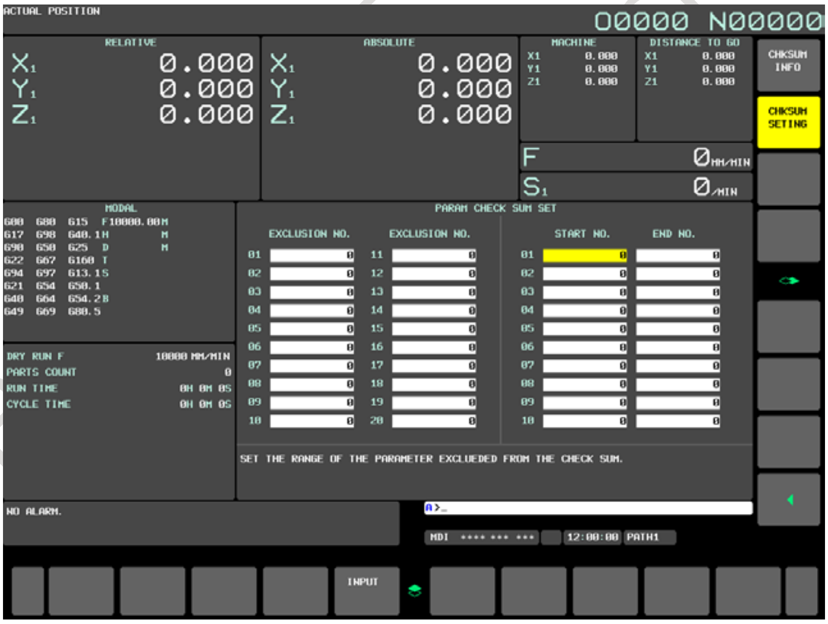

Fig. 13.1.6 (e) Parameter check sum setting screen: range setting (15”)

Operation procedure

The following explains how to display the parameter check sum information screen and how to make settings on the parameter check sum setting screen.

- Displaying parameter check sum information

For the 10.4” display unit, follow the steps below.

1 Press function key SYSTEM.

2 Press continuous menu key several times until soft key [PARAM CHKSUM] appears.

3 Press horizontal soft key [PARAM CHKSUM].

4 Press horizontal soft key [CHKSUM INFO]. The screen in the Fig. 13.1.6 (f) is then displayed:

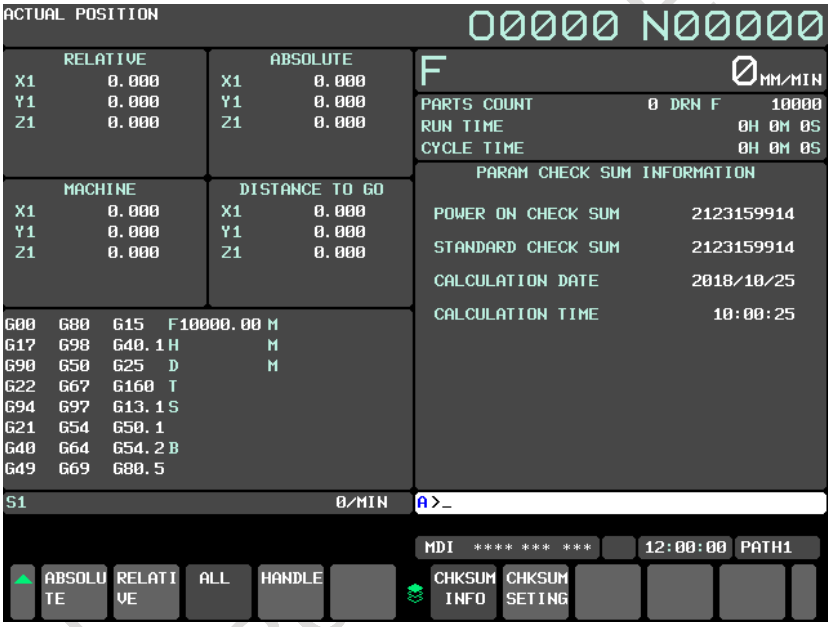

Fig. 13.1.6 (f) Parameter check sum information screen (10.4”)

For the 15” display unit, follow the steps below.

1 Press function key SYSTEM.

2 Press vertical soft key [NEXT PAGE] several times until soft key [PARAM CHKSUM] is displayed.

3 Press vertical soft key [PARAM CHKSUM].

4 Press vertical soft key [CHKSUM INFO]. The screen in the Fig. 13.1.6 (g) is displayed:

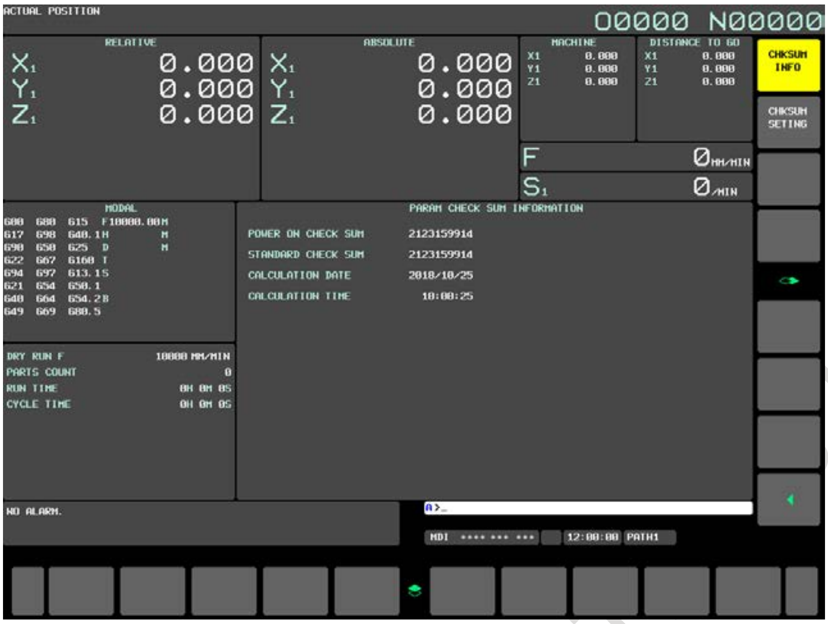

Fig. 13.1.6 (g) Parameter check sum information screen (15")

- Setting parameters to be excluded

For the 10.4" display unit, follow the steps below.

1 Press function key .

2 Press continuous menu key [+] several times until soft key [PARAM CHKSUM] is displayed.

3 Press horizontal soft key [PARAM CHKSUM].

4 Press horizontal soft key [CHKSUM SETING]. The screen in the Fig. 13.1.6 (h) is displayed:

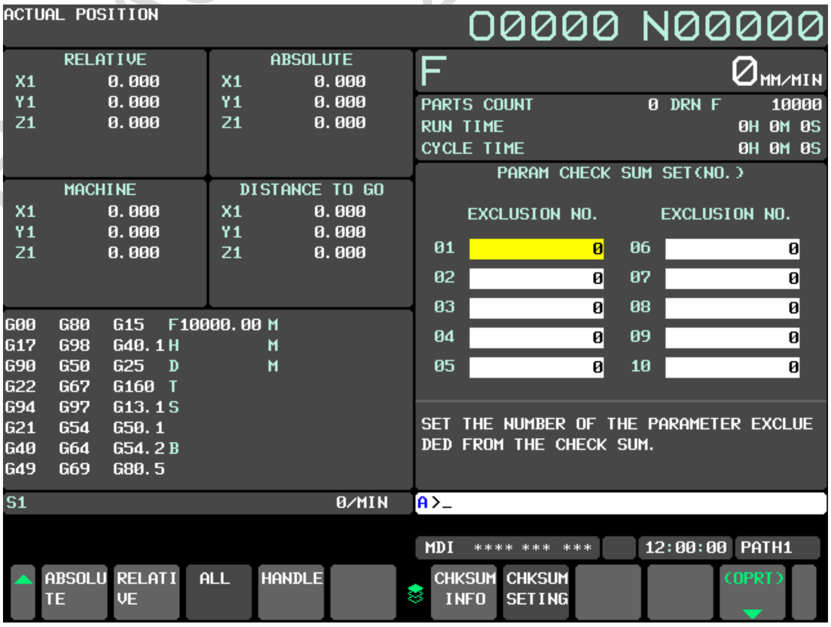

Fig. 13.1.6 (h) Parameter check sum setting screen (10.4")

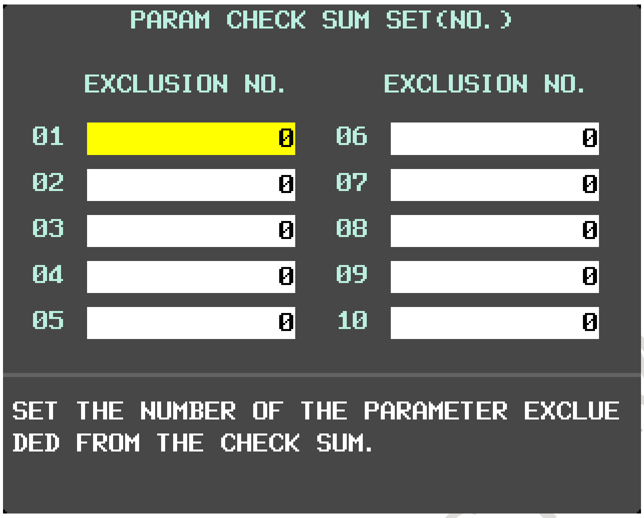
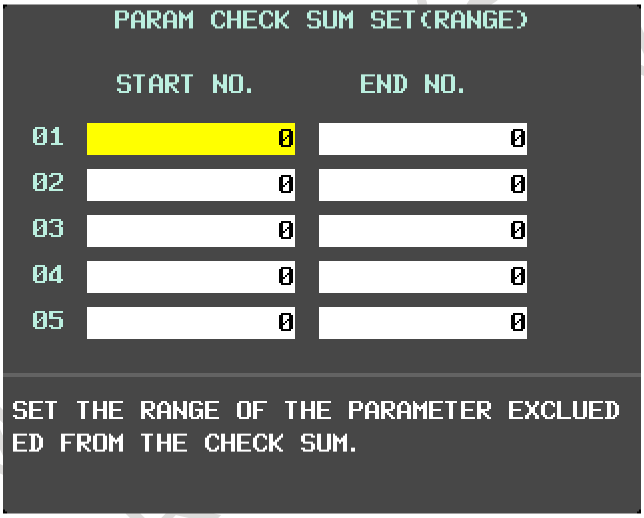
5 By using page keys and , the parameter check sum setting screen changes as follows:

First page



Third page



6 Move the cursor to a target item.

7 Enter the number of a parameter to be excluded from the check sum, and press the key or soft key [INPUT].

8 When completing the setting of all parameters to be excluded, set bit 0 (CKS) of parameter No. 13730 to 1.

For the 15” display unit, follow the steps below.

1 Press function key 

.

2 Press vertical soft key [NEXT PAGE] several times until soft key [PARAM CHKSUM] is displayed.

3 Press vertical soft key [PARAM CHKSUM].

4 Press vertical soft key [CHKSUM SETING]. The following screen is displayed:

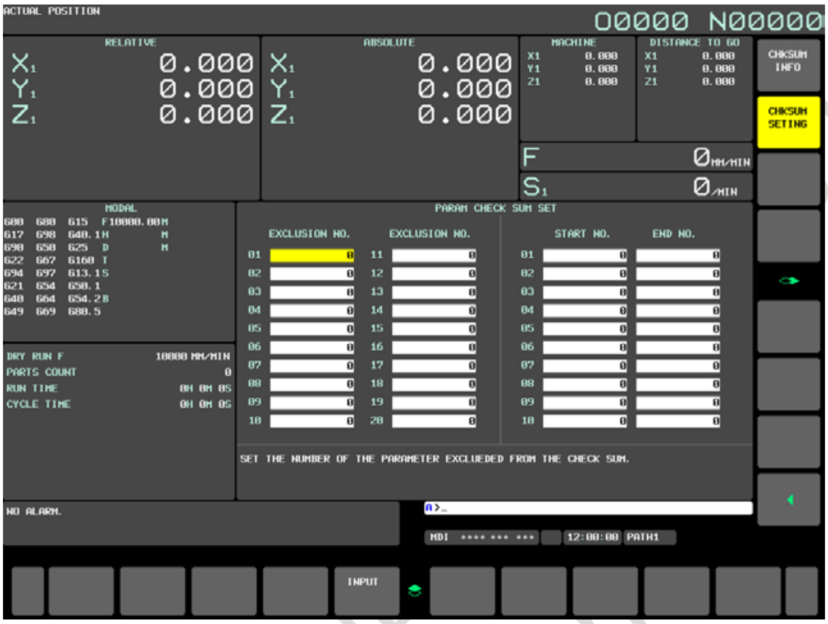


Fig. 13.1.6 (i) Parameter check sum setting screen (15”)

5 Move the cursor to a target item.

6 Enter the number of a parameter to be excluded from the check sum, and press the 
key or soft key [INPUT].

7 When completing the setting of all parameters to be excluded, set bit 0 (CKS) of parameter No. 13730 to 1.

NOTE

1 Items set on this screen correspond to parameter Nos. 13731 to 13770 as shown below. These items can be set also on the parameter screen.
Exclusion Nos. 01 to 20 → Parameters Nos. 13731 to 13750
Exclusion ranges 01 to 10 → Parameters Nos. 13751 to 13770

2 When 0 is set as an exclusion number, it is ignored.

3 Numbers set as the start number and the end number of each exclusion range are also excluded.

4 In a combination of the start No. and end No., if the start No. is greater than the end No. (start No. > end No.), the setting of check sum exclusion numbers becomes invalid.

5 If the start No. equals the end No. (start number = end number), only the set number is excluded.

Excluded parameters

A check sum is not the sum of all parameters but is calculated with particular parameters excluded. The parameters to be excluded satisfy one of the following conditions:

(1) Parameters that can be input by setting input
(2) Parameters of which values may be changed by the system (see Table 13.1.6 (a))
(3) Parameters set on the parameter check sum setting screen

For parameters in (2), see the Table 13.1.6 (a):

Table 13.1.6 (a) Parameters excluded from the check sum

Parameter number	Description
1244	Coordinates of the floating reference position
1320 to 1327	Coordinates at the boundary of stored stroke check 1
1330 to 1348	Chuck and tail stock barrier
3226	Keyword of the key lock for parameters related to dual check safety
4911 to 4914	Spindle speed fluctuation detection
5130	Amount of chamfering in thread cutting cycles G96 and G92
5132 to 5133	Depth of cut and escaping amount of multiple repetitive cycles G71 and G72 (T series)
5134	Clearance value of multiple repetitive cycles G71 and G72
5135	Escaping amount along the X-axis in multiple repetitive cycle G73 (T series)
5136	Escaping amount along the Z-axis in multiple repetitive cycle G73 (T series)
5137	Divide number of multiple repetitive cycle G73 (T series)
5139	Return amount in multiple repetitive cycles G74 and G75 (T series)
5140	Minimum depth of cut in multiple repetitive cycle G76 (T series)
5141	Finishing allowance in multiple repetitive cycle G76 (T series)
5142	Number of repetitions of final finishing in multiple repetitive cycle G76 (T series)
5143	Tool nose angle in multiple repetitive cycle G76 (T series)
5660 to 5668	Flexible synchronization control
5669	Automatic phase synchronization for flexible synchronization control
5670 to 5677	Flexible synchronization control
5680 to 5687	Flexible synchronization control
5690 to 5693	Flexible synchronization control
6581 to 6595	VGA character color number
6750	Integrated value of power-on period
7220 to 7283	Name of general-purpose switch on software operator’s panel
7310	Program restart
8210	Slant angle
8900	PWE
13420	Automatic phase synchronization for flexible synchronization control
13425 to 13436	Automatic phase synchronization for flexible synchronization control
14717	Axis number of the C-axis in simulation (for MGi only)

When the machining condition selecting function is used, the parameters in the Table 13.1.6 (b) to (c) are also excluded from the check sum:

Table 13.1.6 (b) Parameters excluded from the check sum (when the machining condition selecting function is used)

Parameter number	Description
1432	Maximum cutting feedrate for all axes in the look-ahead acceleration/deceleration before interpolation
1769	Time constant for acceleration/deceleration after cutting feed interpolation in the look-ahead acceleration/deceleration before interpolation mode
1772	Acceleration change time of look-ahead bell-shaped acceleration/deceleration before interpolation
1783	Maximum allowable feedrate difference for feedrate determination based on corner feedrate difference
1788	Maximum allowable acceleration change rate in feedrate determination based on acceleration change for each axis
1789	Maximum allowable acceleration change rate in feedrate determination based on acceleration change for each axis (linear interpolation)
1790	Ratio of change time of the rate of change of acceleration in look-ahead smooth bell-shaped acceleration/deceleration before interpolation
13634	Precision level currently selected when AI contour control is used

Table 13.1.6 (c) Parameters for setting the parameter numbers of parameters to be excluded from the check sum (when the machining condition selecting function is used)

Parameter No.
Parameter number set in parameter No. 13628 (parameter number corresponding to item 1 when AI contour control is used)
Parameter number set in parameter No. 13629 (parameter number corresponding to item 2 when AI contour control is used)

NOTE

1 When the machining condition selecting function is not used, these parameters are included in the check sum.

2 The parameters of which numbers are set in parameter Nos. 13628, 13629, 13674, and 13675 are excluded, but parameter Nos. 13628, 13629, 13674, and 13675 are not excluded.

Parameter

11358	Power-On Checksum

[Data type] 2-word
When parameter checksum function is effective, checksum value which is calculated at power-on is set.

0 is set when the parameter checksum function is invalid.

11359	Standard Checksum

[Data type] 2-word
Checksum value which is calculated at when parameter checksum function is changed from invalid to effective is set. It is used as standard value, when checksum is executed at power-on.

0 or last parameter checksum value is set when the parameter checksum function is invalid.

11360	Calculation Data

[Data type] 2-word
The date when the parameter checksum function is changed to effective is set.
The number of 8 digits which show year, month and day is set.
First 4 digits show year. Second 2 digits show month. Last 2 digits show day.

0 or last day when parameter checksum function was changed to effective is set when the parameter checksum function is invalid.

11361	Calculation Time

[Data type] 2-word
The time when the parameter checksum function is changed to effective is set.
The number of 6 digits which show hour, minute and second is set.
First 2 digits show hour. Second 2 digits show minute. Last 2 digits show second.

0 or the last time when parameter checksum function has been changed to effective is set when the parameter checksum function is invalid.

	#7	#6	#5	#4	#3	#2	#1	#0
13730	CSR							CKS

[Data type] Bit

13741	Number to be excluded from the NC parameter check sum, 11
13742	Number to be excluded from the NC parameter check sum, 12
13743	Number to be excluded from the NC parameter check sum, 13
13744	Number to be excluded from the NC parameter check sum, 14
13745	Number to be excluded from the NC parameter check sum, 15
13746	Number to be excluded from the NC parameter check sum, 16
13747	Number to be excluded from the NC parameter check sum, 17
13748	Number to be excluded from the NC parameter check sum, 18
13749	Number to be excluded from the NC parameter check sum, 19
13750	Number to be excluded from the NC parameter check sum, 20

[Data type] 2-word path
[Valid data range] 0 to maximum parameter number

These parameters set the numbers of the parameters to be excluded from the check sum in the parameter check sum function.

13751	Start number of the range to be excluded from the NC parameter check sum, 01
13752	Start number of the range to be excluded from the NC parameter check sum, 02
13753	Start number of the range to be excluded from the NC parameter check sum, 03
13754	Start number of the range to be excluded from the NC parameter check sum, 04
13755	Start number of the range to be excluded from the NC parameter check sum, 05
13756	Start number of the range to be excluded from the NC parameter check sum, 06
13757	Start number of the range to be excluded from the NC parameter check sum, 07
13758	Start number of the range to be excluded from the NC parameter check sum, 08
13759	Start number of the range to be excluded from the NC parameter check sum, 09
13760	Start number of the range to be excluded from the NC parameter check sum, 10

13761	Start number of the range to be excluded from the NC parameter check sum, 11
13762	Start number of the range to be excluded from the NC parameter check sum, 12
13763	Start number of the range to be excluded from the NC parameter check sum, 13
13764	Start number of the range to be excluded from the NC parameter check sum, 14
13765	Start number of the range to be excluded from the NC parameter check sum, 15
13766	Start number of the range to be excluded from the NC parameter check sum, 16
13767	Start number of the range to be excluded from the NC parameter check sum, 17
13768	Start number of the range to be excluded from the NC parameter check sum, 18
13769	Start number of the range to be excluded from the NC parameter check sum, 19
13770	Start number of the range to be excluded from the NC parameter check sum, 20

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 0 to maximum parameter number

These parameters specify the range of parameters to be excluded from the check sum in the parameter check sum function. The parameters ranging from the start number to the end number are excluded from the check sum.

NOTE

1. The parameters with the start and end numbers are also excluded.
2. In a combination of start and end numbers, if the start number is greater than the end number (start number > end number), the combination is invalid.
3. If the start and end numbers are the same (start number = end number), the single parameter with that number is excluded.

Alarm and message

Number	Message	Description
DS5340	PARAMETER CHECK SUM ERROR	Because parameters have been modified, the parameter check sum and the standard check sum do not match. Restore the original parameter state, or set a standard check sum again.

13.1.7 Touch Panel Check Signal

Overview

This function outputs a signal to notify the PMC that a virtual MDI key has been pressed. The machine tool builder can use this function for applications in which, for example, a buzzer is sounded after a press of a virtual MDI key is detected.

Explanation

When a virtual MDI key is pressed, the touch panel check signal TPPRS<F0006.0> is output. (Fig. 13.1.7 (a) and Fig. 13.1.7 (b) show the range of virtual MDI keys that cause signal output.)
In related functions, this function operates as follows:

- CNC screen display function
  When the virtual MDI key function is used in the CNC screen display function, the signal is output.
- Macro executor
  When the macro executor is used on the virtual MDI screen, the signal is output.
- C language executor
  While the C language executor screen is being displayed, the signal is not output.

> **NOTE**
> 1 This function is enabled when the virtual MDI function is used.
> 2 When a virtual MDI key is pressed for a short time or when a virtual MDI key is pressed several times successively, the CNC does not sometimes accept the key input even if the signal is output.

Range of virtual MDI keys that cause signal output

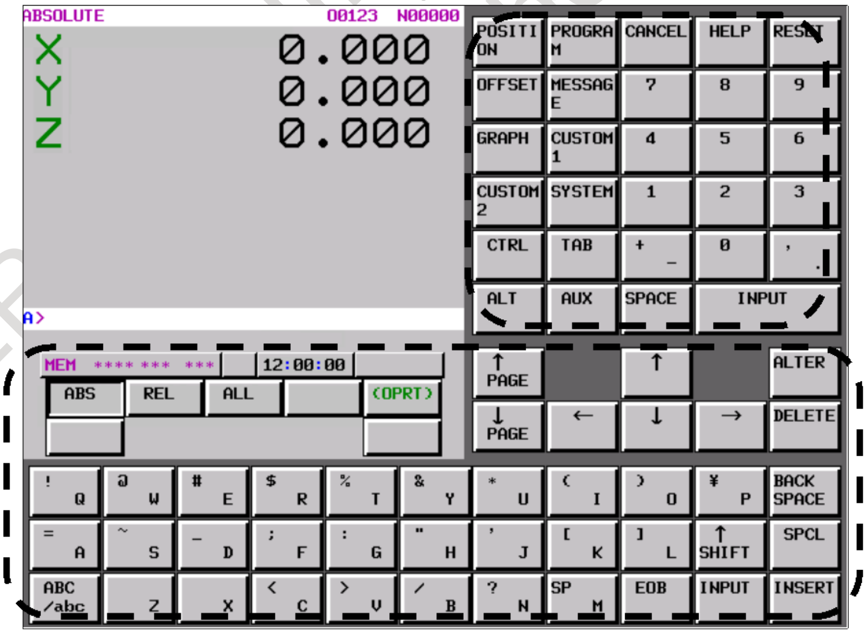

Fig. 13.1.7 (a) When the NC screen is displayed

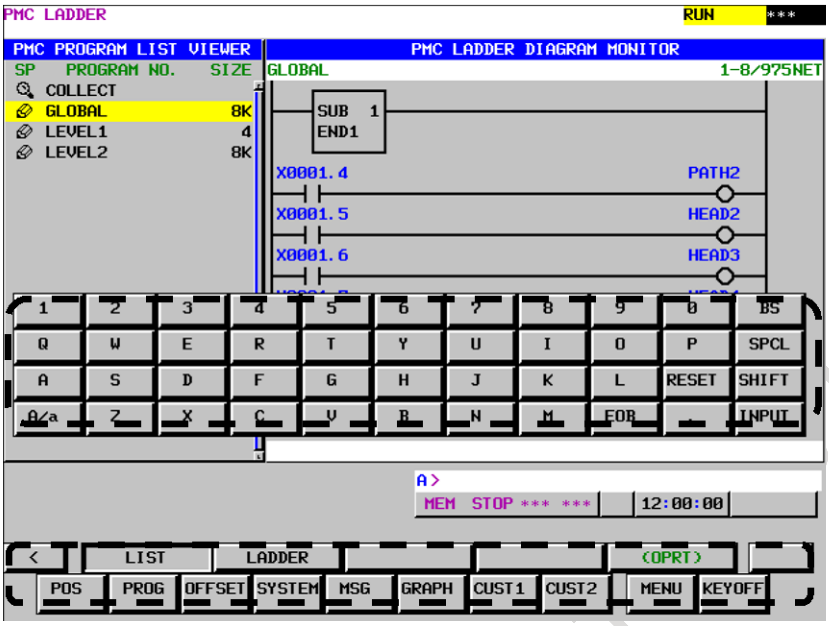

Fig. 13.1.7 (b) When the PMC high-definition screen is displayed

When a virtual MDI key within the range indicated by [dotted box] in Fig. 13.1.7 (a) and Fig. 13.1.7 (b) is pressed, the signal is output.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3207		TPP						

[Input type] Parameter input
[Data type] Bit

#6 TPP When a virtual MDI key is pressed, signal TPPRS <F0006.0> is
0: Not output.
1: Output

Signal

- Touch panel check signal TPPRS<F0006.0>

[Classification] Output signal
[Function] Notifies the PMC that a virtual MDI key has been pressed.
[Operation] The signal is set to 1 when:
- A virtual MDI key is pressed.

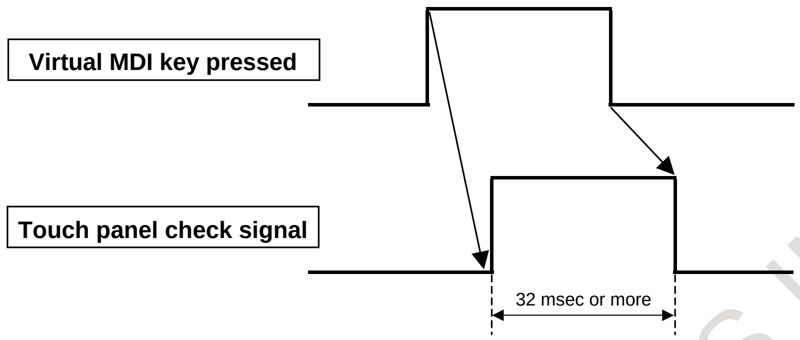
The signal is set to 0 when:
- A virtual MDI key is released.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
F0006								TPPRS

- Timing chart

The following shows a timing chart of a press of a virtual MDI key and the touch panel check signal.



- When a virtual MDI key is pressed, the signal is output for 32 msec or longer.
  Read the signal with a ladder program of which cycle period is shorter than 32 msec.
- When a virtual MDI key is held pressed continuously, the signal is kept output.
- There may be a delay from a press of a virtual MDI key until the touch panel check signal is output. A delay may be generated also when the virtual MDI key is released.
- If the time from when a virtual MDI key is pressed until it is released is within 50 msec, the touch panel check signal is not sometimes output.

13.1.8 Changing the Display Language by PMC Signals

Overview

PMC signals can be used to change the display language of the CNC screen. In this function, a dial or switch on the machine operator's panel can also be used to change the language of the CNC screen.

Explanation

To change the display language by the PCM ladder, set display language setting signals LANG1 to LANG7 <G0581.0 to G0581.6> to a number and change display language switch start signal SLANG <G0581.7> from “0” to “1”. This changes the value of parameter No.3281 to the language number that was set in display language setting signals LANG1 to LANG7.
Upon completion of the change, display language switch completion signal FLANG <F0545.0> is set to “1”.

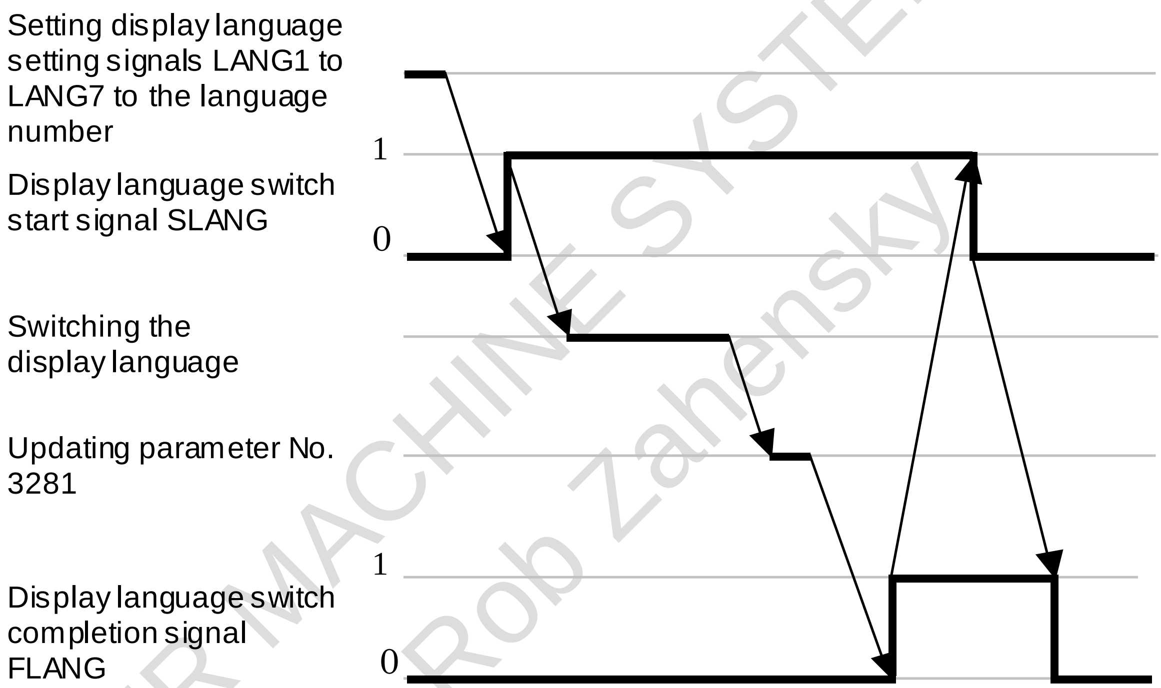
For information on switching the language on the CNC screen, refer to the chapter "Displaying and Switching the Display Language" in OPERATOR’S MANUAL (Common to Lathe System/Machining Center System) (B-64694EN).

NOTE
When the language is selected in the language specification screen, don’t set signal SLANG <G0581.7> to ‘1’.

Time chart

Follow the procedure below to switch the display language.

Set display language setting signals from LANG1 to LANG7 to the language number of the language to be used.
Set display language switch start signal SLANG from “0” to “1”.
The current language is switched to the language with the language number set in display language setting signals from LANG1 to LANG7.
The value of parameter No. 3281 is updated to the value set by display language setting signals from LANG1 to LANG7.
Upon completion of the switching, set display language switch completion signal FLANG is set to “1”.
In the PMC ladder, set display language switch start signal SLANG from “1” to 0 after display language switch completion signal FLANG is set to “1”.
When display language switch start signal SLANG is set to 0, display language switch completion signal FLANG is set to “0”.



Signal

Display language switch start signal SLANG <G0581.7>

[Classification] Input signal

[Function] This signal causes the current language to switch to the language set in display language setting signals LANG1 to LANG7.

[Operation] When this signal is changed from “0” to “1”, the current language switches to the language set in display language setting signals LANG1 to LANG7.

Display language setting signals LANG1 to LANG7 <G0581.0 to G0581.6>

[Classification] Input signal

[Function] These signals set a language number. Available languages and the corresponding input signals are shown in the table.

Language	Language number	LANG7 G0581.6	LANG6 G0581.5	LANG5 G0581.4	LANG4 G0581.3	LANG3 G0581.2	LANG2 G0581.1	LANG1 G0581.0
English	0	0	0	0	0	0	0	0
Japanese	1	0	0	0	0	0	0	1
German	2	0	0	0	0	0	1	0
French	3	0	0	0	0	0	1	1
Chinese (traditional characters)	4	0	0	0	0	1	0	0
Italian	5	0	0	0	0	1	0	1
Korean	6	0	0	0	0	1	1	0
Spanish	7	0	0	0	0	1	1	1
Dutch	8	0	0	0	1	0	0	0
Danish	9	0	0	0	1	0	0	1
Portuguese	10	0	0	0	1	0	1	0
Polish	11	0	0	0	1	0	1	1
Hungarian	12	0	0	0	1	1	0	0

Russian	16	0	0	1	0	0	0	0
Turkish	17	0	0	1	0	0	0	1
Bulgarian	18	0	0	1	0	0	1	0
Rumanian	19	0	0	1	0	0	1	1
Slovak	20	0	0	1	0	1	0	0
Finnish	21	0	0	1	0	1	0	1
Vietnamese	23	0	0	1	0	1	1	1
Indonesian	24	0	0	1	1	0	0	0
Slovenian	25	0	0	1	1	0	0	1

Display language switch completion signal FLANG <F0545.0>

[Classification] Output signal

[Function] This signal indicates that switching to the language set in display language setting signals LANG1 to LANG7 is completed.

[Output cond.] This signal is set to “1” when:

- The display language has been switched.

This signal is set to “0” when:

- Display language switch start signal SLANG is set to “0”.

> **NOTE**
> Even if display language switch start signal SLANG is switched from “0” to “1” when the conditions required for this function are not met, the current language is not switched, but display language switch completion signal FLANG is set to “1”.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0581	SLANG	LANG7	LANG6	LANG5	LANG4	LANG3	LANG2	LANG1

	#7	#6	#5	#4	#3	#2	#1	#0
F0545								FLANG

Parameter

3281	Display language

[Input type] Parameter input
[Data type] Byte
[Valid data range] 0 to 21,23 to 25

Select a display language from the following:
- 0 : English
- 1 : Japanese
- 2 : German
- 3 : French
- 4 : Chinese(traditional characters)
- 5 : Italian
- 6 : Korean
- 7 : Spanish
- 8 : Dutch
- 9 : Danish
- 10 : Portuguese
- 11 : Polish
- 12 : Hungarian
- 13 : Swedish
- 14 : Czech
- 15 : Chinese(simplified characters)
- 16 : Russian
- 17 : Turkish
- 18 : Bulgarian
- 19 : Rumanian
- 20 : Slovak
- 21 : Finnish
- 23 : Vietnamese
- 24 : Indonesian
- 25 : Slovenian

If a number not indicated above is set, English is selected.

13.1.9 CNC Screen Dual Display

Overview

When a PC and a CNC are connected via Ethernet or HSSB, the CNC screen can be displayed on the PC and the CNC at the same time by using the CNC screen display function. When the CNC screen display function is started on the PC while a CNC screen is displayed on the display unit of the CNC, the dual display mode is entered.
When the CNC screen display function is ended on the PC, the CNC screen is displayed only on the display unit of the CNC.

In case the PC hangs up for a cause in the dual display mode, it is also possible to forcibly turn off the CNC screen display function on the PC by using Dual display forcible end request signal to end the dual display mode.

Key input operation can be performed on one of the PC and CNC sides, which can be selected.

> **NOTE**
> When the dual display function is being used, the same screen is displayed on the PC and the CNC. The PC performance may have influence on the display speed on the CNC side and slow down the display on the CNC.

Explanation

- Operation

When bit 7 (NS2) of parameter No. 3206 is set to 1, the CNC screen dual display function is enabled.
Then, when the CNC screen display function on the PC side is started, the CNC screen is displayed on both the PC and the CNC .

- Selection of key control

Either the keyboard of the PC or the MDI keys of the CNC become usable for key control.
Key control selection signal CNCKY<G0295.7> is used to select key control.
If CNCKY<G0295.7> is set to "1", the MDI keys of the CNC become usable; if the signal is set to "0", the keyboard of the PC becomes usable.
The reset key, however, is always usable on both the PC and the CNC.
When the CNC is equipped with a touch panel, if bit 5 (S2K) of parameter No. 3206 is set to 1, it becomes possible to select key control by pressing the upper left corner of the screen. In this case, the signal cannot be used to select key control.
When the upper left part of the display screen on the CNC is pressed, the MDI keys become usable; when the upper left part of the CNC screen display on the PC is clicked, the keyboard of the PC becomes usable.

With Key control selection status signal CNCKYO<F0295.7>, key control selection status can be checked to see which key control, key control on the PC or key control on the CNC, is currently selected.

Selection of key control is disabled when the dual display function is not used.

- Data I/O

When bit 0 (PCM) of parameter No. 0300 is set to 1, the data input/output destination is determined by the selection of key control. When the keyboard of the PC is selected, input and output operations on the PC side are enabled; when the MDI keys of the CNC are selected, input and output operations on the CNC side are enabled.

When the USB memory is selected with parameter No. 0020 set to 17, if bit 0 (PCU) of parameter No. 11506 is set to 1, data input/output operation is performed for the PC. If bit 0 (PCU) of parameter No. 11506 is set to 0, data input/output operation is performed for the CNC control unit.

> **NOTE**
>
> If key control selection is changed and so the data input/output destination is changed when the All I/O screen is displayed, the file list displayed on the All I/O screen is not updated automatically. In this case, press soft key [REFRESH] to update the display.

- Forcible end by Forcible end by Dual display forcible end request signal

If the PC hangs up for a cause when the CNC screen dual display function is being performed, the CNC can issue a DI signal to forcibly end the CNC screen display function on the PC.
When C2SEND<G0295.6> is set to "1", the CNC screen display function on the PC is forcibly ended. The status of the forcible end processing is indicated by Dual display forcible end status signal C2SENO<F0295.6>.

Forcible end by Dual display forcible end request signal is invalid when the dual display function is not used.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
0300								PCM

[Input type] Parameter input
[Data type] Bit

#0 PCM If a CNC contains a memory card interface, or if the FS0*i* is connected to a PC via HSSB or Ethernet, when the CNC screen display function is started:
0: The memory card interface in the CNC is used.
1: The memory card interface or the hard disk on the PC side is used.
When the CNC screen dual display function is being used, the data input/output destination conforms to the selection of key control.

If a CNC does not contain a memory card interface, the memory card interface on the PC side is used regardless of the setting of this parameter. This parameter is valid only when the CNC screen display function is active.

	#7	#6	#5	#4	#3	#2	#1	#0
3206	NS2		S2K					

[Input type] Parameter input
[Data type] Bit

#5 S2K In CNC screen dual display function,
0: Key control is selected by Key control selection signal <G0295.7>.
1: Key control is selected by pushing at left upper corner on the screen. (Touch panel only)

#7 NS2 CNC screen dual display function is:
0: Disabled.
1: Enabled.

	#7	#6	#5	#4	#3	#2	#1	#0
11506								PCU

[Input type] Parameter input
[Data type] Bit

#0 PCU If there is a USB memory interface on the CNC side, the USB memory interface used when the CNC screen display function is started via the HSSB interface is on the:
0: CNC side.
1: PC side.

NOTE
1 With the PC function, a USB memory interface on the PC side is used regardless of the setting of this parameter if there is no USB memory interface on the CNC main unit side.
2 This parameter is valid only when the CNC screen display function is active via the HSSB interface.
When setting 1 to this parameter, the CNC screen display function must always be executed via the HSSB interface.
3 When using the CNC screen display function via the Ethernet interface, set 0.
4 When this parameter is set, the power must be turned off before operation is continued.

Signal

Key control selection signal CNCKY <G0295.7>

[Classification] Input signal
[Function] Selects which key control, key control on the PC or on the CNC, is to be enabled.
[Operation] If the signal is set to "0", key control on the PC is enabled.
If the signal is set to "1", key control from the MDI keys on the CNC is enabled.

Dual display forcible end request signal C2SEND <G0295.6>

[Classification] Input signal
[Function] Requests forcible end of the CNC screen display function on the PC side.
[Operation] If the signal is set to "0", no end request is issued.
If the signal is set to "1", an end request is issued.

Key control selection status signal CNCKYO <F0295.7>

[Classification] Output signal
[Function] Indicates which key control, key control on the PC or on the CNC, is currently selected.
[Operation] If this signal is set to "0", key control on the PC side is selected.
If this signal is set to "1", MDI input on the CNC is selected.

Dual display forcible end status signal C2SENO <F0295.6>

[Classification] Output signal
[Function] Indicates the status of end processing performed in response to the end request issued with the dual display forcible end request signal.
[Operation] If this signal is set to "0", the end processing is not yet completed.
If this signal is set to "1", the end processing is completed.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0

13.1.10 Twin display function with Ethernet

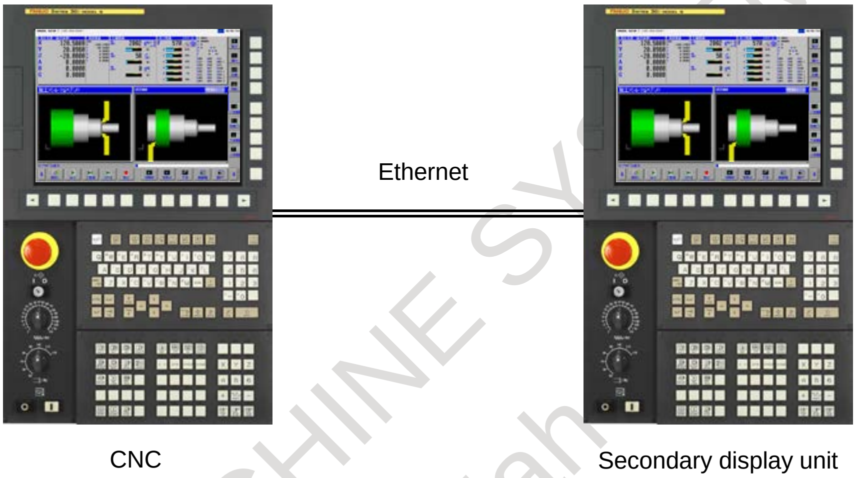
Overview

The twin display function with Ethernet provides the same display and operation as the standard CNC on the secondary display unit for Ethernet connection. (Maximum cable length is 100m.)

The available type of CNC and the kind of Ethernet are as follows.

(1) Type of CNC
  (a) LCD-mounted type CNC
  (b) Stand-alone type CNC

(2) Kind of Ethernet
  (a) Embedded Ethernet with embedded Ethernet port (hereafter referred to as the embedded Ethernet)
  (b) Fast Ethernet (the Ethernet board, the Multi-function Ethernet)



NOTE

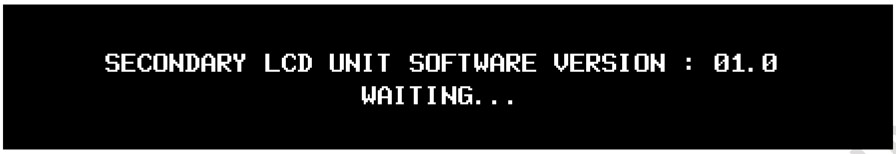
1 The “Twin display function with Ethernet” option is necessary.
2 If the "Twin display function with Ethernet" option is specified, the CNC display function cannot be available at the same time.
3 The display size of the secondary display unit must be the same as the display size of the CNC.
4 The MDI type of the secondary display unit can be different from one of the CNC.
5 CNCs with the personal computer function for Windows XP or Windows CE are not supported.
6 The following screens cannot be displayed on the secondary display unit.
  - BOOT/IPL screen
  - System alarm screen
7 As for the machine operator's panel by the secondary display unit, equip the I/O link and the ladder program for the secondary display unit separately.

Operation

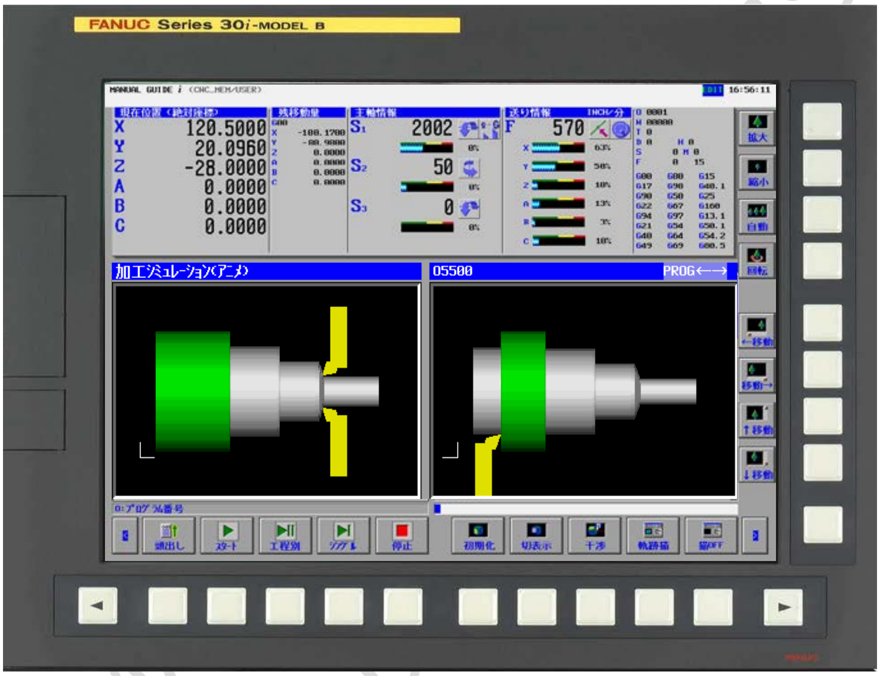
- Start

(1) Turn on the power of the CNC and the secondary display unit.

(2) The following message is displayed on the secondary display unit, then the connection to the CNC is waited.



(3) After the CNC is connected, the same screen of the CNC is displayed on the secondary display unit.



Secondary display unit

> **NOTE**
> The connection settings for the CNC and the secondary display unit are necessary before connecting. Refer to the "Connection settings" later described for details.

- Operation selection for the MDI key and the touch panel

The operation by the MDI key and the touch panel is available on either the CNC or the secondary display unit only.
To select which of them, use the following Key control selection signal CNCKY<G0295.7>.

> **NOTE**
> 1 The reset key is always usable on both the CNC and the secondary display unit.
> 2 It the Ethernet connection is broken during the operation of the secondary display unit, the operation on the secondary display unit and the CNC becomes impossible. Then about 30 seconds later, the operation on the CNC becomes possible.

The related signals are as follows.

Key control selection signal CNCKY <G0295.7>

[Classification] Input signal

[Function] Selects which unit (the CNC or the secondary display unit) is used for the operation by the MDI key and the touch panel.

[Operation] “0” : Secondary display unit
“1” : CNC

Key control selection status signal CNCKYO <F0295.7>

[Classification] Output signal

[Function] Shows which unit (the CNC or the secondary display unit) is selected for the operation by the MDI key and the touch panel at present.

[Operation] “0” : Secondary display unit
“1” : CNC

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0295	CNCKY							

	#7	#6	#5	#4	#3	#2	#1	#0
F0295	CNCKYO							

- Usage of memory card or USB memory in the secondary display unit

When you use a memory card or a USB memory in the secondary display unit, set the following NC parameters. (When you use the CNC side, set the former value to the NC parameters.)

0020	I/O CHANNEL: Input/output device selection, or interface number for a foreground input device

[Input type] Setting input
[Data type] Byte
[Valid data range] 0 to 17

Table for settings and input/output devices	
Setting	**Description**
4	Memory card or USB memory in the secondary display unit.

	#7	#6	#5	#4	#3	#2	#1	#0
0300								PCM

[Input type] Setting input
[Data type] Bit

#0 PCM In case of the secondary display unit for Ethernet connection,
0: A memory card or a USB memory in the CNC is effective.
1: A memory card or a USB memory in the secondary display unit is effective.

> **NOTE**
> The limitations in case of using a memory card or a USB memory in the secondary display unit are as follows:
> 1 The supported functions are the data input/output (read/punch) only. The following functions are not available.
>   - DNC operation, schedule operation and external subprogram call (M198)
>   - Memory card program operation/editing.
>   - Servo Guide
>   - FANUC LADDER-III
>
>   Moreover, the C-language executor and the macro executor cannot access a memory card or a USB memory in the secondary display unit.
> 2 In case of displaying the program folder screen, select the [MEMORY CARD] in [DEVICE CHANGE] even if a USB memory is used.
> 3 If both a memory card and a USB memory are inserted in the secondary display unit, the first inserted device can be used only.

- Notes for connection

When there is a problem about the Ethernet connection, one of the following situations may happen.

(1) The display stops at the waiting screen (the screen of 2) of ”Start” earlier described) for connection to the CNC.
Check the following items.
(a) Start of the CNC
(b) Connection of network
(c) Response from the CNC (Refer to the “Response check of CNC to be connected” of ”Settings & Maintenance” for the secondary display unit” later described)
(d) Ethernet settings for the CNC and the secondary display unit (Refer to the “Connection settings” later described)

(2) The following “CONNECTION FAILED” message is displayed.

The error information is displayed in the following format inside parentheses.
(ERROR: Error No.: Detail1: Detail2)
Handle this error as follows. Detail 1 and 2 show error numbers of the socket error or the protocol error that occurred while communicating. If the problem is not fixed, inform the detail 1 and 2 to FANUC.

Error No.	Meaning	Error handling
-16	Socket error	Check your network connection (Ethernet cable or Ethernet board etc.). If the problem is not fixed, inform the detail 1 and 2 to FANUC.
-17	Protocol error	Inform the detail 1 and 2 to FANUC.
-18	Other error	Inform the detail 1 and 2 to FANUC.

Settings and maintenance

- Connection settings

The following settings are necessary to connect the CNC with onto the secondary display unit.

Settings of the CNC side

Set the IP address and the subnet mask for the CNC, and the TCP port number for the FOCAS2/Ethernet function.
Set also the following NC parameter.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3206	NS2							

[Input type] Parameter input
[Data type] Bit

#7 NS2 Twin display function with Ethernet is:
0: Disabled.
1: Enabled.

Settings of the secondary display unit side

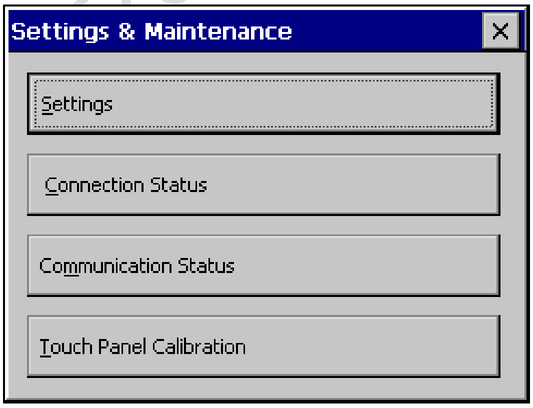
Set the IP address and the subnet mask for the secondary display unit. Also set the IP address and the TCP port number for the CNC.

> **NOTE**
> 1 For the CNC, set the same IP address and TCP port number as "Settings of the CNC side".
> 2 As for the setting method, refer to the “Settings” of ““Settings & Maintenance” for the secondary display unit” later described.

“Settings & Maintenance” for the secondary display unit.

Display the "Settings & maintenance" menu for the settings and maintenance of the secondary display unit by either of the following operations.

- Keep pressing ALT +[S] key more than 2 seconds.
- Keep pressing the upper right corner (within 3cm) on the touch panel display more than 3 seconds.



“Settings & Maintenance” menu

To select the menu button, press on the touch panel or press 
key after select by the cursor key on the MDI keyboard.
As for the operations of each menu items, refer to the following table.

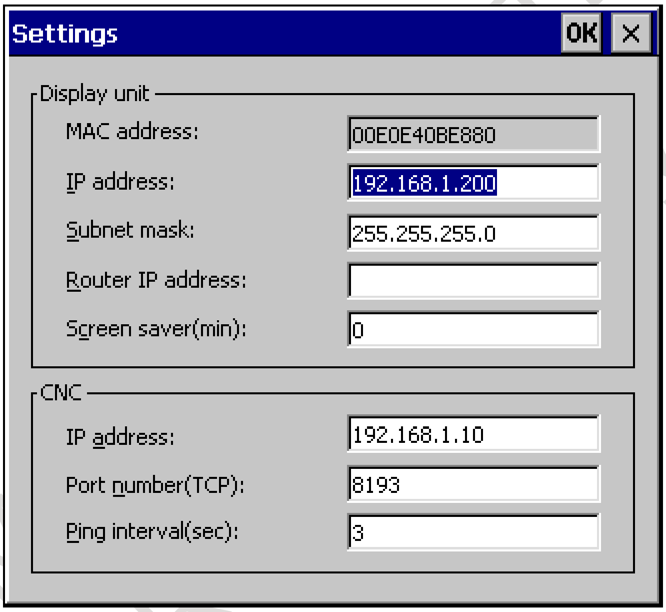
Button name	Reference
Settings	Settings
Connection Status	Response check of CNC to be connected
Communication Status	Communication status with CNC
Touch Panel Calibration	Calibration of the touch panel

To close this menu, press the  button on the screen or press 

key on the MDI keyboard.

- Settings

Select the "Settings" in the "Settings & maintenance" menu, then the setting screen for the Ethernet and the backlight of the secondary display unit will be displayed.



As for the setting items, refer to the following tables (1) and (2).

(1) Display unit: Settings for the secondary display unit

Item	Description	Initial value
MAC address	MAC address (cannot be changed)	-
IP address	IP address	192.168.1.200
Subnet mask	Subnet mask	255.255.255.0
Router IP address	Router IP address (Set if necessary)	None
Screen saver(min)	After this time passes without input of the keys and the touch panel, the backlight is turned off. (Minute) (Range: 0 to 127) In case of "0", the backlight is not turned off.	0

(2) CNC: Settings for the CNC to be connected

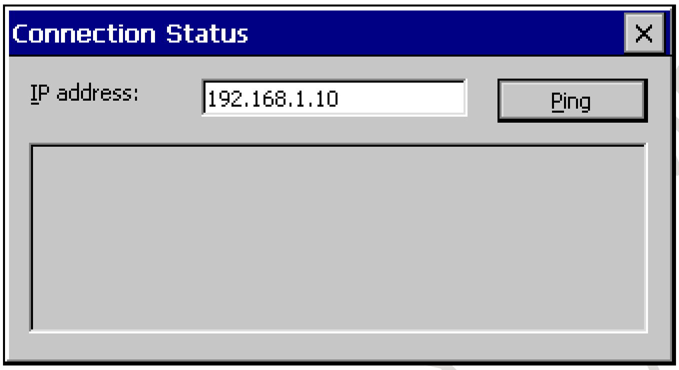
Item	Description	Initial value
IP address	IP address	192.168.1.10
Port number (TCP)	TCP port number (Range: 5001 to 65535)	8193
Ping interval (sec)	Interval time of periodical response check for the CNC (second) (Range : 0 to 120)	3

By pressing the OK button on the screen or INPUT key on the MDI keyboard, the setting values are saved and the "Settings & maintenance" menu comes back.

By pressing the × button on the screen or AUX key on the MDI keyboard, the setting values are ignored and the "Settings & maintenance" menu comes back.

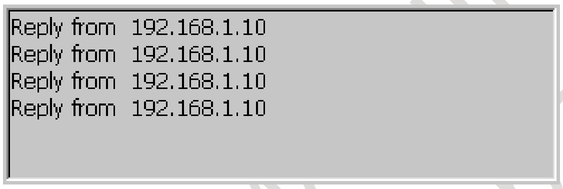
- Response check of CNC to be connected

Select the "Connection Status" in the "Settings & maintenance" menu, then the screen for the response check of CNC to be connected will be displayed.

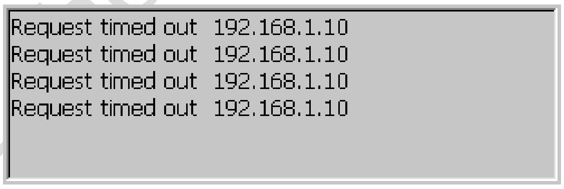


Input an IP address (Ex.: 192.168.1.10) of CNC to check its response, then press the Ping button or INPUT key on the MDI keyboard.

The checking by the PING command is run 4 times, and the result is displayed.



The response is received.

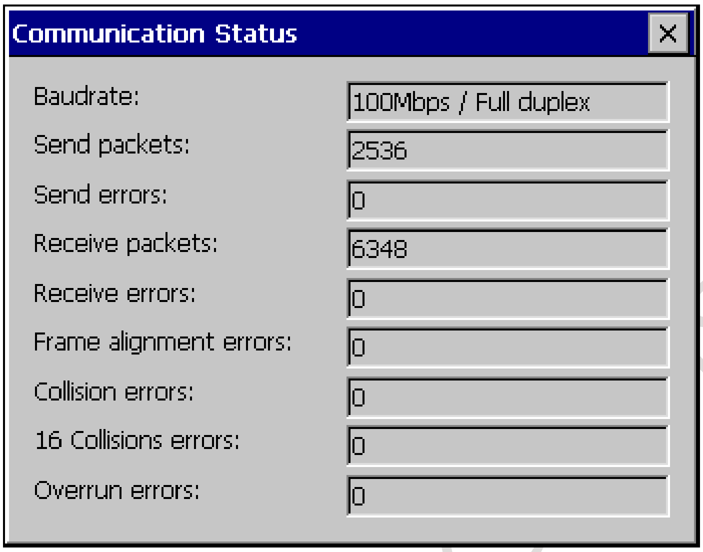


The response is not received.

By pressing the × button on the screen or AUX key on the MDI keyboard, the "Settings & maintenance" menu comes back.

- Communication status with CNC

Select the "Communication Status" in the "Settings & maintenance" menu, then the screen for the communication status with CNC will be displayed.



The communication with CNC is continued while displaying the screen and the data of communication status is updated.

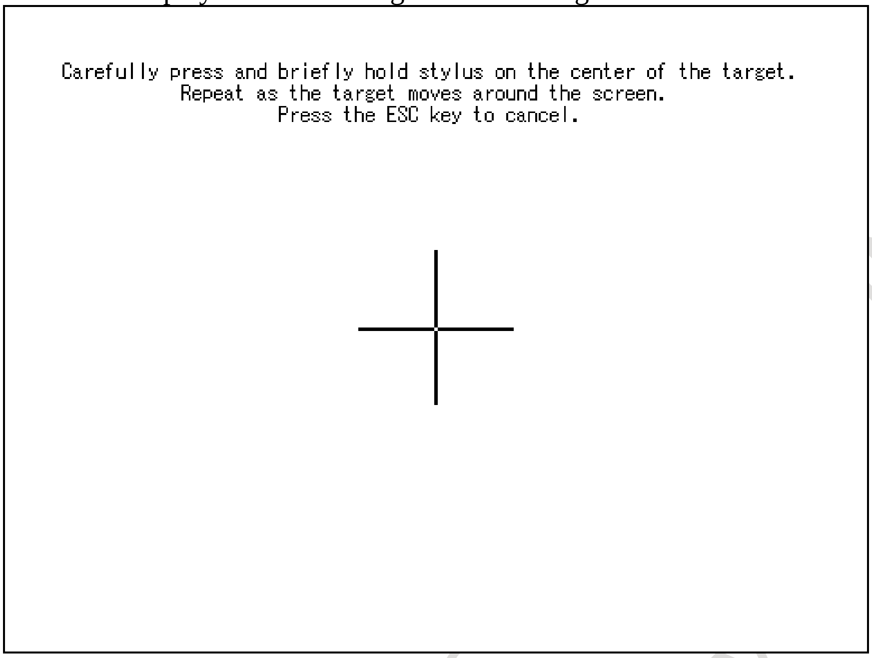
The displayed items are as follows:

Item	Description
Baudrate	Communication rate and mode. When the communication is not established, "------" is displayed.
Send packets	Number of send packets
Send errors	Number of send errors
Receive packets	Number of receive packets
Receive errors	Number of receive errors
Frame alignment errors	Number of frame alignment errors
Collision errors	Number of collision errors
16 Collisions errors	Number of 16 consecutive collision errors
Overrun errors	Number of overrun errors

By pressing the X button on the screen or AUX key on the MDI keyboard, the "Settings & maintenance" menu comes back.

- Calibration of the touch panel

Select the "Touch Panel Calibration" in the "Settings & maintenance" menu, then the calibration screen for the touch panel will be displayed. Follow the guidance messages shown in the screen.



After the calibration is finished, the "Settings & maintenance" menu comes back.

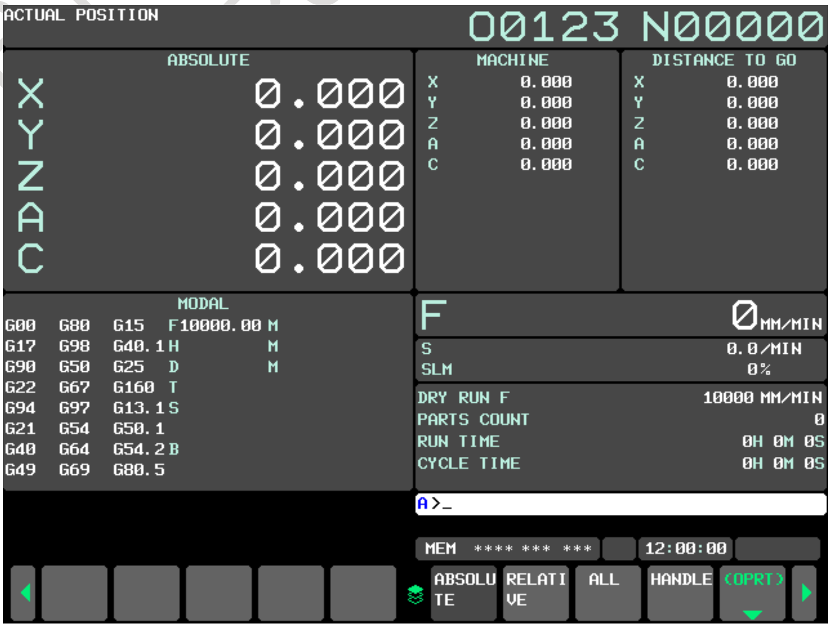
13.1.11 Speed Display Function of a Milling Tool with Servo Motor

Overview

Any servo motor axis can be selected to display its speed considering gear ratio.

Explanation

The screen display can be switched between the speed of the milling axis and the spindle speed by using an input signal SDPC <Gn038.5>.



←(*)

Fig. 13.1.11 (a)

(*)→

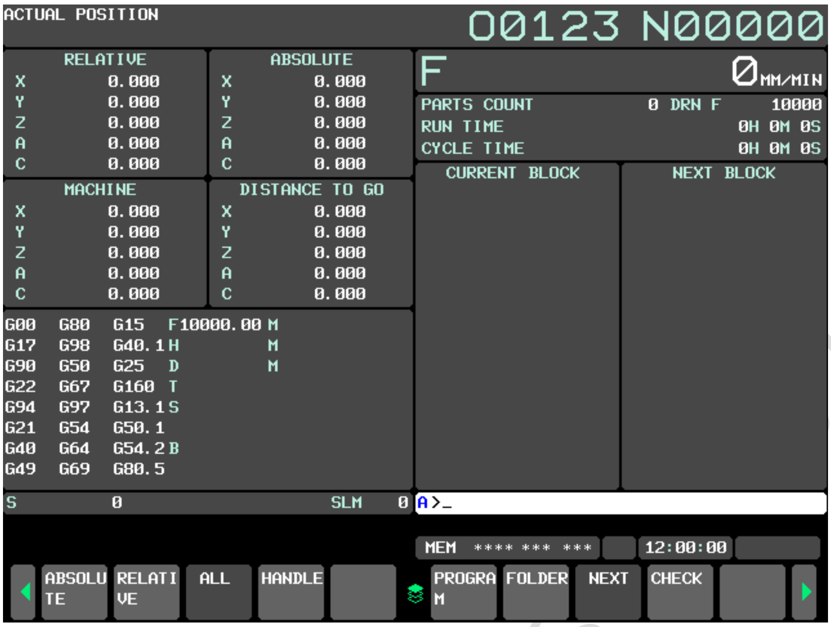


Fig. 13.1.11 (b)

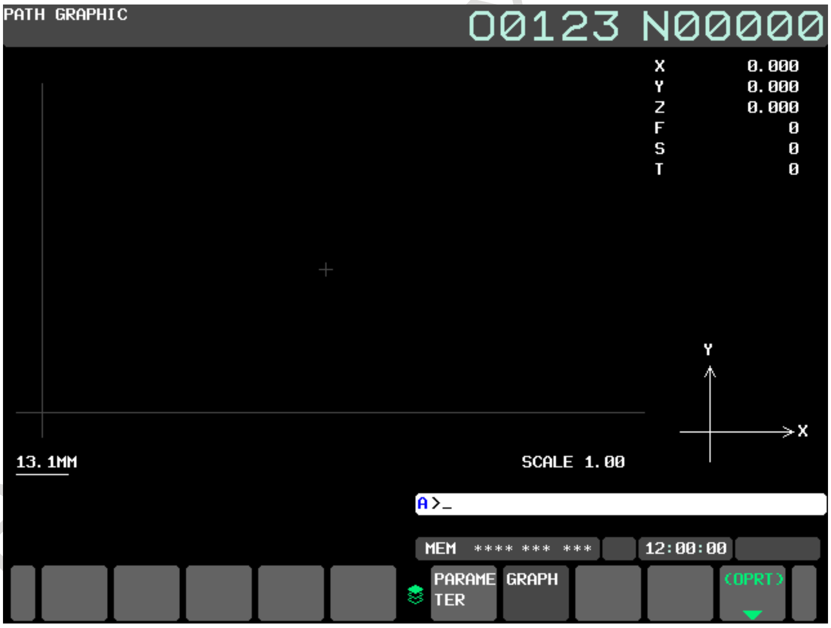

←(*)

Fig. 13.1.11 (c)

- Switching to the display of the speed of a milling tool with a servo motor

With the speed display change signal SDPC<Gn038.5>, the speed of a milling axis or the spindle speed can be selected and indicated in the part marked by (*) in the Fig. 13.1.11 (a) to Fig. 13.1.11 (c).

- Displaying the speed of a milling tool with a servo motor

As the speed of a milling axis, the value obtained by multiplying the servo motor speed by the gear ratio is indicated.

$$\text{Gear ratio} = \frac{\text{Number of gear teeth on the servo motor axis side (parameter No.1898)}}{\text{Number of gear teeth on the milling axis side (parameter No.1899)}}$$

To select the target servo motor axis, set a controlled axis number as the number of a servo motor axis used as the axis of a milling tool (parameter No. 1895).

> **NOTE**
> 1 If parameter Nos. 1898 and 1899 are not set, the gear ratio is assumed to be 1:1.
> 2 If an axis that uses a linear motor is selected, the speed cannot be displayed.
> 3 Even when the speed of a milling axis is displayed, the actual speed of feed per revolution follows the speed of the spindle.

Signal

Speed display change signal SDPC<Gn038.5>

[Classification] Input signal

[Function] Selects the speed to be displayed: the speed of the milling axis or the spindle speed.

[Operation] If this signal is set to "1", the speed of the milling axis is displayed.
If this signal is set to "0", the spindle speed is displayed.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn038			SDPC					

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3105						DPS		

[Input type] Parameter input
[Data type] Bit path

#2 DPS The actual spindle speed is:
0: Not displayed
1: Displayed

1895	Servo motor axis number used for a milling tool

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 1 to number of controlled axes

This parameter sets the servo motor axis number used for displaying the speed of a milling tool that incorporates a servo motor.

1898	Number of gear teeth on the servo motor axis side

[Input type] Parameter input
[Data type] Word axis
[Valid data range] 1 to 9999

This parameter sets the number of servo motor axis gear teeth used for displaying the speed of a milling tool that incorporates a servo motor.

> **NOTE**
> This parameter is valid when a non-zero value is set in parameter No. 1895.

1899	Number of gear teeth on the milling axis side

[Input type] Parameter input
[Data type] Word axis
[Valid data range] 1 to 9999

This parameter sets the number of milling axis gear teeth used for displaying the speed of a milling tool that incorporates a servo motor.

> **NOTE**
> This parameter is valid when a non-zero value is set in parameter No. 1895.

13.1.12 Screen Switching by Mode

Overview

One of the screens displayed using function key 

such as the program edit screen and the program check screen can be selected according to the mode. When a mode switches to other mode, the screen selected last in that mode is displayed.

There are five modes, and immediately after the power is turned on in each mode, a screen is selected as follows:

MEM	:	Program check screen (for MEM)
EDIT	:	Program edit screen (for EDIT)
MDI	:	Program edit screen (for MDI)
TJOG/THND	:	Program edit screen
Other modes	:	Program edit screen

Mode switching and screen examples

- Mode switching after power-on

When the MEM mode is selected and function key 

is pressed at power-on, the program check screen is displayed.
When the mode is changed to the EDIT mode, the program edit screen is displayed.

- Mode switching after screen operation

When soft key [FOLDER] is pressed in the EDIT mode, the program list screen is displayed.
When the mode is changed to the MEM mode, the program check screen is displayed.
Then, when the mode is changed to the EDIT mode, the program list screen is displayed.

MEM mode

EDIT mode

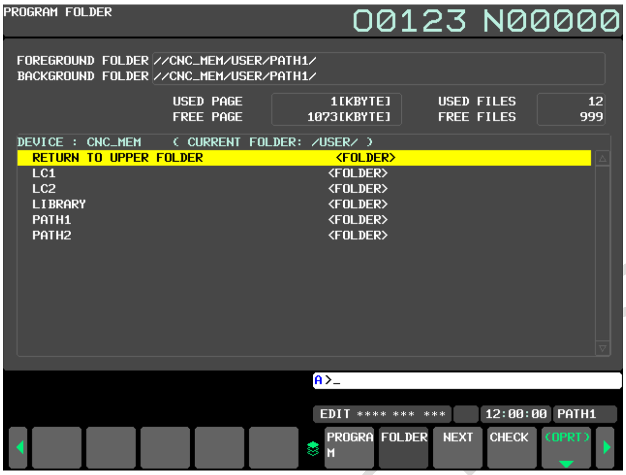
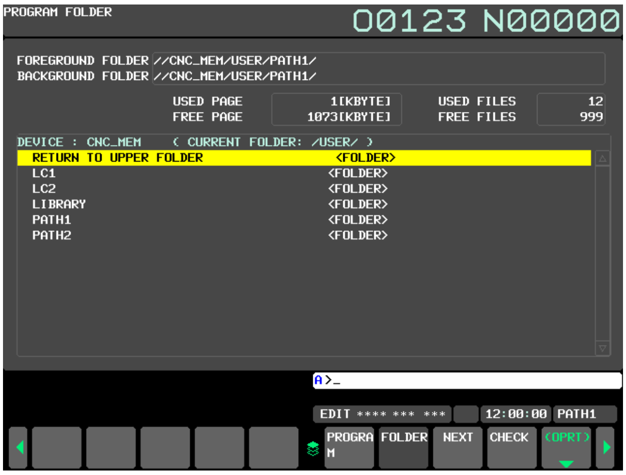
When soft key [FOLDER] is pressed in the EDIT mode, the program list screen is displayed.
When the mode is changed to the MEM mode, the program check screen is displayed.
Then, when the mode is changed to the EDIT mode, the program list screen is displayed.

EDIT mode



MEM mode

EDIT mode



Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11302	CPG							

[Input type] Parameter input
[Data type] Bit

#7 CPG PROG function screen selection is:
0: Not changed according to the CNC mode.
1: Changed according to the CNC mode.

13.1.13 Screen Switching at Path Switching

Overview

When switching from one path to another has been made, the same screen and soft keys as displayed for the previous path can be displayed.
Since the same screen is displayed even after path switching, the user no longer has to change the screen display.
It is also possible to change the screen display to the screen that was selected most recently for each path.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3208			PSC					

[Input type] Parameter input
[Data type] Bit

#5 PSC When the path is switched based on the path switch signal:
0: The screen display is switched to the last selected screen of the path.
1: The same screen as for the path before switching is displayed.
If this parameter is set to 0, the screen selected for each path is stored.
Therefore, when path switching to a path is made, the screen selected last for that path is displayed.
Even if the path is changed, FANUC PICTURE and manual guide ***i*** screen does not change to other screen because these screens are common to each path.

Therefore, different behavior will exist together in case of PSC=0, like as some screen stay in the screen and other screen changed to another screen when the path is changed.
Use with PSC=1 is recommended, so that the screen should not change by the path change on all screens.

13.1.14 Screen Erasure Function and Automatic Screen Erasure Function

Overview

Keeping the same characters displayed in the same positions on the screen for a long time will shorten the life of the LCD.
To prevent this, the CNC screen can be erased. The screen erasure function allows the user to perform a key operation to erase the screen. The automatic screen erasure function erases the screen automatically when there has been no key operation for a parameter-set period of time.

Screen erasure function

When 0 is set in parameter No. 3123, the CNC screen can be erased by pressing the CAN key and any function key (such as POS or PROG) at the same time. The CNC screen can be displayed again by pressing any function key.

Automatic screen erasure function

When there has been no key operation for a time (in minutes) set in parameter No. 3123, the CNC screen is erased automatically. The CNC screen is displayed again by pressing a key.

- Screen erasure by the automatic screen erasure function

If the following conditions are all satisfied for the time (in minutes) set in parameter No. 3123, the CNC screen is erased.
Conditions for automatically erasing the CNC screen

- Parameter No. 3123 $\neq$ 0
- None of the following key operations is performed.
  MDI keys
  Soft keys
  External key input
- No alarm is issued.

- Redisplay of the screen by the automatic screen erasure function

If one of the following conditions is satisfied when the CNC screen is off, the CNC screen is displayed again:
Conditions for redisplaying the CNC screen

- One of the following key operations is performed.
  MDI keys
  Soft keys
  External key input
- An alarm is issued.

- Screen erasure by using the CAN key + function key

When a non-zero value is set in parameter No. 3123, the screen is not erased with the CAN key and a function key.

- Set time

Only the time set in parameter No. 3123 for path 1 is valid.

- Alarm in another path

When an alarm is issued in any of the paths, the screen is not erased.

Signal

Screen erasure disable signal *CRTOF<G0062.1>

[Classification] Input signal

[Function] This signal enables or disables the screen erasure function/automatic screen erasure function.

[Operation] 0: Enables the screen erasure function/automatic screen erasure function.

1: Disables the screen erasure function/automatic screen erasure function.

Automatic screen erasure status in-progress signal ERTVA<Fn006.2>

[Classification] Output signal

[Function] This signal indicates that the CNC screen is being erased by the automatic screen erasure function.

[Operation] This signal is set to “1” when:

- The CNC screen is erased by the automatic screen erasure function.

This signal is set to “0” when:

- One of the following key operations is performed:
  MDI key
  Soft key
  External key input
- An alarm is issued.
- The operation mode is changed.
- The automatic screen erasure disable signal *CRTOF <G0062.1> is set to “1”.

NOTE
This signal is not output when the screen is erased by pressing the key and any function key.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0062							*CRTOF	

	#7	#6	#5	#4	#3	#2	#1	#0
Fn006						ERTVA		

Parameter

3123	Time required before a screen saver is activated

[Input type] Setting input

[Data type] Byte path

[Unit of data] min

[Valid data range] 0 to 127

After a time (in minutes) set in parameter No. 3123 passes without key operation, the NC screen is erased automatically. Pressing a key causes the NC screen to reappear.

NOTE
1 Setting 0 disables automatic screen erasure.
2 This function cannot be used together with manual screen erasure. If 1 or a larger value is set in this parameter, manual screen erasure is disabled.

13.1.15 Screen Hard Copy Function

Overview

This function converts screen information displayed on the CNC into bit map format data and output it to a memory card or USB memory. Once output, bit map format data can be displayed and edited on a personal computer.

Explanation

- Start/cancellation methods

The screen hard copy function is started by pressing and holding down key SHIFT for five seconds or by changing the hard copy execution request signal HCREQ <G0067.7> from "0" to "1". The function can be canceled by pressing key CAN or by changing the hard copy cancellation request signal HCABT <G0067.6> to "1".
While the screen hard copy function is in progress, the hard copy execution status signal HCEXE <F0061.3> is "1", and upon completion, it is set to 0. When a screen hard copy cancellation request is received, the hard copy cancellation request reception signal HCAB2 <F0061.2> is set to "1" and remains in the 1 state until the hard copy function is started again or a reset is made.

- Acquisition and output of screen data

When the screen hard copy function is started, the function acquires screen data and, immediately after the acquisition, outputs bitmap format data to, for example, a memory card inserted into the LCD unit. While screen data is being acquired, the screen remains stationary for a few seconds. Acquired screen data can be output from the memory card screen. Also, while screen data is being output, "OUTPUT" blinks in the status display.

- Screen data file names

Bit map format screen data files created by this function are assigned the names below:

In case of bit 4 (HCN) of parameter No. 3301 is 0, file name starts with "HDCPY000.BMP" and increments the number to 999 as following.
"HDCPY000.BMP" (Name of a file to be first output to a memory card etc. after power-on)
"HDCPY001.BMP" (Name of a file to be second output to a memory card etc. after power-on)
:
:
"HDCPY999.BMP" (Name of a file to be 1000 output to a memory card etc. after power-on)
If the screen hard copy function is executed after a file with "HDCPY999.BMP" is output, the file name returns to "HDCPY000.BMP". However, if a file with the same file name as the one to be output when the screen hard copy function is executed exists on the memory card, alarm SR1973 is issued. If the capacity of the memory card is exceeded, alarm SR1962 is issued.
In either case, screen data is not output, so that either the existing file needs to be deleted or the memory card needs to be replaced with a new one.
In case of using a USB memory, if the name of a file to be output during execution of screen hard copy already exists in the memory, the file is overwritten. If the capacity of the USB memory is exceeded, alarm SR1932 is issued. In this case, please delete unnecessary files or use a new USB memory.

In case of parameter HCN is 1, file name id defined by the date and the execute number of screen hard copy function on that day as following.
"YYMMDD00.BMP" (Name of a file to be first output to a memory card etc. on that day)
"YYMMDD01.BMP" (Name of a file to be second output to a memory card etc. on that day)
:
:
"YYMMDD99.BMP" (Name of a file to be 100 output to a memory card etc. on that day)

(YY(00~99) means the year, MM(01~12) means the month and DD(01~31) means the day)

(Example)

If screen hard copy is executed on 2013/04/17 in the first time, bit map format file is created with the name of “13041700.BMP”.

If the screen hard copy function is executed after a file with “YYMMDD99.BMP” is output, the file name returns to "YYMMDD00.BMP". However, if a file with the same file name as the one to be output when the screen hard copy function is executed exists on the memory card, system searches number which does not exist and output the file with that number. If all number files (00~99) exist on the memory card, alarm SR1973 is issued. If the capacity of the memory card is exceeded, alarm SR1962 is issued.

In either case, screen data is not output, so that either the existing file needs to be deleted or the memory card needs to be replaced with a new one.

In case of using a USB memory, if the name of a file to be output during execution of screen hard copy already exists in the memory, system searches the file number which does not exist on the memory and output the file with that number, same as memory card. If all number files (00~99) exist in the memory, the file is overwritten. If the capacity of the USB memory is exceeded, alarm SR1932 is issued. In this case, please delete unnecessary files or use a new USB memory.

Limitation

- Screens whose hard copies cannot be made

Hard copies of the BOOT screen, the IPL screen, and the system alarm screen cannot be made.

- Foreground I/O devices

During DNC operation, for example, screen data cannot be output while a foreground I/O device is in use.

- Canceling the hard copy function

If the hard copy function is canceled before a hard copy is completed, an incomplete bit map file of data that has been output is created.

- CNC screen display function

If CNC screen display function is working, the screen hard copy function is disabled. In this case, bit map format data can be made by screen copy function of CNC screen display function. Please refer to the operator’s manual of CNC screen display function.

- Output folder

The screen data is output to the root folder of the memory card or the USB memory.

Signal

Hard copy cancellation request signal HCABT <G0067.6>

[Classification] Input signal

[Function] This signal requests the cancellation of the screen hard copy function.

[Operation] When the signal is set to “1”, the control unit operates as follows:

- Cancels the screen hard copy function if it is being executed.
- Does nothing if the screen hard copy function is not being executed. Note that changing HCREQ <G0067.7> from “0” to “1” when HCABT <G0067.6> is “1” does not cause the screen hard copy function to be executed.

> **NOTE**
> If changing this signal from “0” to “1”, set it to “0” on the PMC after the signal is maintained in the 1 state for at least 64 msec.

Hard copy execution request signal HCREQ <G0067.7>

[Classification] Input signal
[Function] This signal requests the execution of the screen hard copy function.
[Operation] When the signal is changed from “0” to “1”, the control unit operates as follows:

- Starts creating a hard copy.

> **NOTE**
> If changing this signal from “0” to “1”, set it to “0” on the PMC after the signal is maintained in the “1” state for at least 64 msec. If making another hard copy execution request, wait until the signal is maintained in the “0” state for at least 64 msec.

Hard copy cancellation request reception signal HCAB2 <F0061.2>

[Classification] Output signal
[Function] This signal notifies that a screen hard copy cancellation request is made.
[Operation] This signal is set to “1” in the following case:

- HCABT <G0067.6> is set to “1” or key CAN is pressed, so that the CNC receives this as a screen hard copy cancellation request.

This signal is set to “0” in the following cases:

- A reset is made.
- The screen hard copy is started again.

Hard copy execution status signal HCEXE <F0061.3>

[Classification] Output signal
[Function] This signal notifies that the screen hard copy function is being executed.
[Operation] This signal is set to “1” in the following case:

- The screen hard copy function is started by changing HCREQ <G0067.7> from “0” to “1” or by pressing and holding down key SHIFT for five seconds.

This signal is set to “0” in the following cases:

- The screen hard copy function is completed.
- The screen hard copy function is canceled.

Timing charts for input/output signals are shown below Fig. 13.1.15 (a) shows a timing chart of the screen hard copy function when it terminates normally, and Fig. 13.1.15 (b) shows a timing chart of the screen hard copy function when it is canceled and restarted.

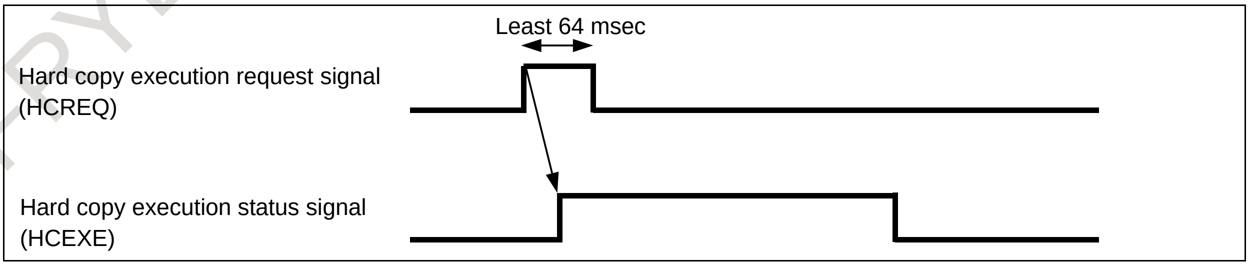


Fig. 13.1.15 (a) When the screen hard copy function terminates normally

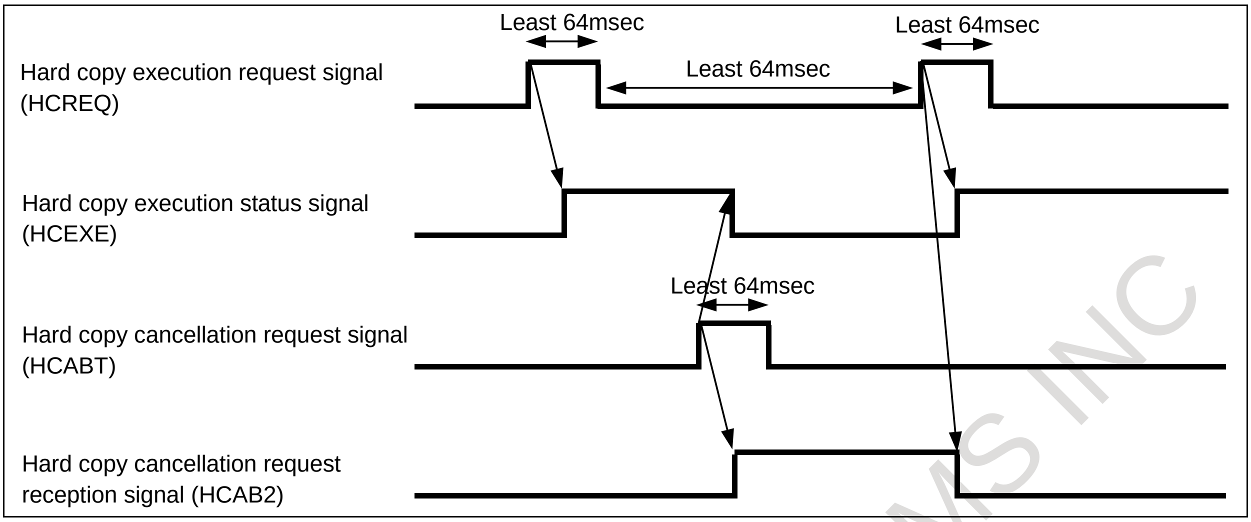

Fig. 13.1.15 (b) When the screen hard copy function is canceled and restarted

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0067	HCREQ	HCABT						

	#7	#6	#5	#4	#3	#2	#1	#0
F0061					HCEXE	HCAB2		

Parameter

0020	I/O CHANNEL : Input/output device selection, or interface number for a foreground input device

[Input type] Setting input
[Data type] Byte
[Valid data range] 0 to 35

Set the interface number for a foreground I/O device.

If enabling the screen hard copy function (by setting bit 7 (HDC) of parameter No. 3301 to 1), set this parameter to 4 (memory card) or 17 (USB memory).

	#7	#6	#5	#4	#3	#2	#1	#0
3301	HDC			HCN				H16

[Input type] Parameter input
[Data type] Bit path

#0 H16 Bit map data of screen hard copies uses:
0: 256 colors.
1: 16 colors.

#4 HCN Bit map file name of the screen hard copy is:
0: "HDCPYxxx.BMP"
(xxx(000~999) means the number of screen hard copy after power-on).
1: "YYMMDDxx.BMP"
(YY(00~99) means the year, MM(01~12) means the month, DD(01~31) means the day and xx(00~99) means the number of screen hard copy in that day)

#7 HDC A screen hard copy function is:
0: Disabled.
1: Enabled.

Only the value of this parameter that is set for path 1 is effective.

13.1.16 Actual Speed Display Axis Selection Signals

Overview

These signals specify whether the speed of each axis is added to the display of actual speed.
The signals can be used when, for example, the movement speed of the slave axis is not added to the display of actual speed during synchronous operation.
The signals are valid for reading of the actual speed of the control axis in the PMC window function (function code 26).

> **NOTE**
> The actual speed obtained by reading of the actual speed of the control axis in the PMC window function (function code 26) is a value used for screen display and cannot be used for control.

Signal

Actual speed display axis selection signals *ACTF1 to *ACTF8 <Gn580>

[Classification] Input signal

[Function] These signals specify whether the movement speed of each axis is added to the display of actual speed.

[Operation] The movement speed of the axis for which 1 is set is not added to the display of actual speed.

*ACTFx :x=1 . . . The speed of the first axis is not added.
x=2 . . . The speed of the second axis is not added.
x=3 . . . The speed of the third axis is not added.
: :

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn580	*ACTF8	*ACTF7	*ACTF6	*ACTF5	*ACTF4	*ACTF3	*ACTF2	*ACTF1

> **NOTE**
> These signals can be used together with bit 3 (NDF) of parameter No. 3115, which specifies whether the movement speed of a selected axis is considered during calculation of actual speed.

13.1.17 Custom Macro Variable Name Expansion 31 Characters

Overview

This function expands the names of custom macro common variables #500 to #549 to a maximum of 31 characters in length.

> **NOTE**
> This function is an optional function.

Explanation

A name of up to eight characters can be assigned to 50 custom macro common variables #500 to #549 using the following command.

SETVN n[VAR500,VAR501,VAR502,……] ;

See Chapter II-16 in the OPERATOR'S MANUAL (B- 64694EN).

If this function is used, a custom macro common variable can have a variable name of up to 31 characters. Up to 31 characters can be displayed on the macro variable screen when:

- The full-screen display of the custom macro variable screen is performed on the 10.4-inch display.
- The custom macro variable screen is displayed on the 15-/19-inch display.

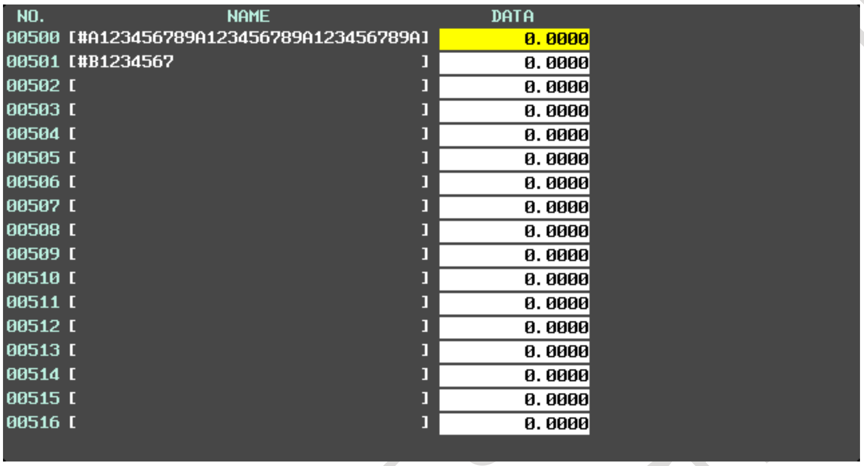

Fig. 13.1.17 (a) 31-character display

In the following cases, custom macro common variable names of up to 11 characters are displayed. If a macro variable name is longer than 11 characters, only the 11 characters are displayed and the rest is represented by "~".

- When the small-screen display of the custom macro variable screen is performed on the 10.4-inch display.

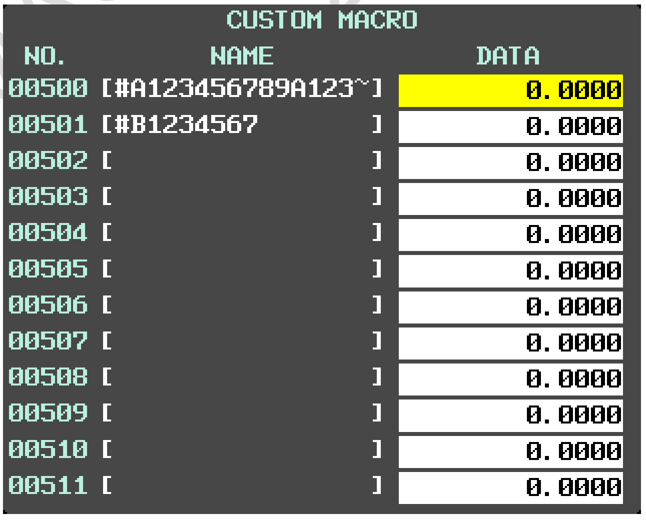

Fig. 13.1.17 (b) 11-character display

Display procedure

1. Press the function key .
2. Press the continuous menu key to display soft key [MACRO].
3. Press the soft key [MACRO].

10.4-inch display unit

The custom macro variable screen below is displayed.
In small screen display, custom macro common variable names of up to 11 characters are displayed.

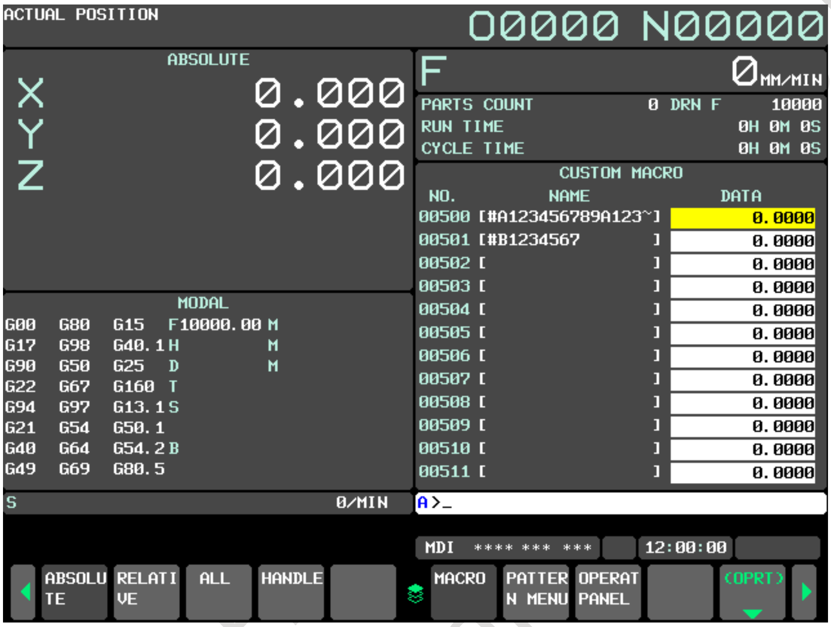

Fig. 13.1.17 (c) 10.4-inch display (small screen display)

Press soft key [MACRO] again to change the custom macro variable screen to full screen display. In full screen display, custom macro common variable names of up to 31 characters are displayed.

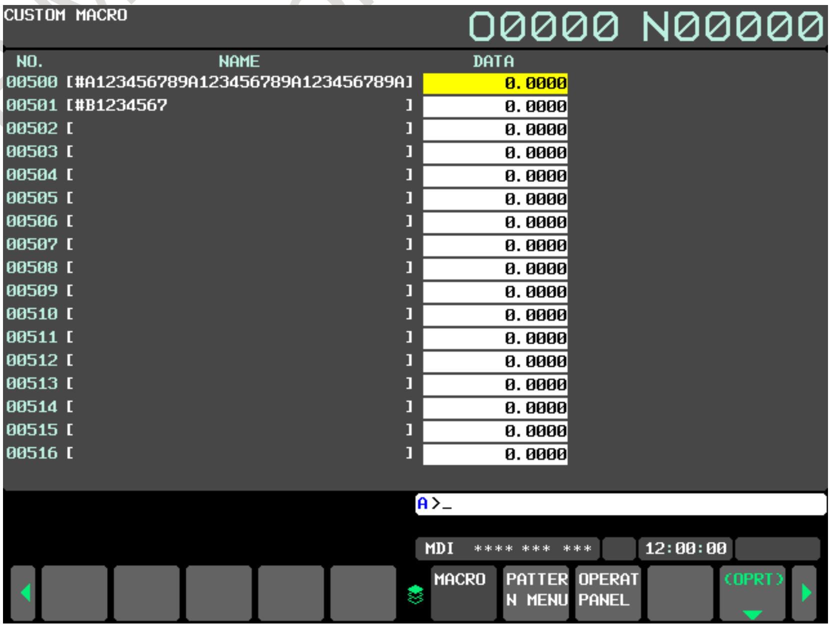

Fig. 13.1.17 (d) 10.4-inch display (full screen display)

NOTE

1. Bit 4 (SCM) of parameter No. 11355 specifies whether small screen display or large screen display is selected in the initial state of the custom macro screen during power-on.
2. If the pattern data input function is enabled and the comment of pattern data input is set to be displayed on the right side, variable names of up to 10 characters are displayed in small screen display.
3. If the macro compiler & executor function is enabled and custom macro common variables #500 to #549 and P-CODE macro common variables are set to be sharable, variable names of up to 31 or 11 characters are displayed on the execution macro variable screen, conversational macro variable screen, and auxiliary macro variable screen, as on the custom macro screen.

15-inch display unit

The custom macro variable screen below is displayed. Custom macro common variable names of up to 31 characters are displayed.

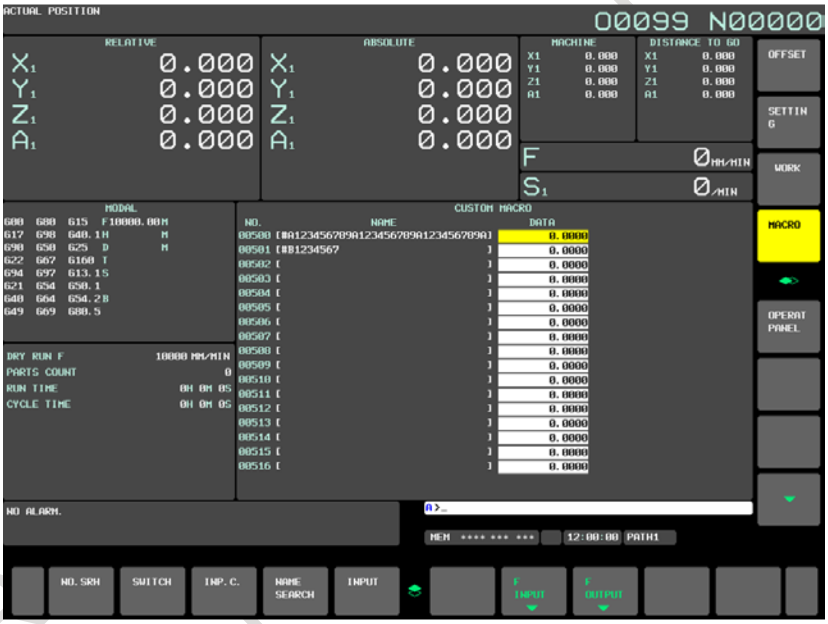

Fig. 13.1.17 (e) 15-inch display

NOTE

If the macro compiler & executor function is enabled and custom macro common variables #500 to #549 and P-CODE macro common variables are set to be sharable, variable names of up to 31 or 11 characters are displayed on the execution macro variable screen, conversational macro variable screen, and auxiliary macro variable screen, as on the custom macro screen.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3207			VRN					

[Input type] Parameter input
[Data type] Bit

#5 VRN On the custom macro variable screen, the variable names of common variables #500 to #549 are:
0: Not displayed.
1: Displayed.

	#7	#6	#5	#4	#3	#2	#1	#0
11355				SCM				

[Input type] Parameter input
[Data type] Bit

#4 SCM In the initial state, the custom macro screen is:
0: A small screen display.
1: A full screen display.

13.1.18 Switching the Axis Name of an Axis Type Alarm

Overview

If an axis type alarm occurs, the type, number, and message of the alarm as well as the name of the axis on which the alarm occurred are displayed on the alarm screen. The axis name is usually the axis name set in parameter No. 1020, but bit 3 (DAA) of parameter No. 11368 can be set to switch the axis name to the one set in parameter No. 3132.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11368					DAA			

[Input type] Parameter input
[Data type] Bit

#3 DAA The axis name used with axis type alarms is one set using parameter No.:
0: 1020.
1: 3132.

> **NOTE**
> 1 Even when this parameter is 1, an axis name set in parameter No. 1020 is used if the value of parameter No. 3132 is 0.
> 2 If an extended axis name is in use, only the first letter in it is replaced.

Limitation

Even when bit 3 (DAA) of parameter No. 11368 is 1, the axis name to be displayed on the operation history screen and the alarm history screen is the one set in parameter No. 1020.

13.1.19 Periodic Maintenance Screen

Overview

The periodic maintenance screen function provides guidelines as to when consumables such as the backup battery of the control unit and the backlight of the LCD unit are to be replaced and checked if the lifetimes of these items have been set in advance.

Signal

Periodic maintenance lifetime warning signal LIFOVR<Fn093.0>

[Classification] Output signal

[Function] Reports that a lifetime warning is issued on the periodic maintenance screen.

[Operation] This signal is set to "1" when any of the items set on the periodic maintenance screen enters the lifetime warning state.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn093								LIFOVR

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
8900					PLC			

[Input type] Setting input

[Data type] Bit path

#3 PLC When the remaining time of an item falls to a value less than the percentage of the life specified in parameter No.8911, the life warning status is displayed at

0: Timer area on CNC status display area.

1: Alarm area on CNC status display area.

	#7	#6	#5	#4	#3	#2	#1	#0
8901	MEN							

[Input type] Setting input

[Data type] Bit path

#7 MEN The periodic maintenance screen and the maintenance information screen are:

0: Displayed.

1: Not displayed.

	#7	#6	#5	#4	#3	#2	#1	#0
8903								PDM

[Input type] Parameter input

[Data type] Bit path

#0 PDM When the remaining time of an item falls to a value less than the percentage of the life specified in parameter No.8911, the life warning status on CNC status display area is

0: Not displayed.

1: Displayed.

	#7	#6	#5	#4	#3	#2	#1	#0
8906		MPM						

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#6 MPM On the periodic maintenance screen,
0: the life time is counted in each path.
1: the life time is not counted in each path.

8911	Percentage for life warning display on the periodic maintenance screen

[Input type] Parameter input
[Data type] Byte path
[Unit of data] %
[Valid data range] 0 to 99

On the periodic maintenance screen, if the remaining time of an item falls to a value less than the percentage of the life specified in this parameter, the item name and remaining time is displayed in red as a warning.

13.1.20 Selection of display axis on the Current Position Screen

Overview

On the current position screen, it can be selected whether to display each axis position by setting the parameter or signal.
Moreover, the order of displaying axis can be changed.

Explanation

- Selection of display axis

If bit 0 (NDPx) of parameter No. 3115 is set to 1, the set axis is not displayed and the blank is displayed.

- Selection of display the absolute and relative coordinates and the distance-to-go

If bit 1 (NDAx) of parameter No. 3115 is set to 1, the absolute and relative coordinates and the distance-to-go is not displayed. (The machine coordinates are displayed)

- Change the order of displaying axis

If parameter No. 3130 is set, the order of displaying each axis can be changed.

> **NOTE**
> 1 The order can be changed only in the current position screen, and it is impossible in other screens such as the work-offset screen and the parameter screen.
> 2 If the parameters of all axes are set to 0, this function is invalid.
> 3 The axis that 0 or value more than number of maximum axes in the path is set to the parameter is not displayed.

- Close up display

If bit 0 (TAD) of parameter No. 13102 is set to 1, when the axis is not displayed by the bit 0 (NDPx) of parameter No. 3115, the axes are closed up and displayed.
Moreover, when the order of displaying axes are changed by parameter No. 3130, the axis that 0 is set to the parameter is closed up and displayed.

- Selection of display axis by the signal

If the axis non-displayed signal NPOS1 to NPOS8 <Gn198> is set to “1”, the set axis is not displayed and the blank is displayed.

NOTE
If bit 0 (TAD) of parameter No. 13102 is set to 1, when the axis non-displayed signal NPOS1 to NPOS8 <Gn198> is set to “1”, the axis is closed up.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3115							NDAx	NDPx

[Input type] Parameter input
[Data type] Bit axis

#0 NDPx The current position is:
0: Displayed.
1: Not displayed.

NOTE
When using the electronic gear box (EGB) function, set 1 for the EGB dummy axis to disable current position display.

#1 NDAx The current position and the amount of the movement to be made in absolute and relative coordinates are:
0: Displayed.
1: Not displayed. (The machine coordinates are displayed.)

3130	Axis display order for current position display screens

[Input type] Parameter input
[Data type] Byte axis
[Valid data range] 0 to 32
Set the order in which axes are displayed on current position display screens.

	#7	#6	#5	#4	#3	#2	#1	#0
13102								TAD

[Input type] Parameter input
[Data type] Bit path

NOTE
When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 TAD When the axis is not displayed by the bit 0 (NDPx) of parameter or parameter No.3130,
0: The set axis is displayed as blanks.
1: The axis is closed up and displayed.

Signal

Axis non-displayed signals NPOS1 to NPOS8<Gn198>

[Classification] Input signal
[Function] The display axis on the current position screen is selected.
[Operation] When these signals are set to “0”, the set axes are displayed.
When these signals are set to “1”, the set axes are not displayed.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn198	NPOS8	NPOS7	NPOS6	NPOS5	NPOS4	NPOS3	NPOS2	NPOS1

13.1.21 Power Consumption Monitor

Function Overview

The electric power consumption and integral power consumption of servo motor and spindle motor can be read through the interface of PMC window, FOCAS2 interface or etc. Custom application can observe consumed power and regenerative power of servo and spindle axes. Then you can use them to appeal your machine with the energy saving ability. Moreover, these values can be confirmed on the CNC screen.
Because the power consumption data is in the diagnosis data, it is possible to read it from user's application in the following way. For the details, please refer to each manual.

- PMC
  WINDR function code 33 Reading diagnosis data (Low-speed)
  For details of the WINDR instruction, please refer to PMC programming manual (B-64513EN).

- FOCAS2 function
  cnc_diagnoss Read diagnosis data
  cnc_diagnosr Read diagnosis data(area specified)
  For details of the function specification, please refer to a data window library specifications bundled to FOCAS1/2 Library disk (A02B-0207-K737).

- C language executor
  cnc_diagnoss Read diagnostics data
  For details of the function specification, please refer to C Language Executor programming manual (B-63943EN-3).

Displaying power consumption

Power consumption monitoring screen

The electric power data of servo axis and spindle axis consumption and regeneration can be displayed.

Fig.13.1.21 (a) Power consumption monitoring screen for 10.4" display unit

Refer to Operator's Manual (Common to Lathe System/Machining Center System) (B-64694EN) for detailed operations on Power consumption monitoring screen.

Bar-graph display of whole power consumption

The bar-graph where the entire power consumption can be confirmed is displayed in the warning message area. Power consumption can be confirmed on every screen.

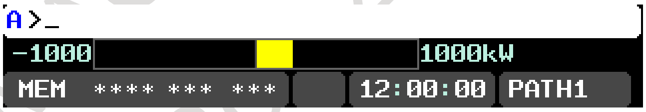

Fig.13.1.21 (b) Bar-graph of entire power consumption

NOTE

1 The bar-graph display can be concealed by the setting of parameter APM (No.11368#6)=1.

2 When the warning message is displayed, the bar-graph is not displayed.

3 The bar-graph displayed in the warning display area is only the entire power consumption.

Diagnosis data

Present power consumption of all axes

4900	Present power consumption of all axes

[Data type] 2-Word
[Unit of data] W
[Valid data range] -99999999 to 99999999

Present power consumption of each servo axis

4901	Present power consumption of each servo axis

[Data type] 2-Word axis
[Unit of data] W
[Valid data range] -99999999 to 99999999

> **NOTE**
> This value becomes negative during regeneration of power that is generated by deceleration of an axis

Present power consumption of each spindle axis

4901	Present power consumption of each spindle axis

[Data type] 2-Word spindle
[Unit of data] W
[Valid data range] -99999999 to 99999999

> **NOTE**
> This value becomes negative during regeneration of power that is generated by deceleration of an axis

Integral power consumption of all axes

4910	Integral net power consumption of all axes

4911	Integral power consumption of all axes

4912	Integral power regeneration of all axes

[Data type] 2-Word
[Unit of data] 0.001kWh
[Valid data range] -99999999 to 99999999

NOTE
- These values are integrated from 0.000kWh every turning on CNC.
- No.4911 and No.4912 are counted as “consumption” when the summational power of all axes is positive value and counted as “regeneration” when the summational power of all axes is negative value. This shows the result of including countervailing among all axes in case that some axes consume power but other axes regenerate power. Therefore these diagnosis data mean the net consumption and net regeneration power exchanging between the power supply and commercial power source.
  Example)
  Assume that the case of power
  in a spindle axis: consumption 100kWh, regeneration 25kWh
  in a servo axis: consumption 20kWh, regeneration 1kWh
  The result of simple summation becomes consumption 120kWh and regeneration 26kWh.
  In this situation, assume that 1kWh power consumption in the spindle axis and 1kWh power regeneration in the servo axis occurs simultaneously. The each 1kWh is countervailed. As a result, integral power consumption becomes 119kWh and the integral power regeneration becomes 25kWh and the integral net power consumption becomes 94kWh.

Integral power consumption of each servo axis

4920	Integral net power consumption of each servo axis
4921	Integral power consumption of each servo axis
4922	Integral power regeneration of each servo axis

[Data type] 2-Word axis
[Unit of data] 0.001kWh
[Valid data range] -99999999 to 99999999

NOTE
These values are integrated from 0.000kWh every turning on CNC.

Integral power consumption of each spindle axis

4930	integral net power consumption of each spindle axis
4931	integral power consumption of each spindle axis
4932	integral power regeneration of each spindle axis

[Data type] 2-Word spindle
[Unit of data] 0.001kWh
[Valid data range] -99999999 to 99999999

NOTE
These values are integrated from 0.000kWh every turning on CNC.

Parameter

		#7	#6	#5	#4	#3	#2	#1	#0
2281							RDPRR	RDPMU2	RDPMU1

L*i*S300A1/4(200V)	L*i*S600A1/4(200V)	L*i*S900A1/4(200V)	1	1

*1) Power Consumption Monitor is not available to the axis using α*i*S3000/2000HV or α*i*S2000/2000HV with torque control.
*2) In the case of “plural winding motor”, which is a motor driven by 2 or 4 amplifiers, please set the following parameters for main axis only. (Please set to 0 for sub axis)
*3) In the case of synchronous built-in servo motors, please set No.2300#2=1. If you use a non-binary type encoder, please set No.2010#2=1 at the same time.
*4) In the case of linear motors, please set No.2010#2=1.
*5) Regarding the other motors, please set it according to the maximum motor output described in each motor manual.

> **NOTE**
> If these bits are wrong, the electric power consumption data is not calculated correctly.

#2 RDPRR Regeneration method of servo amplifier is
0: regeneration to power source
1: register regeneration

> **NOTE**
> In case of using the amplifier with register regeneration, regeneration power is not returned to power source. Therefore, instantaneous power consumption should become greater than 0.

2468	RDPMR Motor winding resistance

[Input type] Parameter input
[Data type] Word axis
[Unit of data] $2^{-12}\,\Omega$

Please set the value of "Armature resistance (1 phase)" in the specifications of the motor.
Example) Case of αi S8/4000

Set value=$0.31/2^{-12}$=1270 where armature resistance=0.31 Ω

Data sheet

Parameter	Symbol	Value	Unit
Stall Torque (*)	Ts	8.0 82	Nm kgfcm
Stall Current (*)	Is	11.1	A (rms)
Rated Output (*)	Pr	2.5 3.3	kW HP
Rating Speed	Nr	4000	min^{-1}
Maximum Speed	Nmax	4000	min^{-1}
Maximum Torque (*)	Tmax	32 327	Nm kgfcm
Rotor Inertia	Jm	0.00117 0.0119	kgm^2 $kgfcms^2$
Rotor Inertia (with Brake)	Jm	0.00124 0.0127	kgm^2 $kgfcms^2$
Torque constant (*)	Kt	0.72 7.3	Nm/A (rms) kgfcm/A (rms)
Back EMF constant (1phase) (*)	Ke Kv	25 0.24	V (rms)/1000 min^{-1} V (rms)sec/rad
Armature Resistance (1 phase) (*)	Ra	0.31	Ω
Mechanical time constant	tm	0.002	s
Thermal time constant	tt	20	min
Static friction	Tf	0.3 3	Nm kgfcm
Weight	w	7.4	kg
Weight (with Brake)	w	9.6	kg
Max. Current of Servo Amp.	Imax	80	A (peak)

> **NOTE**
> 1 Be sure to set this parameter. Power consumption calculation works when this parameter is set to more than 1.
> 2 Power consumption calculation works on main axis only in case of the motor with plural winding. Set this parameter for a main axis only. Set 0 for sub axis.

2469	RDPMA Lose coefficient A of a servo amplifier

[Input type] Parameter input
[Data type] Word axis

Please set the value of loss coefficient A in Table Table 13.1.21 (c) .
Example) Case of αi SV80-B, Set value=832

Case of αi SV80/80-B, Set value (L axis) = 672, Set value (M axis) = 672

> **NOTE**
> 1 Set this value only to main axis in case of a plural winding motor. Set 0 to the sub axis.
> 2 When you use Serial feedback dummy function with servo amplifier, add RDPMA value of dummy axis to No.2469 of other non-dummy axis.

2490	RDPMB Lose coefficient B of a servo amplifier

[Input type] Parameter input
[Data type] Word axis

Please set the value of loss coefficient B in Table Table 13.1.21 (c) .
Example) Case of α*i* SV80-B, α*i* SV80/80-B HRV2, Set value=262
Case of α*i* SV80-B, α*i* SV80/80-B HRV3, Set value=352

> **NOTE**
> 1 Setting value depends on HRV.
> 2 Set this value only to main axis in case of a plural winding motor. Set 0 to the sub axis.

Table 13.1.21 (c) Loss coefficient A, B setting value of servo amplifier

In case of multi-axis amplifier, please set the value corresponding to each axis. If there are two columns, the upper column corresponds to L axis and the lower correspond to M axis. If there are three columns, each corresponds to L, M and N axis from the upper.

Name	Spec. (A06B)	Loss coefficient A	Loss coefficient B	
			HRV2	HRV3
α*i*SV4-B	6240-H101	832	307	397
α*i* SV20-B	6240-H103	832	307	397

2463	RDPMC Loss coefficient C of power supply

[Input type] Parameter input
[Data type] Word axis

Please set the value of loss coefficient C in Table 13.1.21 (d) to the PS loss calculating axis. Please set 0 to the other axis.
PS lose calculating axis is :
One of the axes whose amplifier is connected to a common power supply (PS).
On PS loss calculating axis, the power loss of power supply (PS) is added to the power consumption of the axis.

NOTE
If both main axis and sub axis of a plural winding motor have PS respectively, set double value as loss coefficient C for main axis, and set 0 for sub axis.

2491	RDPMD Loss coefficient D of power supply

[Input type] Parameter input
[Data type] Word axis

Please set the value of loss coefficient D in Table 13.1.21 (d).

NOTE
1 Set the value to all servo axes.
2 Set this value only to main axis in case of a plural winding motor. Set 0 to the sub axis.

#6 APM Bar-graph display that shows the whole of power consumption is
0: valid.
1: invalid.

> **NOTE**
> This parameter is effective at PWC=1.

11371	Scale for PCM bar-graph

[Input type] Parameter input
[Data type] Word
[Unit of data] kW
[Valid data range] 0 to 9999

Specify the absolute value of maximum/minimum scale for the bar graph of power consumption monitoring screen function.
If 0 is specified, the setting of parameter No.2281#0, #1(servo), and parameter No.4541#1 and #2(spindle) are checked, and the biggest motor output value is used as a maximum/minimum value for scale.
e.g.) If 3000 is specified, -3000kW/3000kW are displayed.

11392	Scale for PCM bar-graph of servo axis

[Input type] Parameter input
[Data type] 2-Word axis
[Unit of data] 0.001kW
[Valid data range] 0 to 99999999

Specify the absolute value of maximum/minimum scale for the bar graph of each servo axis in power consumption monitoring screen.
Specify integer from 1 to 9999999.
4 digits from the top are displayed in power consumption monitoring screen, though the value of bar graph is estimated by using this parameter itself.
If 0 is specified, the scale is decided by the parameters 2281#0 and #1.
e.g.) If 9999999 is specified, -9999kW/9999kW are displayed.
If 11100 is specified, -11.10kW/11.10kW are displayed.

11393	Scale of PCM bar-graph of spindle axis

[Input type] Parameter input
[Data type] 2-Word spindle
[Unit of data] 0.001kW
[Valid data range] 0 to 99999999

Specify the absolute value of maximum/minimum scale for the bar graph of each spindle axis in power consumption monitoring screen.
Specify integer from 1 to 9999999.
4 digits from the top are displayed in power consumption monitoring screen, though the value of bar graph is estimated by using this parameter itself.
If 0 is specified, the scale is decided by the parameters 4541#1 and #2.
e.g.) If 9999999 is specified, -9999kW/9999kW are displayed.
If 11100 is specified, -11.10kW/11.10kW are displayed.

Manual name	Item name
OPERATOR'S MANUAL (B-64694EN)	Power consumption monitoring screen

13.1.22 Energy Saving Level Selecting Function

Function Overview

Power consumption in a machine can be categorized into power consumption in spindle motors, that in servo motors and that in peripheral devices (such as a coolant pump) (See Fig. 13.1.22 (a)). Suppressing torque at acceleration/deceleration in spindles, where there is large power consumption, can reduce whole power consumption of a machine, though machining time gets longer.
By utilizing this feature, this function makes it possible to switch between machining with shorter time and that with less power consumption.

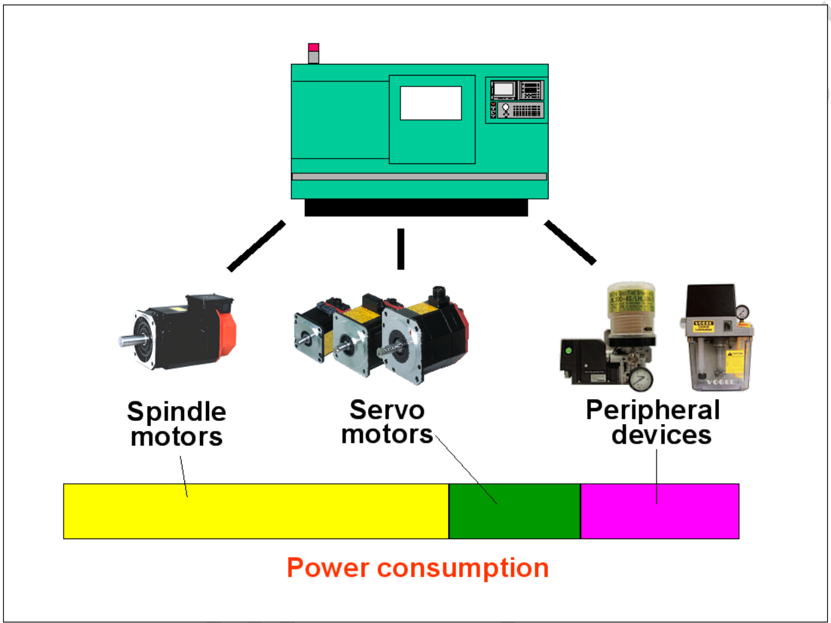

Fig. 13.1.22 (a) Power consumption in machine

Fig. 13.1.22 (b) shows the relation between power consumption and machining time.
Power consumption in spindle motors gets smaller by suppressing spindles' torque at acceleration/deceleration. However, machining time gets longer because acceleration/deceleration requires longer time. Therefore, the longer machining time gets, the smaller the summation of power consumption in spindle motors and in servo motors gets as shown in Fig. 13.1.22 (b). On the other hand, longer machining time makes power consumption in peripheral devices larger because running times of them get longer (See power consumption in peripheral devices in Fig. 13.1.22 (b)). Total power consumption is the sum of these power consumptions above.
'A' in Fig. 13.1.22 (b) shows the point of the fastest machining (normal machining). Utilizing full spindles' torque makes required time for acceleration/deceleration smaller, though total power consumption gets larger because of large power consumption in spindle motors.
'B' shows the point of the least power consumption. As described above, machining time gets longer because of suppression in spindles' torque at acceleration/deceleration.

This function makes it possible to select machining levels (called Eco levels) between the fastest machining ('A') and machining with the least power consumption ('B').

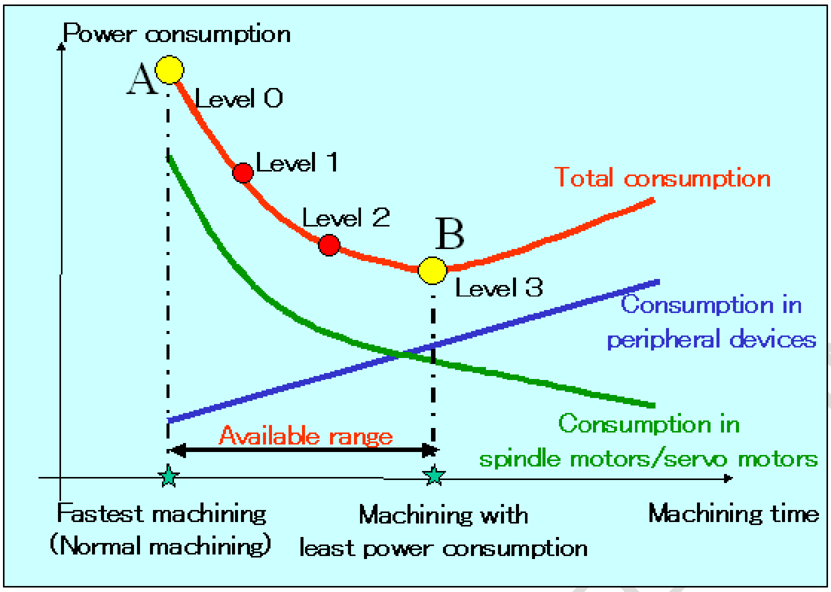

Fig. 13.1.22 (b) Power consumption vs. machining time

Therefore, selecting an Eco level provides both faster machining and less power machining.
By using this function, power consumption can be reduced effectively when, for example, there is enough time to deadline or there is large difference in production time of each part in production line.

NOTE

1. This function can reduce power consumption in spindles only at acceleration/deceleration. Power consumption during cutting does not change even if the selected Eco level changes. Therefore, the effect of eco-machining may get smaller for machining with less acceleration/deceleration of spindles.
2. Power consumption of a spindle motor may fluctuate depending on the conditions of the motor temperature and the power supply voltage even though the motor runs in the same operation.

Setting Overview

Three settings listed below are required before using this function.

- Setting to obtain power consumption in spindle and servo motors
- Setting to obtain power consumption in peripheral devices
- Setting to decide the point of the least power consumption

Obtaining power consumption in spindle and servo motors

Since power consumption in spindle and servo motors referred in this function is obtained by Power consumption monitor, settings for the function are required.
Refer to Operator's Manual (Common to Lathe System/Machining Center System) (B-64694EN) for detail.

Obtaining power consumption in peripheral devices

Some settings are needed to obtain power consumption in peripheral devices such as oil pressure pumps, illuminations and so on.
Power consumption in peripheral devices can be calculated by average power and operating time of each device.
These settings are performed on Power consumption setting screen.
Refer to Operator's Manual (Common to Lathe System/Machining Center System) (B-64694EN) for detailed operations on the screen.

Deciding the point of the least power consumption

Adjustment of spindles' torque is required so that Eco level 0 means normal machining and Eco level 3 means machining with the least power consumption as shown in Fig. 13.1.22 (b).
No adjustment is needed for Eco level 0 because this is normal setting.
Adjust suppression on spindles' torque at acceleration/deceleration (torque override) so that the sum of power consumption in spindles, servos and peripherals is minimum at Eco level 3.
Eco levels 1 and 2 are automatically decided as settings dividing between Eco level 0 and 3 equally.
Refer to below for detailed explanations on torque overrides.

> **NOTE**
> 1 In spindle speed control mode, the torque command is limited at acceleration/deceleration according to the setting of torque overrides. In spindle synchronization control mode and in rigid tapping mode, the time constants for acceleration/deceleration are set longer according to the torque overrides.
> 2 If more detailed selection of an Eco level is needed, set bit 0 (ELV) of the parameter No. 24303 to 1, which enhances divisions of Eco levels from 4 to 8.

About torque override

Torque override and output

Spindles' torque at acceleration/deceleration used in eco-machining is that in normal machining multiplied by torque override.
When torque override is set to 100%, torque in eco-machining is the same as that in normal machining.
If torque override is set to 50%, the torque becomes half.

Sorts of torque overrides

There are three torque overrides; one is for spindle speed control mode, one is for spindle synchronization control mode and the other is for rigid tapping mode.

Relation between Torque overrides and Eco levels

The relation between torque overrides and Eco levels is shown as follows:

- Eco level 0 means normal machining, where torque overrides are equal to 100%.
- Eco level 3 means machining with torque overrides specified by the parameters Nos. 11397, 11398 and 5260. Note that these parameters can be changed on Eco setting screen.
- Eco levels 1 and 2 are defined as machining with torque overrides dividing between Eco level 0 (torque override 100%) and 3 equally. When the parameter No.11397 is set to 70, for example, torque override of Eco level 1 is equal to 90% and that of level 2 is equal to 80%.

> **NOTE**
> 1 When the number of divisions of Eco levels is equal to 8 (bit 0 (ELV) of the parameter No.24303 is set to 1), torque overrides for level 7 are specified by the parameters Nos. 11397, 11398 and 5260. Eco levels 1 to 6 are defined as machining with torque overrides dividing between Eco level 0 and 7 equally.
> 2 Decimal sections of torque overrides are half adjusted.

Setting Details

Obtaining power consumption in peripheral devices

Power consumption in peripheral devices is calculated by average power and running time of each device. Specify average power and reference PMC address, which is used to detect ON/OFF state of each device, on Power consumption setting screen (Fig. 13.1.22 (c)).
Up to 8 devices can be recorded for each path.
Complete this setting by the examples below.
Refer to Operator’s Manual (Common to Lathe System/Machining Center System) (B-64694EN) for detailed operations on Power consumption setting screen.

> **NOTE**
> This setting is required for each path in multi-path systems.

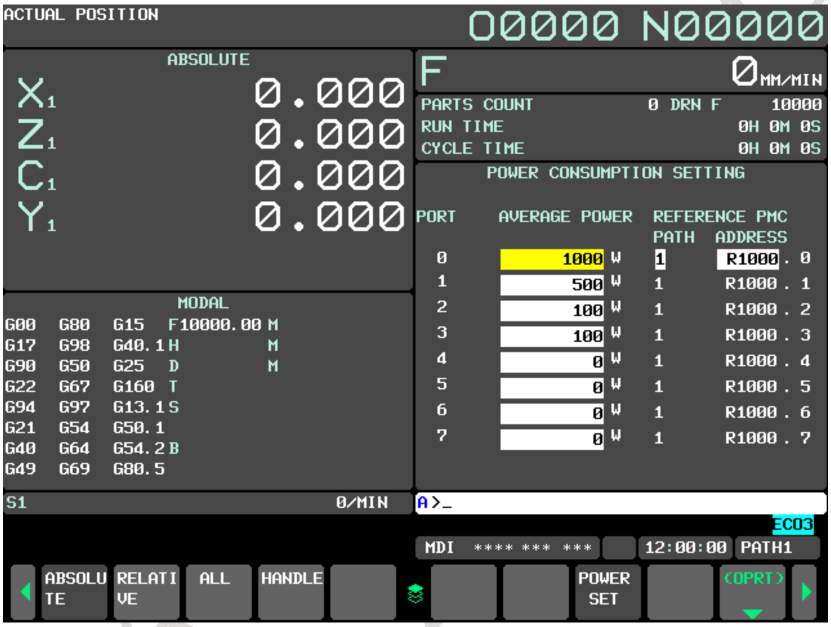

Fig. 13.1.22 (c) Power consumption setting screen

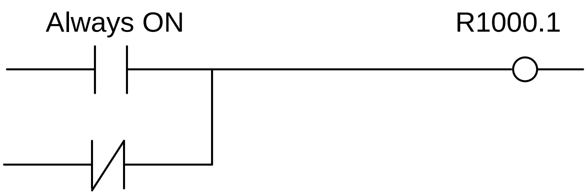
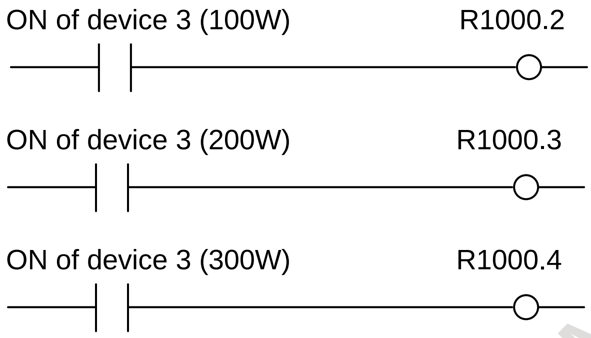
Examples

1 Complete setting by the examples below, corresponding to the ways to utilize devices.
In the case of a device switched ON/OFF during automatic operation:
Set 100W and R1000.0 into average power and PMC address of Port 0 respectively.
Use ladder programs including the ladder like below and set ON/OFF state of the device to the address.

2 In the case of a device always in operation during automatic operation:
Set 100W and R1000.1 into average power and PMC address of Port 1 respectively.
Use ladder programs including the ladder like below and set ON state of the device to the address at any time.



3 In the case of a device whose power varies during operation:
Set 100W/R1000.2 to Port 2, 200W/R1000.2 to Port 3 and 300W/R1000.4 to Port 4 respectively.
Use ladder programs including the ladders like below.
Change addresses to set ON state of the device according to power consumption of the device.



4 In the case of a device used in multiple paths:
Divide average power by the number of paths and input the calculated value for each path.
When paths 1 and 2 use the same device with average power 100W, for example, 50W is assumed to be input to Port 0 of path 1 and Port 0 of path 2. ON/OFF state of the device is needed to set into the addresses specified in Port 0 of path 1 and 2 respectively.

Deciding the point of the least power consumption

Deciding the point of the least power consumption is performed on Eco setting screen.
Decide torque override for Eco level 3 with the help of data of power consumption and cycletime obtained by actual operations so that total power consumption is minimum at Eco level 3. Adjust torque override referring to the example below.
Refer to Operator’s Manual (Common to Lathe System/Machining Center System) (B-64694EN) for detailed operations on Eco setting screen.

Example

Decide setting for the least power consumption by repeating operations at different torque overrides like below.

1 Set bit 0 (ELV) of the parameter No.24303 to 1 in order to enhance divisions of Eco levels from 4 to 8. In addition, switch the displayed unit of power consumption into “Wh” by soft-key operations. These settings make it possible to decide the point of the least power consumption more precisely, though these are not indispensable.
2 Set bit 0 (PWE) of the parameter No.8900 to 1 so that torque override for Eco level 7 can be input on Eco setting screen.
3 Set torque override for Eco level 7 to 30%.
4 Operate a test program at each Eco level 0 to 7 and obtain data of power consumption and cycletime (An example of the result is shown in Fig. 13.1.22 (d).).
A test program including more acceleration/deceleration of spindles makes it possible to decide the point of the least power consumption more precisely because torque override effects on acceleration/deceleration of spindles.
5 Assume the range of torque overrides minimizing power consumption from the graph on Eco setting screen (Fig. 13.1.22 (d) shows that torque override minimizing power consumption is between 60 and 80.).
6 Set torque override for Eco level 7 to 60%, which is the minimum value of the range assumed in 0th step above.
7 Operate the test program at each Eco level 0 to 7 again and obtain data of power consumption and cycletime (An example of the result is shown in Fig. 13.1.22 (e)).

8 Assume the range of torque overrides minimizing power consumption again (Fig. 13.1.22 (e) shows that torque override minimizing power consumption is between 66 and 77.).
9 Repeat above operations in order to assume desired torque override more precisely.
10 After finishing this adjustment, set bit 0 (ELV) of the parameter No.24303 to 0 (set the number of divisions of Eco levels to 4), if needed.

NOTE
1 When using spindle synchronization control or rigid tapping, decision of the point of the least power consumption is needed for spindle synchronization control mode or for rigid tapping mode respectively, as well as for spindle speed control mode.
2 With multiple spindles, decision of the point of the least power consumption is needed for each spindle.

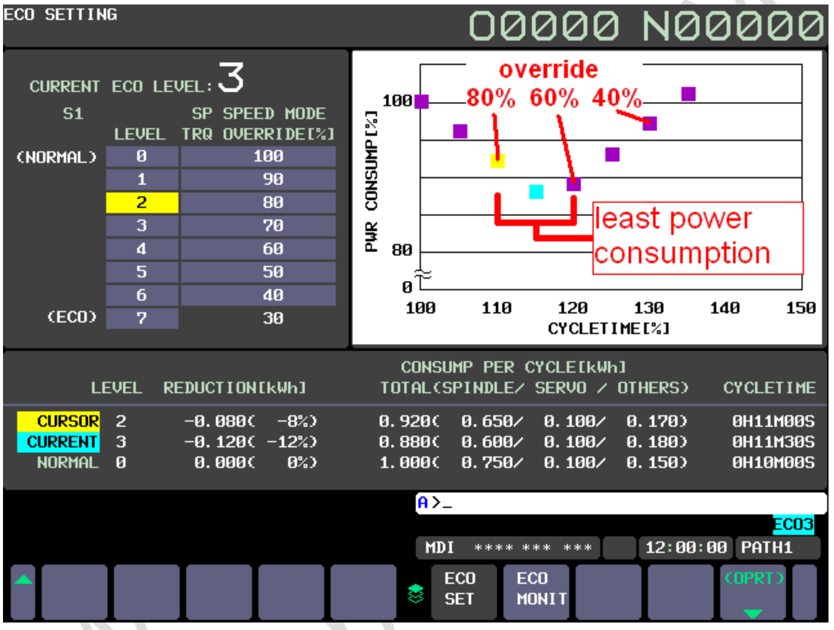


Fig. 13.1.22 (d) Deciding the point of the least power consumption 1

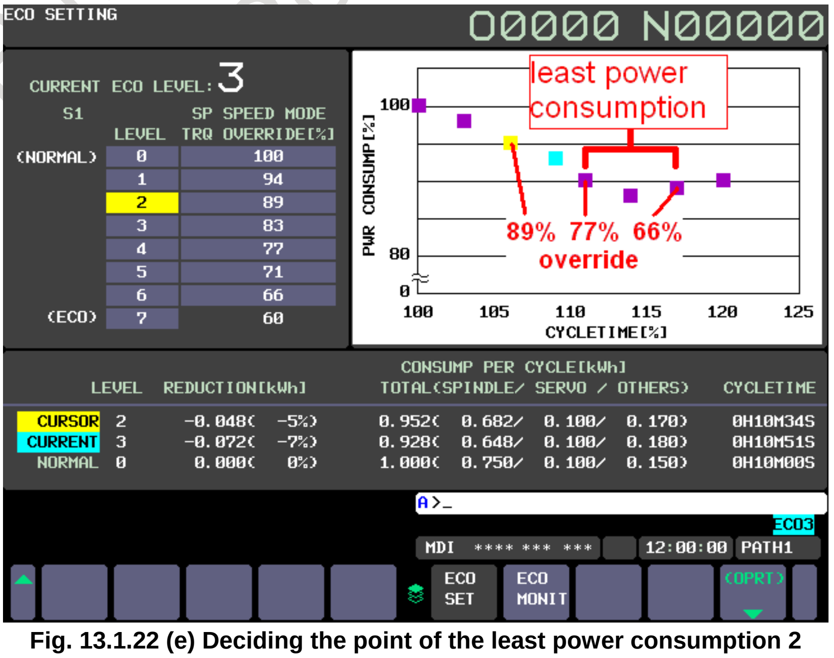

Fig. 13.1.22 (e) Deciding the point of the least power consumption 2

Restriction

This function can be used when Energy saving level selecting function is available in all spindle amplifiers.
In addition, analog spindles cannot be used in this function.

Diagnosis data

Accumulated power consumption

4923	Accumulated power consumption in servo axes

4933	Accumulated power consumption in spindle axes

4943	Accumulated power consumption in peripheral devices

4953	Accumulated reduction of power consumption

[Data type] 2-Word
[Unit of data] 0.001kWh
[Valid data range] -2147483648 to 2147483647

> **NOTE**
> These data have been accumulated since last clear operation.
> These data are not cleared by power off.

Parameter

11397	Minimum torque overrides at acceleration/deceleration in spindle speed control mode

[Input type] Parameter input
[Data type] Byte spindle
[Unit of data] %
[Valid data range] 0 to 100

Set minimum torque override at acceleration/deceleration in spindle speed control mode. This value corresponds to Eco level 3 (when bit 0 (ELV) of the parameter No.24303 is set to 0) or Eco level 7 (when bit 0 (ELV) of the parameter No.24303 is set to 1).

When torque override is set to 50%, for example, time constant for acceleration/deceleration gets twice.
Note that 0% is considered as 100%.
If eco-machining is not necessary, please set 0 or 100 in this parameter.

When bit 0 (PWE) of the parameter No.8900 is set to 1, this value can be changed on Eco setting screen.

> **NOTE**
> This parameter requires the option of Energy saving level selecting function.

11398	Minimum torque overrides at acceleration/deceleration in spindle synchronization control mode

[Input type] Parameter input
[Data type] Byte spindle
[Unit of data] %
[Valid data range] 0 to 100

Set minimum torque override at acceleration/deceleration in spindle synchronization control mode.
This value corresponds to Eco level 3 (when bit 0 (ELV) of the parameter No.24303 is set to 0) or Eco level 7 (when bit 0 (ELV) of the parameter No.24303 is set to 1).

When torque override is set to 50%, for example, time constant for acceleration/deceleration gets twice.
Note that 0% is considered as 100%.
If eco-machining is not necessary, please set 0 or 100 in this parameter.

When bit 0 (PWE) of the parameter No.8900 is set to 1, this value can be changed on Eco setting screen.

> ⚠ **CAUTION**
> Machine or work can be damaged by out-of-synchronization when torque overrides of spindles in synchronization control mode differ from each other. This is because this function differs the time constant for acceleration/deceleration in spindle synchronization mode.
> Set a common value for spindles belonging to the same group of synchronization.

> **NOTE**
> This parameter requires the option of Energy saving level selecting function.

5260	Minimum torque overrides at acceleration/deceleration in rigid tapping

[Input type] Parameter input
[Data type] Byte spindle
[Unit of data] %
[Valid data range] 0 to 100

Set minimum torque override at acceleration/deceleration in rigid tapping.
This value corresponds to Eco level 3 (when bit 0 (ELV) of the parameter No.24303 is set to 0) or Eco level 7 (when bit 0 (ELV) of the parameter No.24303 is set to 1).

When torque override is set to 50%, for example, time constant for acceleration/deceleration gets twice.
Note that 0% is considered as 100%.
If eco-machining is not necessary, please set 0 or 100 in this parameter.

When bit 0 (PWE) of the parameter No.8900 is set to 1, this value can be changed on Eco setting screen.

> **NOTE**
> This parameter requires the option of Energy saving level selecting function.

11399	Conversion factor from power consumption (kWh) to carbon-dioxide emission (kg)

[Input type] Parameter input
[Data type] Word
[Unit of data] 0.001kgCO2/kWh
[Valid data range] 0 to 1000

Specify conversion factor from power consumption (kWh) to carbon-dioxide emission (kg). Adjust the value to correspond to power supplying circumstances in the area where a machine is used.
If 0 or invalid value is specified, 0.555kgCO2/kWh is used as the conversion factor.

> **NOTE**
> This parameter requires the option of Energy saving level selecting function.

	#7	#6	#5	#4	#3	#2	#1	#0
24303							EEP	ELV

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 ELV Divisions of Eco levels are
0: 4 levels.
1: 8 levels.

> **NOTE**
> This parameter requires the option of Energy saving level selecting function.
> If this parameter is changed, adjust the parameters Nos. 11397, 11398 and 5260 again.
> If the current Eco level gets invalid because of change in this parameter, the current Eco level is set to Eco level 0.

#1 EEP An Eco level is
0: Not specified in each path.
The Eco level is common for all paths.
1: Specified in each path.

> ⚠ **CAUTION**
> Machine or work can be damaged by out-of-synchronization when Eco levels of spindles in synchronization control mode differ from each other. This is because this function differs the time constant for acceleration/deceleration in spindle synchronization mode.
> Set “0” without fail when using spindle synchronization control between paths.

NOTE
This parameter requires the option of Energy saving level selecting function.
When this parameter is set to "0" from "1", the current Eco level is set to the Eco level of path 1 before changing this parameter.

13.1.23 Simultaneous Displaying Axis Number Expansion Function

Overview

The number of axis data "current position" and "Distance to go" that are displayed on the same screen can be expanded up to 20.

Explanation

In initial setting, the maximum number of simultaneous displaying axis of current position is for 5. In this function, the maximum number of simultaneous displaying axes can be selected from 5, 10 and 20 axes by setting the parameter No.11305.
The relation of the maximum number of simultaneous displaying axes and the set value of parameter is shown in the following table.

Table. 13.1.23 (a) The related of the maximum number of simultaneous displaying axes and the set value of parameter

Maximum number of simultaneous displaying axes	Parameter (No.11305)
5	0
10	1
20	2

When the number of axes is more than that of the maximum number of simultaneous displaying axis, you can change to the axis coordinates of the remainder by pressing the chapter selection soft key.

(Example)

When 13 axes (X1 to X13) are displayed by each maximum number of simultaneous displaying axes, the display of coordinates is shown in following figures.

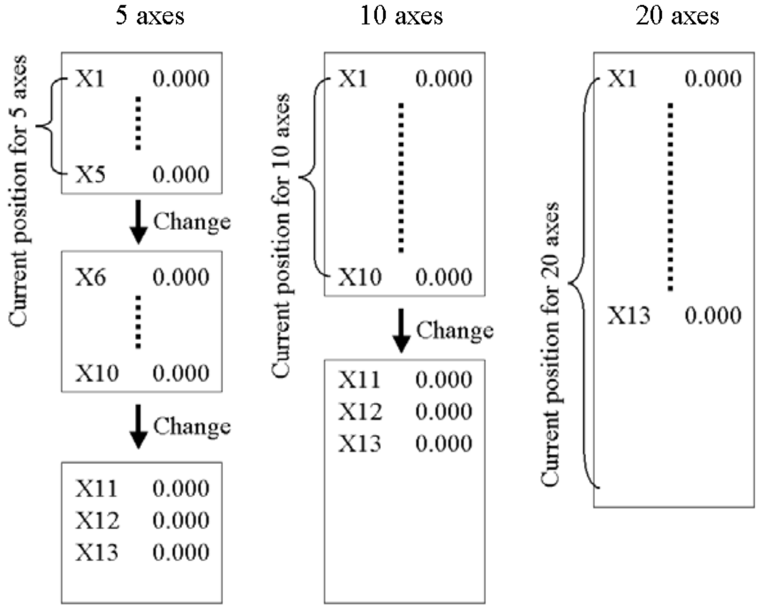

Fig. 13.1.23 (a) Example when current position coordinates for 13 axes are displayed by number of maximum each axes.

When the maximum number of simultaneous displaying axes is 5.

The maximum number of simultaneous displaying axis becomes 5 by setting 0 to parameter No. 11305. When the number of axes exceeds 5, by pressing the chapter selection soft key, axes for the 6th axis and up are displayed.

Fig. 13.1.23 (b) Current position display of 10.4 inch (overall)

Fig. 13.1.23 (c) Current position display of 15 inch (overall)

When the maximum number of simultaneous displaying axes is 10.

The maximum number of simultaneous displaying axis becomes 10 by setting 1 to parameter No. 11305. When the number of axes exceeds 10, by pressing the chapter selection soft key, axes for the 11th axis and up are displayed.

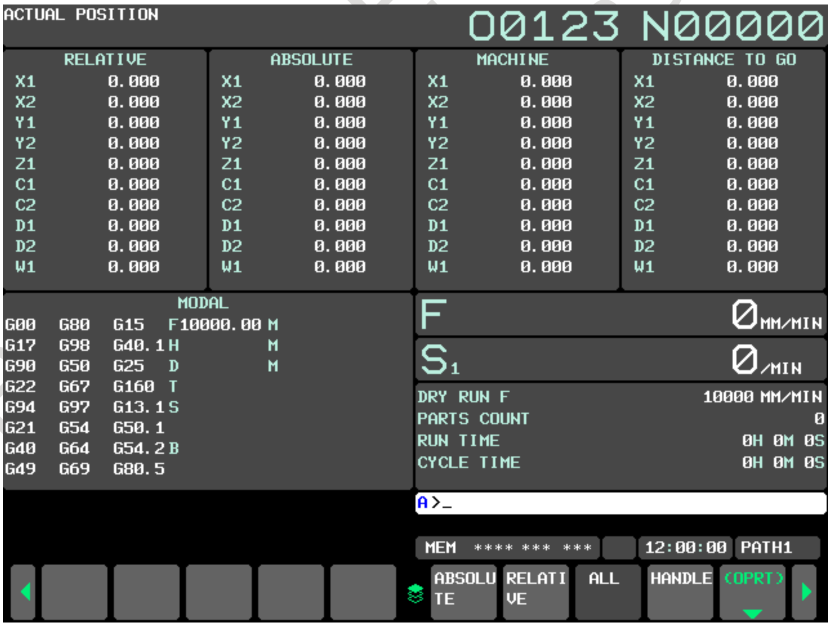

Fig. 13.1.23 (d) Current position display of 10.4 inch (overall)

Fig. 13.1.23 (e) Current position display of 15 inch (overall)

Addition of the chapter selection soft key in 15 inch

The chapter selection soft key of "Absolute" and "Relative" is added setting 1 or 2 to parameter No. 11305.

When you press the chapter selection soft key of "Absolute", absolute coordinate is displayed with the character of 6 times size.

When you press the chapter selection soft key of "Relative", relative coordinate is displayed with the character of 6 times size.

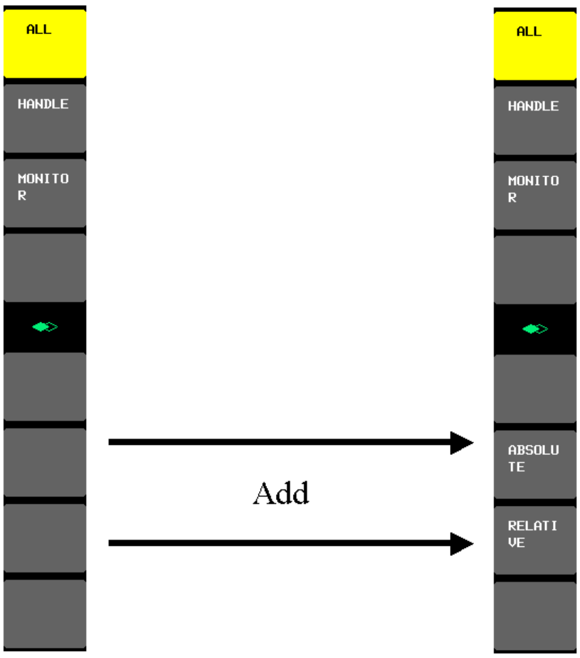

Fig. 13.1.23 (i) Addition of the chapter selection soft key

Fig. 13.1.23 (f) Current position display of 15 inch (relative)

Change of display coordinates

When the maximum number of simultaneous displaying axes is 20 (Parameter No.11305=2), Coordinates displayed in the position display of each screen at the same time are two pairs. The combination of two coordinates is decided by setting the order of displaying four coordinates systems displayed in overall position display screen (parameter No.11307).

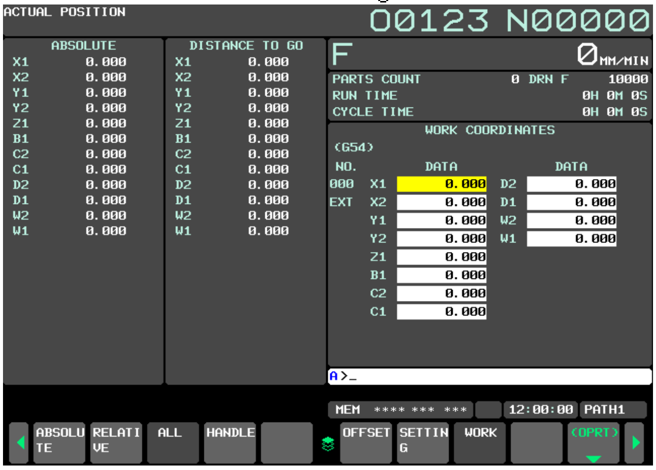
At power-on, the first combination of coordinate is displayed. You can change it

the second one by pressing the chapter selection soft key to selection after SHIFT key. When you do it again, the combination of coordinates is changed to the first one.

(Example)

The workpiece coordinate system setting screen of 10.4 inch. When parameter No.11307 is 4. The maximum number of simultaneous displaying axes is 20.

Absolute coordinates and Distance to go



Relative coordinate and Machine coordinate

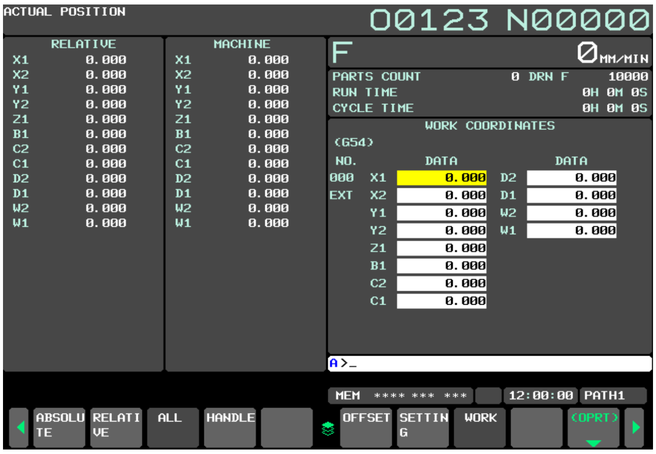


Fig. 13.1.23 (g) Display change example in 10.4 inch.

(Example)

The workpiece coordinate system setting screen of 15 inch. When parameter No.11307 is 4. The maximum number of simultaneous displaying axes is 20.

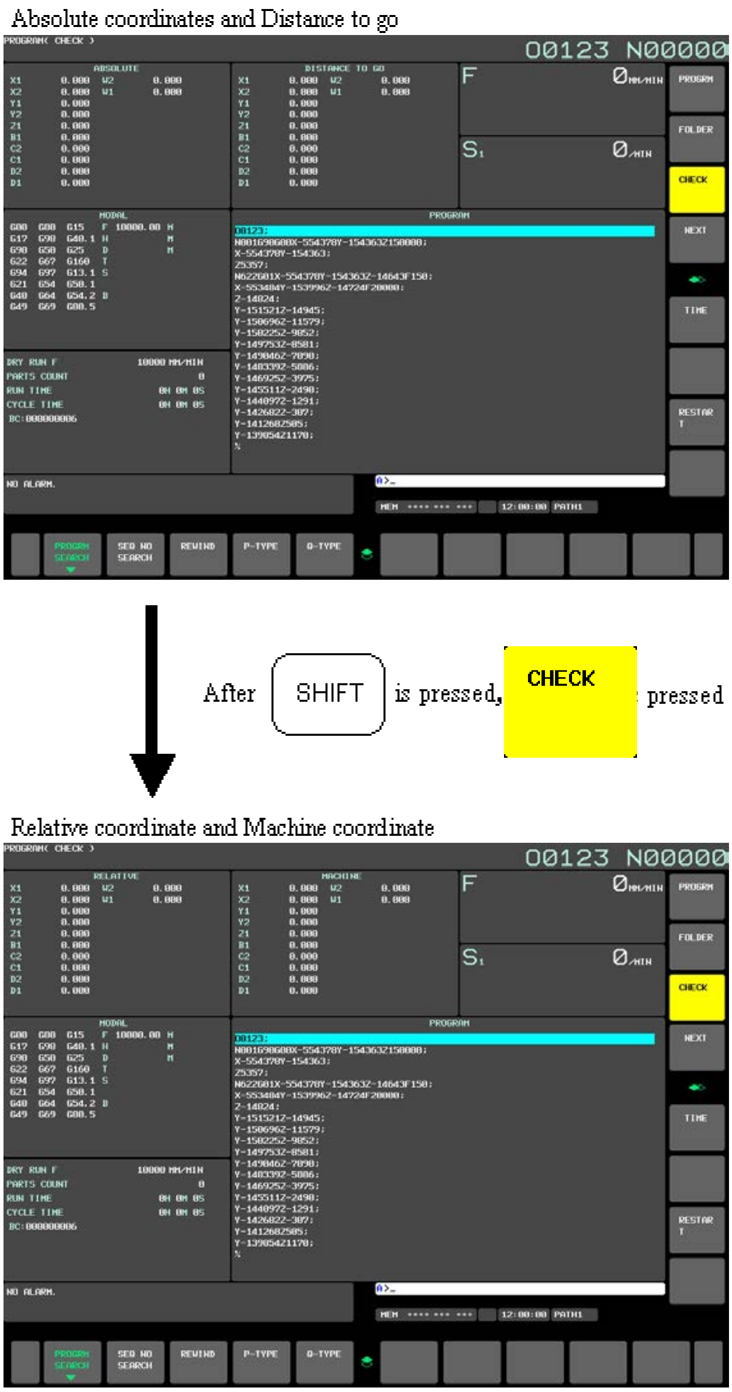

Fig. 13.1.23 (h) Display change example in 15 inch.

About the function for which this function is effective

This function is effective to positional coordinate screen concerning the following functions.

- Handle interruption
- Program restart
- Hypothetical axis
- Operating monitor display

This function is ineffective to positional coordinate screen concerning the following functions

- 3-dimensional manual feed
- Simultaneous display of multiple paths

Parameter

11305	Maximum number of simultaneous displaying axes

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 2

The maximum number of simultaneous displaying axes can be selected from 5, 10 and 20 axes by setting this parameter. The table below indicates the correspondence between the max number of simultaneous displaying axes and the setting value.

Maximum number of simultaneous displaying axes	5	10	20
Setting	0	1	2

When the value other than 1 and 2 is set, the specification of 0 is assumed.

11307	The order of displaying coordinates of current position display

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 5

Set the order of coordinates displayed in the screen of the following size.
10.4inch, 15inch

- Overall Position Display
- Overall Position Display of each screen

When the maximum number of simultaneous displaying axes is 20 (Parameter No.11305=2), Coordinates displayed in the position display of each screen at the same time are two pairs. The combination of two coordinates is decided by setting the order of displaying four coordinates systems displayed in overall position display screen (parameter No.11307).
At power-on, the first combination of coordinate is displayed. You can change it the second one by pressing selection chapter soft key to selection after ⇧ SHIFT key. When you do it again, the combination of coordinates is changed to the first one.
The correspondence of the order of the display and set value of coordinates is as follows.

Setting Value \ Order of displaying coordinates	1	2	3	4
0	Relative coordinates	Absolute coordinates	Machine coordinates	Distance to go
1	Relative coordinates	Machine coordinates	Absolute coordinates	Distance to go
2	Relative coordinates	Distance to go	Absolute coordinates	Machine coordinates
3	Absolute coordinates	Machine coordinates	Relative coordinates	Distance to go
4	Absolute coordinates	Distance to go	Relative coordinates	Machine coordinates
5	Machine coordinates	Distance to go	Relative coordinates	Absolute coordinates

When the value not within the valid data range is set, the specification of 0 is assumed.
When simultaneous display of multiple path is effect (Parameter No.13131≠0, parameter No.13132≧1), this parameter is ineffective.

13.1.24 Warning Function Against Modification of Setting

13.1.24.1 Overview

This function is to protect important setting of parameters, C Language Executor programs, or ladder programs on CNC and to detect unauthorized modifications on them. The following parameters and programs can be protected.

- CNC Parameters (which are selected to be protected)
- C Language Executor program
- Ladder program (each of multi-path PMC programs)
- Dual Check Safety PMC Ladder program

After the registration of above parameters, C Language Executor programs, or ladder programs to this function, those are verified by CNC, when the power of CNC is turned on. If any modification is applied to registered parameters, C Language Executor programs, or ladder programs the signal that means some modification is applied is output. And in this case, it is also possible to generate the alarm.
This is an optional function.

Procedure for protecting parameters, C Language Executor programs, or ladder programs

Procedure

Preparation for registering protected parameters, C Language Executor programs, or ladder programs.

1) Install C Language Executor programs or ladder programs to be protected into the flash ROM.
2) Set the value of parameters to be protected.
3) Edit the ladder program and Dual Check Safety ladder program, if necessary.

Registration of protected parameters, C Language Executor programs, or ladder programs on setting screen.

4) Enter password to enable operations on setting screen. (Refer to 13.1.24.3 and 13.1.24.4)
   By this operation, the following operations 5), 6), 7) are enabled.
5) Change the setting of items, if necessary. (Refer to 13.1.24.2)
6) Select the parameters to be protected. (Refer to 13.1.24.7)
7) Register the parameters, C Language Executor programs, or ladder programs to be protected. (Refer to 13.1.24.3)
   After this operation, if any unauthorized modification to the selected parameters, C Language Executor programs, or ladder programs is detected, CNC outputs signal and alarm.

8) Disable operations on setting screen. (Refer to 13.1.24.3)
Even if the power of CNC is turned off or the screen is switched to other one without the operation 8), operations on the setting screen become disabled automatically

Procedure for cancelling protection of parameters, C Language Executor programs, or ladder programs

Procedure

Cancelling protection of parameters, C Language Executor programs, or ladder programs to be protected on setting screen

1) Enter password to enable operations on setting screen. (Refer to 13.1.24.3 and 13.1.24.4)
By this operation, the following operation 2 is enabled
2) Cancel protection of parameters, C Language Executor programs, or ladder programs. (Refer to 13.1.24.6)
After this operation, the protection is cancelled.
3) Disable operations on the setting screen. (Refer to 13.1.24.3)
Even if the power of CNC is turned off or the screen is switched to other one without this operation, operations on the setting screen become disabled automatically.

13.1.24.2 MODIFICATION WARNING SETTING screen

The operation and displayed information for this function are operated on the MODIFICATION WARNING SETTING screen.

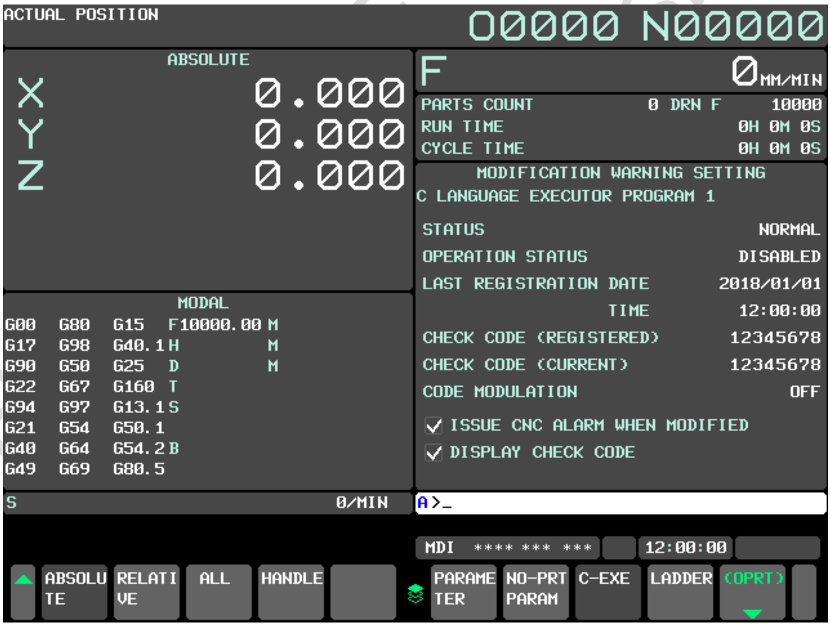

Fig 13.1.24.2 (a) MODIFICATION WARNING SETTING screen

There are separate setting screens for each item to be protected as follows.
You can switch to each setting screen by soft key operation.

MODIFICATION WARNING SETTING screens
- Setting screen for CNC parameters
- Setting screen for non-protected parameters
- Setting screen for C language executor program
- Setting screen for ladder program (Dual Check Safety ladder program is contained.)

> **NOTE**
> 1. You can select any parameters to be protected. Refer to the section "13.1.24.7 Selection of parameters".
> 2. Each ladder program for the 1st – 5th path PMC and Dual check safety PMC can be protected independently. Each ladder program is protected by independent password and settings.

Display setting screen

Procedure

1) Press function key .
2) Press chapter selection soft key [MODIFY WARN].
3) Press the following soft key according to the item which you want to display.

[PARAMETER]	:	CNC parameters
[NO-PRT PARAM]	:	Non-protected parameters
[C-EXE]	:	C Language Executor program
[LADDER]	:	Ladder program (Dual Check Safety ladder program is contained.)

> **NOTE**
> Setting screen for ladder program and setting screen for dual check safety ladder program can be switched with the MDI key [PAGE UP], [PAGE DOWN]. When the key [PAGE UP] / [PAGE DOWN] is pushed, the screen changes in the following sequence.
> 1) 1st path ladder program
> 2) 2nd path ladder program
> 3) 3rd path ladder program
> 4) 4th path ladder program
> 5) 5th path ladder program
> 6) Dual check safety ladder program

Items on setting screen

The following items are displayed on each setting screen.

1) STATUS : Modification status
   NORMAL : Not modified
   MODIFIED : Modified
2) OPERATION STATUS : Status of operations on setting screen
   ENABLED : Operations for changing the items on the setting screen are enabled
   DISABLED : Operations are disabled
3) LAST REGISTRAION DATE and TIME: Registered date
4) CHECK CODE (REGISTERED) : Registered check code
5) CHECK CODE (CURRENT) : Current check code
6) CODE MODULATION : Code-modulation status of C Language Executor program
   ON : Modulated (difficult to analyze)
   OFF : Not modulated (normal C Language Executor program)

> **NOTE**
> 1. Current check code is displayed on "CHECK CODE (CURRENT)"
>   When the parameter is changed, check code after it changes is displayed.
> 2. "CODE MODULATION" is displayed only in the setting screen for C Language Executor program.
>   For details of code modulation, refer to the manual about C Language Executor programming.

Setting items

You can set the following setting items on each setting screen. When you are to change those setting items, enter the password to enable operations on setting screen.

1) When the modification is detected, CNC alarm is "generated" or "not generated".
2) On the setting screen, check code is "displayed" or "not displayed".

Procedure

1) Switch to the setting screen
   Switch to the screen where you want to change the setting by soft key operation.
2) Enable operations on the setting screen
   Press soft key [(OPRT)], then enter password and press the soft key [PASSWORD]. In this case, the entered character is displayed as "*". When the entered password is correct, the OPERATION STATUS becomes "ENABLED".
3) Select the setting item
   Move the cursor to a setting item that you want to change.
4) Change setting
   Change the setting by pressing soft key [ON:1] or [OFF:0].
5) Disable operations on the setting screen
   Press soft key [LOCK] to disable operations on the setting screen.

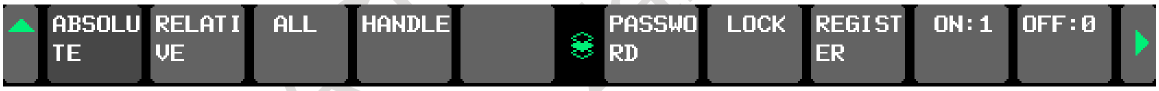

Fig 13.1.24.2 (b) Soft key of MODIFICATION WARNING SETTING screen

> **NOTE**
> 1. The initial password "FFFF" is set to this function when shipping of CNC. Before using this function at the first time, enter the initial password and change password to another one.
> 2. Operation status becomes "DISABLED" form "ENABLED" automatically in the following cases.
>   - When switching to other screens.
>   However, the state of the "operation enabled" is maintained in switching between the screen for CNC PARAMETER SETTING and NON-PROTECTED PARAMETER SETTING screen.
>   - The power of CNC is turned off and on.
> 3. In the state of the "operation disabled", the cursor of the check box and soft key [LOCK], [REGISTER], [ON:1], [OFF:0] are not displayed.

13.1.24.3 Registration and protection parameters, C Language Executor programs, or ladder programs.

You can register parameters, C Language Executor programs, or ladder programs on each setting screen. When a screen is displayed, operations for changing the setting items on the screen are disabled by password. When you change any setting item, you have to enter the password first.
Each setting screen has independent password.

Procedure for registering parameters, C Language Executor programs, or ladder programs

Procedure

1) Switch to the setting screen
   Switch to the screen where you want to change the setting by soft key operation.
2) Enable operations on the setting screen
   Press soft key [(OPRT)], then enter password and press the soft key [PASSWORD]. In this case, the entered character is displayed as “*”. When the entered password is correct, the OPERATION STATUS becomes “ENABLED”.
3) Registration
   Press the soft key [REGISTER].
4) Disable operations on the setting screen
   Press soft key [LOCK] to disable operations on the setting screen.

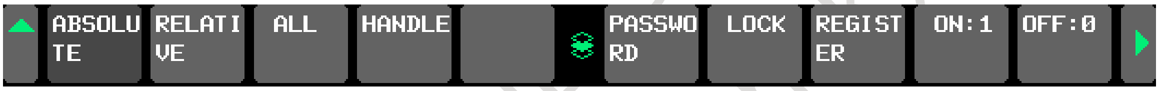

Fig 13.1.24.3 (a) Soft key of MODIFICATION WARNING SETTING screen

> **NOTE**
> 1. The initial password “FFFF” is set to this function when shipping of CNC. Before using this function at the first time, enter the initial password and change password to another one.
> 2. Even after some parameters are registered, you can modify the parameter. But, if you turn off the power of CNC after modifying parameters, CNC will notify the modification of parameters when starting up of CNC. Then, corresponding signal is set and the alarm is generated if you select the setting item to generate the alarm. To remove this notification by signal and alarm, you should restore the registered parameters or register the modified parameters. By this operation, the signal is reset and the alarm is cleared.
> 3. Even if any parameters, C Language Executor programs, or ladder programs are not registered, you can disable operations on setting screen. However in this case, the parameters, C Language Executor programs, or ladder programs are not protected.
> 4. Operation status becomes “DISABLED” form “ENABLED” automatically in the following cases.
>   - When switching to other screens.
>   However, the state of the "operation enabled" is maintained in switching between the screen for CNC PARAMETER SETTING and NON-PROTECTED PARAMETER SETTING screen.
>   - The power of CNC is turned off and on.
> 5. In the state of the "operation disabled", soft key [LOCK], [REGISTER], [ON:1], [OFF:0] are not displayed.

13.1.24.4 Change of password

You can change password on each MODIFICATION WARNING SETTING screen.
When changing the password, you need to enter current password on the setting screen.

> **NOTE**
> Changing password is not necessary to register parameters, C Language Executor programs, or ladder programs. You can repeatedly register parameters, C Language Executor programs, or ladder programs using the same password.

Procedure for changing password

Procedure

1) Switch to the setting screen
   Switch to the screen where you want to change the password by soft key operation.
2) Enable operations on setting screen
   Press soft key [(OPRT)], then enter password and press the soft key [PASSWORD]. In this case, the entered character is displayed as “*”. When the entered password is correct, the OPERATION STATUS becomes “ENABLED”.
3) Enter new password
   Enter new password and press soft key [PASSWORD]. Repeat this operation twice. If these two passwords are same, the password will be changed with the message “PASSWORD CHANGED” on the screen.
   If the two passwords are different, the message “PASSWORD MISMATCH” is displayed, and the password is not changed.
   In either case, the OPERATION STATUS is kept “ENABLED” and you are enabled to perform other operations on the setting screen.
4) Disable operations on setting screen
   Press soft key [LOCK] to disable operations on the setting screen.

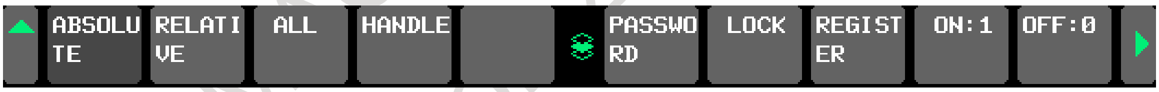

Fig. 13.1.24.4 (a) Soft key of MODIFICATION WARNING SETTING screen

> **NOTE**
> 1. Following characters are available for password.
>   If the lower case alphabetical character, a-z, is set, it is recognized as identical to corresponding upper case alphabetical character, A-Z.
>   - “A” to “Z”, “a” to “z”, “0” to “9”
> 2. The initial password “FFFF” is set to this function when shipping of CNC. When using this function at the first time, enter the initial password to enable operations on setting screen and change password to another one. In other words, when the initial password is set, you cannot execute any operation without changing password.
> 3. You cannot set “FFFF” as a new password.
> 4. In the state of the "operation disabled", soft key [LOCK], [REGISTER], [ON:1], [OFF:0] are not displayed.

13.1.24.5 Notification of the modification of setting

When any parameters, C Language Executor programs, or ladder programs are registered to this function, CNC verifies them at start up of the CNC. When any modification is detected, corresponding signals will be set to notify. In addition, you can enable setting item of this function to generate CNC alarm when any modification is detected.
If you are to remove those notifications of modification, which are resetting signals and clearing CNC alarm, you have to restore the registered parameters, C Language Executor programs, or ladder programs, or you have to register the modified parameters or programs to this function.

> **NOTE**
> When some modification is detected, the notification signals are always set. There is no setting item to specify whether or not to set these signals.

13.1.24.6 Unregistration and canceling protection of parameters, C Language Executor programs, or ladder programs

If you would like to cancel protection of parameters, C Language Executor programs, or ladder programs, unregister the check codes of them on each setting screen. When a screen is displayed, operations for changing the setting items on the screen are disabled by password. When you change any setting item, you have to enter the password first.
Each setting screen has independent password.

Procedure for unregistering of parameters, C Language Executor programs, or ladder programs

Procedure

1) Switch to the setting screen.
   Switch to the screen where you want to change the setting by soft key operation.
2) Enable operations on the setting screen.
   Software key [(OPRT)] is pushed.
   Enter password and press the soft key [PASSWORD]. In this case, the entered character is displayed as “*”.
   When the entered password is correct, the operation status becomes “ENABLED”.
3) Unregistration.
   Press the continuous menu key and press the soft key [UNREGISTER].
4) Disable operations on the setting screen.
   Press soft key [LOCK] to disable operations on the setting screen.

Fig. 13.1.24.6 (a) Soft key of MODIFICATION WARNING SETTING for parameters (Page 1, 2)

NOTE

1. When unregistering, the password is maintained.
2. Operation status becomes “DISABLED” form “ENABLED” automatically in the following cases.
   - When switching to other screens.
     However, the state of the "operation enabled" is maintained in switching between the screen for CNC PARAMETER SETTING and NON-PROTECTED PARAMETER SETTING screen.
   - The power of CNC is turned off and on.
3. In the state of the "operation disabled", soft key [LOCK], [REGISTER], [ON:1], [OFF:0] are not displayed.

13.1.24.7 Selection of parameters

Any parameters can be selected to be protected or not to be protected by definition of non-protected parameters from all of the parameters. Maximum 50 sets of the range of non-protected parameters can be defined.

Parameters not to be protected can be defined on NON-PROTECTED PARAMETER SETTING screen.

Before the setting on this screen, the operations have to be enabled by entering the password on MODIFICATION WARNING SETTING screen for parameters. If the operations on the setting screen are not enabled, you can not define the non-protected parameters.

Moreover, the parameter changed by the system is excluded from the protected parameter.

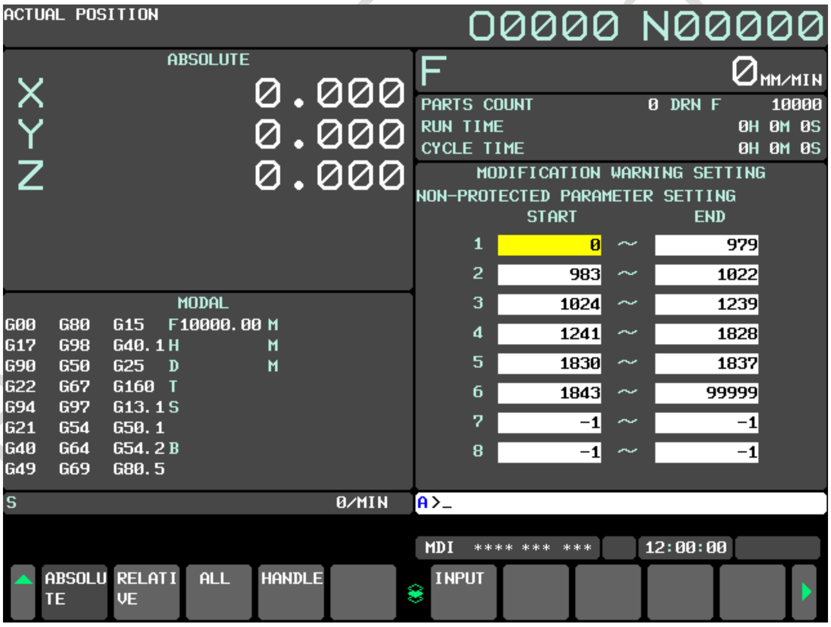

Fig 13.1.24.7 (a) NON-PROTECTED PARAMETER SETTING screen

Setting non-protected parameters

Procedure

1) Change to MDI mode.
2) Enable operations on the setting screen for parameters.
3) Press the return menu key.
4) Press the soft key [NO-PRT PARAM]. NON-PROTECTED PARAMETER SETTING screen is displayed.
5) Move cursor by cursor key ↑ ↓ ← → and page key PAGE ↑ PAGE ↓, then set the range of non-protected parameters to “START NO.” and “END NO” by soft key [INPUT] or [+INPUT].

6) If all of the setting has been finished, press soft key [RETURN] to switch to MODIFICATION WARNING SETTING screen for parameters.
7) Press soft key [REGISTER] to calculate check code from current parameter values. Then the calculated check code is displayed on the item “CHECK CODE(REGISTERED)” and “CHECK CODE(CURRENT)”
8) Press soft key [LOCK] to disable operations on setting screen.

Fig 13.1.24.7 (b) Soft key of MODIFICATION WARNING SETTING screen for parameters (Page 1,2)

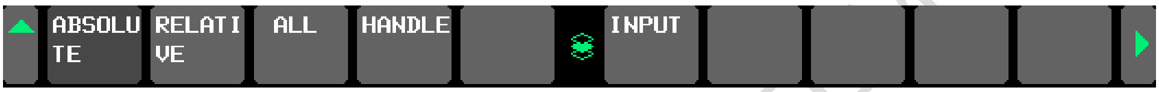

Fig 13.1.24.7 (c) Soft key of NON-PROTECTED PARAMETER SETTING screen (Page 1)

> **NOTE**
> 1 Even if operations on the setting screen for parameters are prohibited, the NON-PROTECTED PARAMETER SETTING screen can be displayed. But, non-protected parameters cannot be set. (Cursor and soft key [INPUT] are not displayed.)
> 2. Operation status becomes “ENABLED” form “DISABLED” automatically in the following cases.
> - When switching to other screens.
>   However, the state of the "operation enabled" is maintained in switching between the screen for CNC PARAMETER SETTING and NON-PROTECTED PARAMETER SETTING screen.
> - The power of CNC is turned off and on.

Setting file of non-protected parameters

Non-protected parameters can be defined also by input of a text file describing the ranges of non-protected parameters in designated format from external I/O devices.
Before input of the file from external I/O device, enable the operations on the screen by entering the correct password on MODIFICATION WARNING SETTING screen for parameters.
And setting of non-protected parameters can be output to external I/O devices. In case of output, you need not to enter the password.
The default name of setting file of non-protected parameters is “MDPRMSET.TXT”.

Example
In case of protecting the following parameters
No.980 - No.982
No.1023
No.1240
N0.1829
No.1838 - No.1842

```
%
G10L99;
N1S0E979;
N2S983E1022;
N3S1024E1239;
N4S1241E1828;
N5S1830E1837;
N6S1843E99999;
G11;
%
```

Input the setting file of non-protected parameters

Procedure

1) Make sure the external I/O device is ready for input.
2) Change to EDIT mode by operating the machine operator's panel or enter emergency stop state.
3) Enable operations on the setting screen for parameters.
4) Press the return menu key.
5) Press the soft key [NO-PRT PARAM]. NON-PROTECTED PARAMETER SETTING screen is displayed.
6) Press the continuous menu key , and then press soft key [F INPUT].
7) Type the name of the file that you want to input.
   If the input file name is omitted, default input file name "MDPRMSET.TXT" is assumed.
8) Press the soft key [EXEC].
   This starts input, and "INPUT" blinks in the lower right part of the screen. When the input operation ends, the "INPUT" indication disappears.
9) After input has been finished, press the return menu key.
10) Press the soft key [PARAMETER]. The setting screen for parameters is displayed.
11) Press the soft key [REGISTER] to calculate the check code.
12) Press the soft key [LOCK] to disable operations.

Fig 13.1.24.7 (d) Soft key of NON-PROTECTED PARAMETER SETTING screen (Page2)

NOTE
In the state of the "operation disabled", soft key [F input] is not displayed.

Output the setting file of non-protected parameters

Procedure

1) Make sure the external I/O device is ready for output.
2) Change to EDIT mode by operating the machine operator's panel or enter emergency stop state.
3) Press the soft key [NO-PRT PARAM]. NON-PROTECTED PARAMETER SETTING screen is displayed.
4) Press the continuous menu key , and then press soft key [F OUTPUT].
5) Type the name of the file that you want to output.
   If the output file name is omitted, default output file name "MDPRMSET.TXT" is assumed.
6) Press the soft key [EXEC].
   This starts input, and "OUTPUT" blinks in the lower right part of the screen. When the input operation ends, the "OUTPUT" indication disappears.
7) After output has been finished, press the return menu key.

Fig13.1.24.7 (e) Soft key of NON-PROTECTED PARAMETER SETTING screen (Page2)

Parameters excluded from protected parameters

Table 13.1.24.7 (a) Parameters excluded from protected parameters

Parameter No.	Description
1244	Coordinates of the floating reference position for each axis
1301	Stored stroke check
1320 to 1321	Coordinates at the boundary of stored stroke check 1
1330 to 1348	Chuck and tail stock barrier
3233	Program edit
3281	Displaying language
3290	Offset
4803, 4840 to 4843	Spindle position
4911 to 4914	Spindle speed fluctuation detection
5130	Cutting value (chamfering value) in thread cutting cycles G92 and G76
5132 to 5133	Depth of cut and escaping amount of multiple repetitive canned cycles G71 and G72
5134	Clearance value of multiple repetitive canned cycle G71 and G72
5135	Escaping amount of X axis in multiple repetitive canned cycle G73
5136	Escaping amount of Z axis in multiple repetitive canned cycle G73
5137	Divide number of multiple repetitive canned cycle G73
5139	Return amount in multiple repetitive canned cycle G74 and G75
5140	Minimum depth of cut in multiple repetitive turning canned cycle G76
5141	Finishing allowance in multiple repetitive turning canned cycle G76
5142	Repetition count of final finishing in multiple repetitive turning canned cycle G76
5143	Tool nose angle in multiple repetitive turning canned cycle G76
5402	Manual handle interruption
5660 to 5677	Flexible synchronization control
5680 to 5687, 5690 to 5693	Flexible synchronization control
6404	Manual handle
6510	Specifying the graphic coordinate system
6581 to 6595	Color number of character
6750	Integrated value of power-on period
7220 to 7283	Name of general-purpose switch on software operator's panel
7310	Program restart
8210	Slant angle
8370 to 8374	Oscillation
8860 to 8861	Trouble diagnosis function
8900	PWE
8940 to 8949	Initial screen title character code
10000 to 10329	Tool offsets
10331 to 10332	External workpiece zero point offsets
10421 to 10435, 10461 to 10475	Screen display colors
10601 to 10719	Waveform diagnosis
11221	Tilted working plane indexing
11309	Menu number selected in pattern menu display
11318	Program list screen
11329 to 11331, 11334 to 11337, 11341 to 11349	Dynamic graphic display function
11355 to 11356	Display
11358 to 11359	Parameter check sum
11364	Program edit
11369	Warning function against modification of setting

Parameter No.	Description
11496	Measurement result of thread groove
11501	Machine lock shift value check
11505	Code of Input/Output of data of USB memory
12801 to 12820, 12841 to 12860	Operation history signal selection
13151	Serial number for the files output to a memory card by external output command DPRNT/BPRNT
13203 to 13204, 13206	Tool management function
13420, 13425 to 13440	Flexible synchronization control
14500 to 14637	SERVO GUIDE Mate
14717	C axis’s number in simulation (for MGi)

Table 13.1.24.7 (b) Parameters excluded from protected parameters (Machining condition selecting function is valid)

Parameter No.	Description
1432	Maximum cutting feedrate for all axes in the look-ahead acceleration / deceleration before interpolation
1660	Maximum allowable acceleration rate in look-ahead acceleration/deceleration before interpolation for each axis
1735	Maximum allowable acceleration rate for the deceleration function based on acceleration in circular interpolation for each axis (Only at the setting of No.13600#0=0)
1737	Maximum allowable acceleration rate for the deceleration function based on acceleration in AI contour control for each axis
1769	Time constant for acceleration/deceleration after cutting feed interpolation in the look-ahead acceleration/deceleration before interpolation mode
1772	Acceleration change time of look-ahead bell-shaped acceleration/deceleration before interpolation
1783	Maximum allowable feedrate difference for feedrate determination based on corner feedrate difference
1788	Maximum allowable acceleration change rate in feedrate determination based on acceleration change for each axis
1789	Maximum allowable acceleration change rate in feedrate determination based on acceleration change for each axis (linear interpolation)
1790	Ratio of change time of the rate of change of acceleration in look-ahead smooth bell-shaped acceleration/deceleration before interpolation
13634	Current precision level in AI contour control

Table 13.1.24.7 (c) Parameters for setting the parameter numbers of parameters to be excluded from protected parameters (Machining condition selecting function is valid)

Parameter explanation
Parameter whose number is set in parameter No.13628 (Parameter number corresponding to arbitrary item 1 when AI contour control is used)
Parameter whose number is set in parameter No.13629 (Parameter number corresponding to arbitrary item 2 when AI contour control is used)

NOTE

1. If machining condition selecting function is invalid, parameters in table 13.1.24.7 (b) and table 13.1.24.7 (c) are contained in protected parameters
2. If machining condition selecting function is invalid, parameters in table 13.1.24.7 (d) are contained in protected parameters.
3. The parameters of which numbers are set in parameter Nos. 13628 and 13629 are excluded, but parameter Nos. 13628 and 13629 are not excluded.
4. Setting parameters and locked parameters are contained in non-protected parameters.
5. When the CNC software edition is changed, the alarm (DS5350) might be generated. In this case, register the parameter again.

13.1.24.9 Signals

Notification signal for modification of C Language Executor program
CDCEX <F0558.0>

[Classification] Output signal
[Function] Notify the modification of C Language Executor program
[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

Notification signal for modification of 1st path PMC Ladder program
CDLAD1 <F0558.1>

[Classification] Output signal
[Function] Notify the modification of 1st path PMC Ladder program
[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

Notification signal for modification of 2nd path PMC Ladder program
CDLAD2 <F0558.2>

[Classification] Output signal
[Function] Notify the modification of 2nd path PMC Ladder program

[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

---

Notification signal for modification of 3rd path PMC Ladder program
CDLAD3 <F0558.3>

[Classification] Output signal
[Function] Notify the modification of 3rd path PMC Ladder program
[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

---

Notification signal for modification of Dual Check Safety PMC Ladder program
CDDCL <F0558.4>

[Classification] Output signal
[Function] Notify the modification of Dual Check Safety PMC Ladder program
[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

---

Notification signal for modification of CNC parameter
CDPRM <F0558.5>

[Classification] Output signal
[Function] Notify the modification of selected CNC parameters
[Output condition] When this signal becomes 0, any selected CNC parameters are not modified or not registered
When this signal becomes 1, some selected CNC parameters are modified

---

Notification signal for modification of 4th path PMC Ladder program
CDLAD4 <F0558.6>

[Classification] Output signal
[Function] Notify the modification of 4th path PMC Ladder program
[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

---

Notification signal for modification of 5th path PMC Ladder program
CDLAD5 <F0558.7>

[Classification] Output signal
[Function] Notify the modification of 5th path PMC Ladder program
[Output condition] When this signal becomes 0, the program is not modified or not registered
When this signal becomes 1, the registered program is modified

13.1.24.10 Alarm and Message

Number	Message	Contents
DS5345	C-EXECUTOR VERIFY ERROR	C Language Executor program has been modified. Restore the registered program or register the modified program.
DS5346 DS5347 DS5348 DS5352 DS5353	LADDER PROGRAM VERIFY ERROR	Ladder program has been modified. Restore the registered ladder program or register the modified ladder program.
DS5349	DCS LADDER PROGRAM VERIFY ERROR	Ladder program of Dual Check Safety PMC has been modified. Restore the registered ladder program or register the modified ladder program.
DS5350	PARAMETER VERIFY ERROR	CNC parameter has been modified. Restore the registered parameters or register the modified parameters.

NOTE

The following DS alarm numbers are corresponding to ladder program of multi-path PMC

DS5346 = 1st path PMC ladder program
DS5347 = 2nd path PMC ladder program
DS5348 = 3rd path PMC ladder program
DS5352 = 4th path PMC ladder program
DS5353 = 5th path PMC ladder program

13.1.25 Title Display Function in Initial Screen

Overview

The character string (up to 10 characters) set by the parameter is displayed on the initial screen immediately after power-on.

Details

The character string set by parameter No.8940 to No.8949 can be displayed on the initial screen immediately after power-on as shown in the following figure 13.1.25 (a). ("ABCDE01234" is displayed in the example of figure)

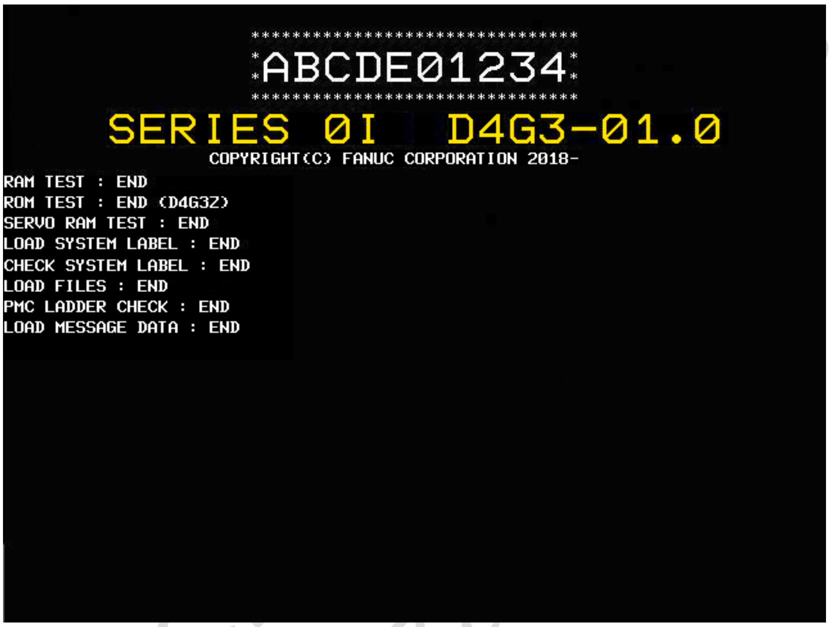

Fig.13.1.25 (a) Title display in initial screen（10.4” display unit）

The character string is enclosed with the frame (* mark) and displayed. The color of the character is only white. It is possible to display up to ten characters, and the character that can be used is the following characters.

0 to 9
A to Z
“-”（Negative sign）
“.”（period）
“ ”（space）

The frame becomes small in proportion to the number of characters when character strings are less than 10 characters.
Character string, series name, and COPYRIGHT are displayed at the center for the 10.4” display unit. However, in 15” display unit, it is displayed as shown in the following figure 13.1.25 (b).

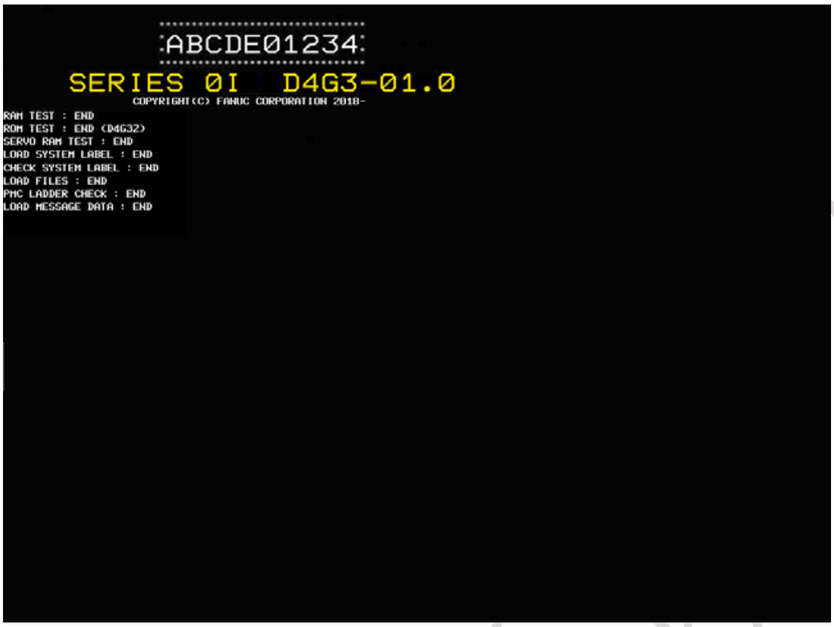

Fig.13.1.25 (b) Title display in initial screen（15” display unit）

When parameter No.8940-No.8949 is not set (When the parameter is all 0), the character string is not displayed. A conventional initial screen is displayed as shown in Figure 13.1.25 (c).

Fig.13.1.25 (c) Initial screen（conventional display）

NOTE

1. The character string is displayed also on the IPL screen. However, when the IPL menu screen ends, a conventional screen is displayed.
2. When the parameter is set by using "SRAM RESTORE" of the boot menu, the set character string is not displayed on an initial screen immediately after restore. It is necessary to restart CNC to display the character string.

Parameters

8940	**Initial screen title character code 1**
8941	**Initial screen title character code 2**
to	**to**
8949	**Initial screen title character code 10**

[Input type] Parameter input
[Data type] Byte
[Valid data range] 0,32,45,46,48 to 57,65 to 90

This parameter sets the character codes of the character string to be displayed on the initial screen immediately after power-on. If the number of characters to be displayed is less than 10, the parameters corresponding to the space exceeding the character length are set to 0.

The set character code is as follows.

A : 65	N : 78	0 : 48	
B : 66	O : 79	1 : 49	
C : 67	P : 80	2 : 50	
D : 68	Q : 81	3 : 51	
E : 69	R : 82	4 : 52	
F : 70	S : 83	5 : 53	
G : 71	T : 84	6 : 54	
H : 72	U : 85	7 : 55	
I : 73	V : 86	8 : 56	
J : 74	W : 87	9 : 57	
K : 75	X : 88	: 32	(Space)
L : 76	Y : 89	- : 45	(Negative sign)
M : 77	Z : 90	. : 46	(Period)
		: 0	(Null character)

When the codes other than the character that can be used are set, space is displayed.
When 10 parameters are all 0, this function is not executed.

Use example

For example, the parameter is set as follows when displaying as "FANUC_NC". ("_" is space)

Parameter No.	Input value
8940	70
8941	65
8942	78
8943	85
8944	67
8945	0
8946	78
8947	67
8948	0
8949	0

Character-code 0 is basically considered to be space, and it is treated as a null character when there is only character-code 0 since 0.
The input value “0” of parameter No.8945 is treated as space because there are character-codes other than 0 since No.8946.
The input value “0” of parameter No.8948 is treated as a null character because there is only character-code 0 since No.8949.

13.1.26 One-touch menu

Overview

By using One-touch menu, you can allocate shortcut key of screen witch you use frequently.
This function can be used with 10.4”, 15” and 19” display.

Signal

One-touch menu display signal WMDS <F0528.7>

[Classification] Output signal
[Function] This signal indicates that one-touch menu is being displayed.
[Output cond.] The signal is set to “1” when:
- One-touch menu is displayed.

The signal is set to “0” when:
- One-touch menu is not displayed.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
F0528	WMDS							

NOTE
This signal is set to “1” only while the one-touch menu is displayed.
If machine operation menu is displayed, this signal always becomes “0”.
Following display unit that can display one-touch menu is necessary for this signal.
10.4-inch, 15-inch, 19-inch

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3208			PSC	OFY	NOS			SKY

[Input type] Setting input
[Data type] Bit

#3 NOS The one-touch menu is
0: Displayed.
1: Not displayed.

3321	Screen number assigned to the 1st vertical soft key
to	to
3336	Screen number assigned to the 16th vertical soft key

[Input type] Parameter input
[Data type] Word
[Valid data range] 1 to 10000
Assign a screen number to be displayed as a shortcut to a vertical soft key.

The 1st to 8th vertical soft keys are displayed on page 1, and the 9th to 16th vertical soft keys are displayed on page 2.
When specifying page 2, be sure to specify "Display of next page" on each page.
When not specifying page 2, set 0 for the 9th to 16th soft keys.

In this case, page 2 is not used, so that "Display of next page" need not be specified on page 1.

If all of these parameters are 0 when turning on the power supply, one-touch menu of the default table is displayed.

NOTE
1 When screen numbers are specified in at least one of CNC parameters Nos. 3321 to 3336, the setting is valid. In the case, nothing is displayed in the vertical soft-key where 0 is specified in the parameter.
2 In order to display the default one-touch menu again, it is needed to turn off power after all of these parameters are set to 0.

24300	Time for One-touch menu to be closed (before switching screen)

[Input type] Parameter input
[Data type] Byte
[Unit of data] sec
[Valid data range] 0 to 127

The One-touch menu is automatically closed when the One-touch menu is not operated during the time set by this parameter before switching the screen with the One-touch menu.

24301	Time for One-touch menu to be closed (after switching screen)

[Input type] Parameter input
[Data type] Byte
[Unit of data] sec
[Valid data range] -1 to 127

The One-touch menu is automatically closed when the One-touch menu is not operated during the time set by this parameter after switching the screen with the One-touch menu.
If -1 is set, the one-touch menu closes at once after switching the screen.

Ex1)
In case that until switching the screen from One-touch menu is open, automatic close is invalid.
One-touch menu is closed automatically 5 second later after switching the screen.
No.24300 = 0, No.24301 = 5

Ex2)
In case that when One-touch menu is closed automatically with no operation of One-touch menu 10 second from open.
One-touch menu is closed automatically just after switching the screen.
No.24300 = 10, No.24301 = -1

NOTE
1 If 0 is set to parameter No.24300 and No.24301, One-touch menu is not closed automatically.
2 When the One-touch menu switched to the screen being displayed now is pressed, parameter No.24301 is applied though the screen doesn't switch.

13.2 EDIT

13.2.1 Memory Protection Keys

Overview

Memory protection keys can be provided so as not to inadvertently store, change, or delete programs, offset values, parameters, settings, and so forth.
For a multi-path system, protection keys are common to all paths.

Signal

Memory protection signals KEY1 to KEY4<G0046.3 to G0046.6>

[Classification] Input signal

[Function] These signals allow MDI panel operations that change the memory contents. There are the following four signals. The target memory contents depend on the setting of bit 7 (KEY) of parameter No.3290.

When the KEY is "0" :

KEY1 : Allows the input of tool offset values, workpiece origin offsets, and workpiece coordinate system shift values.
KEY2 : Allows the setting of data input, macro variable input, and tool life management data input.
KEY3 : Allows program registration and editing.
KEY4 : Allows PMC data (counter data table).

When the KEY is "1" :

KEY1 : Allows program registration, program editing, PMC data input.
KEY2 to KEY4 : Not used.

[Operation] If a memory protection signal is set to "0", the corresponding operation is disabled.
If a memory protection signal is "1", the corresponding operation is enabled.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0046		KEY4	KEY3	KEY2	KEY1			

NOTE
For a multi-path system, signal addresses are common to all paths.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3290	KEY							

[Input type] Parameter input
[Data type] Bit path

#7 KEY For memory protection keys:
0: The KEY1, KEY2, KEY3, and KEY4 signals are used.
1: Only the KEY1 signal is used.

NOTE

1 The functions of the signals depend on whether KEY=”0” or KEY=”1”.
When KEY = “0”:
- KEY1: Enables a tool offset value, workpiece zero point offset value, and workpiece shift value to be input.
- KEY2: Enables setting data, macro variables, and tool life management value to be input.
- KEY3: Enables program registration and editing.
- KEY4: Enables PMC data (counter and data table) to be input.

When KEY = “1”:
- KEY1: Enables program registration and editing, and enables PMC parameter input.
- KEY2 to KEY4: Not used

2 When a multi-path system is used, the setting for path 1 is followed.

13.2.2 Memory Protection Signal for CNC Parameter

Overview

It is possible to use a signal to enable and disable parameter writing. This function is enabled and disabled by setting bit 0 (PKY) of parameter No. 3299, and the signal KEYP<G0046.0> is used to enable and disable parameter input.
Conventionally, parameter writing was enabled and disabled on the setting screen.

Signal

Memory protection signal KEYP<G0046.0>

[Classification] Input signal
[Function] Enables or disables operation on CNC parameters from the MDI panel.
[Operation] If this signal is set to “0”, input of CNC parameters is disabled.
If this signal is set to “1”, input of CNC parameters is enabled.
This signal is valid only when bit 0 (PKY) of parameter No. 3299 is set to 1.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0046								KEYP

NOTE
For a multi-path system, the signal address is common to all paths.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3299								PKY

[Input type] Setting input
[Data type] Bit

#0 PKY "PARAMETER WRITE" is:
0: Set on the setting screen (bit 0 (PWE) of setting parameter No. 8900).
1: Set by the memory protection signal KEYP<G0046.0>.

Notes

- When bit 0 (PKY) of parameter No. 3299 is set to 1, “PARAMETER WRITE” on the setting screen cannot be set.
- When bit 0 (PKY) of parameter No. 3299 has been set to 1 and bit 0 (PWE) of parameter No. 8900 has been set to 0 at power-on, setting the signal KEYP<G0046.0> to “1” in the operation mode causes alarm SW0100 and stops operation.

13.2.3 MDI Key Setting

Overview

Because the type of the MDI keys of the CNC is determined automatically, no additional setting is required for the MDI keys. When the machine tool builder's own MDI keys are connected, valid key input is made possible by parameter setting.

Parameter

3160	Setting of MDI unit type

[Input type] Parameter input
[Data type] Byte
[Valid data range] 0 to 4

Set the type of an MDI unit when the type of an MDI unit is not automatically identified.

Setting value	Type
0	Depends on the system type and display unit type.
1	Standard MDI unit for the lathe system
2	Standard MDI unit for the machining center system

When 0 is set in this parameter, the type of a MDI unit is determined as follows:

Type of path control	Type of indicator	Type
When the type for the lathe system is used with path 1	Type of 12 horizontal soft keys	Standard MDI unit for the lathe system
When the type for the machining center system is used with path 1	Type of 12 horizontal soft keys	Standard MDI unit for the machining center system

13.3 MULTI PATH DISPLAY AND EDIT

13.3.1 Multi Path Display

Overview

In a multi path system, operations such as program creation and data input are performed with a display/operation target path selected by switching. For path selection, the path select signals are used. For a selected path, MDI key operation is performed.
By parameter setting, a selection can be made to display only one path on the screen at a time or display multiple paths on the screen simultaneously. When multiple paths are displayed simultaneously, the order of path display can be specified according to the machine configuration and layout.
Moreover, a selection can be made by a parameter to display the same screen at path switching or to store the last displayed screen of each path and display the last displayed screen of a selected path.

Explanation

- Multi path simultaneous display

Information about multiple paths can be displayed on one screen simultaneously.
Multi path information can be displayed simultaneously on the following screens:

- Absolute position screen
- Relative position screen
- Overall position display
- Program screen
- Program check screen
- Tool path graphic screen

MDI key operation is performed for a screen selected with the path select signals.
The maximum number of paths that can be displayed simultaneously depends on the size of the display unit as indicated in the Table 13.3.1 (a).

Table 13.3.1 (a)

Size of display unit	Maximum number of simultaneously displayable paths
7.2, 8.4, or 10.4”	3 paths
15”	4 paths

Setting of multi path simultaneous display

- Simultaneous display group

When paths more than the maximum number of simultaneously displayable paths are involved, the paths can be divided into several path groups for display. Those groups are referred to as multi path simultaneous display groups.

Example)

When four paths are handled on a 10.4” display unit, all paths cannot be displayed simultaneously. So, the paths are divided into two simultaneous display groups: a group consisting of paths 1, 2, and 3, and a group consisting of paths 4.

Table 13.3.1 (b)

Path number	Simultaneous display group number
1, 2, 3	1
4	2

Use parameter No. 13131 to set a multi path simultaneous group number. Parameter No. 13131 is a path-type parameter. In this parameter, specify a successive number not less than 1.
In this example, specify 1 in parameter No. 13131 for paths 1, 2, and 3, and specify 2 in parameter No. 13131 for paths 4.

- Display order number

In a multi path simultaneous display group, the order of path display can be specified.
Path information can be displayed in a desired order by specifying display order numbers.

Example)

When six paths are involved and divided into two groups and group 1 is displayed in the order from path 3 to path 2 to path 1 and group 2 is displayed in the order from path 4, specify display order numbers in each multi path simultaneous display group.

Table 13.3.1 (c)

Number of CNC paths	Path	Display group number (Parameter No. 13131)	Display order number (Parameter No. 13132)	Screen display (The numbers in the illustration below represent path numbers.)
4 paths	Path 1	1	3	3 | 2 | 1
	Path 2	1	2	
	Path 3	1	1	
	Path 4	2	1	4
	Path 5			
	Path 6			

Use parameter No. 13132 to set a display order number. Parameter No. 13132 is a path-type parameter. In this parameter, specify a successive number not less than 1 for each of the paths belonging to a multi path simultaneous display group.
In this example, specify 1, 2, and 3 for paths 3, 2, and 1 in display group number 1 respectively, and specify 1 for paths 4 in display group number 2 respectively.

- Example of setting simultaneous display groups and display order numbers

Number of CNC paths	Path	Display group number (Parameter No. 13131)	Display order number (Parameter No. 13132)	Screen display (The numbers in the illustration below represent path numbers.)	
1 path (*)	Path 1	0	0	Group 1	1
3 paths	Path 1	1	1	Group 1	1 | 2 | 3
	Path 2	1	2		
	Path 3	1	3		
	Path 1	1	1	Group 1	1
	Path 2	2	1	Group 2	2
	Path 3	3	1	Group 3	3
	Path 1	1	2	Group 1	2 | 1
	Path 2	1	1		
	Path 3	2	1	Group 2	3
4 paths	Path 1	1	2	Group 1	2 | 1 | 4
	Path 2	1	1		
	Path 3	2	1	Group 2	3
	Path 4	1	3		

NOTE
When the number of CNC paths is 1, multi path simultaneous display is disabled. In this case, parameters Nos. 13131 and 13132 need not be set.

Switching of simultaneous display group

When multi path simultaneous display groups are set, the screen display can be switched from the currently displayed path group to another by performing a group switching operation.
Two methods described below can be used to switch from one group to another in multi path simultaneous display.

- Switching by path select signal

By setting bit 0 (PGR) of parameter No. 11304 to 1, the display group switching function based on the path select signals can be enabled. The simultaneous display group including a path selected with the path select signals is displayed.

Number of CNC paths	Path	Display group number (Parameter No. 13131)	Display order number (Parameter No. 13132)	Path selected with the path select signals	Screen display (The numbers in the illustration below represent path numbers.) (Box in heavy lines: Selected path)
3 paths	Path 1	1	2	1	$\boxed{1}$ 2
	Path 2	1	1	2	1 $\boxed{2}$
	Path 3	2	1	3	$\boxed{3}$

- Switching by MDI key operation

The display group can be sequentially switched by SHIFT + PAGE ⇩ (pressing PAGE DOWN while holding down SHIFT) or SHIFT + PAGE ⇧.

Number of CNC paths	Path	Display group number (Parameter No. 13131)	Display order number (Parameter No. 13132)	Screen display (The numbers in the illustration below represent path numbers.) (Example of SHIFT+PAGE DOWN)
3 paths	Path 1	1	1	1 ⇨ 2 ⇨ 3
	Path 2	2	1	
	Path 3	3	1	
	Path 1	1	2	2 1 ⇨ 3
	Path 2	1	1	
	Path 3	2	1	

- Path select signal

The path select signals are used to select a path for which LCD/MDI operation and display are to be performed.
A path to be selected is determined using a combination of four signals.
The following four signals (HEAD) are used:

HEAD <G0063.0>
HEAD2 <G0062.7>
HEAD3 <G0408.1>
HEAD4 <G0408.2>

The table below indicates the relationships between the combinations of the path select signals and selected paths.

Path select signal				Selected path
HEAD4 <G0408.2>	HEAD3 <G0408.1>	HEAD2 <G0062.7>	HEAD <G0063.0>	
0	0	0	0	Path 1
0	0	0	1	Path 2
0	0	1	0	Path 3
0	0	1	1	Path 4

Parameter

13131	Group number for simultaneous display of multiple paths

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 4

This parameter sets a group for simultaneous display on one screen in a multi-path system.
The paths set to belong to the same group are displayed on one screen.
If the values for all paths are set to 0, the simultaneous multi-path display function is disabled.

> **NOTE**
> When specifying groups, specify group numbers not less than 1 successively.
> On 8.4" and 10.4" display units, up to three paths can be specified for simultaneous display.
> On a 15" and 19" display units, up to four paths can be specified for simultaneous display.

13132	Simultaneous multi-path display order number

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 1 to number of paths included in a simultaneous multi-path display group

This parameter sets the display order of a path defined to belong to a simultaneous multi-path display group.
Set the order, using numbers ranging from 1 to the number of paths included in the simultaneous multi-path display group.

[Example] Setting of simultaneous display group numbers and simultaneous display order numbers

Number of paths of CNC	Path	Display group number	Intra-group display order number	Screen display (Numbers represent displayed path numbers.)
One path	Path 1	1	1	1
Three path	Path 1	1	1	1 2 3
	Path 2	1	2	
	Path 3	1	3	
	Path 1	1	1	1 ⇨ 2 ⇨ 3
	Path 2	2	1	
	Path 3	3	1	
	Path 1	1	2	2 1 ⇨ 3
	Path 2	1	1	
	Path 3	2	1	

> **NOTE**
> Specify successive order numbers not less than 1 for the paths defined to belong to a group.

	#7	#6	#5	#4	#3	#2	#1	#0
3208			PSC					

[Input type] Setting input
[Data type] Bit

#5 PSC When the path is switched based on the path switch signal:
0: The screen display is switched to the last selected screen of the path.
1: The same screen as for the path before switching is displayed.

	#7	#6	#5	#4	#3	#2	#1	#0
11304								PGR

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 PGR When the path select signal is changed, the screen of the multi path simultaneous display group:
0: Is not switched.
1: Is switched to the display group including the selected path.

> **NOTE**
> This parameter is initial setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

Signal

Path select signals

HEAD<G063.0>, HEAD2<G0062.7>, HEAD3<G0408.1>, HEAD4<G0408.2>

[Classification] Input signal
[Function] These signals select the target path for which MDI operation and display are to be performed.
Operations with the MDI panel are performed for a path specified by the combination of HEAD, HEAD2, HEAD3, and HEAD4.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0

G0063								HEAD
G0408						HEAD4	HEAD3	

13.3.2 Simultaneous Multi Path Program Editing

Overview

Simultaneous multi path program editing allows the user to edit programs for more than one path on a single screen according to the settings of the simultaneous multi path display parameters (parameters Nos.13131 and 13132).
This function is enabled by setting bit 0 (DHD) of parameter No. 3106.
For details of parameter Nos. 13131 and 13132, see Subsection "Multi Path Display".

Screen display

Fig. 13.3.2 (a) to Fig. 13.3.2 (c) show sample screens on which simultaneous multi path program editing is being performed.
The status line in the upper part of each program shows the name of the program, "FG-EDIT" indicating that foreground editing is in progress, and the path name.
The status line of the currently edited program is highlighted.

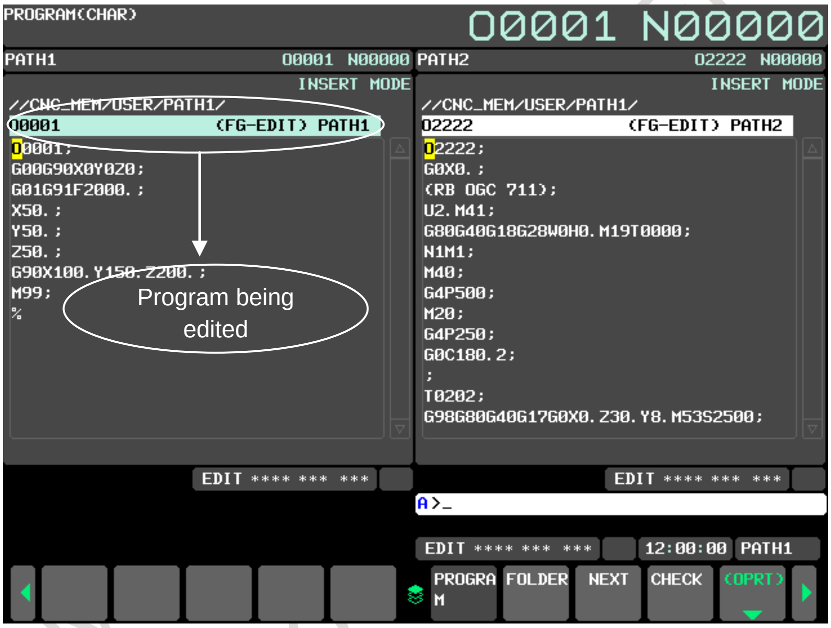

Fig. 13.3.2 (a) Simultaneous multi path program edit screen (10.4” display unit)

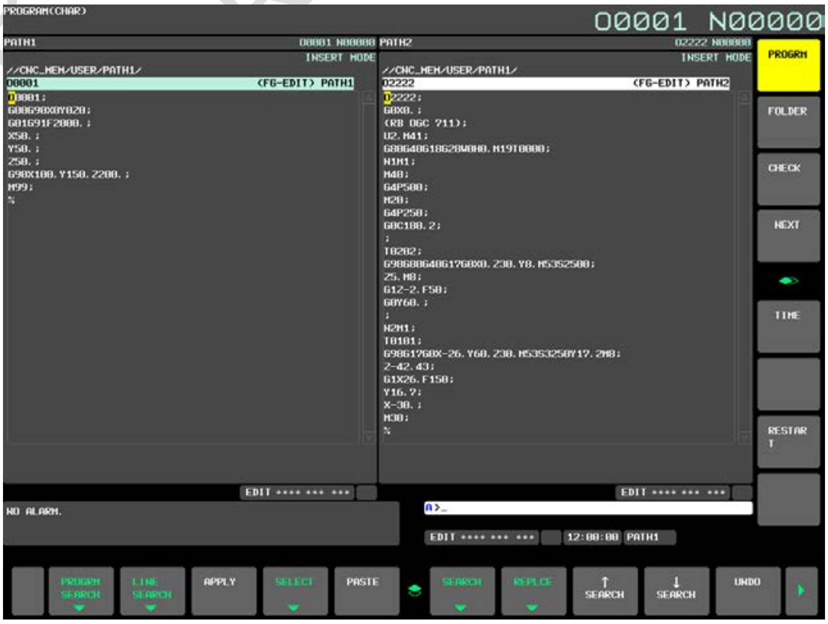

Fig. 13.3.2 (b) Simultaneous multi path program edit screen (15” display unit)

Explanation

- Mode

When the target paths for simultaneous display are in the EDIT mode or the MEM mode, the programs for these paths are displayed simultaneously on the program screen. When the EDIT mode is selected for a path, selecting that path allows program editing.
Fig. 13.3.2 (c) shows an example in which the EDIT mode and MEM mode are set together.
The first path is in the MEM mode (execution status screen), and the second path is in the EDIT mode (edit screen).
Soft keys are displayed according to the mod of the path currently selected.

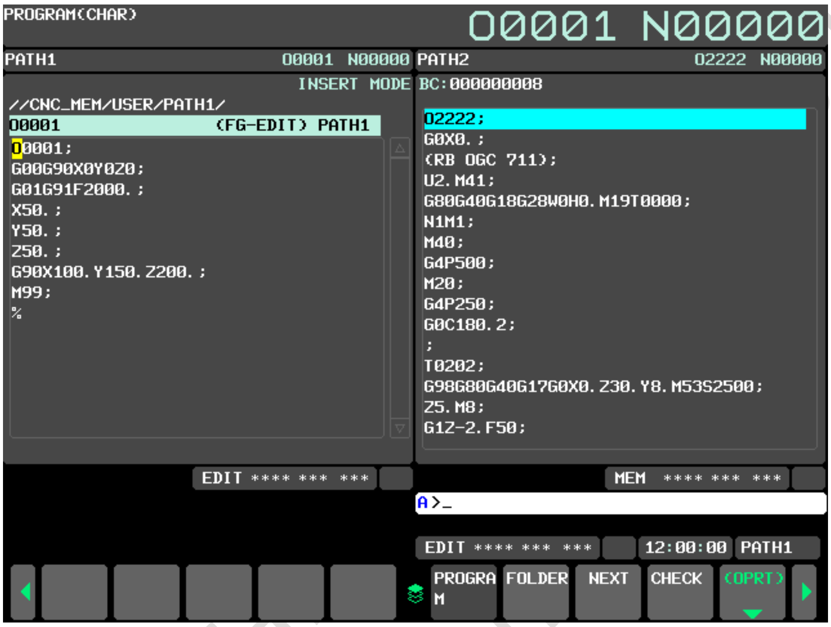

Fig. 13.3.2 (c) Screen showing the MEM mode and EDIT mode

- Changing the path to be edited

The path selected by the path selection signals is to be edited.

- Maximum number of paths for which simultaneous editing is enabled

The maximum number of paths for which simultaneous editing is enabled depends on the display unit as follows:

Display unit size	Maximum number of paths for simultaneous editing
8.4 and 10.4”	3 paths
15 and 19”	4 paths

- Conditions for disabling simultaneous editing

Simultaneous multi path program editing is disabled in the following cases:

- The program screen is displayed with the entire screen size.
- The paths selected for simultaneous display include a path that is in a mode other than the EDIT and MEM modes.
- The virtual MDI key function is enabled.

If background editing is started during simultaneous multi path program editing, background editing is performed with the entire screen size. Simultaneous multi path program editing and background editing cannot be performed at the same time.

- Simultaneous editing with a 8.4" display unit

When simultaneous editing is performed with a 8.4" display unit, displayed characters become smaller.
The number of characters displayed per path in the edit area is as follows:

- When simultaneous display is not performed, characters are displayed in 38 columns by 10 lines.
- For simultaneous display for one path, characters are displayed in 74 columns by 15 lines.
- For simultaneous display for two paths, characters are displayed in 35 columns by 14 lines.
- For simultaneous display for three paths, characters are displayed in 22 columns by 14 lines.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3106								DHD

[Input type] Setting input
[Data type] Bit

#0 DHD On the program screen:
0: Only a selected path can be edited and displayed.
1: Multiple paths can be edited and displayed at the same time.

13.4 HIGH-SPEED PROGRAM MANAGEMENT

Overview

When many kinds of machining is arranged, this function can achieve the short processing time when many programs are registered collectively or all programs are deleted. The program is not saved automatically to nonvolatile memory at registration, modification, or deletion of program.

Explanation

In conventional program management, the program is saved automatically to nonvolatile memory at registration, modification, or deletion of one program. Therefore, if many programs are registered at a time or all programs are deleted, all processing time becomes long, because automatic save is frequently done.

In this function, if bit 7 (HPM) of parameter No.11354 is set to 1, the processing time of registering many programs or deleting all programs can be shorten because automatic save to nonvolatile memory is invalid.

Perform saving operation by the all programs save request signal HPMRSV <G0514.4> or the application by FOCAS2/ C Language Library, if it is necessary that programs are saved to nonvolatile memory.

Function	Explanation
cnc_saveprog_start	Start saving program to nonvolatile memory.
cnc_saveprog_end	Check of end saving program to nonvolatile memory.

The status that programs aren't saved to nonvolatile memory can be confirmed by the programs not saved status signal HPMNTS <F0547.5>.
During the saving all programs to nonvolatile memory, the programs saving in progress signal HPMSVM <F0547.6> becomes "1".

> **NOTE**
> 1 There are no changes about the display of programs and the editing operation method of programs.

NOTE

2 In cases that this function is enabled, if the power supply is turned off without saving, the changed programs data is not saved.
The program selection by the following operation also is not saved.
- MDI operation
- External workpiece number search
- External program number search

Please perform saving operation by the signal or the application by FOCAS2/ C Language Library, if it is necessary to preserve the changed programs data/ the program selection after the power supply is turned off.

3 When the automatic operation signal is "1" in any path, the save operation is not executed.

4 When the programs not saved status signal HPMNTS is "0", if the all programs save request to nonvolatile memory start, the save operation is not executed because of unnecessary.

5 If the power supply is turned off during saving the programs programs (the programs saving in progress signal HPMSVM is "1"), all programs are deleted. In this case, an alarm PS0519 occurs when the power supply is turned on next.

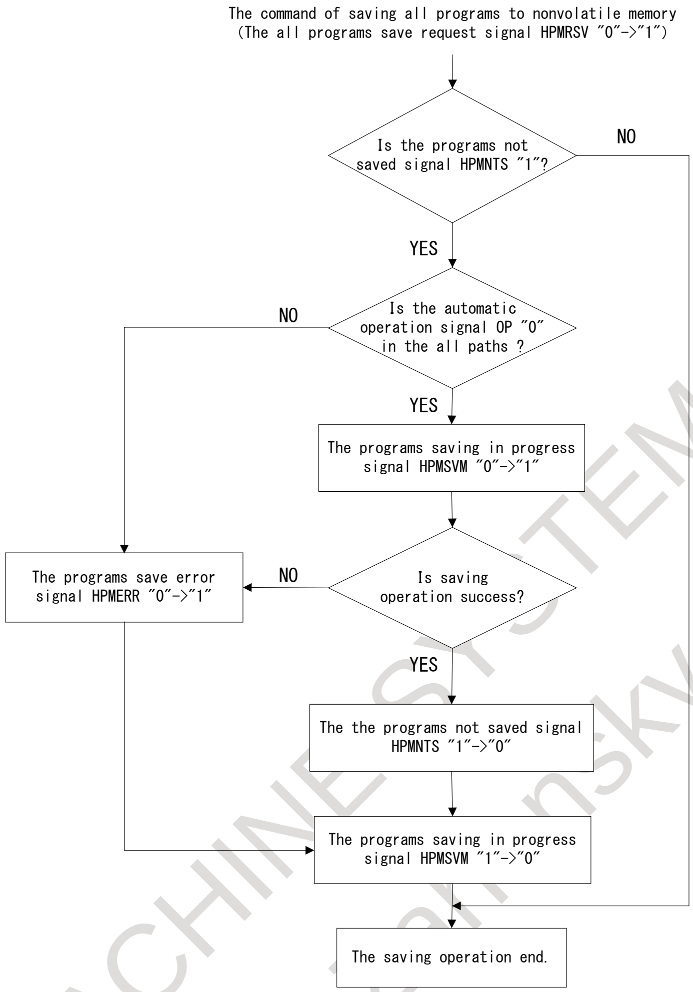
6 Do not save all programs to nonvolatile memory too frequently.

7 In automatic data backup function, if this function is enabled, bit 2 (AAP) of parameter No.10340 should be set to 0.

8 When the embedded macro program is registered, bit 7 (HPM) of parameter No.11354 should be set to 0.

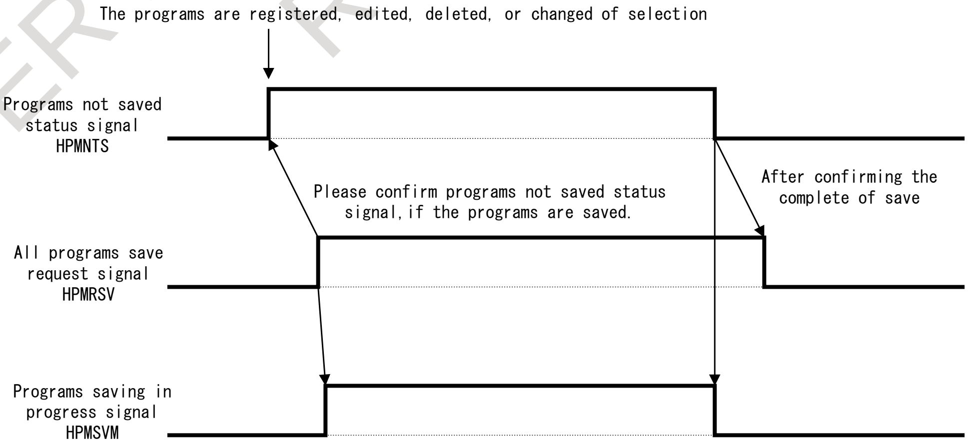
9 This function can be enabled only on CNC program storage memory (CNC_MEM device).

The flow chart of all programs saving to nonvolatile memory by the signal

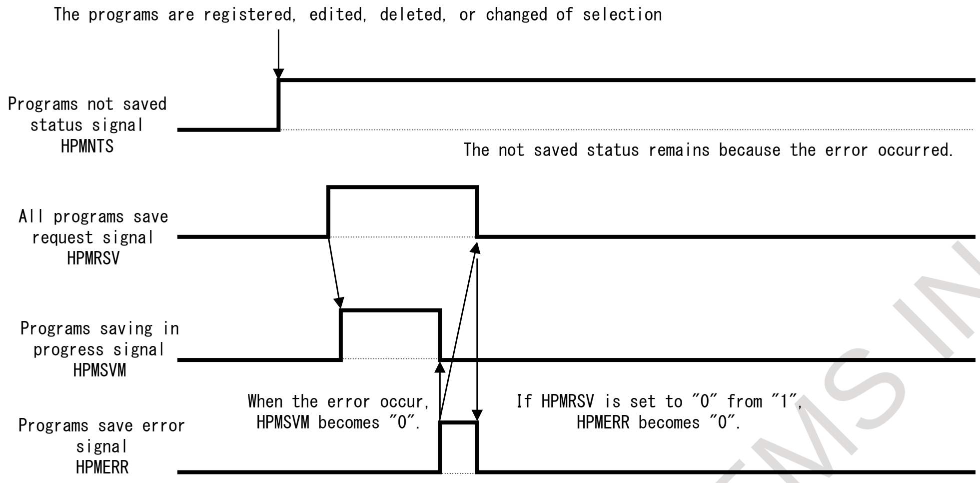


The time chart of all programs saving to nonvolatile memory by the signal

- The case of success



- The case of error



If the all programs save request signal HPMRSV is set to "1" from "0" in the automatic operation, the programs error signal becomes "1" at once.

Signal

All programs save request signal HPMRSV <G0514.4>

[Classification] Input signal

[Function] On high-speed program management, the save of all programs is requested by this signal.

[Operation] When the programs not saved status signal HPMNTS is "1", if this signal is set to "1" from "0", the save of all programs to nonvolatile memory start.
During program saving, the programs saving in progress signal HPMSVM is "1".
This signal is effective when bit 7 (HPM) of parameter No.11354 is "1".

NOTE
1 In the case of the following conditions, the save request does not start even if this signal is set to "1" from "0".
   - When the automatic operation signal is "1" in any path.
   - When the programs not saved status signal HPMNTS is "0".
   - When the programs saving in progress signal HPMSVM is "1".
   - When the automatic data backup executing signal ATBK is "1".
2 If the power supply is turned off during saving the programs (the programs saving in progress signal HPMSVM is "1"), all programs are deleted. In this case, an alarm PS0519 occurs when the power supply is turned on next. Therefore, please preserve the backup of the programs in the external memory beforehand.
3 Do not save all programs to nonvolatile memory too frequently.

Programs not saved status signal HPMNTS <F0547.5>

[Classification] Output signal

[Function] On high-speed program management, the signal indicates the signal indicates the status that the programs are not saved.

[Operation] When the programs are registered, edited, deleted, or changed of selection, this signal becomes "1".
If the programs are saved to nonvolatile memory by the all programs save request signal HPMRSV or the application by FOCAS2/ C Language Library, this signal becomes "0".
This signal is effective when bit 7 (HPM) of parameter No.11354 is "1".

Programs saving in progress signal HPMSVM <F0547.6>

[Classification] Output signal

[Function] On high-speed program management, the signal indicates the saving mode of the programs.

[Operation] During saving the programs to nonvolatile memory by the all programs save request signal HPMRSV or the application by FOCAS2/ C Language Library, this signal become "1". When the saving operation ends, this signal becomes "0".
This signal is effective when bit 7 (HPM) of parameter No.11354 is "1".

> **NOTE**
> 1 If the power supply is turned off when this signal is "1", all programs are deleted. In this case, an alarm PS0519 occurs when the power supply is turned on next.
> 2 If the time of saving is extremely short, this signal might not become "1".

Programs save error signal HPMERR <F0547.7>

[Classification] Output signal

[Function] On high-speed program management, the signal indicates the occurrence of the programs saving error.

[Operation] In the following condition when the programs saved by the all programs save request signal HPMRSV, this signal become "1" is requested, this signal becomes "1".
- When the automatic operation signal is "1" in either path.
- If the error is occurred, during saving to nonvolatile memory.

If all programs save request signal HPMRSV is set to "0" from "1", this signal becomes "0".
This signal is effective when bit 7 (HPM) of parameter No.11354 is "1".

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0514				HPMRSV

11354	HPM							

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#7 HPM High-speed program management is
0: Disabled.
1: Enabled.

NOTE

1 In cases that this function is enabled, if the power supply is turned off without saving, the changed programs data is not saved.
The program selection by the following operation also is not saved.
- MDI operation
- External workpiece number search
- External program number search

Please perform saving operation by the all programs save request signal HPMRSV or the application by FOCAS2/ C Language Library, if it is necessary to preserve the changed programs data/ the program selection after the power supply is turned off.

2 When the automatic operation signal is "1" in any path, the save operation is not executed.

3 Even if this parameter is changed from 1 to 0, automatic save of programs isn't executed until the power supply will be turned on next.

4 If the power supply is turned off during saving the programs (the programs saving in progress signal HPMSVM is "1"), all programs are deleted. In this case, an alarm PS0519 occurs when the power supply is turned on next.

5 Do not save all programs to nonvolatile memory too frequently.

6 In automatic data backup function, if this function is enabled, bit 2 (AAP) of parameter No.10340 should be set to 0.

7 When the embedded macro program is registered, bit 7 (HPM) of parameter No.11354 should be set to 0.

8 This function can be enabled only on CNC program storage memory (CNC_MEM device).

Alarm and message

No.	Message	Description
PS0519	PROGRAM FILES ARE BROKEN AND CLEARED	The program have been cleared, because the program were broken. The power supply might have been turned off while the program files is being saved to nonvolatile memory.

14 INPUT/OUTPUT OF DATA

14.1 RS-232C INTERFACE

Overview

The data shown below can be input/output through RS-232C interface.

1. Program
2. Offset data
3. Parameter
4. Pitch error compensation data
5. Custom macro common variables.
6. Workpiece coordinate system setting data
7. Operation history data (output only)
8. Tool management data

The above data can be output to a memory card or USB memory via a memory card interface or USB memory interface.

When a memory card is selected as the data input/output destination (parameter No. 20 = 4) at this time, if a file with the same file name already exists during writing of NC data such as programs or parameters, it is possible to select whether to overwrite the file or cancel the operation.
To enable this function, set bit 1 (COW) of parameter No. 11308.

When a USB memory is selected as the data input/output destination (parameter No. 20 = 17), a file with the same file name is already present during writing of NC data, the file is overwritten.

The channel for data I/O is determined by setting parameter No. 0020. In this case, foreground or background data I/O is restricted to one channel. In addition, data I/O can be controlled separately by setting bit 0 (IO4) of parameter No. 0110. Concretely, a channel can be assigned to each of foreground input, foreground output, background input, and background output.

Explanation

The parameters described below must be set up to use an I/O unit interface (RS-232C serial port) or memory card interface for inputting and outputting data (such as programs and parameters) between external input/output units and memory cards.
The channel to which an I/O unit is connected needs be specified by setting I/O CHANNEL (parameter No. 0020). In addition, the specification number, baud rate, and number of stop bits of each I/O unit must be set in the parameter corresponding to each channel in advance. For setting of channel 1, two types of parameters for setting I/O units are provided.
Channel setting can be made for each of foreground I/O and background I/O by setting bit 0 (IO4) of parameter No. 0110. At this time, channel setting is made with parameters Nos. 0020, 0021, 0022, and 0023.
The following shows correlation of interface parameters related to individual channels.

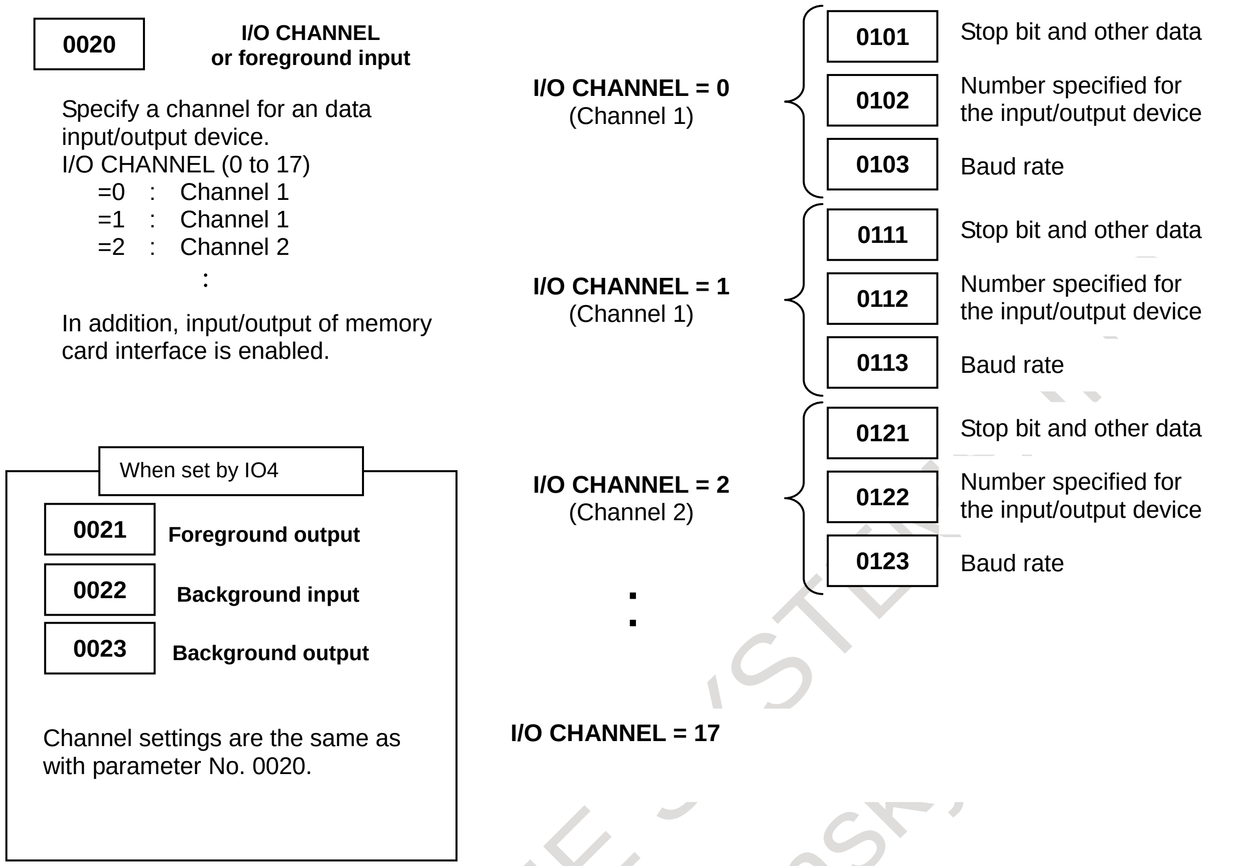

Fig. 14.1 (a) Correlation of interface parameters related to individual channels

Diagnosis

- Foreground

030	CHARACTER NUMBER DATA

When the alarm SR0001, “TH ERROR” occurred, the position in which it occurred is indicated by the number of characters counted from the beginning of the block.

031	TH DATA

Readout code of the number of characters in which an alarm SR0001, “TH ERROR” occurred

- Background

032	CHARACTER NUMBER DATA

When the alarm SR0001, “TH ERROR” occurred, the position in which it occurred is indicated by the number of characters counted from the beginning of the block.

033	TH DATA

Readout code of the number of characters in which an alarm SR0001, “TH ERROR” occurred

Parameter

0020	I/O CHANNEL : Input/output device selection, or interface number for a foreground input device
0021	Foreground output device setting
0022	Background input device setting
0023	Background output device setting

[Input type] Setting input
[Data type] Byte
[Valid data range] 0 to 17

The CNC has the following interfaces for transferring data to and from an external input/output device and the host computer:

- Input/output device interface (RS-232C serial ports 1 and 2)
- Memory card interface
- Data server interface
- Embedded Ethernet interface
- USB memory interface

By setting bit 0 (IO4) of parameter No. 0110, data input/output can be controlled separately. When IO4 is not set, data input/output is performed using the channel set in parameter No. 0020. When IO4 is set, a channel can be assigned to each of foreground input, foreground output, background input, and background output.

In these parameters, specify the interface connected to each input/output device to and from which data is to be transferred. See the table below for these settings.

Correspondence between settings and input/output devices

Setting	Description
0,1	RS-232C serial port 1
2	RS-232C serial port 2
4	Memory card interface
5	Data server interface
9	Embedded Ethernet interface
17	USB memory interface

0: Not performed.
1: Performed.
If the I/O channels are not separately controlled, set the input/output device in parameter No. 0020.
If the I/O channels are separately controlled, set the input device and output device in the foreground and the input device and output device in the background in parameters Nos. 0020 to 0023 respectively.
Separate control of I/O channels makes it possible to perform background editing, program input/output, and the like during the DNC operation.

Alarm and message

Number	Message	Description
SR0001	TH ERROR	A TH error was detected during reading from an input device. The read code that caused the TH error and how many statements it is from the block can be verified in the diagnostics screen.
SR0002	TV ERROR	An error was detected during the single–block TV error. The TV check can be suppressed by setting bit 0 (TVC) of parameter No. 0000 to 0.
SR1805	ILLEGAL COMMAND	An attempt was made to specify an illegal command during I/O processing on an I/O device.
SR1806	DEVICE TYPE MISS MATCH	An operation not possible on the I/O device that is currently selected in the setting was specified. This alarm is also generated when file rewind is instructed even though the I/O device is not a FANUC Cassette.
SR1807	PARAMETER SETTING ERROR	An I/O interface option that has not yet been added on was specified. The external I/O device and baud rate, stop bit and protocol selection settings are erroneous.
SR1808	DEVICE DOUBLE OPENED	An attempt was made to open a device that is being accessed.
SR1973	FILE ALREADY EXIST	A file having the same name already exists on the memory card.

- Channel 1

Number	Message	Description
SR0085	OVERRUN ERROR	During a read by RS-232C interface 1, an overrun, parity, or framing error occurred. The number of bits for entered data was not matched, or baud rate setting or I/O device specification number was incorrect.
SR0086	DR OFF	During I/O process by RS-232C interface 1, the data set ready input signal of the I/O device (DR) was OFF. Possible causes are an I/O device not turn on, a broken cable, and a defective printed circuit board.
SR0087	BUFFER OVERFLOW	During a read by RS-232C interface 1, although a read stop command was issued, more than 10 characters were input. The I/O device or printed circuit board was defective.

- Channel 2

Number	Message	Description
SR1830	DR OFF(2)	During I/O process by RS-232C interface 2, the data set ready input signal of the I/O device (DR) was OFF. Possible causes are an I/O device not turn on, a broken cable, and a defective printed circuit board.
SR1832	OVERRUN ERROR(2)	During a read by RS-232C interface 2, an overrun, parity, or framing error occurred. The number of bits for entered data was not matched, or baud rate setting or I/O device specification number was incorrect.
SR1834	BUFFER OVERFLOW(2)	During a read by RS-232C interface 2, although a read stop command was issued, more than 10 characters were input. The I/O device or printed circuit board was defective.

- DNC operation

Number	Message	Description
PS0123	ILLEGAL MODE FOR GOTO/WHILE/DO	A GOTO statement or WHILE–DO statement was found in the program in the MDI or DNC mode. Modify the program.
PS1081	EXT DEVICE SUB PROGRAM CALL MODE ERROR	1. M198 or M99 was executed during scheduled operation. Alternatively, M198 was executed during DNC operation. Modify the program. 2. An interruption macro was specified and M99 was executed during pocketing of multiple repetitive canned cycles.

14.2 NC DATA OUTPUT FUNCTION

Overview

This function outputs the following various data into memory card or USB memory by one operation.

- SRAM data
- User files (made by user such as PMC ladder)
- Text data (Parameter, program, and so on)

This function enables to back up the system data easily.
Moreover, the contents of SRAM data can be confirmed immediately because both SRAM data and text data are output.
NC data output signal ALLO<F0578.5> is set to "1" from the beginning to the end of outputting text data.

Signal

NC data output signal ALLO<G0578.5>

[Classification] Output signal

[Function] This signal indicates that text data are under output by NC data output function.

[Output condition] This signal becomes "1", when:

- Outputting text data by NC data output function is started.

This signal becomes "0", when:

- Outputting text data by NC data output function is finished.
- Outputting text data by NC data output function is terminated abnormally.

Signal address

Parameter

0020	**I/O CHANNEL : Input/output device selection, or interface number for a foreground input device**
0021	**Foreground output device setting**
0022	**Background input device setting**
0023	**Background output device setting**

[Input type] Setting input
[Data type] Byte
[Valid data range] 0 to 17

The CNC has the following interfaces for transferring data to and from an external input/output device and the host computer:

- Input/output device interface (RS-232C serial ports 1 and 2)
- Memory card interface
- Data server interface
- Embedded Ethernet interface
- USB memory interface

By setting bit 0 (IO4) of parameter No. 0110, data input/output can be controlled separately. When IO4 is not set, data input/output is performed using the channel set in parameter No. 0020. When IO4 is set, a channel can be assigned to each of foreground input, foreground output, background input, and background output.
In these parameters, specify the interface connected to each input/output device to and from which data is to be transferred. See the table below for these settings.

Correspondence between settings and input/output devices

Setting	Description
0,1	RS-232C serial port 1
2	RS-232C serial port 2
4	Memory card interface of CNC Memory card/USB interface in the secondary display unit for Ethernet connection or the shared display unit for Ethernet connection
5	Data server interface
9	Embedded Ethernet interface
17	USB memory interface

	#7	#6	#5	#4	#3	#2	#1	#0
0110								IO4

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 IO4 Separate control of I/O channel numbers is:
0: Not performed.
1: Performed.
If the I/O channels are not separately controlled, set the input/output device in parameter No. 0020.
If the I/O channels are separately controlled, set the input device and output device in the foreground and the input device and output device in the background in parameters No. 0020 to No. 0023 respectively.
Separate control of I/O channels makes it possible to perform background editing, program input/output, and the like during the DNC operation.

	#7	#6	#5	#4	#3	#2	#1	#0
0138								MDP

[Input type] Parameter input
[Data type] Bit

#0 MDP To the extensions of input/output files, a path number is:
0: Not added.
1: Added.

> **NOTE**
> If a file name is specified by setting F, this parameter is ignored, and a path number is not added to the extension.

	#7	#6	#5	#4	#3	#2	#1	#0
0313							TFO	BOP

[Input type] Parameter input
[Data type] Bit

#0 BOP NC data output function is:
0: Disabled.
1: Enabled.

> **NOTE**
> If a file with the same name already exists in the external I/O device, the file is overwritten. It is recommended to clear the external I/O device before using this function.

#1 TFO On NC data output function, text data (such as parameter, program) is:
0: Output.
1: Not output.

OPERATOR'S MANUAL (B-64694EN)	NC data output function

15 MEASUREMENT

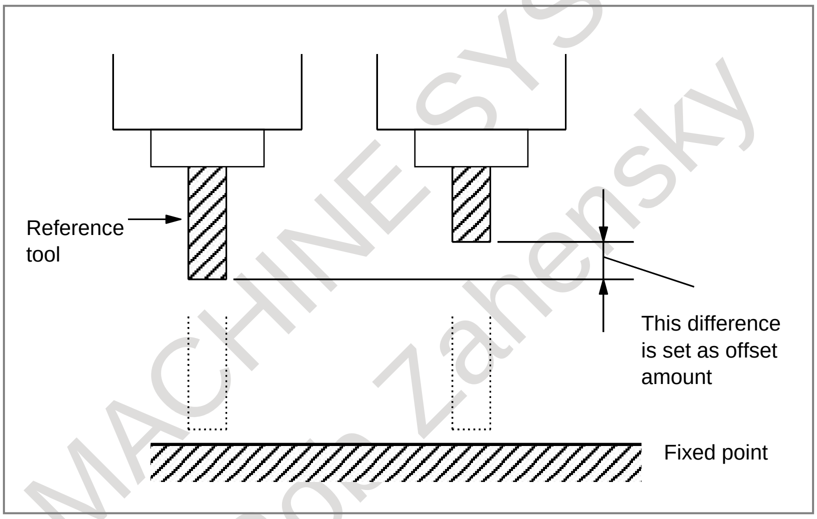
15.1 TOOL LENGTH MEASUREMENT

M

Overview

The value displayed as a relative and machine position can be set in the offset memory as an offset value by a soft key.

Switch to the offset value display screen on the screen. Relative positions are also displayed on this screen. Then select the reference tool and set it at the fixed point on the machine by manual operation. Reset the displayed relative position to zero. Set the tool for measurement at the same fixed point on the machine by manual operation. The relative position display at this point shows difference between the reference tool and the tool measured and the relative position display value is then set as offset amounts. Another way is to display machine positions and compensate by inputting adjustment values.



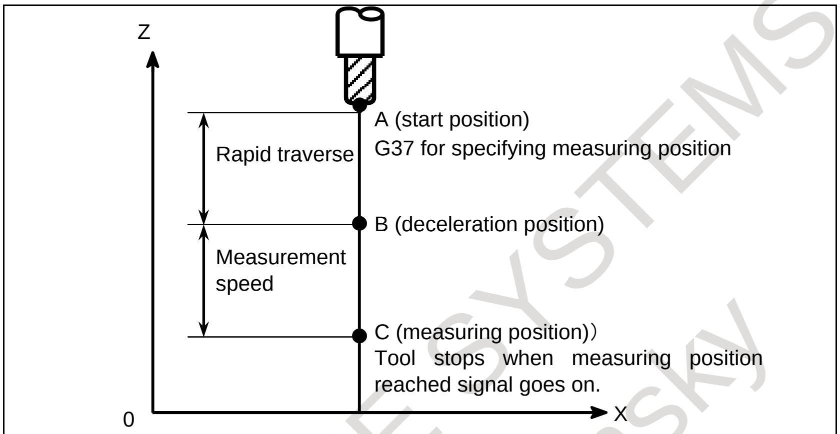
Reference item

Manual name	Item name
OPERATOR'S MANUAL (B-64694EN)	Tool length compensation

15.2 AUTOMATIC TOOL LENGTH MEASUREMENT (M SERIES) / AUTOMATIC TOOL OFFSET (T SERIES)

Overview

When a tool is moved to the measurement position by execution of a command given to the CNC, the CNC automatically measures the difference between the current coordinate value and the coordinate value of the command measurement position and uses it as the offset value for the tool. When the tool has been already offset, it is moved to the measurement position with that offset value.
The difference between the coordinate value of a measuring position and a specified coordinate value is added to current compensation.



Compensation = (Current compensation) + [(Coordinate at tool stop) - (Coordinate at specification of measuring position)]

Format

M

Hxx ;	Specifies an offset number for tool length compensation.
G90 G37 IP_ ;	Automatic tool length measurement. Absolute programming. G37 is valid only in the block in which it is specified. IP_ indicates the X-, Y-, Z-, or fourth axis.

T

Txx ;	Specifies an offset number for tool position compensation.
G36 X_ ; or G37 Z_ ;	Automatic tool offset. Absolute programming. G36 and G37 are valid only in the block in which it is specified.

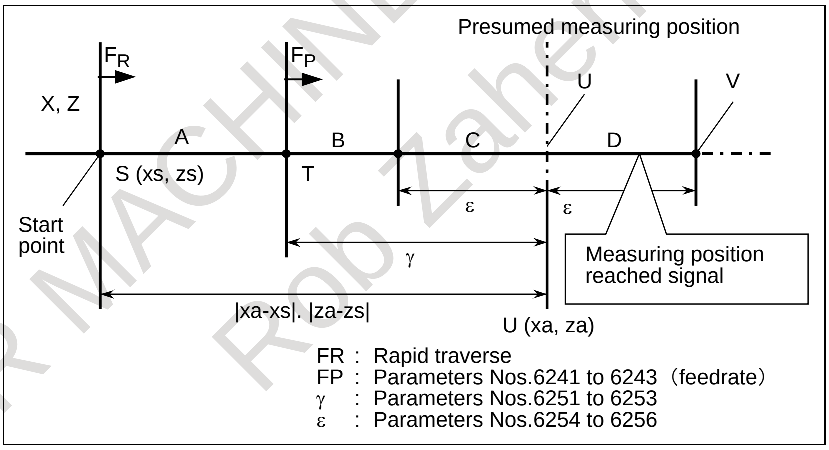
Signal

Measuring position reached signals

XAE1#1<X0004.0>, XAE2#1<X0004.1> (M/T series), XAE3#1<X0004.2> (M series only)
XAE1#2<X0013.0>, XAE2#2<X0013.1> (M/T series), XAE3#2<X0013.2> (M series only)
XAE1#3<X0011.0>, XAE2#3<X0011.1> (M/T series), XAE3#3<X0011.2> (M series only)
GAE1<Gn517.0>,GAE2<Gn517.1>, GAE3<Gn517.2> (M/T series)

[Classification] Input signal

[Function] If the measuring position specified by a program command differs from the measuring position which a tool has reached in practice, that is, the position at the moment the measuring position reached signal has just been turned "1", the difference in the coordinate value is added to the current tool compensation value to update the compensation value. The tool is first fed to the specified measuring position by rapid traverse in a block where one of the following commands has been specified:
G37 (Mseries)
G36,G37 (Tseries) (G37.1, G37.2 if the bit 6 (MDC) of parameter No. 6210 is set to 1)
The tool decelerates and temporarily stops at the distance γ before the measuring position. The tool then moves to the measuring position at the speed preset by a parameters Nos. 6241 to 6243. If the measuring position reached signal corresponding to the G code is turned "1" after the tool has approached within distance ε of the measuring position and before the tool overshoots the measuring position by distance ε, the control unit updates the compensation value and terminates the move command for the block.
If the measuring position reached signal is not turned "1" even after the tool has overshot the measuring position by distance ε, the control unit enters an alarm state and terminates the move command for the block without updating the compensation value.



Command code	Axis specification		Signal input		Valid parameters	
	T series	M series	T series	M series	T series	M series
G36 (bit 3 (G36) of parameter No. 3405=0)	Basic 1st axis		XAE1 or GAE1		6241, 6251, 6254	
G37 (bit 3 (G36) of parameter No. 3405=0)	Basic 3rd axis	Basic1st to 3rd axes	XAE2 or GAE2	XAE1 to XAE3 or GAE1 to GAE3	6242, 6252, 6255	6241 to 6243, 6251 to 6253, 6254 to 6256
G37.1 (bit 3 (G36) of parameter No. 3405=1)	Basic 1st axis	Basic 1st axis	XAE1 or GAE1	XAE1 or GAE1	6241, 6251, 6254	6241, 6251, 6254
G37.2 (bit 3 (G36) of parameter No. 3405=1)	Basic 3rd axis	Basic 2nd axis	XAE2 or GAE2	XAE2 or GAE2	6242, 6252, 6255	6242, 6252, 6255
G37.3 (bit 3 (G36) of parameter No. 3405=1)		Basic 3rd axis		XAE3 or GAE3		6243, 6253, 6256

NOTE

If parameters Nos. 6242 and 6243 are set to 0, the setting of parameter No. 6241 becomes valid.

[Operation] When the measuring position reached signals (XAE1-XAE3 or GAE1-GAE3) is turned "1", the control unit works as follows:

- Reads the position of the tool along the axis currently specified and updates the current compensation value based on the difference between the specified measuring position and the read measuring position in the following case: When the measuring position reached signal corresponding to the G code is turned on in a block where G36 (T series) or G37 is specified after the tool is within distance ε of the measuring position specified by a program and before the tool overshoots the measuring position by distance ε. The control unit then stops the tool, and terminates the move command for the block.
- Enters an alarm (PS0080) "G37 MEASURING POSITION REACHED SIGNAL IS NOT PROPERLY INPUT" state and terminates the move command for the block without updating the compensation value in the following case: When the measuring position reached signal corresponding to the command is turned "1" in a block where G36 (T series), G37 is specified after the tool is within distance γ of the measuring position but before the tool is within distance ε of the measuring position.
- The measuring position reached signal is not monitored on the rising edge, but the state of the signal is simply monitored. So, if the measuring position reached signal remains to be set to "1", and automatic tool length measurement (M series) (automatic tool offset (T series) (G36, G37) is then specified, the CNC issues the PS0080 alarm when a movement has been made to distance γ before the measurement position.

NOTE

1 The measuring position reached signal requires at least 10 msec.
2 A delay or variation in detecting a measuring position reached signal is 0 to 2 ms just on the CNC side, excluding the PMC side. Accordingly, the measurement error is the sum of 2 ms and a delay or variation in transferring a measuring position reached signal on the PMC side (including receiver delay or variation), multiplied by the feedrate specified in parameter No. 6241.
3 A delay or variation after the detection of a measuring position reached signal until feed stop is 0 to 8 ms. When an overshoot is calculated, an acceleration/deceleration delay, servo delay, PMC delay must also be considered.
4 Measuring position reached signals XAE1 to XAE3 need not be processed on the PMC side because the CNC reads the signals directly from the machine.
5 If the tool length measurement function is not used, the PMC can use the pins corresponding to the measuring position reached signals for general-purpose input signals.
6 When the bit 2 (XSG) of parameter No. 3008 is set to 1, address <X0004> including measuring position reached signals can be assigned to an X address specified in parameter No. 3019.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0	
X0004							XAE2[#1]	XAE1[#1]	(T series)
						XAE3[#1]	XAE2[#1]	XAE1[#1]	(M series)
X0013							XAE2[#2]	XAE1[#2]	(T series)
						XAE3[#2]	XAE2[#2]	XAE1[#2]	(M series)
X0011							XAE2[#3]	XAE1[#3]	(T series)
						XAE3[#3]	XAE2[#3]	XAE1[#3]	(M series)
Gn517						GAE3[#P]	GAE2[#P]	GAE1[#P]	

NOTE

To use independent measuring position reached signals for all the paths in a system having four or more paths, use a G address.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3008						XSG		

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#2 XSG A signal assigned to an X address is:
0: Fixed at the address.
1: Able to be reassigned to an arbitrary X address.

> **NOTE**
> When this parameter is set to 1, set parameters Nos. 3013, 3014, 3012, and 3019. If parameter No. 3013 and No. 3014 are not set, the deceleration signal for reference position return is assigned to bit 0 of <X0000>. If parameters Nos. 3012 and 3019 are not set, the skip signal, the PMC axis control skip signal, the measuring position reached signal, the interlock signal for each axis direction, and the tool compensation value write signal are assigned to <X0000>.

> ⚠ **WARNING**
> Please set an appropriate value to parameters (Nos. 3013, 3014, 3012, and 3019) beforehand when you set 1 to this parameter.
> If you used the set address in the parameters (Nos. 3013, 3014, 3012, and 3019) by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

3019	Address to which the PMC axis control skip signal, measuring position reached signal, and tool offset write signals are assigned

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the PMC axis control skip signal ESKIP, measuring position reached signals (XAE, YAE, and ZAE (M series) or XAE and ZAE (T series)), and tool offset write signals (±MIT1 and ±MIT2 (T series)) are to be assigned.

> ⚠ **WARNING**
> If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
> Be careful enough that you must prevent the competition of the used X address.

[Input type] Parameter input
[Data type] Bit path

#0 AE0 Measurement position arrival is assumed when the measuring position reached signals XAE1, XAE2, GAE1<Gn517.0> and GAE2<Gn517.1> (T series) or the measuring position reached signals XAE1, XAE2, XAE3, GAE1<Gn517.0>, GAE2<Gn517.1> and GAE3<Gn517.2> (M series) are:
0: 1.
1: 0.

> **NOTE**
> Setting this parameter to 1, input measuring position reached signals to both XAE1, XAE2, XAE3 and GAE1, GAE2, GAE3<Gn517.0, Gn517.1, Gn517.2>. If the other measuring position reached signals are not input, the CNC issues the PS0080 alarm to the movement to the position of the distance γ.

6241	**Feedrate during measurement of automatic tool compensation (T series) (for the XAE1 and GAE1 signals)**
	Feedrate during measurement of automatic tool length measurement (M series) (for the XAE1 and GAE1 signals)
6242	**Feedrate during measurement of automatic tool compensation (T series) (for the XAE2 and GAE2 signals)**
	Feedrate during measurement of automatic tool length measurement (M series) (for the XAE2 and GAE2 signals)
6243	
	Feedrate during measurement of automatic tool length measurement (M series) (for the XAE3 and GAE3 signals)

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
These parameters set the relevant feedrate during measurement of automatic tool compensation (T series) or automatic tool length measurement (M series).

> **NOTE**
> When the setting of parameter No. 6242 or 6243 is 0, the setting of parameter No. 6241 is used.

6251	γ value on the X axis during automatic tool compensation (T series)
	γ value during automatic tool length measurement (M series) (for the XAE1 and GAE1 signals)

6252	γ value on the Z axis during automatic tool compensation (T series)
	γ value during automatic tool length measurement (M series) (for the XAE2 and GAE2 signals)

6253	
	γ value during automatic tool length measurement (M series) (for the XAE3 and GAE3 signals)

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] mm, inch, deg (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

These parameters set the relevant γ value during automatic tool compensation (T series) or automatic tool length measurement (M series).

NOTE
When the Reference axis (parameter No.1031) is Diameter specification, specify the diameter value. When the Reference axis (parameter No.1031) is Radius specification, specify the radius value.

6254	ε value on the X axis during automatic tool compensation (T series)
	ε value during automatic tool length measurement (M series) (for the XAE1 and GAE1 signals)

6255	ε value on the Z axis during automatic tool compensation (T series)
	ε value during automatic tool length measurement (M series) (for the XAE2 and GAE2 signals)

6256	
	ε value during automatic tool length measurement (M series) (for the XAE3 and GAE3 signals)

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] mm, inch, deg (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

These parameters set the relevant ε value during automatic tool compensation (T series) or automatic tool length measurement (M series).

NOTE
When the Reference axis (parameter No.1031) is Diameter specification, specify the diameter value. When the Reference axis (parameter No.1031) is Radius specification, specify the radius value.

Alarm and message

Number	Message	Description
PS0080	G37 MEASURING POSITION REACHED SIGNAL IS NOT PROPERLY INPUT	- For machining center series When the tool length measurement function (G37) is performed, a measuring position reached signal goes 1 in front of the area determined by the ε value specified in parameter No.6254. Alternatively, the signal does not go 1. - For lathe When the automatic tool compensation function (G36, G37) is used, a measuring position reached signals (XAE1, XAE2) does not go 1 within the range determined by the ε value specified in parameters Nos.6254 and 6255.
PS0081	G37 OFFSET NO. UNASSIGNED	- For machining center series The tool length measurement function (G37) is specified without specifying an H code. Correct the program. - For lathe The automatic tool compensation function (G36, G37) is specified without specifying an T code. Correct the program.
PS0082	G37 SPECIFIED WITH H CODE	- For machining center series The tool length measurement function (G37) is specified together with an H code in the same block. Correct the program. - For lathe The automatic tool compensation function (G36, G37) is specified together with an T code in the same block. Correct the program.
PS0083	G37 IMPROPER AXIS COMMAND	- For machining center series An error has been found in axis specification of the tool length measurement function (G37). Alternatively, a move command is specified as an incremental command. Correct the program. - For lathe An error has been found in axis specification of the automatic tool compensation function (G36, G37). Alternatively, a command is specified as an incremental command. Correct the program.

Note

NOTE

1. If an H code and G37 are specified in the same block, an alarm will be raised. Specify an H code before a block including G37.
2. A measurement speed (FP), γ, and ε are specified as parameters (FP: No.6241, γ: No.6251, ε: No.6254) by the machine tool builder. As ε, specify a positive value satisfying the condition of $\gamma > \varepsilon$.

NOTE

3 The compensation value is updated by the following formula:
New compensation value =(Current compensation value)+[(Current position of the tool along the specified axis when the measuring position reached signal is 1) - (specified measuring position)]
The following compensation values are updated:
(1) In an M series, the compensation value corresponding to the tool compensation number selected by an H code.
When offset memory A is used, the offset value is changed.
When offset memory B is used, the tool wear compensation value is changed.
When offset memory C is used, the tool wear compensation value for the H code is changed.
(2) In a T series, the compensation value corresponding to the tool compensation number selected by a T code and to the specified axis (X, Z) in G36, G37.

4 A delay or variation in detecting a measuring position reached signal is 0 to 2 ms just on the CNC side, excluding the PMC side. Accordingly, the measurement error is the sum of 2 ms and a delay or variation in transferring a measuring position reached signal on the PMC side (including receiver delay or variation), multiplied by the feedrate specified in parameter No. 6241.

5 A delay or variation after the detection of a measuring position reached signal until feed stop is 0 to 8 ms. When an overshoot is calculated, an acceleration/deceleration delay, servo delay, PMC delay must also be considered.

6 A measuring position reached signal is monitored just as a state not by the rising edge. Accordingly, if a measuring position reached signal is held to 1 and if the corresponding tool length measurement function (G37) is specified, the CNC will raise alarm PS0080 when a movement is made to a position at a distance of γ, in front of the measuring position.

7 When using this function, set the parameter EVO (bit 6 of parameter No. 5001) to zero. (If the tool compensation value of tool length compensation A or B is changed in the offset mode (G43 or G44), the new value becomes effective from a subsequent block including G43, G44, or an H code.)

15.3 SKIP FUNCTION

15.3.1 Skip Function

Overview

Linear interpolation can be commanded by specifying axial move following the G31 command, like G01. If an external skip signal is input during the execution of this command, execution of the command is interrupted and the next block is executed.
The skip function is used when the end of machining is not programmed but specified with a signal from the machine, for example, in grinding. It is used also for measuring the dimensions of a workpiece.

The coordinates when the skip signal turned on are stored in the system variables (#100151 to #100182) for custom macros, so they can be used by custom macros. For a system with up to 20 axes, the system variables (#5061 to #5080) compatible with FS16 can also be used.

#100151 (#5061)	: First axis coordinate value
#100152 (#5062)	: Second axis coordinate value
:	
:	
#100170 (#5080)	: 20th axis coordinate value
#100171	: 21st axis coordinate value
#100172	: 22nd axis coordinate value
:	
:	
#100182	: 32nd axis coordinate value

- Feedrate

Two types of feedrate can be selected for the G31 block, using bit 1 (SFP) of parameter No.6207.

(1) If bit 1 (SFP) of parameter No.6207 is 0
Feedrate specified with address F (may be specified before or in the G31 block).

(2) If bit 1 (SFP) of parameter No.6207 is 1
Feedrate set for parameter No.6281.
Even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when a feedrate with the G31 command is the feedrate which is set for parameter No.6821.

> ⚠ **CAUTION**
> To increase the precision of the tool position when the skip signal is input, feedrate override, dry run, and automatic acceleration/deceleration are disabled in moving by the skip function regardless of the feedrate which is specified as a feed per minute or a feed per rotation.
> To enable these functions, set bit 7 (SKF) of parameter No.6200 to 1.
> However, even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when bit 1 (SFP) of parameter No.6207 is set to 1.

- Acc./Dec. after interpolation of the skip function

To enable the Acc./Dec. after cutting feed interpolation of the skip function, set bit 7 (SKF) of parameter No. 6200 to 1. When SKF is 0, the Acc./Dec. after cutting feed interpolation of the skip function is disabled.
If the Acc./Dec. type is set by bit 3 (ASL) of parameter No. 6210 and the time constant is set by bit 4 (ASB) of parameter No. 6210 when SKF is 1, it is possible to set a separate Acc./Dec. type and time constant that are different from those of the normal Acc./Dec. after cutting feed interpolation. When ASB is 0 and ASL is 0, the normal Acc./Dec. after cutting feed interpolation is assumed.
In this case, the Acc./Dec. type set by bit 0 (CTLx) of parameter No. 1610 and bit 1 (CTBx) of parameter No. 1610 and the time constant set by parameter No. 1622 are enabled.

- Skip signal

In the skip function, skip signal which is valid is as follows.

Table 15.3.1 (a) Whether the skip signals are enabled or disabled

Parameter	Bit 4 (IGX) of parameter No. 6201	Bit 0 (GSK) of parameter No. 6200	Bit 7 (SKPXE) of parameter No .6201	Skip signal SKIPP	Skip signal SKIP
Setting	0	0	0	Disabled	Enabled
	0	1	0	Enabled	Enabled
	0	0	1	Disabled	Disabled
	0	1	1	Enabled	Disabled
	1	0	0	Disabled	Disabled
	1	1	0	Disabled	Disabled
	1	0	1	Disabled	Disabled
	1	1	1	Disabled	Disabled

Bit 4 (IGX) of parameter No. 6201 is valid for the skip function using high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 1) or for the multistage skip function using high-speed skip signals (when bit 5 (SLS) of parameter No. 6200 is set to 1).
And, when bit 1 (SK0) of parameter No. 6200 is set to 1, Skip signal is valid when the skip signal SKIP is 0.

- Accumulated pulses and positional deviation due to acceleration/deceleration

When bit 1 (SEB) of parameter No. 6201 is set to 1, the accumulated pulses and positional deviation due to acceleration/deceleration are considered and compensated.

- Skip block signal

Skip block signal SKPEXE<Fn537.3> becomes “1” while executing G31 block.

Signal

Skip Signals SKIP <X0004.7>, SKIPP <Gn006.6>

[Classification] Input signal

[Function] This signal terminates skip cutting. That is, the position where a skip signal turns to 1 in a block containing G31 is stored in a custom macro variable, and the move command of the block is terminated at the same time.

[Operation] When a skip signal turns to 1, the control unit works as described below.

- When a block contains a skip cutting command G31, the control unit reads and stores the current position of the specified axis at that time. The control unit stops the axis, then cancels the remaining distance that the block was supposed to be moved.

NOTE

1. The skip signal width requires at least 10 msec.
2. The delay or variation on the CNC side (excluding the PMC side) in detecting the skip signal is 0 to 2 msec. Therefore, the measurement error is the sum of 2 msec and the delay or variation (including the delay or variation of the receiver) of the skip signal on the PMC side, multiplied by the feedrate.
3. The delay or variation until feed stops after detection of the skip signal is 0 to 8 msec. To calculate the overshoot, further consider delay in acceleration/deceleration, delay in servo, delay on the PMC side.
4. The CNC directly reads the skip signal SKIP <X0004.7> from the machine tool, the PMC is no longer requires to process the signal.
5. If the skip function G31 is not used, the PMC can use the signal terminal SKIP <X0004.7> corresponding to the skip signal as a general purpose input signal.
6. When the skip signal is monitored, the state rather than the rising edge is sampled. Therefore, when the level remains 1, the skip condition is assumed to be met immediately after skip cutting is specified next.
7. Address <X0004>including skip signal SKIP <X0004.7> can be assigned to the X addresses that were set for parameters Nos. 3012 and 3019 when bit 2 (XSG) of parameter No. 3008 is 1.
8. When bit 2 (XSG) of parameter No. 3008 is 0, the address of the skip signal SKIP is <X0013.7> in case of the 2nd path and <X0011.7> in case of the 3rd path.
9. When the Multi-step skip function is effective, the bit 0 (1S1) of parameter No.6202 must be set to 1.

Skip Block Signal SKPEXE <Fn537.3>

[Classification] Output signal

[Function] This signal indicates that G31 block is executing.

[Operation] This signal becomes “1” while executing G31 block.
Other cases become “0”.

NOTE

When G31 block is stopped by the feed hold stop, this signal is “1”. Though this signal becomes “0” when the skip signal is input, this signal becomes “1” again when restarting from the feed hold stop.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
X0004	SKIP							
X0011	SKIP#3							
X0013	SKIP#2							
Gn006		SKIPP

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3008						XSG		

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#2 XSG A signal assigned to an X address is:
0: Fixed at the address.
1: Able to be reassigned to an arbitrary X address.

> **NOTE**
> When this parameter is set to 1, set parameters Nos. 3013, 3014, 3012, and 3019. If parameters Nos. 3013 and 3014 are not set, the deceleration signal for reference position return is assigned to bit 0 of <X0000>. If parameters Nos. 3012 and 3019 are not set, the skip signal, the PMC axis control skip signal, the measuring position reached signal, the interlock signal for each axis direction, and the tool compensation value write signal are assigned to <X0000>.

> ⚠ **WARNING**
> Please set an appropriate value to parameters (Nos. 3013, 3014, 3012, 3019) beforehand when you set 1 to this parameter.
> If an input signal of the set address in parameters (Nos. 3013, 3014, 3012, 3019) is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

3012	Skip signal assignment address

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727
Set an X address to which the skip signal SKIPn is to be assigned.

> **NOTE**
> This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
> Depending on the configuration of the I/O Link, the actually usable X addresses are:
> <X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

> ⚠ **WARNING**
> If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
> Be careful enough that you must prevent the competition of the used X address.

3019	Address to which the PMC axis control skip signal, measuring position reached signal, and tool offset write signals are assigned

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the PMC axis control skip signal ESKIP, measuring position reached signals (XAE, YAE, and ZAE (M series) or XAE and ZAE (T series)), and tool offset write signals (±MIT1 and ±MIT2 (T series)) are to be assigned.

Example 1. When parameter No. 3012 is set to 5 and parameter No. 3019 is set to 6

When bit 2 (XSG) of parameter No. 3008 is 1, the PMC axis control skip signal, and measuring position reached signal are allocated to X0006 and the skip signal is allocated to X0005.

	#7	#6	#5	#4	#3	#2	#1	#0	
X0005	SKIP	SKIP6	SKIP5	SKIP4	SKIP3	SKIP2	SKIP8	SKIP7	(T series)
	SKIP	SKIP6	SKIP5	SKIP4	SKIP3	SKIP2	SKIP8	SKIP7	(M series)

	#7	#6	#5	#4	#3	#2	#1	#0	
X0006		ESKIP					ZAE	XAE	(T series)
		ESKIP				ZAE	YAE	XAE	(M series)

Example 2. When parameter No. 3012 is set to 5 and parameter No. 3019 is set to 5

When bit 2 (XSG) of parameter No. 3008 is 1, the PMC axis control skip signal, measuring position reached signal, and skip signal are allocated to X0005.

	#7	#6	#5	#4	#3	#2	#1	#0	
X0005	SKIP	ESKIP SKIP6	 SKIP5	 SKIP4	 SKIP3	 SKIP2	ZAE SKIP8	XAE SKIP7	(T series)
	SKIP	ESKIP SKIP6	SKIP5	SKIP4	SKIP3	ZAE SKIP2	YAE SKIP8	XAE SKIP7	(M series)

> **NOTE**
> This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
> Depending on the configuration of the I/O Link, the actually usable X addresses are:
> <X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

> ⚠ **WARNING**
> If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
> Be careful enough that you must prevent the competition of the used X address.

	#7	#6	#5	#4	#3	#2	#1	#0
6200	SKF			HSS			SK0	GSK

[Input type] Parameter input
[Data type] Bit path

#0 GSK As a skip signal, the skip signal SKIPP is:
0: Invalid.
1: Valid.

#1 SK0 This parameter specifies whether the skip signal is made valid under the state of the skip signal SKIP and the multistage skip signals SKIP2 to SKIP8.
0: Skip signal is valid when these signals are 1.
1: Skip signal is valid when these signals are 0.

#4 HSS 0: The skip function does not use high-speed skip signals while skip signals are input. (The conventional skip signal is used.)
1: The step skip function uses high-speed skip signals while skip signals are input.

#7 SKF Dry run, override, and automatic acceleration/deceleration for G31 skip command
0: Disabled
1: Enabled

> ⚠ **CAUTION**
> 1 When bit 7 (SKF) of parameter No.6200 is set to 0, feedrate override, dry run, and automatic acceleration/deceleration are disabled in moving by the skip function regardless of the feedrate which is specified as a feed per minute or a feed per rotation.
> 2 Even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when bit 1 (SFP) of parameter No.6207 is set to 1. When the multi-step skip is used and bit 2 (SFN) of parameter No.6207 is set to 1, dry run and automatic acceleration/deceleration are similarly disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
6201	SKPXE			IGX			SEB	

[Input type] Parameter input
[Data type] Bit path

#1 SEB When a skip signal, high-speed skip signal or measuring position reached signal goes on while the skip function, the continuous high-speed skip function or the automatic tool length measurement (M series) or automatic tool compensation (T series) is used, the accumulated pulses and positional deviation due to acceleration/deceleration are:
0: Ignored.
1: Considered and compensated.
The accumulated pulses and positional deviation due to actual acceleration/deceleration when the skip signal, high-speed skip signal or measuring position reached signal goes on are considered to obtain the position at which the signal is input.

#4 IGX When the high-speed skip function is used, SKIP, SKIPP, and SKIP2 to SKIP8 are:
0: Enabled as skip signals.
1: Disabled as skip signals.

#7 SKPXE For the skip function (G31), the skip signal SKIP is:
0: Enabled.
1: Disabled.

Whether the skip signals are enabled or disabled

Parameter	Bit 4 (IGX) of parameter No. 6201	Bit 0 (GSK) of parameter No. 6200	Bit 7 (SKPXE) of parameter No .6201	Skip signal SKIPP	Skip signal SKIP	Multistage skip signals SKIP2-SKIP8
Setting	0	0	0	Disabled	Enabled	Enabled
	0	1	0	Enabled	Enabled	Enabled
	0	0	1	Disabled	Disabled	Enabled
	0	1	1	Enabled	Disabled	Enabled
	1	0	0	Disabled	Disabled	Disabled
	1	1	0	Disabled	Disabled	Disabled
	1	0	1	Disabled	Disabled	Disabled
	1	1	1	Disabled	Disabled	Disabled

Bit 4 (IGX) of parameter No. 6201 is valid for the skip function using high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 1) or for the multistage skip function using high-speed skip signals (when bit 5 (SLS) of parameter No. 6200 is set to 1).
To use multistage skip signals, the multistage skip function is required.

	#7	#6	#5	#4	#3	#2	#1	#0
6202								1S1

[Input type] Parameter input
[Data type] Bit path

1S1 This parameter specify whether to enable or disable each high-speed skip signal when the G31 skip command is issued.
0: The high-speed skip signal HDI0 is disabled.
1: The high-speed skip signal HDI0 is enabled.

NOTE
1 Do not specify the same signal simultaneously for different paths.
2 At all of the following conditions, the bit 0 (1S1) of parameter No.6202 must be set to 1.
- The Multi-step skip function is effective.
- The High-speed skip signals are not used.
- Skip Signals SKIP<X0004.7>, SKIPP<Gn006.6> are used.

	#7	#6	#5	#4	#3	#2	#1	#0
6207							SFP	

[Input type] Parameter input
[Data type] Bit path

#1 SFP The feedrate used when the skip function (G31) is being executed is:
0: Feedrate of a programmed F code.
1: Feedrate set in parameter No. 6281.

> **NOTE**
> For the multi-stage skip function and high-speed skip, see the description of bit 2 (SFN) of parameter No. 6207.

	#7	#6	#5	#4	#3	#2	#1	#0
6210				ASB	ASL			

[Input type] Parameter input
[Data type] Bit path

#3 ASL
#4 ASB The ASB and ASL bits set the type and time constant of acceleration/deceleration after interpolation in the skip function as follows:

ASB	ASL	Type of acceleration/ deceleration	Parameter No. for time constant
0	1	Linear type	Parameter No. 6280
1	–	Bell-shaped	
0	0	This function is disabled(NOTE).	

When bell-shaped acceleration/deceleration is specified, T1=T/2 and T2=T/2 are obtained as with normal acceleration/deceleration after cutting feed interpolation, where T is the time constant. Therefore, the acceleration/deceleration type includes no linear part.

> **NOTE**
> In this case, the acceleration/deceleration type is set in bits 0 and 1 of parameter No. 1610, and the time constant is set in parameter No. 1622.

6280	Time constant for acceleration/deceleration after interpolation for the skip function for each axis

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 512

This parameter sets a time constant for acceleration/deceleration after interpolation for the skip function for each axis.
This parameter is valid when bit 3 (ASB) of parameter No. 6210 or bit 4 (ASL) of parameter No. 6210 is set to 1.

6281	Feedrate for the skip function (G31)

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

This parameter sets a feedrate for the skip function (G31). This parameter is valid when bit 1 (SFP) of parameter No. 6207 is set to 1.

> **NOTE**
> For the multi-stage skip function and high-speed skip, see the description of parameters Nos. 6282 to 6285.

Alarm and message

Number	Message	Description
PS0035	CAN NOT COMMANDED G31	- G31 cannot be specified. This alarm is generated when a G code (such as for cutter or tool-nose radius compensation) of group 07 is not canceled. - A torque limit skip was not specified in a torque limit skip command (G31P98 or P99). Specify the torque limit skip in the PMC window or the like. Or, specify the torque limit override by address Q.

Note

> **NOTE**
> This function is disabled for the synchronous slave axis and enabled for axes not related to composite control.

15.3.2 Multiple Axis Command Skip Function

Overview

In a G31 block, the move command can be executed for multiple axes. When the skip signal is input externally during execution of this command, the execution is aborted for all axes and the next block is executed.

The skip positions of all of the specified axes are set in macro variables #5061 to #5080 (#100151 to #100182 for a system having 20 or more axes) corresponding to the axes.

Note

> **NOTE**
> This function is disabled for the synchronous slave axis and enabled for axes not related to composite control.

15.3.3 High-speed Skip

Overview

The skip function operates based on a high-speed skip signal (HDI0 to HDI7 : connected directly to the CNC; not via the PMC) instead of an ordinary skip signal. In this case, up to eight signals can be input. (Either can be enabled/disabled, using parameters HSS and IGX (bit 4 of parameter No. 6201 and bit 4 of parameter No. 6200).) If a high-speed skip signal is used, up to eight signals can be input.

Delay and error of skip signal input is 0 to 2 msec at the CNC side (not considering those at the PMC side).
This high-speed skip signal input function keeps this value to 0.1 msec or less, thus allowing high precision measurement.

Explanation

High–speed skip signal

The high-speed skip signal to be used is selected by bits 0 to 7 (1S1 to 1S8) of parameter No. 6202.
The high-speed skip signal is assumed to be input on the rising or falling edge. However, when the skip cutting is specified, the skip signal is monitored as a state. Therefore, skip operation is performed immediately when the skip cutting is specified with the high-speed skip signal input. The rising or falling edges of the high-speed skip signal can be selected as a trigger by setting bit 6 (SRE) of parameter No. 6200.

If setting bits 1 (SEB) of parameter No. 6201, the accumulated pulses and positional deviation due to acceleration/deceleration are considered and compensated.

Feedrate

Two types of feedrate can be selected for the high-speed skip block, using bit 2 (SFN) of parameter No.6207.

(1) If bit 2 (SFN) of parameter No.6207 is 0
Feedrate specified with address F (may be specified before or in the high-speed skip block).

(2) If bit 2 (SFN) of parameter No.6207 is 1
Feedrate set for parameters Nos.6282 to 6285.
Even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when a feedrate with the G31 command is the feedrate which is set for parameters Nos.6282 to 6285.

> ⚠ **CAUTION**
> To increase the precision of the tool position when the high-speed skip signal is input, feedrate override, dry run, and automatic acceleration/deceleration are disabled in moving by the skip function regardless of the feedrate which is specified as a feed per minute or a feed per rotation.
> To enable these functions, set bit 7 (SKF) of parameter No.6200 to 1.
> However, even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when bit 2 (SFN) of parameter No.6207 is set to 1.

Signal

High-Speed Skip Status Signals HDO0 to HDO7<Fn122>

[Classification] Output signal

[Function] This signal informs the PMC of the input status of the high-speed skip signal. The signal-to-bit correspondence is as follows:

High-speed skip signal	Bit name
HDI0	HDO0
HDI1	HDO1
HDI2	HDO2
HDI3	HDO3
HDI4	HDO4
HDI5	HDO5
HDI6	HDO6
HDI7	HDO7

[Output cond.] Each bit is set to 1 when:
- The corresponding high-speed skip signal is logical “1”.

Each bit is set to 0 when:
- The corresponding high-speed skip signal is logical “0”.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn122	HDO7	HDO6	HDO5	HDO4	HDO3	HDO2	HDO1	HDO0

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
6200		SRE		HSS				

[Input type] Parameter input
[Data type] Bit path

#4 HSS 0: The skip function does not use high-speed skip signals while skip signals are input. (The conventional skip signal is used.)
1: The step skip function uses high-speed skip signals while skip signals are input.

#6 SRE When a high-speed skip signal is used:
0: The signal is assumed to be input on the rising edge (contact open → close).
1: The signal is assumed to be input on the falling edge (contact close → open).

	#7	#6	#5	#4	#3	#2	#1	#0
6201							SEB	

[Input type] Parameter input
[Data type] Bit path

#1 SEB When a skip signal, high-speed skip signal or measuring position reached signal goes on while the skip function, the continuous high-speed skip function or the automatic tool length measurement (M series) or automatic tool compensation (T series) is used, the accumulated pulses and positional deviation due to acceleration/deceleration are:
0: Ignored.
1: Considered and compensated.

The accumulated pulses and positional deviation due to actual acceleration/deceleration when the skip signal, high-speed skip signal or measuring position reached signal goes on are considered to obtain the position at which the signal is input.

	#7	#6	#5	#4	#3	#2	#1	#0
6202	1S8	1S7	1S6	1S5	1S4	1S3	1S2	1S1

[Input type] Parameter input
[Data type] Bit path

1S1 to 1S8 These parameters specify whether to enable or disable each high-speed skip signal when the G31 skip command is issued.
The following table shows the correspondence between the bits, input signals, and commands.
The settings of the bits have the following meaning :
0: The high-speed skip signal corresponding to a bit is disabled.
1: The high-speed skip signal corresponding to a bit is enabled.

Parameter	High-speed skip signals	Parameter	High-speed skip signals
1S1	HDI0	1S5	HDI4
1S2	HDI1	1S6	HDI5
1S3	HDI2	1S7	HDI6
1S4	HDI3	1S8	HDI7

NOTE
1 Do not specify the same signal simultaneously for different paths.
2 At all of the following conditions, the bit 0 (1S1) of parameter No.6202 must be set to 1.
- The Multi-step skip function is effective.
- The High-speed skip signals are not used.
- Skip Signals SKIP<X0004.7>, SKIPP<Gn006.6> are used.

	#7	#6	#5	#4	#3	#2	#1	#0
6207						SFN		

[Input type] Parameter input
[Data type] Bit path

#2 SFN The feedrate used when the skip function based on high-speed skip signals (with bit 4 (HSS) of parameter No. 6200 set to 1) or the multi-skip function is being executed is:
0: Feedrate of a programmed F code.
1: Feedrate set in a parameter from parameters Nos. 6282 to 6285.

NOTE
For not the multistage skip function, but the skip function using no high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 0), see the description of bit 1 (SFP) of parameter No. 6207.

6282	Feedrate for the skip function (G31, G31 P1)
6283	Feedrate for the skip function (G31 P2)
6284	Feedrate for the skip function (G31 P3)
6285	Feedrate for the skip function (G31 P4)

[Input type] Parameter input
[Data type] Real path

[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
Each of these parameters sets a feedrate for each skip function G code. These parameters are valid when bit 2 (SFN) of parameter No. 6207 is set to 1.

Alarm and message

Number	Message	Description
PS0373	ILLEGAL HIGH-SPEED SKIP SIGNAL SELECTED	In the skip commands (G31, G31P1 to G31P4) and dwell commands (G04, G04Q1 to G04Q4), the same high-speed signal is selected in different paths.

Note

NOTE
1 This function is disabled for the synchronous slave axis and enabled for axes not related to composite control.
2 Do not specify the same high-speed skip signal simultaneously for different paths. In the skip commands (G31, G31P1 to G31P4) and dwell commands (G04, G04Q1 to G04Q4), if the same high-speed signal is selected in different paths, an alarm (PS0373) "ILLEGAL HIGH-SPEED SKIP SIGNAL SELECTED" is issued.

Notes on using high speed skip

- Overview

Note that the contact state during a skip is different from that of Series 0*i*-C in the high speed skip signal of Series 0*i*-F Plus.

- Series 0*i*-F Plus :
  The skip signal is assumed to be input when an open contact is closed.
- Series 0*i*-C :
  The skip signal is assumed to be input when an closed contact is opened.

- Detail

The difference in the specification of the high speed skip signal between Series 0*i*-F Plus and Series 0*i*-C is as follows.

- For Series 0*i*-F Plus
  The high-speed skip signal is assumed to be 1 when the input voltage is at a low level and assumed to be 0 at a high level. That is, the skip signal is assumed to be 1 when a contact is closed.
  Therefore the skip signal is input when an open contact is closed.
- For Series 0*i*-C
  The high-speed skip signal is assumed to be 0 when the input voltage is at a low level and assumed to be 1 at a high level. That is, the skip signal is assumed to be 1 when a contact is opened.
  Therefore the skip signal is input when a closed contact is opened.
  When the wiring designed for 0*i*-C is applied to 0*i*-F Plus, the modification of wiring is not necessary by setting the following parameter.
  Depending on the detector to be used, the settings on the detector are used instead of parameter settings to switch between contact A and contact B of for output signals. For details, see the manual of the detector.

- Parameter

	#7	#6	#5	#4	#3	#2	#1	#0

[Classification] Output signal
[Function] This signal informs the PMC of the input status of the high-speed skip signal.
[Output cond.] 1: When the contact of the high-speed skip signal is closed.
(The input voltage is at a low level.)
0: When the contact of the high-speed skip signal is open.
(The input voltage is at a high level.)

15.3.4 Continuous High-Speed Skip Function

Overview

The continuous high-speed skip function enables reading of absolute coordinates by using the high-speed skip signals (HDI0 to HDI7). Once a high-speed skip signal has been input in a G31P90 block, absolute coordinates are written to custom macro variables #5061 to #5080. For a system with more than 20 axes, #100151 to #100182 are used. The input of a skip signal does not stop axial movement, thus continuous reading of the coordinates of two or more points is possible.
Both the rising and falling edges of the high-speed skip signal can be used as a trigger by setting bit 5 (CSE) of parameter No. 6201.

Explanation

Custom macro variables

Once a high–speed skip signal has been input in a G31P90 block, absolute coordinates are written to custom macro variables #5061 to #5080. For a system with more than 20 axes, #100151 to #100182 are used.

These variables are immediately updated once the tool reaches the next skip position. The feedrate must, therefore, be specified so that the tool does not reach the next skip position before the application completes reading of the variables.

System with up to 20 axes		System with more than 20 axes	
#5061	Coordinate along the first axis	#100151	Coordinate along the first axis
#5062	Coordinate along the second axis	#100152	Coordinate along the second axis
#5063	Coordinate along the third axis	#110153	Coordinate along the third axis
:		:	
#5079	Coordinate along the 19th axis	#100181	Coordinate along the 31st axis
#5080	Coordinate along the 20th axis	#100182	Coordinate along the 32nd axis

High–speed skip

This function is enabled only for high-speed skip signals.
The high-speed skip signal to be used is selected by bits 0 to 7 (9S1 to 9S8) of parameter No. 6208.

End of block

The G31P90 block is terminated when the axis reaches the end point.

Limitations

Only one axis can be specified in the block for the continuous high-speed skip function (G31P90). If two or more axes are specified, alarm PS5068, "FORMAT ERROR IN G31P90" is issued.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
6200		SRE		HSS				

[Input type] Parameter input
[Data type] Bit path

#4 HSS 0: The skip function does not use high-speed skip signals while skip signals are input. (The conventional skip signal is used.)
1: The step skip function uses high-speed skip signals while skip signals are input.

#6 SRE When a high-speed skip signal is used:
0: The signal is assumed to be input on the rising edge (contact open → close).
1: The signal is assumed to be input on the falling edge (contact close → open).

	#7	#6	#5	#4	#3	#2	#1	#0
6201			CSE				SEB	

[Input type] Parameter input
[Data type] Bit path

#1 SEB When a skip signal, high-speed skip signal or measuring position reached signal goes on while the skip function, the continuous high-speed skip function or the automatic tool length measurement (M series) or automatic tool compensation (T series) is used, the accumulated pulses and positional deviation due to acceleration/deceleration are:
0: Ignored.
1: Considered and compensated.
The accumulated pulses and positional deviation due to actual acceleration/deceleration when the skip signal, high-speed skip signal or measuring position reached signal goes on are considered to obtain the position at which the signal is input.

#5 CSE For the continuous high-speed skip command, high-speed skip signals are:
0: Effective at either a rising or falling edge (depending on the setting of bit 6 (SRE) of parameter No. 6200).
1: Effective at both the rising and falling edges.

	#7	#6	#5	#4	#3	#2	#1	#0
6208	**9S8**	**9S7**	**9S6**	**9S5**	**9S4**	**9S3**	**9S2**	**9S1**

[Input type] Parameter input
[Data type] Bit path

9S1 to 9S8 Specify which high-speed skip signal is enabled for the continuous high-speed skip command G31P90 or the EGB skip command G31.8.
The settings of each bit have the following meaning:
0: The high-speed skip signal corresponding to the bit is disabled.
1: The high-speed skip signal corresponding to the bit is enabled.
The bits correspond to signals as follows:

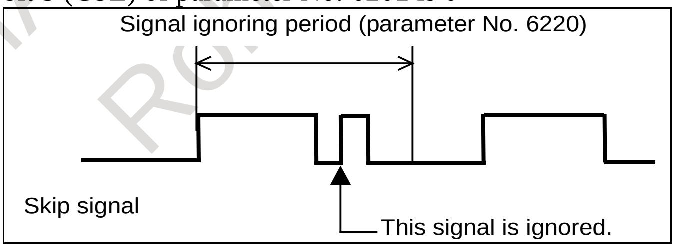
Parameter	High-speed skip signal	Parameter	High-speed skip signal
9S1	HDI0	9S5	HDI4
9S2	HDI1	9S6	HDI5
9S3	HDI2	9S7	HDI6
9S4	HDI3	9S8	HDI7

6220	Period during which skip signal input is ignored for the continuous high-speed skip function and EGB axis skip function

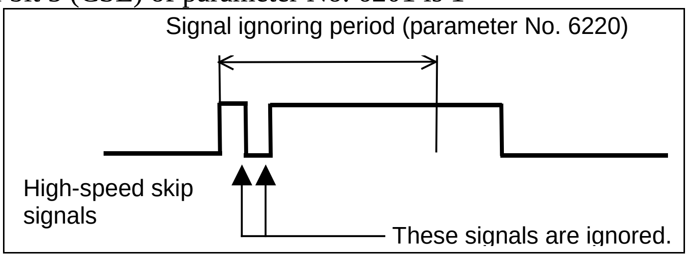
[Input type] Parameter input
[Data type] Byte path
[Unit of data] 8msec
[Valid data range] 3 to 127(× 8msec)

This parameter specifies the period from when a skip signal is input to when the next skip signal can be input for the continuous high-speed skip function and EGB axis skip function. This parameter is used to ignore chattering in skip signals.
If a value that falls outside the valid range is specified, the setting is assumed to be 24 msec.

Example 1)
When bit 5 (CSE) of parameter No. 6201 is 0



Example 2)
When bit 5 (CSE) of parameter No. 6201 is 1



Signal

In a continuous high-speed skip, the high-speed skip signal is used. For details on the signal, see Section, "High-Speed Skip Signal".

Alarm and message

Number	Message	Description
PS5068	FORMAT ERROR IN G31P90	No travel axis was specified. Two or more travel axes were specified.
PS0369	G31 FORMAT ERROR	- No axis is specified or tow or more axes are specified in the torque limit switch instruction (G31P98/P99). - The specified torque Q value in the torque limit switch instruction is out of range. The torque Q range is 1 to 254. - The high-speed continuous skip is not effective.

Note

NOTE
To use this function, the continuous high-speed skip, high-speed skip and custom macro are required.

15.3.5 Multi-step Skip

Overview

The multi-step skip function stores the coordinate values when skip signals are input in the block where G31P1 to G31P4 are specified, and skips the remaining movement. In the block where Q1 to Q4 are specified after G04, dwell can be skipped when skip signals are input.
A skip signal from equipment such as a fixed-dimension size measuring instrument can be used to skip programs being executed.
In plunge grinding, for example, a series of operations from rough machining to spark-out can be performed automatically by applying a skip signal each time rough machining, semi-fine machining, fine-machining, or spark-out operation is completed.

When the multi-step skip function is effective, to use high-speed skip signals, set bit 5 (SLS) of parameter No.6200 to 1.

- Feedrate

Two types of feedrate can be selected for the multi-step skip block, using bit 2 (SFN) of parameter No.6207.

(1) If bit 2 (SFN) of parameter No.6207 is 0
Feedrate specified with address F (may be specified before or in the multi-step skip block).

(2) If bit 2 (SFN) of parameter No.6207 is 1
Feedrate set for parameters Nos.6282 to 6285.
Even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when a feedrate with the G31 command is the feedrate which is set for parameters Nos.6282 to 6285.

⚠ CAUTION
To increase the precision of the tool position when the skip signal is input, feedrate override, dry run, and automatic acceleration/deceleration are disabled in moving by the skip function regardless of the feedrate which is specified as a feed per minute or a feed per rotation.
To enable these functions, set bit 7 (SKF) of parameter No.6200 to 1.
However, even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when bit 2 (SFN) of parameter No.6207 is set to 1.

Signal

Skip signals SKIPP<Gn006.6>,SKIP<X0004.7>,SKIP2<X0004.2>,SKIP3<X0004.3> SKIP4<X0004.4>,SKIP5<X0004.5>,SKIP6<X0004.6>,SKIP7<X0004.0> SKIP8<X0004.1>

[Classification] Input signal

[Function] These signals terminate skip cutting. That is, the position where a skip signal turns to 1 in a command program block containing G31P1 (or G31), G31P2, or G31P3, G31P4 is stored in a custom macro variable, and the move command of the block is terminated at the same time. Furthermore, in a block containing G04, G04Q1, G04Q2, G04Q3 or G04Q4, the dwell command of the block is terminated.

In either case, until all other commands (such as miscellaneous functions) of the block are completed, machining never proceeds to the next block.

Parameters Nos. 6202 to 6206 are used to select the signals to be enabled from eight signals. The eight skip signals can correspond to the G codes on a one-to-one basis. One skip signal can also be made applicable to multiple G codes. Conversely, multiple skip signals can be made applicable to one G code.

[Operation] When a skip signal turns to 1, the control unit functions as described below.

- When a block contains a G code from (G31, G31P1 to P4) for skip cutting, and the skip signal is made applicable by parameter setting to the command, the control unit reads and stores the current position of the specified axis at that time. The control unit stops the axis, then cancels the remaining distance that the axis was supposed to be moved in that block.
- When a block contains a G04, or G04Q1 to Q4 code for dwell, and the skip signal is made applicable by parameter setting to the command, the control unit stops dwell operation, and cancels any remaining dwell time.

NOTE

1. The skip signal width requires at least 10 msec.
2. The delay or variation on the CNC side (excluding the PMC side) in detecting the skip signal is 0 to 2 msec. Therefore, the measurement error is the sum of 2 msec and the delay or variation (including the delay or variation of the receiver) of the skip signal on the PMC side, multiplied by the feedrate.
3. The delay or variation until feed stops after detection of the skip signal is 0 to 8 msec. To calculate the overshoot, further consider delay in acceleration/deceleration, delay in servo, delay on the PMC side.
4. The G codes for skip cutting (G31P1, G31P2, G31P3, and G31P4) are the same except for their correspondence with skip signals. G31 and G31P1 are equivalent.
5. The skip signal is not monitored for a rising edge, but for its state. So, if a skip signal continues to be 1, a skip condition is assumed to be satisfied immediately when the next skip cutting or dwell operation is specified.
6. Address <X0004> can be allocated optionally to the X addresses set in parameter No. 3012 and parameter No. 3019 when bit 2 (XSG) of parameter No. 3008 is 1.
7. In case that the command value of G31P or G04Q is incorrect, or in the absence of the Multi-step skip function, alarm PS0370 “G31P/G04Q ERROR” occurs.

> **NOTE**
> 8 The same high-speed signal cannot be selected in different paths. In that case, alarm PS0373 “ILLEGAL HIGH-SPEED SKIP SIGNAL SELECTED” occurs.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3008						XSG		

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#2 XSG A signal assigned to an X address is:
0: Fixed at the address.
1: Able to be reassigned to an arbitrary X address.

NOTE

When this parameter is set to 1, set parameters Nos. 3013, 3014, 3012, and 3019. If parameters Nos. 3013 and 3014 are not set, the deceleration signal for reference position return is assigned to bit 0 of <X0000>. If parameters Nos. 3012 and 3019 are not set, the skip signal, the PMC axis control skip signal, the measuring position reached signal, the interlock signal for each axis direction, and the tool compensation value write signal are assigned to <X0000>.

⚠ **WARNING**

Please set an appropriate value to parameters (Nos. 3013, 3014, 3012, 3019) beforehand when you set 1 to this parameter.
If an input signal of the set address in parameters (Nos. 3013, 3014, 3012, 3019) is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

3012	Skip signal assignment address

NOTE

When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the skip signal SKIPn is to be assigned.

NOTE

This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
Depending on the configuration of the I/O Link, the actually usable X addresses are:
<X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

⚠ **WARNING**

If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
Be careful enough that you must prevent the competition of the used X address.

3019	Address to which the PMC axis control skip signal, measuring position reached signal, and tool offset write signals are assigned

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the PMC axis control skip signal ESKIP, measuring position reached signals (XAE, YAE, and ZAE (M series) or XAE and ZAE (T series)), and tool offset write signals (±MIT1 and ±MIT2 (T series)) are to be assigned.

NOTE
This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
Depending on the configuration of the I/O Link, the actually usable X addresses are:
<X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

⚠ **WARNING**
If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
Be careful enough that you must prevent the competition of the used X address.

	#7	#6	#5	#4	#3	#2	#1	#0
6200	SKF		SLS				SK0	GSK

[Input type] Parameter input
[Data type] Bit path

#0 GSK As a skip signal, the skip signal SKIPP is:
0: Invalid.
1: Valid.

#1 SK0 This parameter specifies whether the skip signal is made valid under the state of the skip signal SKIP and the multistage skip signals SKIP2 to SKIP8.
0: Skip signal is valid when these signals are “1”.
1: Skip signal is valid when these signals are “0”.

#5 SLS 0: The multi-step skip function does not use high-speed skip signals while skip signals are input. (The conventional skip signal is used.)
1: The multi-step skip function uses high-speed skip signals while skip signals are input.

> **NOTE**
> The skip signals (SKIP and SKIP2 to SKIP8) are valid regardless of the setting of this parameter. They can also be disabled using bit 4 (IGX) of parameter No. 6201.
> If you want to use high-speed skip signals when the multi-step skip function is used, set this parameter to 1.

#7 SKF Dry run, override, and automatic acceleration/deceleration for G31 skip command
0: Disabled
1: Enabled

> ⚠ **CAUTION**
> 1 When bit 7 (SKF) of parameter No.6200 is set to 0, feedrate override, dry run, and automatic acceleration/deceleration are disabled in moving by the skip function regardless of the feedrate which is specified as a feed per minute or a feed per rotation.
> 2 Even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when bit 1 (SFP) of parameter No.6207 is set to 1. When the multi-step skip is used and bit 2 (SFN) of parameter No.6207 is set to 1, dry run and automatic acceleration/deceleration are similarly disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
6201	SKPXE			IGX			SEB	

[Input type] Parameter input
[Data type] Bit path

#1 SEB When a skip signal, high-speed skip signal or measuring position reached signal goes on while the skip function, the continuous high-speed skip function or the automatic tool length measurement (M series) or automatic tool compensation (T series) is used, the accumulated pulses and positional deviation due to acceleration/deceleration are:
0: Ignored.
1: Considered and compensated.
The accumulated pulses and positional deviation due to actual acceleration/deceleration when the skip signal, high-speed skip signal or measuring position reached signal goes on are considered to obtain the position at which the signal is input.

#4 IGX When the high-speed skip function is used, SKIP, SKIPP, and SKIP2 to SKIP8 are:
0: Enabled as skip signals.
1: Disabled as skip signals.

#7 SKPXE For the skip function (G31), the skip signal SKIP is:
0: Enabled.
1: Disabled.

Whether the skip signals are enabled or disabled

Parameter	Bit 4 (IGX) of parameter No. 6201	Bit 0 (GSK) of parameter No. 6200	Bit 7 (SKPXE) of parameter No .6201	Skip signal SKIPP	Skip signal SKIP	Multistage skip signals SKIP2-SKIP8
Setting	0	0	0	Disabled	Enabled	Enabled
	0	1	0	Enabled	Enabled	Enabled
	0	0	1	Disabled	Disabled	Enabled
	0	1	1	Enabled	Disabled	Enabled
	1	0	0	Disabled	Disabled	Disabled
	1	1	0	Disabled	Disabled	Disabled
	1	0	1	Disabled	Disabled	Disabled
	1	1	1	Disabled	Disabled	Disabled

Bit 4 (IGX) of parameter No. 6201 is valid for the skip function using high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 1) or for the multistage skip function using high-speed skip signals (when bit 5 (SLS) of parameter No. 6200 is set to 1).
To use multistage skip signals, the multistage skip function is required.

	#7	#6	#5	#4	#3	#2	#1	#0

6206	DS8	DS7	DS6	DS5	DS4	DS3	DS2	DS1

[Input type] Parameter input
[Data type] Bit path

1S1to1S8, 2S1to2S8, 3S1to3S8, 4S1to4S8, DS1toDS8

Specify which skip signal is enabled when the skip command (G31, or G31P1 to G31P4) and the dwell command (G04, G04Q1 to G04Q4) are issued with the multi-step skip function.
The following table shows the correspondence between the bits, input signals, and commands.
The setting of the bits have the following meaning :
0: The skip signal corresponding to a bit is invalid.
1: The skip signal corresponding to a bit is enabled.

Multi-step skip function

Command / Input signal	G31 G31P1 G04Q1	G31P2 G04Q2	G31P3 G04Q3	G31P4 G04Q4	G04
SKIP/HDI0	1S1	2S1	3S1	4S1	DS1
SKIP2/HDI1	1S2	2S2	3S2	4S2	DS2
SKIP3/HDI2	1S3	2S3	3S3	4S3	DS3
SKIP4/HDI3	1S4	2S4	3S4	4S4	DS4
SKIP5/HDI4	1S5	2S5	3S5	4S5	DS5
SKIP6/HDI5	1S6	2S6	3S6	4S6	DS6
SKIP7/HDI6	1S7	2S7	3S7	4S7	DS7
SKIP8/HDI7	1S8	2S8	3S8	4S8	DS8

> **NOTE**
> 1 HDI0 to HDI7 are high-speed skip signals. Do not specify the same signal simultaneously for different paths.
> 2 At all of the following conditions, the bit 0 (1S1) of parameter No.6202 must be set to 1.
> - The Multi-step skip function is effective.
> - The High-speed skip signals are not used.
> - Skip Signals SKIP<X0004.7>, SKIPP<Gn006.6> are used.

When bit 0 (GSK) of parameter No. 6200 is set to 1, commands to be skipped can be selected by setting the following parameter:

Commands skipped by SKIPP signal <G006.6>

Parameter	Command skipped
When bit 0 (1S1) of parameter No. 6202 is set to 1	G31P1,G04Q1
When bit 0 (2S1) of parameter No. 6203 is set to 1	G31P2,G04Q2
When bit 0 (3S1) of parameter No. 6204 is set to 1	G31P3,G04Q3
When bit 0 (4S1) of parameter No. 6205 is set to 1	G31P4,G04Q4
When bit 0 (DS1) of parameter No. 6206 is set to 1	G04,G04Q1,G04Q2,G04Q3,G04Q4

	#7	#6	#5	#4	#3	#2	#1	#0
6207						SFN		

[Input type] Parameter input
[Data type] Bit path

#2 SFN The feedrate used when the skip function based on high-speed skip signals (with bit 4 (HSS) of parameter No. 6200 set to 1) or the multi-skip function is being executed is:
0: Feedrate of a programmed F code.
1: Feedrate set in a parameter from parameters Nos. 6282 to 6285.

> **NOTE**
> For not the multistage skip function, but the skip function using no high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 0), see the description of bit 1 (SFP) of parameter No. 6207.

6282	**Feedrate for the skip function (G31, G31 P1)**
6283	**Feedrate for the skip function (G31 P2)**
6284	**Feedrate for the skip function (G31 P3)**
6285	**Feedrate for the skip function (G31 P4)**

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
Each of these parameters sets a feedrate for each skip function G code. These parameters are valid when bit 2 (SFN) of parameter No. 6207 is set to 1.

Alarm and message

Number	Message	Description
PS0035	CAN NOT COMMANDED G31	- G31 cannot be specified. This alarm is generated when a G code (such as for cutter or tool-nose radius compensation) of group 07 is not canceled. - A torque limit skip was not specified in a torque limit skip command (G31P98 or P99). Specify the torque limit skip in the PMC window or the like. Or, specify the torque limit override by address Q.
PS0370	G31P/G04Q ERROR	1) The specified address P value for G31 is out of range. The address P range is 1 to 4 in a multistage skip function. 2) The specified address Q value for G04 is out of range. The address Q range is 1 to 4 in a multistage skip function. 3) P1-4 for G31, or Q1-4 for G04 was commanded without a multistage skip function. 4) <T series > The specified value of address P of G72 or G74 falls outside the range. Address P ranges from 1 to 4 in the multistage skip function. P1-4 was specified in G72 or G74 even though the multistage skip function is not present.
PS0373	ILLEGAL HIGH-SPEED SKIP SIGNAL SELECTED	In the skip commands (G31, G31P1 to G31P4) and dwell commands (G04, G04Q1 to G04Q4), the same high-speed signal is selected in different paths.

Note

NOTE

This function is disabled for the synchronous slave axis and enabled for axes not related to composite control.

15.3.6 Torque Limit Skip Function

Overview

When the movement command following G31 P99 (or G31 P98) is executed with the servo motor torque limit[*1] overridden[*2], cutting feed similar to linear interpolation (G01) can be performed. When the servo motor torque[*3] reaches the torque limit (overridden servo motor torque limit) by pushing or the skip signal (including the high-speed skip signal) is input during the movement, the remaining movement commands are canceled and then the next block is executed. (The operation that executes the next block by canceling the remaining movement command is called skip operation later.)

The servo motor torque limit can be overridden by:

(1) Executing the torque limit override command for the PMC window.

(2) Executing the address Q command in the same block in which G31 P99 (or G31 P98) exists.

*1: The servo motor torque limit (parameter No.2060) is automatically set according to the settings of the motor model. The override is applied to the maximum torque of the servo motor.

*2: Set the torque limit override by the window function (function code 152) of PMC. Refer to PMC PROGRAMMING MANUAL (B-64513EN) for window Functions.

*3: Servo motor torque can be traced by waveform diagnosis display. Refer to Series 0*i*-F Plus MAINTENANCE MANUAL (B-64695EN) for waveform diagnosis display.

In order to override the torque limit on the servo motor, set bit 0 (TQO) of parameter No. 6286 to 1.

If the bit 0 (TQI) of parameter No.1803 is set to 1, in-position check is disabled during torque limit.

If the bit 1 (TQA) of parameter No.1803 is set to 1, an excessive stop-time/move-time error is not checked during torque limit.

If setting parameter No.6221, torque limit reached signals are ignored for a set period of time.

Signal

Torque limit reached signals TRQL1 to TRQL 8<Fn114>

[Classification] Input signal

[Function] Indicates that the torque limit has been reached.

[Output cond.] Set to 1 when:

- The torque limit has been reached.

Set to 0 when:

- The torque limit has not been reached.

Indicates the signal for each axis. The value at the end of a signal name indicates the number of each control axis.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn114	TRQL8	TRQL7	TRQL6	TRQL5	TRQL4	TRQL3	TRQL2	TRQL1

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
1803							TQA	TQI

[Input type] Parameter input

[Data type] Bit path

#0 TQI Within a torque limit, an in-position check is:

0: Made.

1: Not made.

#1 TQA Within a torque limit, an excessive stop-time/move-time error is:

0: Checked.

1: Not checked.

	#7	#6	#5	#4	#3	#2	#1	#0
3008						XSG		

[Input type] Parameter input

[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#2 XSG A signal assigned to an X address is:

0: Fixed at the address.

1: Able to be reassigned to an arbitrary X address.

> **NOTE**
> When this parameter is set to 1, set parameters Nos. 3013, 3014, 3012, and 3019. If parameters Nos. 3013 and 3014 are not set, the deceleration signal for reference position return is assigned to bit 0 of <X0000>. If parameters Nos. 3012 and 3019 are not set, the skip signal, the PMC axis control skip signal, the measuring position reached signal, the interlock signal for each axis direction, and the tool compensation value write signal are assigned to <X0000>.

> ⚠ **WARNING**
> Please set an appropriate value to parameters (Nos. 3013, 3014, 3012, 3019) beforehand when you set 1 to this parameter.
> If an input signal of the set address in parameters (Nos. 3013, 3014, 3012, 3019) is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

3012	Skip signal assignment address

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the skip signal SKIPn is to be assigned.

> **NOTE**
> This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
> Depending on the configuration of the I/O Link, the actually usable X addresses are:
> <X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

> ⚠ **WARNING**
> If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
> Be careful enough that you must prevent the competition of the used X address.

3019	Address to which the PMC axis control skip signal and measuring position reached signals are assigned

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the PMC axis control skip signal ESKIP and measuring position reached signals (XAE, YAE, and ZAE (M series) or XAE and ZAE (T series)) are to be assigned.

> **NOTE**
> This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
> Depending on the configuration of the I/O Link, the actually usable X addresses are:
> <X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

> ⚠ **WARNING**
> If you used the set address in this parameter by another usage, it may cause an unexpected machine behavior.
> Be careful enough that you must prevent the competition of the used X address.

	#7	#6	#5	#4	#3	#2	#1	#0
6200	SKF			HSS			SK0	GSK

[Input type] Parameter input
[Data type] Bit path

#0 GSK As a skip signal, the skip signal SKIPP is:
- 0: Invalid.
- 1: Valid.

#1 SK0 This parameter specifies whether the skip signal is made valid under the state of the skip signal SKIP and the multistage skip signals SKIP2 to SKIP8.
- 0: Skip signal is valid when these signals are “1”.
- 1: Skip signal is valid when these signals are “0”.

#4 HSS
- 0: The skip function does not use high-speed skip signals while skip signals are input. (The conventional skip signal is used.)
- 1: The step skip function uses high-speed skip signals while skip signals are input.

#7 SKF Dry run, override, and automatic acceleration/deceleration for G31 skip command
- 0: Disabled
- 1: Enabled

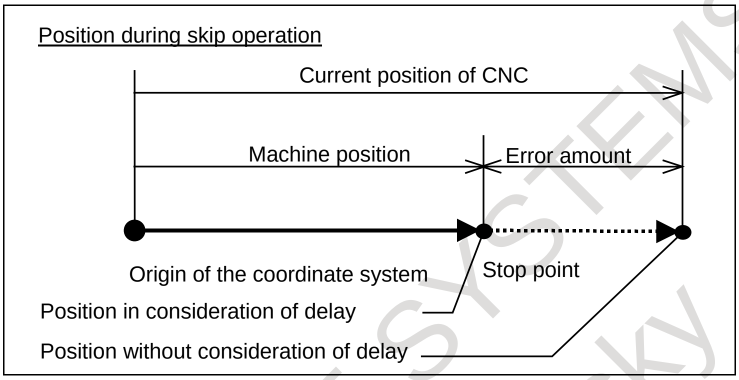
> ⚠ **CAUTION**
> 1 When bit 7 (SKF) of parameter No.6200 is set to 0, feedrate override, dry run, and automatic acceleration/deceleration are disabled in moving by the skip function regardless of the feedrate which is specified as a feed per minute or a feed per rotation.
> 2 Even if bit 7 (SKF) of parameter No.6200 is set to 1, dry run and automatic acceleration/deceleration are disabled when bit 1 (SFP) of parameter No.6207 is set to 1. When the multi-step skip is used and bit 2 (SFN) of parameter No.6207 is set to 1, dry run and automatic acceleration/deceleration are similarly disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
6201	**SKPXE**			**IGX**		**TSE**		

[Input type] Parameter input
[Data type] Bit path

#2 TSE When the torque limit skip function (G31 P99/98) is used, the skip position held in a system variable (#5061 to #5080 (#100151 to #100182 for a system having more than 20 axes)) is:

0: Position that is offset considering the delay (positional deviation) incurred by the servo system.
1: Position that does not reflect the delay incurred by the servo system.



#4 IGX When the high-speed skip function is used, SKIP, SKIPP, and SKIP2 to SKIP8 are:

0: Enabled as skip signals.
1: Disabled as skip signals.

#7 SKPXE For the skip function (G31), the skip signal SKIP is:

0: Enabled.
1: Disabled.

Whether the skip signals are enabled or disabled

Parameter	Bit 4 (IGX) of parameter No. 6201	Bit 0 (GSK) of parameter No. 6200	Bit 7 (SKPXE) of parameter No .6201	Skip signal SKIPP	Skip signal SKIP	Multistage skip signals SKIP2-SKIP8
Setting	0	0	0	Disabled	Enabled	Enabled
	0	1	0	Enabled	Enabled	Enabled
	0	0	1	Disabled	Disabled	Enabled
	0	1	1	Enabled	Disabled	Enabled
	1	0	0	Disabled	Disabled	Disabled
	1	1	0	Disabled	Disabled	Disabled
	1	0	1	Disabled	Disabled	Disabled
	1	1	1	Disabled	Disabled	Disabled

Bit 4 (IGX) of parameter No. 6201 is valid for the skip function using high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 1) or for the multistage skip function using high-speed skip signals (when bit 5 (SLS) of parameter No. 6200 is set to 1).
To use multistage skip signals, the multistage skip function is required.

	#7	#6	#5	#4	#3	#2	#1	#0
6207						**SFN**	**SFP**	

[Input type] Parameter input
[Data type] Bit path

#1 SFP The feedrate used when the skip function (G31) is being executed is:
0: Feedrate of a programmed F code.
1: Feedrate set in parameter No. 6281.

> **NOTE**
> For the multi-stage skip function and high-speed skip, see the description of bit 2 (SFN) of parameter No. 6207.

#2 SFN The feedrate used when the skip function based on high-speed skip signals (with bit 4 (HSS) of parameter No. 6200 set to 1) or the multi-skip function is being executed is:
0: Feedrate of a programmed F code.
1: Feedrate set in a parameter from parameters Nos. 6282 to 6285.

> **NOTE**
> For not the multistage skip function, but the skip function using no high-speed skip signals (when bit 4 (HSS) of parameter No. 6200 is set to 0), see the description of bit 1 (SFP) of parameter No. 6207.

6281	**Feedrate for the skip function (G31)**

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
This parameter sets a feedrate for the skip function (G31). This parameter is valid when bit 1 (SFP) of parameter No. 6207 is set to 1.

> **NOTE**
> For the multi-stage skip function and high-speed skip, see the description of parameters Nos. 6282 to 6285.

6282	**Feedrate for the skip function (G31, G31 P1)**
6283	**Feedrate for the skip function (G31 P2)**
6284	**Feedrate for the skip function (G31 P3)**
6285	**Feedrate for the skip function (G31 P4)**

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the reference axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
Each of these parameters sets a feedrate for each skip function G code. These parameters are valid when bit 2 (SFN) of parameter No. 6207 is set to 1.

6221	Torque limit dead zone time for a torque limit skip command

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] 2msec
[Valid data range] 0 to 65535

The torque limit reached signal is ignored for a set period of time.
If G31P98 is specified, skip operation is not performed for a set period of time after the torque limit reached signal is set to “1”.
If G31P99 is specified, skip operation is not performed for a set period of time after the torque limit reached signal is set to “1”.
However, if a skip signal is input, skip operation is performed, regardless of the period of time set in this parameter.

	#7	#6	#5	#4	#3	#2	#1	#0
6286								TQO

[Input type] Parameter input
[Data type] Bit axis

#0 TQO The torque limit override function is:
0: Disabled. (Override of 100%)
1: Enabled.

> **NOTE**
> Before the torque limit skip function can be used, this parameter must be set to 1.

6287	Positional deviation limit in torque limit skip

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] Detection unit
[Valid data range] 0 to 327670

This parameter sets a positional deviation limit for each axis imposed when torque limit skip is specified. When the actual positional deviation exceeds the positional deviation limit, the alarm SV0004, “EXCESS ERROR (G31)” is issued and an immediate stop takes place.

Alarm and message

Number	Message	Description
PS0035	CAN NOT COMMANDED G31	- G31 cannot be specified. This alarm is generated when a G code (such as for cutter or tool-nose radius compensation) of group 07 is not canceled. - A torque limit skip was not specified in a torque limit skip command (G31P98 or P99). Specify the torque limit skip in the PMC window or the like. Or, specify the torque limit override by address Q.
PS0369	G31 FORMAT ERROR	- No axis is specified or two or more axes are specified in the torque limit switch instruction (G31P98/P99). - The specified torque Q value in the torque limit switch instruction is out of range. The torque Q range is 1 to 254.
SV0004	EXCESS ERROR (G31)	The amount of positional deviation during torque limit skip command operation exceeded the limit value of the parameter No. 6287.

Note

> **NOTE**
> This function is disabled for the synchronous slave axis and enabled for axes not related to composite control.

15.3.7 Skip Function of Measurement I/O Unit

Overview

Measurement I/O Unit is provided with an interface for connecting such measuring instruments as a touch probe for on-machine measurement system. It is possible to skip by the skip signals input from the Measurement I/O Unit. The skip signals are available for the G31 command and the measurement cycle. Up to two Measurement I/O Units can be connected and up to four skip signals can be input.

This function is effective to the following function:

- Skip function (G31)

Explanation

Skip signals of Measurement I/O Unit

When 1 Measurement I/O Unit is connected, 2 points SKIP_A and SKIP_B are available for the skip signals input.
When 2 Measurement I/O Units are connected, 4 points SKIP_A, SKIP_B, SKIP_C and SKIP_D are available for the skip signals input.

Correspondence between the number of connection and the skip signals is the following table.

Skip signal	Input of the unit	Unit connection order
SKIP_A	DI3A (pin11 of TM1)	1st unit
SKIP_B	DI3B (pin11 of TM2)	1st unit
SKIP_C	DI3A (pin11 of TM1)	2nd unit
SKIP_D	DI3B (pin11 of TM2)	2nd unit

The operation of all skip signals SKIP_A to SKIP_D are equivalent to that of the skip signal SKIP<X0004.7>.
The signals inputs of the skip signals SKIP_A to SKIP_D are always “1”.
The signals inputs are also “1” when bit 1 (SK0) of parameter No.6200 is set to 1.

To enable or disable skip signals

Bit 0 (MS1) to bit 3 (MS4) of parameter No.24714 enable to enable or disable each skip signals SKIP_A to SKIP_D.
Other parameters for selecting whether to enable or disable the skip signals are followings. However, the skip signals SKIP_A to SKIP_D are not affected by these parameters setting.

- bit 4 (IGX) of parameter No.6201
- bit 0 (GSK) of parameter No.6200
- bit 7 (SKPEXE) of parameter No.6201

Multi-step skip function

If the skip signals SKIP_A to SKIP_D are used for the multi-step skip or the dwell skip, please set bit 0 of parameters Nos. 6202 to 6206.

Delay time of skip signal

The parameters No.24715 to No.24718 enable to set the delay time of the skip signals SKIP_A to SKIP_D.
The coordinate values of the skip position are stored in the system variables for custom macros in consideration of the delay time.

Signal

Skip Signals SKIP_A to SKIP_D

[Classification] Input signal

[Function] This signal terminates skip cutting. That is, the position where a skip signal turns to 1 in a block containing G31 is stored in a custom macro variable, and the move command of the block is terminated at the same time.
Bit 0 (MS1) to bit 3 (MS4) of parameter No.24714 enable to enable or disable each skip signals SKIP_A to SKIP_D.

[Operation] When a skip signal turns to 1, the control unit works as described below.
When a block contains a skip cutting command G31, the control unit reads and stores the current position of the specified axis at that time. The control unit stops the axis, then cancels the remaining distance that the block was supposed to be moved.
There is no distinction between the skip signals SKIP_A to SKIP_D. The operation of all signals is equivalent to that of the skip signal SKIP<X0004.7>.

[Operation] When a skip signal turns to 1, the control unit works as described below.

- When a block contains a skip cutting command G31, the control unit reads and stores the current position of the specified axis at that time. The control unit stops the axis, then cancels the remaining distance that the block was supposed to be moved. There is no distinction between the skip signals SKIP_A to SKIP_D. The operation of all signals is equivalent to that of the skip signal SKIP<X0004.7>.

NOTE

1. The skip signal width requires at least 10 msec.
2. The delay or variation on the CNC side (excluding the PMC side) in detecting the skip signal is 0 to 2 msec. Therefore, the measurement error is the sum of 2 msec and the delay or variation (including the delay or variation of the receiver) of the skip signal on the PMC side, multiplied by the feedrate.
3. The delay or variation until feed stops after detection of the skip signal is 0 to 8 msec. To calculate the overshoot, further consider delay in acceleration/deceleration, delay in servo, delay on the PMC side.
4. The skip signals SKIP_A to SKIP_D do not need to be processed on the PMC side since the CNC directly reads the signals from the machine side.
5. When the skip signals SKIP_A to SKIP_D are monitored, the state rather than the rising edge is sampled. Therefore, when the level remains 1, the skip condition is assumed to be met immediately after skip cutting is specified next.
6. The skip signals SKIP_A to SKIP_D are effective to the EGB skip function and the Continuous high-speed skip function. When disabling them for each function, please set not to output the signals on the probe side.
7. In the case of the multi-path system, the skip signals SKIP_A to SKIP_D are common to all paths.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
24714					MS4	MS3	MS2	MS1

[Input type] Parameter input
[Data type] Bit path

MS1～MS4 This parameters enable to disable each skip signals SKIP_A to SKIP_D for Measurement I/O Unit. The table below indicates the correspondence between bits and skip signals. The setting of a bit has the following meaning:
0: Skip signal of Measurement I/O Unit corresponding to a bit is effective.
1: Skip signal of Measurement I/O Unit corresponding to a bit is not effective.

Parameter	Skip signal
MS1	SKIP_A
MS2	SKIP_B
MS3	SKIP_C
MS4	SKIP_D

24715	Delay time of skip signal 1 (Measurement I/O Unit)

[input type] Parameter input
[Data type] Word
[Unit of data] 0.1msec
[Valid data range] 0, 1 to 320
Delay time of skip signal SKIP_A for Measurement I/O Unit is set.
When setting is out of range, it is assumed that 0 is set.

NOTE
This parameter is effective to the following function.
- skip function (G31)

24716	Delay time of skip signal 2 (Measurement I/O Unit)

[input type] Parameter input
[Data type] Word
[Unit of data] 0.1msec
[Valid data range] 0, 1 to 320
Delay time of skip signal SKIP_B for Measurement I/O Unit is set.
When setting is out of range, it is assumed that 0 is set.

NOTE
This parameter is effective to the following function.
- skip function (G31)

24717	Delay time of skip signal 3 (Measurement I/O Unit)

[input type] Parameter input
[Data type] Word
[Unit of data] 0.1msec
[Valid data range] 0, 1 to 320
Delay time of skip signal SKIP_C for Measurement I/O Unit is set.
When setting is out of range, it is assumed that 0 is set.

> **NOTE**
> This parameter is effective to the following function.
> - skip function (G31)

24718	Delay time of skip signal 4 (Measurement I/O Unit)

[input type] Parameter input
[Data type] Word
[Unit of data] 0.1msec
[Valid data range] 0, 1 to 320

Delay time of skip signal SKIP_D for Measurement I/O Unit is set.
When setting is out of range, it is assumed that 0 is set.

> **NOTE**
> This parameter is effective to the following function.
> - skip function (G31)

15.4 COMPENSATION VALUE INPUT

T

15.4.1 Direct Input of Tool Offset Value Measured

Overview

This is a function of setting an offset value by key-inputting a workpiece dimension manually cut and measured from the MDI keyboard. First the workpiece is cut in the longitudinal or cross direction manually. When the position record signal is turned “1” (prepare a button on the machine operator’s panel) on completion of the cutting, the workpiece coordinate value of X axis(X axis of the basic three axes) and Z axis(Z axis of the basic three axes) at that time is recorded in the CNC. Then, withdraw the tool, stop the spindle, and measure the diameter or the radius if the cutting was on the longitudinal direction or measure the distance from the standard face if the cutting was on the facing. (The reference face is made as Z = 0.) When the measured value is entered on the offset value display screen, NC inputs the difference between the input measured value and the coordinate value recorded in NC, as the offset value of the offset number. If you release the tool without moving the tool in the axis along which an offset value is entered but moves the tool along the other axis, an offset value can be set without using the position record signal. The workpiece coordinate system can be shifted using the technique of directly inputting the measured value for offset. This technique is used when the coordinate system planned in the program does not match with the coordinate system actually set. The procedures are the same as those for direct input for offset, except a difference of using the standard tool on the work shift screen.
For details of the method of the operations, refer to the OPERATOR'S MANUAL (For Lathe System)(B-64694EN-1) of Setting and displaying data.

Explanation

- Relationship between the input of measurement value and the diameter/radius specification

Whether to set offset value by using a diameter value or radius value shift value depend on the setting of bit 3 (DIAx) of parameter No.1006 and bit 1 (ORC) of parameter No.5004.

Parameter DIAx(No.1006#3)	Parameter ORC(5004#1)	Offset value set
0	0	Radius
1	0	Diameter
0	1	Radius
1	1	Radius

Signal

Position record signal PRC <Gn040.6>

[Classification] Input signal

[Function] This signal is prepared for the function of direct input of tool offset value measured.
It is used to store in the control unit the data on the positions of the tool for tentative cutting. After measuring a dimension of the workpiece, input the measured value by the specified manual operation. The difference is then stored as the specified tool compensation value.

[Operation] The control unit stores the current position along X and Z axes when the signal turns to "1".

> ⚠ **CAUTION**
> To use this signal, set bit 2 (PRC) of parameter No. 5005 to 1.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn040		PRC						

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
5005						PRC		

[Input type] Parameter input
[Data type] Bit path

#2 PRC For direct input of a tool offset value or workpiece coordinate system shift amount:
0: The position record signal PRC <Gn040.6> is not used.
1: The position record signal PRC <Gn040.6> is used.

	#7	#6	#5	#4	#3	#2	#1	#0
11222			DRM					

[Input type] Parameter input
[Data type] Bit path

#5 DRM For direct input of tool offset value measured and direct input of coordinate system shift, whether to iput measurement value by using a diameter value or radius value depend on:
0: The setting of bit 3 (DIAx) of parameter No.1006.
1: The specification of dynamic switching of diameter/radius specification.

15.4.2 Direct Input of Offset Value Measured B (for Lathe System)

T

Overview

When the touch sensor is provided, the tool offset value can be automatically settable in the tool offset memory, by moving the tool to make contact with the touch sensor during manual operation. The workpiece coordinate system shift amount can also be automatically set.

Explanation

- Touch sensor

Either of the following two cases may be selected depending on parameter setting.

1) If bit 3 (TS1) of parameter No. 5004 is 0
   The touch sensor has two direction–specific contact faces for each axis, thus outputting four signals (+MIT1 <X0004.2,X0013.2, X0011.2> ,+MIT2 <X0004.4,X0013.4,X0011.4> , -MIT1 <X0004.3,X0013.3,X0011.3> ,-MIT2 <X0004.5,X0013.5, X0011.5>) when contact is detected.
2) If bit 3 (TS1) of parameter No. 5004 is 1
   A touch sensor based on one contact input outputs one signal (+MIT1) when the one–contact input detects contact. So, which of directions of each axis is involved is automatically determined, and feeding in the corresponding axis direction is disabled.

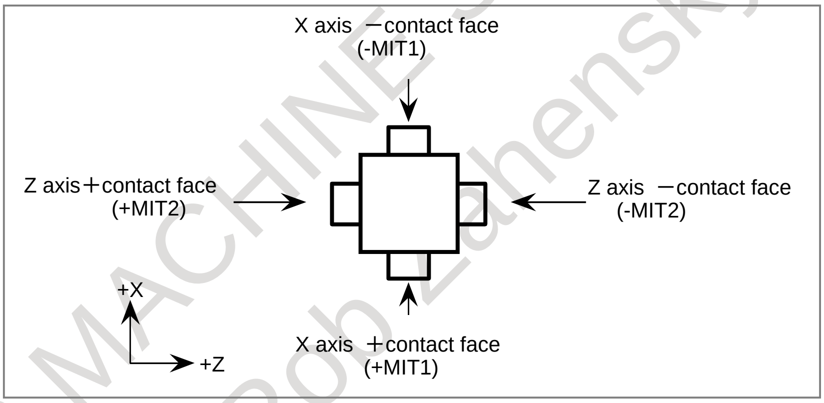

Fig. 15.4.2 (a) Touch Sensor

- Setting tool offset value

Determine a specific point on the machine tool as the measuring reference position. In advance, set the distance from this point to the measuring position (contact face of the touch sensor) as a reference value, using parameters Nos. 5015 to 5018. Select the tool whose offset value is to be measured, and bring it to touch the sensor, receiving a contact detection signal (tool compensation value write signal). The mechanical coordinate value is the distance from the tool nose position of the measuring tool at the mechanical reference (home) position to the measuring position; set the difference between this value and the reference value (parameter setting) into the tool offset value memory as the tool geometry offset value. The corresponding tool wear offset value becomes 0.

(Tool offset value to be set)

= (Mechanical coordinate value when tool compensation value write signal has become 1) – (Reference value (parameter value) corresponding to the tool compensation value write signal)

The tool geometry offset value to be set differs according to the method of determining the measuring reference position.

- If touch sensor contact detection is based on a one-contact input

If touch sensor contact detection is based on a one–contact input (bit 3 (TS1) of parameter No. 5004 is 1), when a contact detected signal (tool compensation amount write signal +MIT1) is received from the touch sensor, which of the two directions of each axis is involved is automatically determined according to several pulses stored as a result of the axis movement that was made before the signal reception. So the number of interpolation cycles related to the stored pulses must previously be set in parameter No. 5021. Once which of the two directions of each axis is involved is automatically determined, the corresponding axis direction is subjected to axis interlock to stop feeding, and the obtained tool geometry compensation amount is stored in tool compensation memory. If the directions of stored pulses are not unified, or no pulse has been stored, for example, because the servo power has been shut off (servo off) or no axis movement occurred, an alarm PS5195 is issued. An alarm PS5195is issued also if the tool moves along two axes (X–axis and Z–axis) simultaneously; move the tool along one axis at a time. If an alarm PS5195 is issued, no tool geometry compensation amount will be set up, resulting in the four directions (two axes) being subjected to interlock.

NOTE

1 Pulse storage for automatic decision is carried out in the manual mode while the GOSQM <Gn039.7> (tool compensation amount write mode select) signal is “1”. Stored pulses are lost if:
   a. The manual mode is exited,
   b. The GOSQM <Gn039.7> (tool compensation amount write mode select) signal becomes “0”,
   c. A contact detected signal is received from the touch sensor, resulting in a tool geometry compensation amount being set or an alarm PS5195 being issued,
   d. The servo power becomes off (resulting in the stored pulses for the related axis being lost), or
   e. Axis movement occurs (resulting in the stored pulses for the other axis being lost).

2 Axis interlock that has occurred for the axis direction identified by parameter–based automatic decision and two–axis, four–direction interlock that has occurred because of an alarm PS5195 being issued are canceled when the manual mode is exited or the GOSQM <Gn039.7> (tool compensation mount write mode select) signal becomes “0”.
   A reset does not cancel interlock.

- Determination of the axis movement direction in four-contact input

Set bit 3 (TS1) of parameter No. 5004 to 0 and bit 4 (TSD) of parameter No. 5009 to 1 to enable the input signals from the touch sensor and the movement direction of an axis to be monitored during measurement in the tool compensation write mode.
When the measurement is determined to be invalid, the moving axis is interlocked and an alarm PS5195 occurs.

- Conditions under which measurement is determined to be invalid
  The movement direction of an axis and the tool compensation write signals (+MIT1, +MIT2, -MIT1, -MIT2) are monitored in the tool compensation write mode (GOQSM<Gn039.7>=”1”). In the following case, the operation is determined to be invalid, the axis is interlocked, and an alarm PS5195 occurs.

  (1) A tool compensation write signal whose direction did not match the axis was input during measurement.
  (2) Any of the tool compensation write signals was input while the X- and Z-axes moved together.
  (3) Any of the tool compensation write signals was input without the axis being moved.

(4) The movement direction of the axis was not constant when the movement direction of the axis was determined (*1).

(*1) When the axis moves in one direction of one axis by the compensation cycle count set in parameter No. 5021, the axis is assumed to move in the direction.

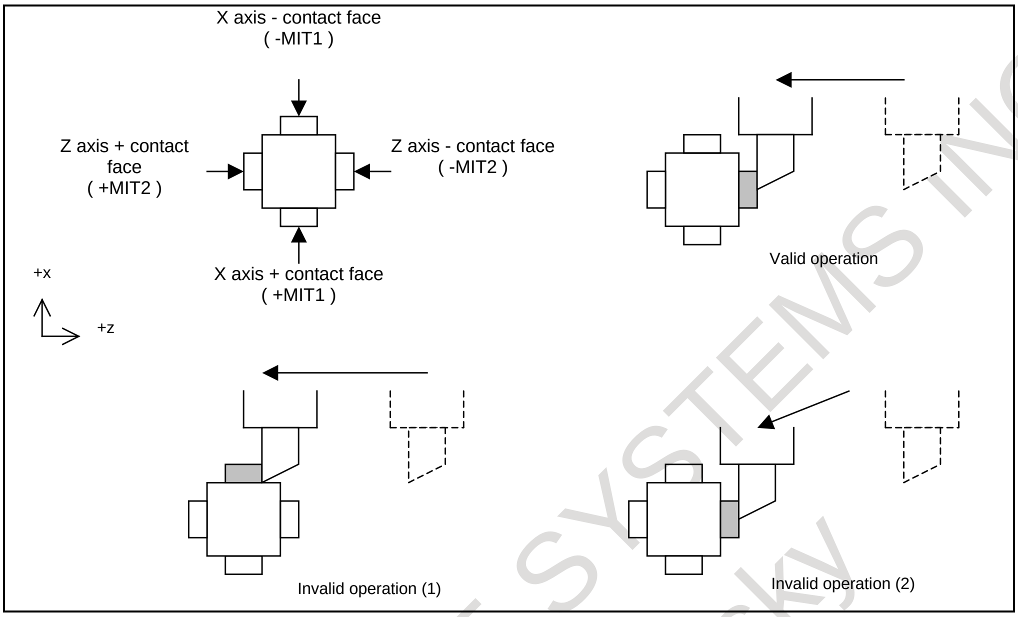

Fig. 15.4.2 (b) Examples of operations determined to be invalid

- Interlock applied when measurement is invalid
  When measurement is determined to be invalid, movement only in the direction opposite to the previous movement direction is allowed. That is, the directions other than the direction opposite to the previous movement direction are interlocked.

  Examples of interlock
  (1) When a tool compensation write signal other than Z-axis/contact surface (-MIT2) is input during movement in the minus direction of the Z-axis, the minus direction of the Z-axis and the plus and minus directions of the X-axis are interlocked.
  (2) When any of tool compensation write signals is input during movement in the plus direction of the X-axis and the minus direction of the Z-axis, the plus directions of the X-axis and the minus direction of the Z-axis are interlocked.
  (3) When any of tool compensation write signals is input without axis movement, the four directions of the two axes are interlocked.

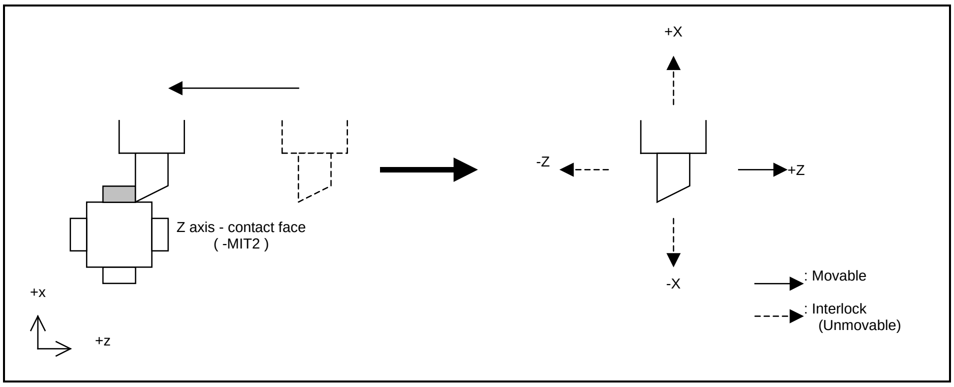

Fig. 15.4.2 (c) Interlock direction in example (1)

The release interlock applied because measurement is determined to be invalid, keep the tool away from the touch sensor (+MIT1, +MIT2, -MIT1, -MIT2 = “0”) and reset the CNC. If the tool is not kept away from the touch sensor, resetting the CNC does not release interlock.
In conditions (3) and (4) in which measurement is determined to be invalid, no axis can be moved because the four directions of the two axes are interlocked. In such a case, cancel the tool compensation write mode and reset the CNC to release the interlock. To cancel the tool compensation write mode, set the tool compensation write mode signal GOQSM <Gn039.7> is to “0” or select the MDI mode, MEM mode, or EDIT mode.
A reset releases interlock and an alarm. Even if another tool compensation write signal (+MIT1, +MIT2, -MIT1, or -MIT2) is input before the interlock or alarm is released, the signal is ignored.

- For direct input of offset value measured B for two-spindle lathe

When the tool compensation number specification signal ONSC <Gn547.6> is to “0”, parameter No. 5053 is used to specify for which spindle (1 or 2) tool compensation numbers (tool compensation amount memory) are to be used.

(Example)
When there are 32 tool compensation pairs

Tool compensation number	Parameter No. 5053	
	8	10
Spindle 1	1 to 8	1 to 10
Spindle 2	9 to 32	11 to 32

NOTE
If parameter No. 5053 for grouping tool compensation numbers is 0 or greater than the maximum allowable number of tool compensation sets, grouping is carried out as listed below.

Number of tool compensation pairs	32 pairs	64 pairs	99 pairs	200 pairs
Spindle 1	1 to 16	1 to 32	1 to 49	1 to 100
Spindle 2	17 to 32	33 to 64	50 to 98	101 to 200

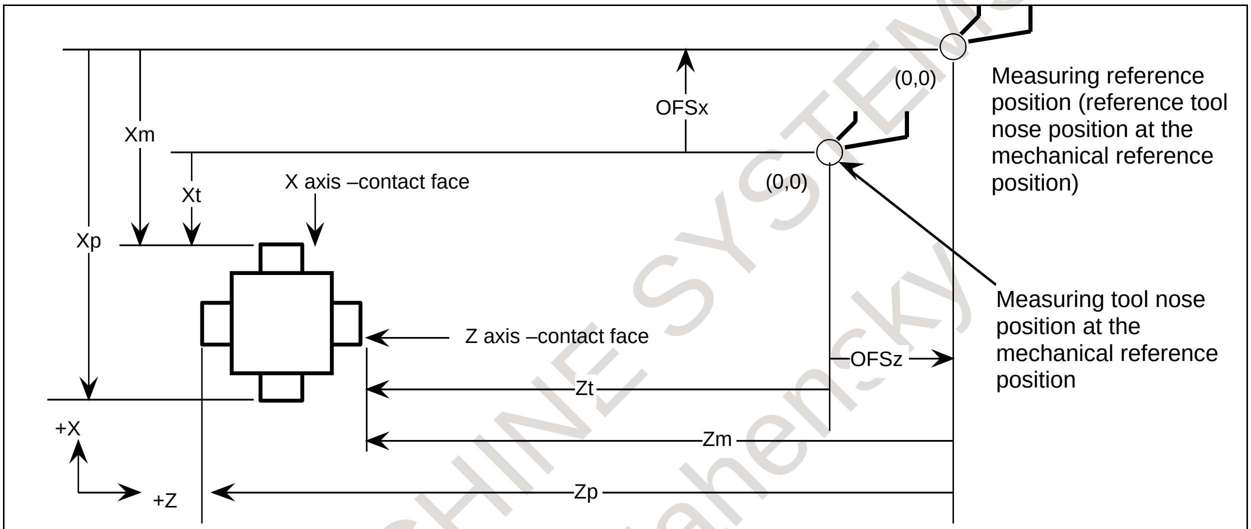
Number of tool compensation pairs	400 pairs	499 pairs	999 pairs
Spindle 1	1 to 200	1 to 249	1 to 499
Spindle 2	201 to 400	250 to 498	500 to 998

When tool compensation number specification signal ONSC is “1”, the tool compensation amount memory is shared between spindle 1 and spindle 2 regardless of the setting of parameter No. 5053. Spindle measurement selection signal S2TLS <Gn040.5> is used only to select which spindle is measured; any tool compensation number within the number of tool compensation pairs can be selected for each spindle.
(Example)
When the following settings are made, the tool geometry compensation number to be selected is shown in the table below.
Number of tool compensation pairs is 32.
Bit 5 (QNI) of parameter No. 5005 = 1:
The tool compensation number is set by signal input from the PMC.
Parameter No. 5053 = 10:
Tool compensation number shift amount
Tool offset number selection signals OFN0 to OFN9=2:
A tool compensation number of 3 is specified.

Tool compensation number specification signal ONSC	Spindle measurement select signal S2TLS	Tool compensation number to be selected
0	0	3
0	1	13
1	0	3
1	1	3

Example 1

The difference between the reference tool nose tip position and the measuring tool nose tip position can be set as the tool offset value. Define the reference tool nose tip position at the mechanical reference position (machine zero position) as the measuring reference position, then set the distances Xp, Zp, Xm, Zm, from the measuring reference position to the contact faces of the sensor in parameters.



Xp: Distance from the measuring reference position to X-axis (+) contact face (parameter No.5015)
Xm: Distance from the measuring reference position to X-axis (–) contact face (parameter No.5016)
Zp: Distance from the measuring reference position to Z-axis (+) contact face (parameter No.5017)
Zm: Distance from the measuring reference position to Z-axis (–) contact face (parameter No.5018)
Xt: X-axis direction moving distance of the measuring tool up to the contact face of sensor (X-axis machine coordinate value)
Zt: Z-axis direction moving distance of the measuring tool up to the contact face of sensor (Z-axis machine coordinate value)
(when Xt and Zt touch the X-axis (–) contact face and Z-axis (–) contact face in the above figure)
OFSx: Tool offset value to be set (X-axis): OFSx = Xt - Xm
OFSz: Tool offset value to be set (Z-axis): OFSz = Zt - Zm

Fig. 15.4.2 (d) When the reference tool nose tip position is set as the measuring reference position

When two touch sensors are used (Parameter 2NR (No.5051#0)=1), each parameter is set as follows.

Content	For touch sensor 1	For touch sensor 2
Distance to X-axis + contact surface of touch sensor	5015	5056
Distance to X-axis - contact surface of touch sensor	5016	5057
Distance to Z-axis + contact surface of touch sensor	5017	5058
Distance to Z-axis - contact surface of touch sensor	5018	5059

Example 2

The measuring reference point may be an imaginary point (imaginary zero point), as shown in the Fig. 15.4.2 (e). The difference between the imaginary zero point and the measuring tool nose tip position at the mechanical reference point can be set as the tool geometry offset value of the measuring tool, by setting the distances from the imaginary zero point to the respective contact faces in parameters.

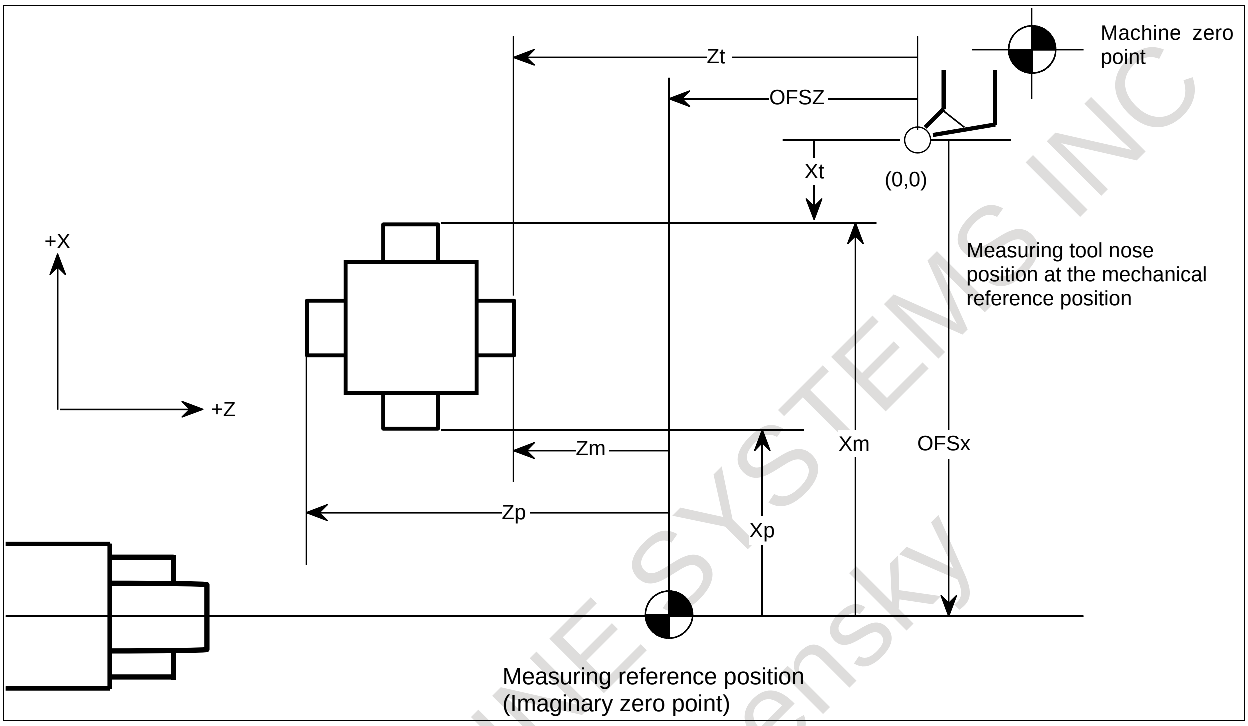


Fig. 15.4.2 (e) When the imaginary zero position is set as the measuring reference position

- Setting the workpiece coordinate system shift amount

The workpiece coordinate system shift amount for the Z-axis can be set as follows: Bring the tool to touch the workpiece end face. Subtract the tool geometry offset value of the tool (the value shifted in the coordinate system by the tool geometry offset) from the machine coordinate value (the distance from the measuring tool nose tip position at the mechanical reference position (machine zero point) to the workpiece end face).The result is set as the workpiece coordinate system shift value.

[Z axis workpiece coordinate system shift amount to be set (EXOFSz)]

= [Z axis tool geometry offset value of the corresponding tool (OFSz)] – [Z axis machine coordinate value(Zt)]

Using the above methods, the workpiece coordinate system is set with the workpiece end face (the contact point of the sensor) specified as the programmed zero point of the workpiece coordinate system of the Z-axis.

- If the direct input of offset value measured B for two-spindle lathe is used

  For the direct input of offset value measured B for two-spindle lathe, the workpiece coordinate shift amount for the Z–axis is automatically set in any of workpiece coordinate systems G54 to G59 for workpiece coordinate system memory.

  [Z–axis workpiece coordinate system shift amount to be set up]

  = –([corresponding Z–axis tool geometry compensation amount] – [Z–axis machine coordinate value])

  Select the desired workpiece coordinate systems from G54 to G59 manually or automatically, using the 2AT parameter (bit 1 of No. 5051).

  - 2AT = 0 (manual selection)

    Set the cursor to the desired workpiece coordinate system G54 to G59
    by operating the MDI (such as page and cursor keys).

> **NOTE**
> It is inhibited to select an external workpiece coordinate system offset (EXT). If the cursor is set to it, the warning message ”Write inhibited” is displayed when the workpiece coordinate system shift write amount signal becomes “1”.

- 2AT = 1 (automatic selection)
  Previously set any of workpiece coordinate systems G54 to G59 in parameter No. 5054 for spindle 1 and parameter No. 5055 for spindle 2. When the workpiece coordinate system shift amount write mode is entered, the cursor is set to any of workpiece coordinate systems G54 to G59.

> **NOTE**
> If 0 or a value out of the valid data range is set in parameter No. 5053 or 5054, workpiece coordinate systems G54 and G57 are set up, respectively, for spindles 1 and 2.

Also select a tool compensation number to be used in measurement manually or automatically, using the bit5 (QNI) of parameter No.5005.

- QNI = 0 (manual selection)
  Specify the desired tool compensation number in parameter No. 5020.
- QNI = 1 (automatic selection)
  The cursor is set to the desired tool compensation number, using the tool compensation number input signal.
  For spindle 1, the cursor is set to a tool compensation number selected by the input signal.
  For spindle 2, the cursor is set to the sum of the value specified in parameter No. 5053 and the tool compensation number selected by the input signal is used.

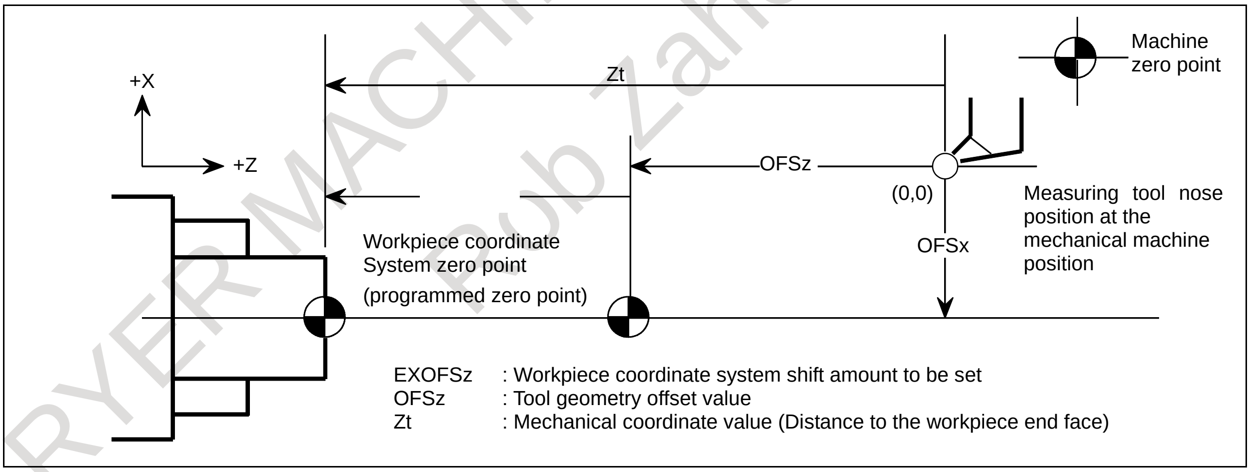

Fig. 15.4.2 (f) Setting of workpiece coordinate system shift amount

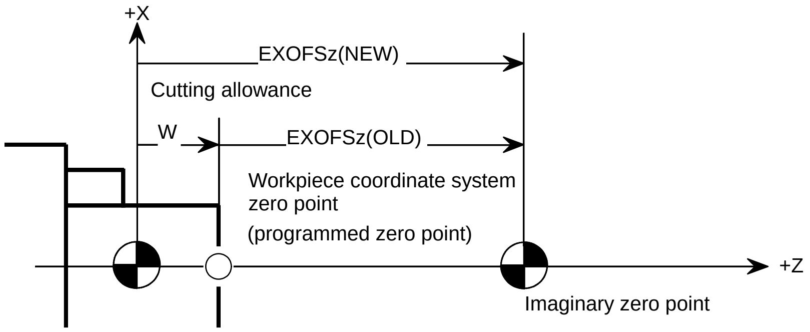
To deviate the programmed zero point of the workpiece coordinate system from the workpiece end face, such as by adding a cutting allowance, use the incremental input of the workpiece coordinate system shift amount in MDI operation. By setting the distance from the programmed zero point to the workpiece end face with a sign, the numeric value input is added to the preset amount.



EXOFSz(OLD) : Workpiece coordinate system shift amount being set by the function of input of tool offset value measured B
W : Cutting allowance (incremental input value)
EXOFSz(NEW) : Workpiece coordinate system shift amount after adding the cutting allowance

Fig. 15.4.2 (g) Setting of cutting allowance

- Basic procedure to set tool offset value

To use the direct input of offset value measured B for two-spindle lathe, first specify the spindle to be measured, using the S2TLS (spindle measurement select) signal.

(1) Execute manual reference position return.
By executing manual reference position return, a machine coordinate system is established.
The tool offset value is computed on the machine coordinate system.

(2) Select manual handle mode or manual continuous feed mode and set the tool compensation value write mode select signal GOQSM to “1”. The display is automatically changed to the tool offset screen (geometry), and the “OFST” indicator starts blinking in the status indication area at the bottom of the screen, which indicates that the tool compensation value writing mode is ready. When the direct input of offset value measured B for two-spindle lathe is in use, the S1MES <Fn062.3> or S2MES <Fn062.4> (spindle under measurement) signal, whichever is applicable, becomes “1”.

NOTE
After this, do not change the S2TLS (spindle measurement selection) signal until the GOQSM (offset write mode) signal becomes 0.

(3) Select a tool to be measured.

(4) When the cursor does not coincide with the tool offset number desired to be set, move the cursor to the desired tool offset number using the page key and cursor key.
The cursor can also be coincided with the tool offset number desired to be set automatically by the tool offset number input signals (when bit 5 (QNI) of parameter No. 5005=1).
In this case, the position of the cursor cannot be changed on the tool compensation screen using page keys or cursor keys.

(5) Near the tool to the sensor by manual operation.

(6) Place the tool edge to a contacting surface of the sensor by manual handle feed.
Bring the tool edge in contact with the sensor. This causes the tool compensation value writing signals to input to be CNC.
The following tool compensation amount write signals are set up according to the setting of the TS1 parameter (bit 3 of No. 5004).
When the parameter is 0: +MIT1, –MIT1, +MIT2, –MIT2
When the parameter is 1: +MIT1 only
The tool compensation value writing signal is set to “1”, and then :
i) The axis is interlocked in this direction and its feed is stopped.
ii) The tool offset value extracted by the tool offset memory (tool geometry offset value) which corresponds to the tool offset number shown by the cursor is set up.

(7) For both X-axis and Z-axis, their offset values are set by operations (5) and (6).

(8) Repeat operations (3) to (7) for all necessary tools.

(9) Set the tool compensation value writing mode signal GOQSM to “0”.
The writing mode is canceled and the blinking “OFST” indicator light goes off.

When the direct input of offset value measured B for two-spindle lathe is in use, the S1MES or S2MES (spindle under measurement) signal for the spindle being measured becomes 0.

- Basic procedure to set workpiece coordinate shift value

To use the direct input of offset value measured B for two-spindle lathe, first specify the spindle to be measured, using the S2TLS (spindle measurement select) signal.

(1) Set the tool geometry offset values of each tool in advance.

(2) Execute manual reference position return.
By executing manual reference position return, the machine coordinate system is established.
The workpiece coordinate system shift amount is computed based on the machine coordinate system of the tool.

(3) Set the workpiece coordinate system shift amount writing mode select signal WOQSM <Gn039.6> to “1”.
The display automatically switches to the workpiece shifting screen, the “WFST” indicator starts blinking at the status indicator area in the bottom of the screen, which indicates that the workpiece coordinate system shift amount writing mode is ready.
When the direct input of offset value measured B for two-spindle lathe is in use, the workpiece coordinate system screen is selected, and the S1MES or S2MES (spindle under measurement) signal, whichever is applicable, becomes “1”.

> **NOTE**
> After this, it is impossible to switch the S2TLS (spindle measurement selection) signal until the WOQSM (offset write mode) signal becomes “0”.

(4) Select a tool to be measured.

(5) Check tool offset numbers.
The tool offset number corresponding to the tool required for measurement, shall be set in the parameter No. 5020 in advance.
The tool offset number can also be set automatically by setting the tool offset number input signal (with bit 5 (QNI) of parameter No. 5005=1).

(6) Manually approach the tool to an end face of the workpiece.

(7) Place the tool edge to the end face (sensor) of the workpiece using manual handle feed.
When the tool edge contacts the end face of the workpiece, input the workpiece coordinate system shift amount signal WOSET <Gn040.7>.
The workpiece coordinate system shift amount on the Z–axis is automatically set.

(8) Release the tool.

(9) Set the workpiece coordinate system shift amount write mode select signal WOQSM to “0”.
The writing mode is canceled and the blinking “WSFT” indicator light goes off.
When the direct input of offset value measured B for two-spindle lathe is in use, the S1MES or S2MES (spindle under measurement) signal, whichever is applicable, becomes “0”.

- Switching from a customized user screen to the measurement screen

When the MANUAL GUIDE i screen or a user screen customized by C Language Executor or macro executor is displayed, if tool compensation amount write mode select signal GOQSM or workpiece coordinate system shift amount write mode signal WOQSM is set to 1, a shift to the measurement screen is made automatically.

When a user screen customized by C Language Executor is assigned as the tool geometry compensation screen or workpiece shift screen, turning on the measurement mode switches to the user screen, not to the CNC screen.

Limitation

This function cannot be used with the following functions.

- Composite control
- Mirror image
- Programmable mirror image
- Mirror image for double turret

The direct input of offset value measured B for two-spindle lathe function is also the same.

Signal

Tool offset write mode select signal GOQSM <Gn039.7>

[Classification] Input signal

[Function] Select the mode for writing tool compensation

[Operation] When this signal is turned “1” in a manual operation mode, the mode for writing tool compensation is selected. The control unit then automatically switches the screen on the display to the tool geometry compensation screen and blinks the “OFST” status display at the bottom of the screen to notify that the mode has been changed to the mode for writing tool compensation.

Tool offset write signals
(Path 1) +MIT1#1, +MIT2#1<X0004.2, X0004.4> -MIT1#1, -MIT2#1<X0004.3, X0004.5>
(Path 2) +MIT1#2, +MIT2#2<X0013.2, X0013.4>-MIT1#2, -MIT2#2<X0013.3, X0013.5>
(Path 3) +MIT1#3, +MIT2#3<X0011.2, X0011.4>-MIT1#3, -MIT2#3<X0011.3, X0011.5>

[Classification] Input signal

[Function] Each of these signals inhibits the tool from being fed along the corresponding axis during manual operation. When signal GOQSM for selecting the mode for writing tool compensation is set to “1”, the manual feed is inhibited and also the tool geometry compensation along the axis is automatically calculated and the result is set in tool compensation memory.

[Operation] When these signals are turned “1” during tool offset write mode, the control unit operates as follows:

- Inhibits tools from being fed along the corresponding axis during manual operation.
  If bit 3 (TS1) of parameter No. 5004 is set to 0
  +MIT1 : Inhibits the tool from being manually fed in the positive direction along the X-axis.
  –MIT1 : Inhibits the tool from being manually fed in the negative direction along the X-axis.
  +MIT2 : Inhibits the tool from being manually fed in the positive direction along the Z-axis.
  –MIT2 : Inhibits the tool from being manually fed in the negative direction along the Z-axis.
  If bit 3 (TS1) of parameter No. 5004 is set to 1
  +MIT1 : Automatic decision causes the related two directions of each axis to be subjected to interlock.
  –MIT1 : Not used
  +MIT2 : Not used
  –MIT2 : Not used
- When signal GOQSM for selecting the mode for writing tool compensation is turned “1”, the interlock signal also automatically calculates the tool geometry compensation for the tool compensation number pointed to by the cursor and sets the result in tool compensation memory.

> **NOTE**
> 1 This signal is used as the interlock signal in each axis direction.
> 2 This signal is valid only when the bit 0 (GSC) of parameter No. 5009 is 0.
> 3 In case of bit 2 (XSG) of parameter No. 3008=1, the address assigned by parameter No. 3019 is used

---

Tool offset write signals
+MIT1to +MIT2 <Gn132.0 to Gn132.1>, -MIT1 to-MIT2 <Gn134.0 to Gn134.1>

[Classification] Input signal

[Function] Each of these signals inhibits the tool from being fed along the corresponding axis during manual operation. When signal GOQSM for selecting the mode for writing tool compensation is set to “1”, the manual feed is inhibited and also the tool geometry compensation along the axis is automatically calculated and the result is set in tool compensation memory.

[Operation] When these signals are turned “1”, the control unit operates as follows:

- Inhibits tools from being fed along the corresponding axis during manual operation.
  When bit 3 (TS1) of parameter No. 5004 is 0 and the X-axis is assumed to be the first axis and the Z-axis to be the second axis
  - +MIT1 : Inhibits the tool from being manually fed in the positive direction along the X-axis.
  - –MIT1 : Inhibits the tool from being manually fed in the negative direction along the X-axis.
  - +MIT2 : Inhibits the tool from being manually fed in the positive direction along the Z-axis.
  - –MIT2 : Inhibits the tool from being manually fed in the negative direction along the Z-axis.

  If bit 3 (TS1) of parameter No. 5004 is set to 1
  - +MIT1 : Automatic decision causes the related two directions of each axis to be subjected to interlock.
  - –MIT1 : Not used
  - +MIT2 : Not used
  - –MIT2 : Not used
- When signal GOQSM for selecting the mode for writing tool compensation is turned “1”, the interlock signal also automatically calculates the tool geometry compensation for the tool compensation number pointed to by the cursor and sets the result in tool compensation memory.

> **NOTE**
> This signal is valid only when the bit 0 (GSC) of parameter No. 5009 is 1.

Tool offset number selection signals
OFN0 to OFN5, OFN6 to OFN9 <Gn039.0 to Gn039.5, Gn040.0 to Gn040.3>

[Classification] Input signal

[Function] Select the tool offset number.

[Operation] When the mode for writing tool compensation is selected, the cursor is automatically positioned on the tool geometry compensation number selected by these signals.
A tool offset number is specified by a 10–bit binary number. Numbers 0 to 998 correspond to the compensation number 1 to 999.

NOTE
This signal is available only when bit 5 (QNI) of parameter No. 5005 =1.

Workpiece coordinate system shift value write mode select signal WOQSM <Gn039.6>

[Classification] Input signal

[Function] Select the mode for writing the shift amount for the workpiece coordinate system.

[Operation] When this signal is turned to “1” in a manual operation mode, the mode for writing the shift amount for the workpiece coordinate system is selected. The control unit then automatically switches the screen displayed to the WORK SHIFT screen and blinks the “OFST” status display at the bottom of the screen to notify that the mode has been changed to the mode for writing the shift amount for the workpiece coordinate system. However, this is not performed when the mode for writing tool compensation values is selected.

Spindle measurement select signal S2TLS <Gn040.5>

[Classification] Input signal

[Function] For the direct input of offset value measured B for two-spindle lathe, a spindle is selected for measurement. If the signal is “0“, spindle 1 is selected. If it is “1“, spindle 2 is selected.
If spindle 2 is to be selected for measurement, the tool offset write mode select signal GOQSM and the workpiece coordinate system shift value write mode select signal WOQSM as well as the spindle measurement select signal must be set to 1.

[Operation] If the signal is “0“, spindle 1 is selected. If it is “1“, spindle 2 is selected.

Workpiece coordinate system shift value write signal WOSET <Gn040.7>

[Classification] Input signal

[Function] Automatically calculates and sets the shift amount for the workpiece coordinate system.

[Operation] When this signal turns to “1“ in the mode for writing the shift amount for the workpiece coordinate system, it triggers the automatic calculation and setting of the shift amount for the workpiece coordinate system.

Tool compensation number specification signal ONSC <Gn547.6>

[Classification] Input signal

[Function] When bit 5 (QNI) of parameter No. 5005 is 1 in direct input of offset value measured B for two-spindle lathe, the tool compensation number specified by tool offset number selection signals OFN0 to OFN9 is selected as is, regardless of spindle measurement select signal S2TLS and the setting of parameter No. 5053.

[Operation] When this signal is set to "1", the tool compensation number specified by tool offset number selection signals OFN0 to OFN9 is selected as is, regardless of spindle measurement select signal S2TLS and the setting of parameter No. 5053.

Spindle 1 under measurement signal S1MES <Fn062.3>
Spindle 2 under measurement signal S2MES <Fn062.4>

[Classification] Output signal

[Function] For the direct input of offset value measured B for two-spindle lathe, it is indicated which spindle, 1 or 2, is under measurement.

[Operation] These signals check which head is being measured in the tool offset write mode or workpiece coordinate system shift amount write mode according to the S2TLS (spindle measurement select) signal.
If spindle 1 is selected, S1MES = “1“ and S2MES = “0“. If spindle 2 is selected, S1MES = “0“ and S2MES = “1“.

Signal address

(Path 1)

	#7	#6	#5	#4	#3	#2	#1	#0
X0004			-MIT2	+MIT2	-MIT1	+MIT1		
			SKIP5	SKIP4	SKIP3	SKIP2		

(Path 2)

	#7	#6	#5	#4	#3	#2	#1	#0
X0013			-MIT2[#2]	+MIT2[#2]	-MIT1[#2]	+MIT1[#2]		
			SKIP5[#2]	SKIP4[#2]	SKIP3[#2]	SKIP2[#2]		

(Path 3)

	#7	#6	#5	#4	#3	#2	#1	#0
X0011			-MIT2[#3]	+MIT2[#3]	-MIT1[#3]	+MIT1[#3]		
			SKIP5[#3]	SKIP4[#3]	SKIP3[#3]	SKIP2[#3]		

> ⚠ **CAUTION**
> Since the same addresses are used for both +MIT1, MIT1,+MIT2, –MIT2 and skip signals SKIP2 to SKIP5 (multi–step skip), be careful when using these two signal types.

	#7	#6	#5	#4	#3	#2	#1	#0

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3003					DIT			

[Input type] Parameter input
[Data type] Byte path

#3 DIT The interlock signal for each axis direction is:
0: Valid.
1: Invalid.

	#7	#6	#5	#4	#3	#2	#1	#0
3008						XSG		

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#2 XSG A signal assigned to an X address is:
0: Fixed at the address.
1: Able to be reassigned to an arbitrary X address.

NOTE
When this parameter is set to 1, set parameters Nos. 3013, 3014, 3012, and 3019. If parameters Nos. 3013 and 3014 are not set, the deceleration signal for reference position return is assigned to bit 0 of <X0000>. If parameters Nos. 3012 and 3019 are not set, the skip signal, the PMC axis control skip signal, the measurement position arrival signal, the interlock signal for each axis direction, and the tool compensation value write signal are assigned to <X0000>.

⚠ WARNING
Set an appropriate value to parameters (Nos. 3013, 3014, 3012, 3019) beforehand when you set 1 to this parameter.
If an input signal of the set address in parameters (Nos. 3013, 3014, 3012, 3019) is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

3019	Address to which the PMC axis control skip signal, measurement position arrival signal, and tool offset write signals are assigned

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 727

Set an X address to which the PMC axis control skip signal ESKIP, measurement position arrival signals (XAE, YAE, and ZAE (M series) or XAE and ZAE (T series)), and tool offset write signals (±MIT1 and ±MIT2 (T series)) are to be assigned.

Example 1. When parameter No. 3012 is set to 5 and parameter No. 3019 is set to 6

When bit 2 (XSG) of parameter No. 3008 is 1, the PMC axis control skip signal, and measurement position arrival signal are allocated to X0006 and the skip signal is allocated to X0005.

	#7	#6	#5	#4	#3	#2	#1	#0	
X0005	SKIP	SKIP6	SKIP5	SKIP4	SKIP3	SKIP2	SKIP8	SKIP7	(T series)
	SKIP	SKIP6	SKIP5	SKIP4	SKIP3	SKIP2	SKIP8	SKIP7	(M series)

	#7	#6	#5	#4	#3	#2	#1	#0	
X0006		ESKIP	-MIT2	+MIT2	-MIT1	+MIT1	ZAE	XAE	(T series)
		ESKIP				ZAE	YAE	XAE	(M series)

Example 2. When parameter No. 3012 is set to 5 and parameter No. 3019 is set to 5

When bit 2 (XSG) of parameter No. 3008 is 1, the PMC axis control skip signal, measurement position arrival signal, and skip signal are allocated to X0005.

X0005	#7	#6	#5	#4	#3	#2	#1	#0	
	SKIP	ESKIP	-MIT2	+MIT2	-MIT1	+MIT1	ZAE	XAE	(T series)
		SKIP6	SKIP5	SKIP4	SKIP3	SKIP2	SKIP8	SKIP7	

	#7	#6	#5	#4	#3	#2	#1	#0	
	SKIP	ESKIP	SKIP5	SKIP4	SKIP3	ZAE	YAE	XAE	(M series)
		SKIP6				SKIP2	SKIP8	SKIP7	

NOTE

1 This parameter is valid when bit 2 (XSG) of parameter No. 3008 is set to 1.
Depending on the configuration of the I/O Link, the actually usable X addresses are:
<X0000 to X0127>, <X0200 to X0327>, <X0400 to X0527>, <X0600 to X0727>

2 When this parameter is 0, an input signal from address X0 is used.

⚠ **WARNING**

If an input signal of the set address in this parameter is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

	#7	#6	#5	#4	#3	#2	#1	#0
5004					TS1			

[Input type] Parameter input
[Data type] Bit path

#3 TS1 For touch sensor contact detection with the function for direct input of offset value measured B:
0: Four-contact input is used.
1: One-contact input is used.

NOTE

For the machining center system, set TS1 to 1.

	#7	#6	#5	#4	#3	#2	#1	#0
5005		TLE	QNI					

[Input type] Parameter input
[Data type] Bit path

#5 QNI With the tool length/workpiece zero point measurement function or the function for direct input of offset value measured B, a tool compensation number is selected by:
0: Operation through the MDI panel by the operator (selection based on cursor operation).
1: Signal input from the PMC.

#6 TLE The "direct input of offset value measured B" function updates the offset value in offset write mode:
0: Constantly.
1: During axis movement.
Axis movement assumes a positional deviation other than 0.

	#7	#6	#5	#4	#3	#2	#1	#0
5009				TSD				GSC

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

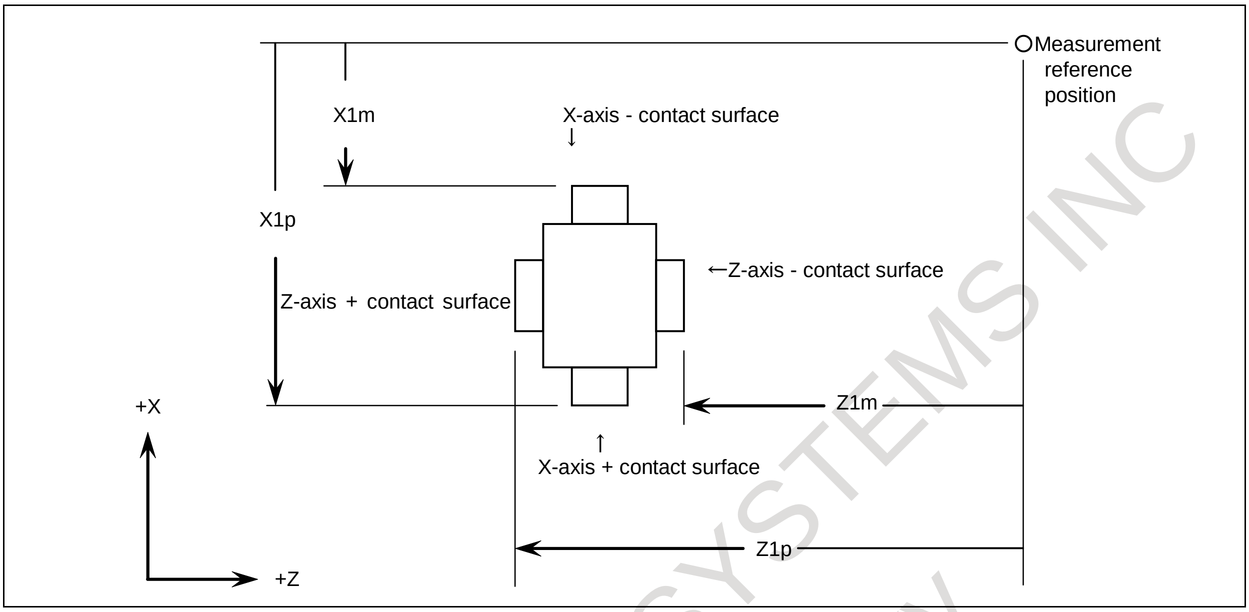
#0 GSC When the function for direct input of offset value measured B is used, an offset write input signal is input from:
0: Machine side
1: PMC side
When the interlock function for each axis direction is enabled (when bit 3 (DIT) of parameter No. 3003 is set to 0), switching can also be made between input from the machine side and input from PMC side for the interlock function for each axis direction.

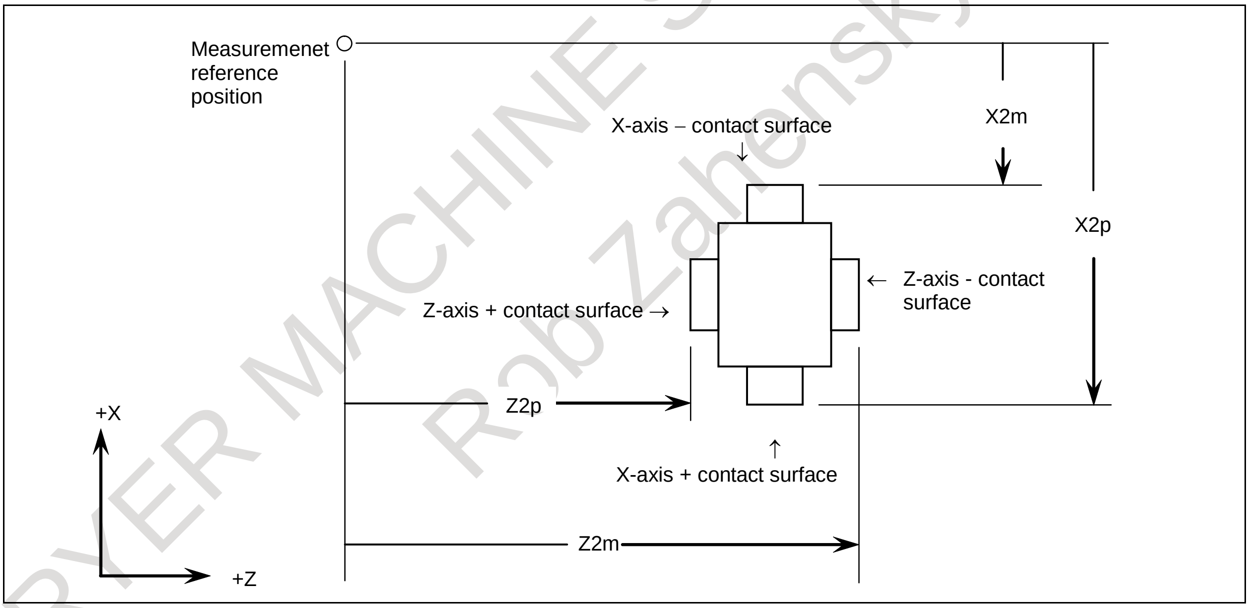
#4 TSD In the function for direct input of offset value measured B, the movement direction determination specifications:
0: Do not apply.
1: Apply.
This parameter is valid when four-contact input is used (bit 3 (TS1) of parameter No. 5004 is set to 0).

5015	Distance to X-axis + contact surface of touch sensor 1 (X1P)
5016	Distance to X-axis - contact surface of touch sensor 1 (X1M)
5017	Distance to Z-axis + contact surface of touch sensor 1 (Z1P)
5018	Distance to Z-axis - contact surface of touch sensor 1 (Z1M)
5056	Distance to X-axis + contact surface of touch sensor 2 (X2P)
5057	Distance to X-axis - contact surface of touch sensor 2 (X2M)
5058	Distance to Z-axis + contact surface of touch sensor 2 (Z2P)
5059	Distance to Z-axis - contact surface of touch sensor 2 (Z2M)

[Input type] Parameter input
[Data type] Real path
[Unit of data] mm, inch (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
This parameter is related to the function for direct input of offset value measured B.
Set the distance (signed) from a measurement reference position to each contact surface of a sensor. For a diameter specification axis, set a diameter value.
When arbitrary angular axis control is performed, set the distance in the Cartesian coordinate system.

> **NOTE**
> Parameters Nos. 5056 to 5059 are valid when bit 0 (2NR) of parameter No. 5051 is set to 1.





5020	**Tool offset number used with the function for direct input of offset value measured B**

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to number of tool compensation values

Set a tool offset number used with the function for direct input of offset value measured B (when a workpiece coordinate system shift amount is set). (Set the tool offset number corresponding to a tool under measurement beforehand.) This parameter is valid when automatic tool offset number selection is not performed (when bit 5 (QNI) of parameter No. 5005 is set to 0).

5021	Number of interpolation cycles of pulses stored until the tool is about to touch the touch sensor

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 8

When a touch sensor with one contact signal input is used for the "direct input of offset value measured B" function or when the movement direction determination specification is enabled, set the number of interpolation cycles of pulses stored until the tool is about to touch the touch sensor by manual operation. When 0 is set, the specification of the maximum value 8 is assumed.

NOTE
This parameter is valid when bit 3 (TS1) of parameter No. 5004 or bit 4 (TSD) of parameter No. 5009 is set to 1.

5024	Number of tool compensation values

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to 999

Set the maximum allowable number of tool compensation values used for each path.
Ensure that the total number of values set in parameter No. 5024 for the individual paths is within the number of compensation values usable in the entire system. The number of compensation values usable in the entire system depends on the option configuration.
If the total number of values set in parameter No. 5024 for the individual paths exceeds the number of compensation values usable in the entire system, or 0 is set in parameter No. 5024 for all paths, the number of compensation values usable for each path is a value obtained by dividing the number of compensation values usable in the entire system by the number of paths.
Tool compensation values as many as the number of compensation values used for each path are displayed on the screen. If tool compensation numbers more than the numbers of compensation values usable for each path are specified, alarm PS0115 “VARIABLE NO. OUT OF RANGE” is issued.
For example, 64 tool compensation sets are used, 20 sets may be allocated to path 1, 30 sets to path 2, and 14 sets to path 3. All of 64 sets need not be used.

	#7	#6	#5	#4	#3	#2	#1	#0
5051							2AT	2NR

[Input type] Parameter input
[Data type] Bit path

#0 2NR When the direct input of offset value measured B for 2 spindle lathe is used:
0: One touch sensor is used.
1: Two touch sensors are used.

#1 2AT When a workpiece coordinate system shift amount is set in the workpiece coordinate system memory with the direct input of offset value measured B for 2 spindle lathe:
0: A setting is made at the current cursor position.
1: An automatic selection is made.

5053	Tool compensation number shift amount for the direct input of offset value measured B for 2 spindle lathe

[Input type] Parameter input
[Data type] Word path
[Valid data range] 0 to number of tool compensation values

When the direct input of offset value measured B for 2 spindle lathe is used, tool compensation numbers used to set measured tool compensation values are divided into two groups, one for spindle 1 and the other for spindle 2.

[Example] When there are 32 tool offset pairs

	Setting	
	8	10
Spindle 1	1 to 8	1 to 10
Spindle 2	9 to 32	11 to 32

When this parameter is set to 0 or a value greater than the maximum number of tool offset pairs, the table below is applied.

Number of tool offset pairs	32 pairs	64 pairs	99 pairs	200 pairs	400 pairs	499 pairs	999 pairs
Spindle 1	1 to 16	1 to 32	1 to 49	1 to 100	1 to 200	1 to 249	1 to 499
Spindle 2	17 to 32	33 to 64	50 to 98	101 to 200	201 to 400	250 to 498	500 to 998

5054	Workpiece coordinate system memory for spindle 1

5055	Workpiece coordinate system memory for spindle 2

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 54 to 59

Specify a workpiece coordinate system from G54 to G59 for which a workpiece coordinate system shift amount is set. When parameter No. 5054 or No. 5055 is set to 0 or a value beyond the valid data range, the specification of 54 is assumed for the workpiece coordinate system memory for spindle 1, or the specification of 57 is assumed for the workpiece coordinate system memory for spindle 2.

NOTE
These parameters are valid when bit 1 (2AT) of parameter No. 5051 is set to 1.

Alarm and message

Number	Message	Description
PS5195	DIRECTION CAN NOT BE JUDGED	Measurement is invalid in the tool compensation measurement value direct input B function. [For 1-contact input] 1. The recorded pulse direction is not constant. - The machine is at a stop in the offset write mode. - The servo power is off. - Pulse directions are diverse. 2. The tool is moving along the two axes (X-axis and Z-axis). [For the movement direction discrimination specification] 1. The recorded pulse direction is not constant. - The machine is at a stop in the offset write mode. - The servo power is off. - Pulse directions are diverse. 2. The tool is moving along the two axes (X-axis and Z-axis). 3. The direction indicated by the tool compensation write signal does not match the movement direction of the axis.

15.4.3 Chattering Prevention of "Direct Input of Offset Value Measured B"

Overview

This function is provided by the "direct input of offset value measured B" function to prevent an invalid offset value from being set even when the input signal from a touch sensor chatters due to mechanical vibration.

Explanation

If the "direct input of offset value measured B" function encounters a chattering input signal from a touch sensor, for example, due to mechanical vibration, the same signal input later can be ignored. Once an offset value is measured with a signal from the touch sensor, any signal input that follows is rejected until movement over at least the distance set by parameter No. 5019 later is specified. Signals are ignored if input.

Assuming that an offset value is measured correctly at point A in Fig. 15.4.3 (a), even when movement from A to B is specified, measurement at point C is invalid and ignored as the travel distance is smaller than the setting of parameter No. 5019.

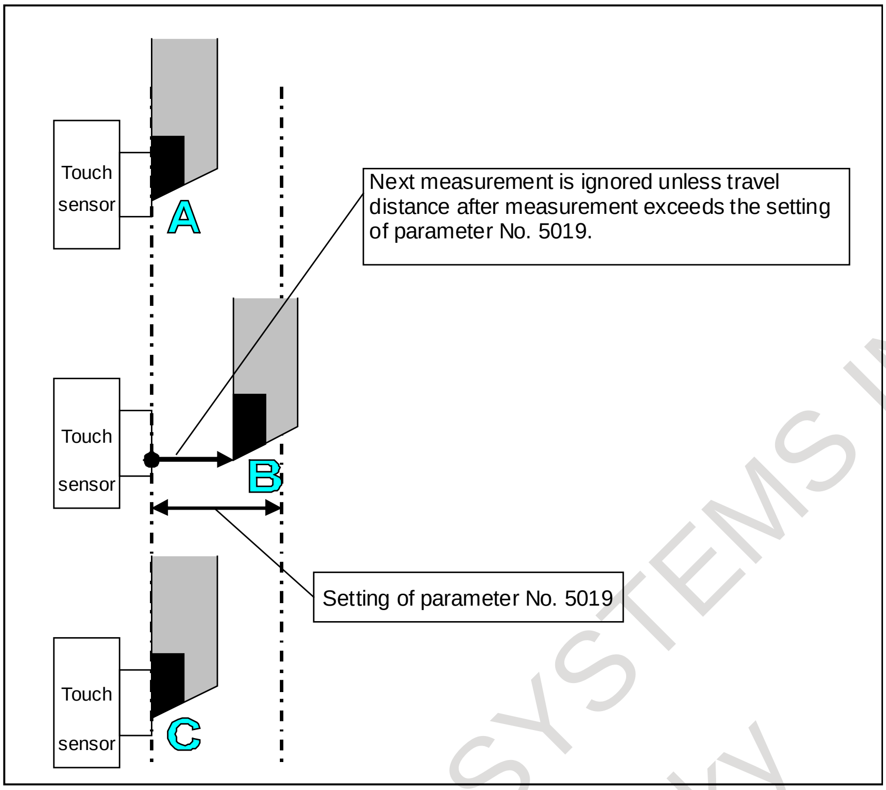

Fig. 15.4.3 (a) Chattering prevention 1

When movement from A to D is specified, measurement at point E is valid and an offset value is measured as the travel distance is larger than the setting of parameter No. 5019.

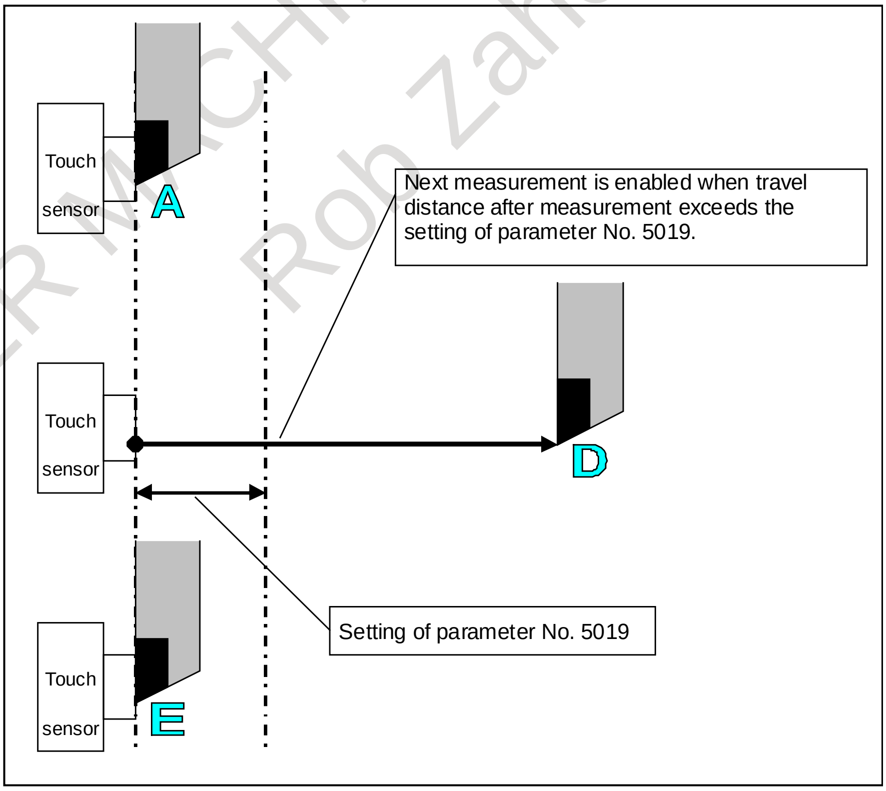

Fig. 15.4.3 (b) Chattering prevention 2

Parameter

5019	Chattering preventive distance of "direct input of offset value measured B"

[Input type] Parameter input
[Data type] 2-word path
[Unit of data] Detection
[Valid data range] 0 to 999999999

Once a signal is input from a touch sensor, any signal input from the touch sensor is ignored until movement over at least the distance set by this parameter is specified. If the setting is 0, this function is disabled and any input from the touch sensor is always accepted. Note that changing the setting of this parameter cancels the input signal ignoring status.

Caution

⚠ CAUTION

1. This function is available to both of tool offset value setting and workpiece coordinate shift amount setting.
2. The function is valid whether the contact detection type of the touch sensor is four-contact or one-contact.

16 PMC CONTROL FUNCTION

16.1 PMC AXIS CONTROL

16.1.1 PMC Axis Control

Overview

The PMC signals can directly control any given axis, independent of the CNC. An axis can be controlled by signals alone without using an NC program. For example, by specifying an amount of travel, feedrate, and so forth from the PMC, a movement can be made along an axis independently of other axes operated under CNC control. This enables the control of turrets, pallets, index tables and other peripheral devices using any given axes of the CNC.

Whether the CNC or PMC controls an axis is determined by the input signal provided for that particular axis.

Table 16.1.1 (a) Commands that can be executed by PMC axis control

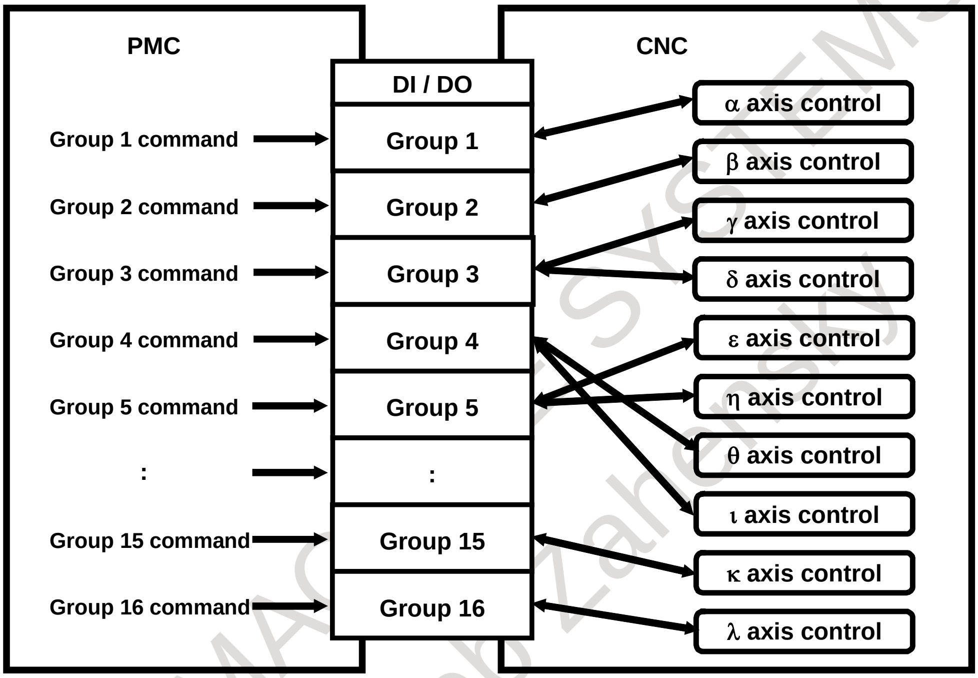
Rapid traverse
Cutting feed - feed per minute
Cutting feed - feed per revolution
Skip - feed per minute
Dwell
Reference position return
Continuous feed
1st to 4th reference position return
External pulse synchronization - Position code
External pulse synchronization - 1st to 3rd manual handle
Feedrate control command
Torque control command
Auxiliary function, Auxiliary function 2, Auxiliary function 3
Selection of the machine coordinate system
Cutting feed - sec/block specification

NOTE

Ladder sequence of the PMC axis control can be easily incorporated by using PMC function. Functional instruction AXCTL(Axis Control Command by PMC: SUB 53) that can easily realize the PMC axis control command is provided.
In the FANUC LADDER-III CD, function block that can be incorporated easily arious PMC axis control command is stored in the form of a library.
For details on functional instruction AXCTL and function block, refer to the PMC Programming Manual (B-64513EN). For details on library of function block, refer to the documents in the FANUC LADDER-III CD.

Explanation

Under PMC axis control, various types of control are exercised using signals.
To allow the command that can be executed by PMC axis control operations indicated in Table 16.1.1 (a) by PMC, maximum 16 groups of input/output signals are available. The groups are named group 1, group 2, ..., group 15, and group 16. (The number of available groups depends on the number of NC path.)
Each of these groups of input/output signals used with PMC axis control serves as the unit of PMC axis control. Which axis is to be controlled by each group must be set in parameter No. 8010 beforehand.(See Supplement 1 of Concept of PMC axis control Fig. 16.1.1 (a))
One group may be able to be assigned to multiple axes so that the same operation can be performed on the multiple axes. (Supplement 2)
By commanding multiple groups at the same time, multiple axes can be controlled independently. (Supplement 3)



(Supplement 1) The relationships between groups and axes are set in parameter No. 8010.
(Supplement 2) Multiple axes can be specified as with group 3.
(Supplement 3) Group 1 and group 2 can be specified independently.

Fig. 16.1.1 (a) Concept of PMC axis control

- Signals

Three types of signals are used with PMC control:
Group-by-group signals are assigned to each group.
Axis-by-axis signals are assigned to each axis.
Path-by-path signals are assigned to each path.

- Relationships between groups and axes (group-by-group signals)

Group-by-group signal addresses are allocated in the signal area of each path. (See Allocation of group-by-group signals (Table 16.1.1 (b)).)
Note, however, that PMC axis control and multi-path control are independent of each other.

NOTE
The number of available groups depends on the number of NC path or type of PMC.
In general, groups equal to 4 times the number of NC path are available.

Table 16.1.1 (b) Allocation of group-by-group signals

Group-by-group signal	Input signal (G) address	Output signal (F) address
Group 1	G0142 to G0149, G0150.5, G0151	F0130 to F0132, F0142
Group 2	G0154 to G0161, G0162.5, G0163	F0133 to F0135, F0145
Group 3	G0166 to G0173, G0174.5, G0175	F0136 to F0138, F0148
Group 4	G0178 to G0185, G0186.5, G0187	F0139 to F0141, F0151
Group 5	G1142 to G1149, G1150.5, G1151	F1130 to F1132, F1142
Group 6	G1154 to G1161, G1162.5, G1163	F1133 to F1135, F1145
Group 7	G1166 to G1173, G1174.5, G1175	F1136 to F1138, F1148
Group 8	G1178 to G1185, G1186.5, G1187	F1139 to F1141, F1151
Group 9	G2142 to G2149, G2150.5, G2151	F2130 to F2132, F2142
Group 10	G2154 to G2161, G2162.5, G2163	F2133 to F2135, F2145
Group 11	G2166 to G2173, G2174.5, G2175	F2136 to F2138, F2148
Group 12	G2178 to G2185, G2186.5, G2187	F2139 to F2141, F2151
Group 13	G3142 to G3149, G3150.5, G3151	F3130 to F3132, F3142
Group 14	G3154 to G3161, G3162.5, G3163	F3133 to F3135, F3145
Group 15	G3166 to G3173, G3174.5, G3175	F3136 to F3138, F3148
Group 16	G3178 to G3185, G3186.5, G3187	F3139 to F3141, F3151

The notation of group-by-group signals is described below.
For example, the group-by-group signals include the axis control command read signal EBUF (described later). This signal is represented as:
EBUFg#p
A group number is represented by "p" and "g".
"g" is replaced with A, B, C, or D, and A = 1, B = 2, C=3, and D = 4 are assumed.
"p" is replaced with a number from 1 to 4.
A group number is related with "p" and "g" as follows:
Group number = g+(p-1)×4

EBUFA#1 represents group 1 (1+(1-1)×4).
EBUFB#2 represents group 6 (2+(2-1)×4).
EBUFC#3 represents group 11 (3+(3-1)×4).
EBUFD#4 represents group 16 (4+(4-1)×4).

Note, however, for the small letter of “g” or “p”, that a signal named EBUFg#p does not actually exist.

In the text, signal names such as "EBUFA", "EBUFB", "EBUFC", "EBUFD", and "EBUFg" are used. Unless otherwise noted, these signal names are the abbreviations of "EBUFA#1" for group 1, "EBUFB#1" for group 2, "EBUFC#1" for group 3, "EBUFD#1" for group 4, and "EBUFg#1 to EBUFg#4" for general EBUF signals, respectively.

When assigning multiple axes to one group, set parameter No. 8010 so that the axes belong to the same path. A setting in which the assigned axes do not belong to the same path is erroneous (see "Example of incorrect relationships between groups and axes"). (Fig. 16.1.1 (c))
In Example of correct relationships between groups and axes (Fig. 16.1.1 (b)) , the first and second axes specified with group 1 belong to the same path (path 1), and the third and fourth axes specified with group 2 belong to the same path (path 2), so that operation is performed correctly.

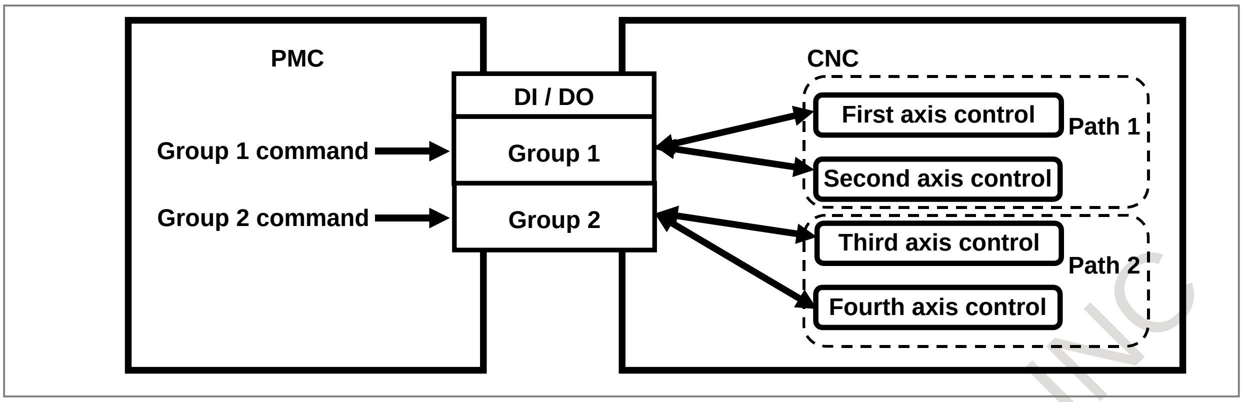


Fig. 16.1.1 (b) Example of correct relationships between groups and axes

In Fig. 16.1.1 (c), " Example of incorrect relationships between groups and axes", the first and second axes specified with group 1 belong to path 1, but the third axis specified with group 1 belongs to path 2, so that an intended operation is not performed.

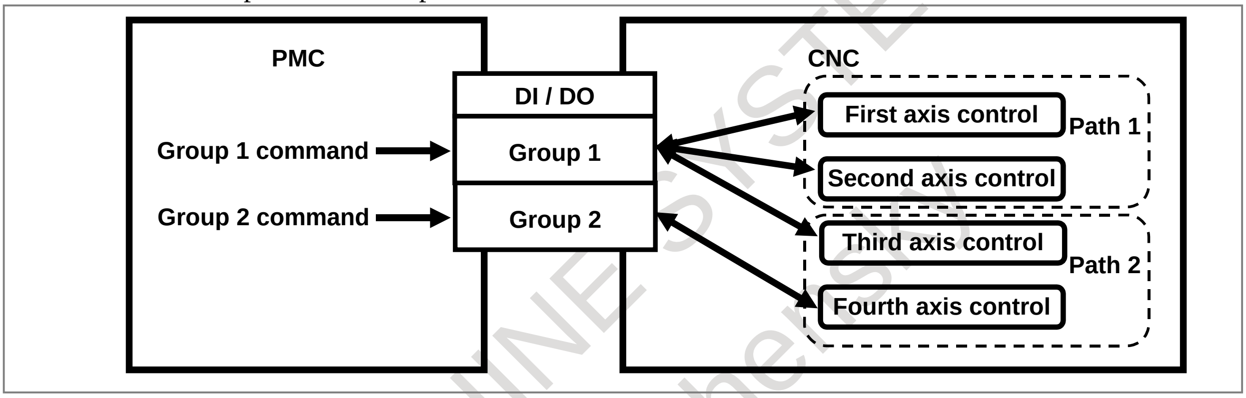

Fig. 16.1.1 (c) Example of incorrect relationships between groups and axes

As mentioned earlier, in PMC axis control, group-by-group signal addresses are allocated in the signal area of each path, but PMC axis control and multi-path control are independent of each other.
So, from the path to which group-by-group signal addresses are allocated, commands can be issued to axes that belong to another path. In this case, however, check that the target axes belong to the same path.

In Fig. 16.1.1 (d), “Commands to different paths”, the group-by-group signal addresses of group 1 are allocated to path 1, and the group-by-group signal addresses of group 5 are allocated to path 2. (See Table 16.1.1 (b), “Allocation of group-by-group signals”.)

Group 1 can issue commands to the axes that belong to path 2. Similarly, group 5 can issue commands to the axes that belong to path 1.

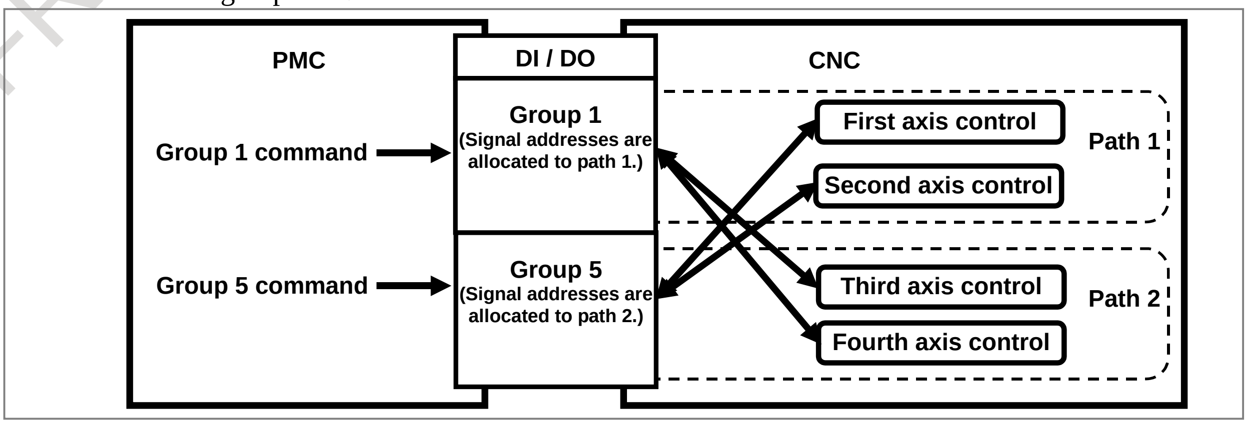

Fig. 16.1.1 (d) Commands to different paths

- Relationships between paths and groups (path-by-path signals, path-by-path parameters)

Path-by-path signal addresses are allocated in the signal area of each path. (See Table 16.1.1 (c), "Example of Path-by-path signal (PMC axis control override signal) allocation".)
However, PMC axis control and multi-path control are independent of each other.
The path-by-path direct signal (X) is described later.

> **NOTE**
> The number of available groups depends on the number of NC path or type of PMC.
> Generally, the maximum number of available groups equals the number of NC paths multiplied by 4.

Table 16.1.1 (c) Example of Path-by-path signal (PMC axis control override signal) allocation

Group-by-group signal	Input signal (G) address	Output signal (F) address
Group 1	G0150.0,1,6,7, G0151	F0129.5,7
Group 2	G0150.0,1,6,7, G0151	F0129.5,7
Group 3	G0150.0,1,6,7, G0151	F0129.5,7
Group 4	G0150.0,1,6,7, G0151	F0129.5,7
Group 5	G1150.0,1,6,7, G1151	F1129.5,7
Group 6	G1150.0,1,6,7, G1151	F1129.5,7
Group 7	G1150.0,1,6,7, G1151	F1129.5,7
Group 8	G1150.0,1,6,7, G1151	F1129.5,7
Group 9	G2150.0,1,6,7, G2151	F2129.5,7
Group 10	G2150.0,1,6,7, G2151	F2129.5,7
Group 11	G2150.0,1,6,7, G2151	F2129.5,7
Group 12	G2150.0,1,6,7, G2151	F2129.5,7
Group 13	G3150.0,1,6,7, G3151	F3129.5,7
Group 14	G3150.0,1,6,7, G3151	F3129.5,7
Group 15	G3150.0,1,6,7, G3151	F3129.5,7
Group 16	G3150.0,1,6,7, G3151	F3129.5,7

A path-by-path signal is input/output to and from a signal of the path to which the group belongs (for example, path 1 when a command is issued from group 1). No path-by-path signal is input/output to and from the path to which the axis assigned to the group belongs.

In Fig. 16.1.1 (e), "Relationships between paths and groups for path-by-path signals (G, F)", for example, the signal EBUFB#2 (described later) input from group 5 (whose signal addresses are allocated to path 2) is output to EOV#2 (path-by-path signal described later) of path 2 to which group 5 addresses are allocated.
EBUFB#2 is not output to EOV#1 of path 1, to which the first axis assigned to group 5 belongs.

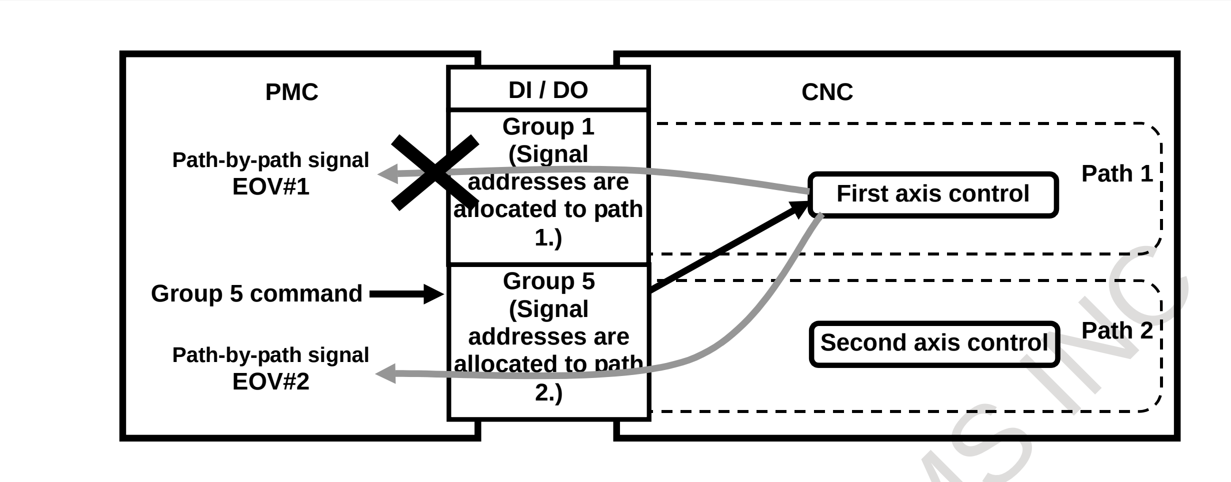

Fig. 16.1.1 (e) Relationships between paths and groups for path-by-path signals (G, F)

Restrictions on the number of groups

Basically, PMC axis control and multi-path control are independent of each other, but there are the following restrictions.

1. When PMC/L is used as PMC, the groups up to group 8 can be used. Group 9 and later groups cannot be used.

2. When PMC control is performed with more than four times as many groups as the number of NC paths, the signals shown in (A) and (B) below cannot be used for the excess paths and groups.
   To use feedrate override signals, etc., set bit 2 (OVE) of parameter No. 8001 to 1.
   (A) Path-by-path signals common to all groups
   Fx129.7 *EAXSL
   Fx129.5 EOV0
   (B) Signals same as the CNC
   Gx012 *FV0-*FV7
   Gx006.4 OVC
   Gx014.0,1 ROV1,2
   Gx046.7 DRN
   Gx019.7 RT

For example, when the number of NC paths is 2, the signals in (A) and (B) can be used by the groups up to group 8.

The restrictions on the number of NC paths, available (A) signals, and available (B) signals are shown Table 16.1.1 (d).

Table 16.1.1 (d)

Number of NC paths	Available (A) signals	Available (B) signals
1	F129.5,7	(B) signals in the range from G0 to G0767
2	F129.5,7,…, F1129.5,7	(B) signals in the range from G0 to G1767
3	F129.5,7,…, F2129.5,7	(B) signals in the range from G0 to G2767
4	F129.5,7,…, F3129.5,7	(B) signals in the range from G0 to G3767

- Direct signal, path-by-path parameter

The direct signal (X) and path-by-path parameter differ from the path-by-path signals (G, F).
The direct signals and parameter values set for the paths to which all axes related to a group belong are valid.
The direct signals and parameter values are irrelevant to values set for the path to which a group belongs.

In Fig. 16.1.1 (f), "Relationships between paths and groups for the direct signal (X)", when a command is issued from group 5 to an axis of path 1, the valid direct signal ESKIP (described later) is ESKIP#1 of path 1. The signal ESKIP#2 of path 2 is invalid.

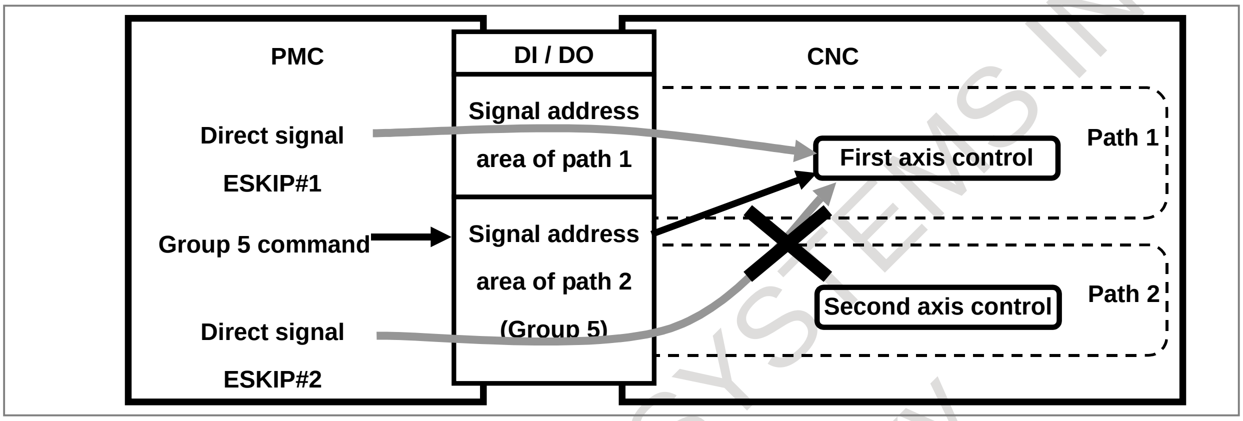

Fig. 16.1.1 (f) Relationships between paths and groups for the direct signal (X)

In Fig. 16.1.1 (g), "Relationships between path-by-path parameters and groups", when a command is issued from group 5 to path 1, the setting value of 0 with bit 2 (OVE) of the path-by-path parameter No. 8001 for path 1 is valid.

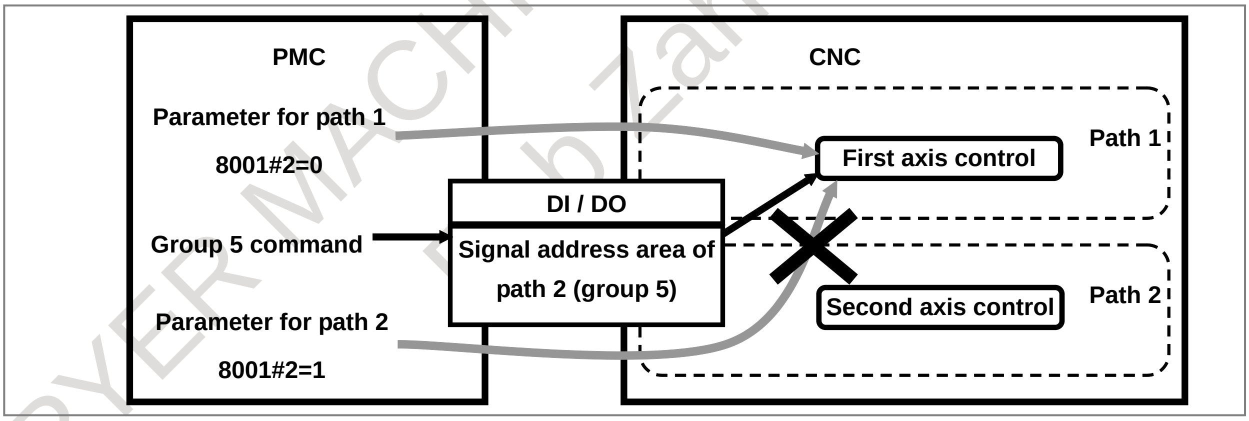

Fig. 16.1.1 (g) Relationships between path-by-path parameters and groups

- Relationships between axes and paths (axis-by-axis signals, axis-by-axis parameters)

The specifications of the axis-by-axis signals and axis-by-axis parameters associated with the relationships between paths and axes are the same as the NC specifications.
Signals and parameters set for an axis are valid for the axis, and are not affected by groups.

PMC axis control consists of groups, axes, and paths.

Among the three relationships, that is, the group-axis, path-group, and path-axis relationships, the two relationships other than the path-axis relationship represent a concept specific to PMC axis control.

⚠ **CAUTION**

1 PMC axis control cannot be used to an axis under the axis synchronous control. Cancel axis synchronous control before starting PMC axis command.
2 PMC axis control cannot be used to an axis under synchronous slave axis of synchronous/composite control. Cancel synchronous control before starting PMC axis command in slave axis.
3 Each axes cannot execute another PMC axis command by assigning two or more axes to the same group. Assign the axes to another groups, and command to each group.

Basic procedure

(1) In parameter No. 8010, set one of groups 1 to 16 for use with each axis to be used.
When movements are made along multiple axes for synchronization by using one group, ensure that the feedrate-related parameters (rapid traverse, acceleration/deceleration time constant, diameter/ radius specification, linear axis/rotation axis, and so forth) must be set to the same conditions.
When assigning multiple axes to one group, check that all axes that belong to the group are in the same path.

(2) To detach from CNC control and to enable direct PMC axis control, set each control axis selection signal (EAX1 to EAX8) bit, that corresponds to an axis to be controlled, to "1".

(3) Determine the operation.
The axis control command signals (EC0g to EC6g) specify the type of operation. The axis control feedrate signals (EIF0g to EIF15g) specify the feedrate. The axis control data signals (EID0g to EID31g) specify the moving distance and other data.
These signals, together with block stop prohibition signal EMSBKg (described later), determine one complete operation, which is tantamount to one block command executed during CNC-controlled automatic operation. These signals may be collectively called the axis control block data signals. (Refer to Table 16.1.1 (e), "List of signals determining data, tantamount to one block for PMC axis control".)

Table 16.1.1 (e) List of signals determining data, tantamount to one block for PMC axis control

Generic name	Signal name	Symbol	Data type
Axis control block data signals	Block stop prohibition signal	EMSBKg	Bit
	Axis control command signal	EC0g to EC6g	Byte
	Axis control feedrate signal	EIF0g to EIF15g	Word
	Axis control data signal	EID0g to EID31g	2-word

(4) When the data governing a complete operation (one block) is determined, reverse the logical state of the axis control command read signal EBUFg (i.e., from "0" to "1" or vice versa). Note that, for this to occur, axis control command read completion signal EBSYg must be in the same logical state as EBUFg.

(5) The CNC is capable of storing axis control functions from the PMC in its buffer so that multiple operations can be performed in series, under the control of the PMC. This allows the CNC to accept a new command block from the PMC during the execution of another block if the buffer has free space.
The Fig. 16.1.1 (h), "Buffering under PMC axis control" illustrates an example in which command [1] is being executed, commands [2] and [3] are stored in the buffers, and command [4] has been issued (the axis control block data signal is set).

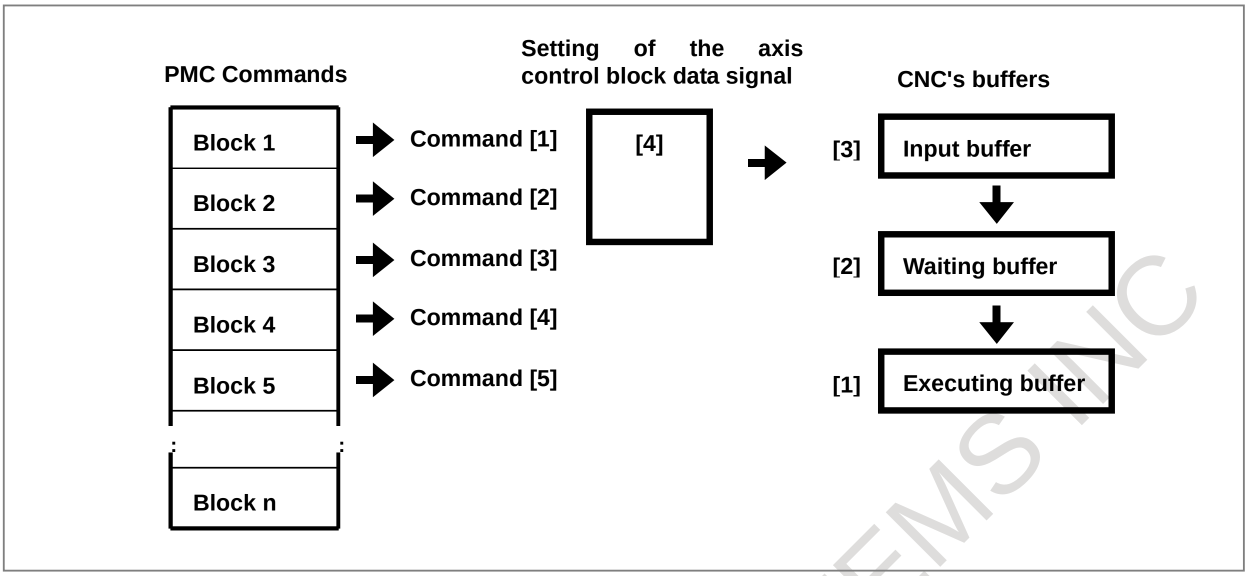

Fig. 16.1.1 (h) Buffering under PMC axis control

When the execution of command [1] is completed:
Command [2] is transferred from the waiting buffer to the executing buffer;
Command [3] is transferred from the input buffer to the waiting buffer;
and
Command [4] is transferred to the input buffer as the command block (axis control block data signal).
After the reception of command [4] by the input buffer, the PMC can issue command [5] to the CNC (the axis control block data signal is set).
The timing chart for the command operation is shown below. (Fig. 16.1.1 (i), "Timing chart of command operation")

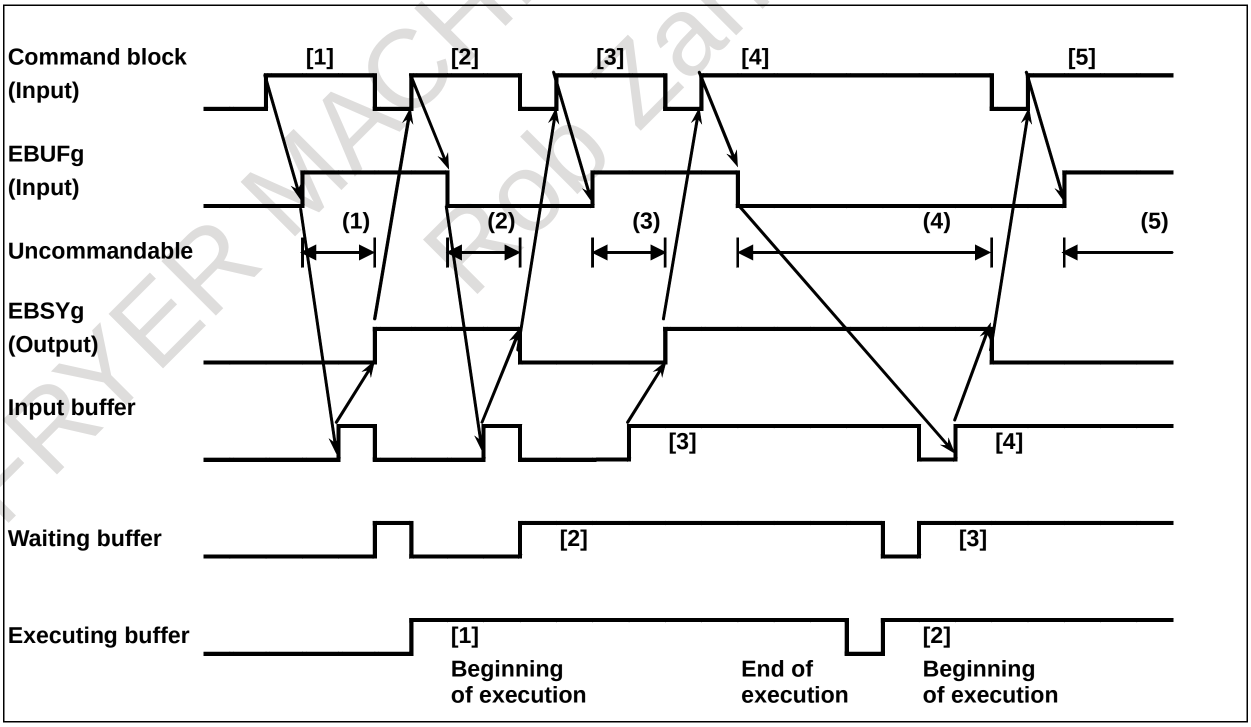

Fig. 16.1.1 (i) Timing chart of command operation

(1), (2), (3), (4), (5) : A new block cannot be issued during these intervals (while EBUFg and EBSYg are in different logical states). In interval (4), the buffer is in the "full" state.

The status of the CNC buffer can be determined by the exclusive OR of the axis control command read signal EBUFg, input from the PMC, and axis control command read completion signal EBSYg, output from the CNC. (Table 16.1.1 (f), "Buffering status in PMC axis control")

Table 16.1.1 (f) Buffering status in PMC axis control

EBUFg	EBSYg	Exclusive OR (XOR)	CNC buffer status
0	0	0	The previous block has already been read into the CNC buffer. The PMC can issue the next block.
1	1		
0	1	1	The previous block has not yet been read completely. It is just being read or buffer is in the "full" state, and waiting for the CNC buffer to become available. Do not issue the next block, nor reverse the logical state of EBUFg. Reversing the EBUFg state invalidates any block that has been already issued.
1	0		

(6) Repeat steps (3) and (4) until all the blocks have been issued.
When the final block has been issued and other command is unnecessary, set control axis selection signals EAX1 to EAX8 to “0“. Before setting these signals to “0“, however, check that the blocks stored in the CNC's input, waiting, and executing buffers have all been executed. Setting the signals to “0“ while a block is being executed, or while a block remains in any of these buffers, results in the issue of a P/S alarm. This alarm PS0139, “CANNOT CHANGE PMC CONTROL AXIS” suspends the current block execution and invalidates the blocks stored in the input and waiting buffers.
To ensure no block is being executed, or that there are no blocks remaining in the input or waiting buffer, check that control axis selection status signal *EAXSL is set to “0“.
For those axes that are always subject to PMC control without switching the management between CNC and PMC, such as those controlling turrets, pallets, and ATCs, ensure that the EAX1 to EAX8 signals are always set to “1“. There is no need to set these signals to “0“ after issuing commands from the PMC to the CNC. When all command blocks have been executed (there are no blocks remaining to be executed), the CNC automatically stops execution.

(7) When control axis selection signals EAX1 to EAX8 are set from “1“ to “0“, control is returned to the CNC.

Command

Overview of commands

As described in step (3) in the basic procedure, one PMC axis control command block is represented by the axis control block data signals.

PMC axis control enables the commands indicated in Table 16.1.1 (g), “Command list” to be specified.

In Table 16.1.1 (g), "Command list":
"Command" represents the axis control command signals (EC0g to EC6g).
"Data 1" represents the axis control feedrate signals (EIF0g to EIF15g).
"Data 2" represents the axis control data signals (EID0g to EID31g).

Table 16.1.1 (g) Command list

No.	Command	Operation	Data 1	Data 2	Description
(1)	00h	Rapid traverse	Rapid traverse rate (NOTE)	Total moving distance	The same operation as “G00” of the CNC is performed.
(2)	01h	Cutting feed - feed per minute	Cutting feedrate	Total moving distance	The same operation as “G94 G01” of the CNC is performed.
(3)	02h	Cutting feed - feed per revolution	Feedrate per revolution	Total moving distance	The same operation as “G95 G01” of the CNC is performed.
(4)	03h	Skip - feed per minute	Cutting feedrate	Total moving distance	The same operation as “G31 G01” of the CNC is performed.
(5)	04h	Dwell	---	Dwell time	The same operation as “G04” of the CNC is performed.
(6)	05h	Reference position return	---	---	After a rapid traverse movement is made in the reference position return direction set by bit 5 (ZMIx) of parameter No. 1006, the same operation as manual reference position return of the CNC is performed.
(7)	06h	Continuous feed	Continuous feedrate	Feed direction (EID31g only)	A continuous feed operation is performed along a controlled axis in a certain direction. The same operation as continuous feed in the JOG mode of the CNC is performed.
(8)	07h	First reference position return	Rapid traverse rate (NOTE)	---	The same operation as reference position return from an intermediate position done with “G28” of the CNC is performed.
(9)	08h	Second reference position return	Rapid traverse rate (NOTE)	---	The same operation as reference position return from an intermediate position done with “G30 P2” of the CNC is performed.
(10)	09h	Third reference position return	Rapid traverse rate (NOTE)	---	The same operation as reference position return from an intermediate position done with ”G30 P3” of the CNC is performed.
(11)	0Ah	Fourth reference position return	Rapid traverse rate (NOTE)	---	The same operation as reference position return from an intermediate position done with G30 P4” the CNC is performed.
(12)	0Bh	External pulse synchronization - position coder	Pulse weight	---	Synchronous operation with the position coder is performed.
(13)	0Dh	External pulse synchronization - first manual handle	Pulse weight	---	Synchronous operation with the first manual handle is performed.
(14)	0Eh	External pulse synchronization - second manual handle	Pulse weight	---	Synchronous operation with the second manual handle is performed.
(15)	0Fh	External pulse synchronization - third manual handle	Pulse weight	---	Synchronous operation with the third manual handle is performed.
(16)	10h	Speed command	Speed specified by speed command	---	Continuous feed operation based on a speed command is performed.
(17)	11h	Torque control	Maximum feedrate	Torque data	Continuous feed operation based on torque control is performed.
(18)	12h	Auxiliary function 1	---	Auxiliary function code	The same operation as an auxiliary function of the CNC is performed.

No.	Command	Operation	Data 1	Data 2	Description
(19)	14h	Auxiliary function 2	---	Auxiliary function code	The same operation as an auxiliary function of the CNC is performed.
(20)	15h	Auxiliary function 3	---	Auxiliary function code	The same operation as an auxiliary function of the CNC is performed.
(21)	20h	Machine coordinate system selection	Rapid traverse rate (NOTE)	Machine coordinate value	The same operation as “G53” of the CNC is performed.
(22)	21h	Cutting feed - sec/block specification	Cutting feed time	Total moving distance	Cutting feed is performed according to a specified period of time. In the sec/block specification, specify a period of time required for ending a block.

NOTE
The rapid traverse rate is valid only when bit 0 (RPD) of parameter No. 8002 is set to 1.

Details of commands

A detailed description of each command is provided below. The parenthesized number following each command title represents the value of the axis control command signals EC0g to EC6g.

(1) Rapid traverse (00h)

This command performs the same operation as "G00" of the CNC.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Rapid traverse command (00h)
EIF0g to EIF15g	G144,145	Rapid traverse rate
EID0g to EID31g	G146 to 149	Total moving distance

Rapid traverse rate

With bit 0 (RPD) of parameter No. 8002, whether the same rapid traverse rate as set in the parameter No. 1420 of the CNC is used or the feedrate of the PMC axis interface set by EIF0g to EIF15g is used independently of the CNC can be chosen.

When bit 0 (RPD) of parameter No. 8002 is set to 1, set a rapid traverse rate with a binary code.

[Unit of data]

		Unit of data	Unit
		IS-A to IS-C	
Linear axis	Metric machine	1	mm/min
	Inch machine	0.1	inch/min
Rotation axis		1	deg/min

NOTE
When bit 0 (CMI) of parameter No. 11850 is 0, the rapid traverse rate set by EIF0g to EIF15g is always represented in millimeters.

[Valid data range] 1 to 65535

Total moving distance

Set an incremental travel amount in the input system unit of the axis with a binary code.

[Unit of data] Least input increment of the applied axis (Refer to the standard parameter setting table (A))

[Valid data range]

IS-A	IS-B to IS-C
-99999999 to 99999999 (8-digit)	-999999999 to 999999999 (9-digit)

For diameter specification based on bit 3 (DIAx) of parameter No. 1006, whether to specify a radius value or diameter value can be chosen using bit 1 (CDI) of parameter No. 8005.

When bit 0 (RPD) of parameter No. 8002 is set to 1 (to use the PMC axis interface for rapid traverse rate selection), the rapid traverse rate unit is 1 mm/min if bit 2 (R10) of parameter No. 8005 is set to 0; the rapid traverse rate unit is 10 mm/min if bit 2 (R10) of parameter No. 8005 is set to 1.

With bit 2 (OVE) of parameter No. 8001, select a dry run signal and manual rapid traverse selection signal to be used. In addition to these signals, with bit 2 (OVE) of parameter No.8001, select also a feed rate override signal, a override cancellation signal and rapid traverse override signal. The Table 16.1.1 (h) indicates the relationships between the bit and signals.

Table 16.1.1 (h)

Signals	Bit 2 (OVE) of parameter No.8001 = 0 (same signals as those used for the CNC)	Bit 2 (OVE) of parameter No. 8001 = 1 (signals specific to the PMC)
Feedrate override signals	*FV0 to *FV7<G012>	*EFOV0 to *EFOV7<G151>
Override cancellation signal	OVC<G006.4>	EOVC<G150.5>
Rapid traverse override signals	ROV1,2<G014.0,1>	EROV1,2<G150.0,1> or *EROV0 to *EROV7<G151>
Dry run signal	DRN<G046.7>	EDRN<G150.7>
Manual rapid traverse selection signal	RT<G019.7>	ERT<G150.6>

When the dry run signal DRN/EDRN is set to “1”, the relationship of feedrate is indicated as Table 16.1.1 (i)

Table 16.1.1 (i)

Manual rapid traverse selection signal (RTorERT)	When rapid traverse is commanded	
	RDE(No.8001#3)=0	**RDE(No.8001#3)=1**
0	Rapid traverse	Dry run feedrate ×*JV (NOTE)
1	Rapid traverse	Rapid traverse

> **NOTE**
> When bit 1 (JOV) of parameter No. 1402 is set to 1, the manual feedrate override signal *JV is not applied, but the dry run feedrate is just applied.

Related parameters

Bit 3 (DIAx) of parameter No. 1006
Bit 1 (JOV) of parameter No. 1402
Parameter No. 1420
Bit 2 (OVE) of parameter No. 8001
Bit 3 (RDE) of parameter No. 8001
Bit 0 (RPD) of parameter No. 8002
Bit 1 (CDI) of parameter No. 8005
Bit 2 (R10) of parameter No. 8005

Related signals

Manual rapid traverse selection signal RT <G019.7>
Dry run signal DRN <G046.7>
Manual rapid traverse selection signal (for PMC axis control) ERT <G150.6>
Dry run signal (for PMC axis control) EDRN <G150.7>

(2) Cutting feed - feed per minute (01h)

This command performs the same operation as “G94 G01” of the CNC.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Cutting feed - feed minute (01h)
EIF0g to EIF15g	G144,145	Cutting feedrate
EID0g to EID31g	G146 to 149	Total moving distance

Cutting feed rate

Set a feedrate along the axis with a binary code.
A set feedrate can be increased by a factor of 10 with bit 3 (F10) of parameter No. 8002.

When bit 4 (EFD) of parameter No. 8006 is set to 1, the unit of feedrate data increases by a factor of 100. Moreover, the feedrate unit can be changed using a combination of bit 4 (PF1) of parameter No. 8002 and bit 5 (PF2) of parameter No. 8002.

[Unit of data]When the bit 3 (F10) of parameter No. 8002 is set to 0.

		Unit of data			Unit
		IS-A	IS-B	IS-C	
Linear axis	Metric input	10	1	0.1	mm/min
	Inch input	0.1	0.01	0.001	inch/min
Rotation axis		10	1	0.1	deg/min

When the bit 3 (F10) of parameter No. 8002 is set to 1.

		Unit of data			Unit
		IS-A	IS-B	IS-C	
Linear axis	Metric input	100	10	1	mm/min
	Inch input	1	0.1	0.01	inch/min
Rotation axis		100	10	1	deg/min

[Valid data range] 1 to 65535

⚠ **CAUTION**

1 When “0” is specified, the buffering state remains unchanged and no axis movement takes place. In such a case, perform a reset operation with the reset signal ECLRg.
2 Clamping to the cutting feedrate (parameter No. 1430) is disabled.

Total moving distance

The specifications of the rapid traverse command (EC0g to EC6g: 00h) are applicable.

With bit 2 (OVE) of parameter No. 8001, select a dry run signal and manual rapid traverse selection signal to be used. In addition to these signals, with bit 2 (OVE) of parameter No.8001, select also a feed rate override signal, a override cancellation signal and rapid traverse override signal. The Table 16.1.1 (j) below indicates the relationships between the bit and signals.

Table 16.1.1 (j)

Signals	Bit 2 (OVE) of parameter No.8001 = 0 (same signals as those used for the CNC)	Bit 2 (OVE) of parameter No. 8001 = 1 (signals specific to the PMC)
Feedrate override signals	*FV0 to *FV7<G012>	*EFOV0 to *EFOV7<G151>
Override cancellation signal	OVC<G006.4)	EOVC<G150.5>
Rapid traverse override signals	ROV1,2<G014.0,1>	EROV1,2<G150.0,1> or *EROV0 to *EROV7<G151>
Dry run signal	DRN<G046.7>	EDRN<G150.7>
Manual rapid traverse selection signal	RT<G019.7>	ERT<G150.6>

When the dry run signal DRN/EDRN is set to “1”, the feedrate is as indicated Table 16.1.1 (k).
Unlike rapid traverse, the feedrate does not depend on the value of bit 3 (RDE) of parameter No. 8001.

Table 16.1.1 (k)

Manual rapid traverse selection signal (RT / ERT)	When cutting feed is specified
0	Dry run speed × *JV (Note)
1	Cutting feed

> **NOTE**
> When bit 1 (JOV) of parameter No. 1402 is set to 1, the manual feedrate override signal *JV is not applied, but the dry run feedrate is just applied.

Related parameters

Manual rapid traverse selection signal (for PMC axis control) ERT <G150.6>
Dry run signal (for PMC axis control) EDRN <G150.7>

(3) Cutting feed - feed per revolution (02h)

This command performs the same operation as "G95 G01" of the CNC.
Set the amount of feed along the axis per spindle revolution.
The feedrate per spindle revolution depends on whether the M series or T series is used.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Cutting feed - feed per revolution command (02h)
EIF0g to EIF15g	G144,145	Feedrate per revolution
EID0g to EID31g	G146 to 149	Total moving distance

Feedrate per revolution

<For the T series>

[Unit of data] The Table 16.1.1 (l) indicates the unit of data depending on the setting of bits 6 (FR1) and bit 7 (FR2) of parameter No. 8002.

Table 16.1.1 (l)

Parameter		Metric input (mm/rev)	Inch input (inch/rev)	Rotation axis (deg/rev)
FR2	**FR1**			
1	**1**	0.0001	0.000001	0.0001
0	**0**			
0	**1**	0.001	0.00001	0.001
1	**0**	0.01	0.0001	0.01

[Valid data range] 1 to 65535
(However, data within the ranges indicated Table 16.1.1 (m) must be commanded.)

Table 16.1.1 (m)

		Valid data range	Unit
		IS-A to IS-C	
Linear axis	**Metric input**	0.0001 to 500.0000	mm/rev
	Inch input	0.000001 to 9.999999	inch/rev
Rotation axis		0.0001 to 500.0000	deg/rev

<For M series>

[Unit of data] The Table 16.1.1 (n) indicates the unit of data depending on the setting of bits 6 (FR1) and bit 7 (FR2) of parameter No. 8002.

Table 16.1.1 (n)

Parameter		Metric input (mm/rev)	Inch input (inch/rev)	Rotation axis (deg/rev)
FR2	**FR1**			
1	**1**	0.01	0.0001	0.01
0	**0**			
0	**1**	0.1	0.001	0.1
1	**0**	1	0.01	1

[Valid data range] 1 to 65535
(However, data within the ranges indicated Table 16.1.1 (o) must be commanded.)

Table 16.1.1 (o)

		Valid data range	Unit
		IS-A to IS-C	
Linear axis	**Metric input**	0.01 to 500.00	mm/rev
	Inch input	0.0001 to 9.9999	inch/rev
Rotation axis		0.01 to 500.00	deg/rev

⚠ CAUTION

1. A set feedrate can be increased by a factor of 10 or 100 by setting bit 6 (FR1) and bit 7 (FR2) of parameter No. 8002.
2. The feedrate is clamped to a value not exceeding the setting of parameter No. 8022.
3. Override is enabled. Dry run depends on the value of bit 3 (DRR) of parameter No. 8005.

Total moving distance
The specifications of the rapid traverse command (EC0g to EC6g: 00h) are applicable.

Dry run operation follows the specifications of cutting feed - feed per minute.

Related parameters
Bit 3 (DRR) of parameter No. 8005
Parameter No. 8022
Others follow the specifications of the cutting feed - feed per minute.

Related signals
Same as for cutting feed - feed per minute

(4) Skip - feed per minute (03h)

Skip

This command performs the same operation as "G31 G01" of the CNC.
High-speed skip is disabled.

Available skip signal
Skip signal of PMC axis control uses the same skip signal SKIP<X0004.7> as CNC. When bit 7 (SKE) of parameter No.8001 is set to 1, unique skip signal ESKIP<X0004.6> of PMC axis control can be used. Also, when bit 2 (XSG) of parameter No.3008 is set to 1, arbitrary X address specified by the parameters Nos.3012, 3019 can be used as a skip signal. Available skip signal is shown in Table 16.1.1 (p).

Table 16.1.1 (p) Skip signal to be used in PMC axis control skip

Bit 7(SKE) of parameter No.8001	Bit 2 (XSG) of parameter No.3008	Available skip signal
0	0	SKIP <X0004.7>, SKIP[#2] <X0013.7>, SKIP[#3]<X0011.7>, path 4 can not use skip signal.
1	0	ESKIP <X0004.6>, ESKIP[#2] <X0013.6>, ESKIP[#3]<X0011.6>, path 4 can not use skip signal.
0	1	Bit 7 of X address set to the parameter No.3012
1	1	Bit 6 of X address set to the parameter No.3019

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Skip command (03h)
EIF0g to EIF15g	G144,145	Cutting feedrate
EID0g to EID31g	G146 to 149	Total moving distance

Cutting feedrate
The specifications of the cutting feed command (EC0g to EC6g: 01h) are applicable.

> ⚠ **CAUTION**
> Feedrate override, dry run, and automatic acceleration/deceleration are disabled.

Total moving distance
The specifications of the rapid traverse command (EC0g to EC6g: 00h) are applicable.

Acceleration/deceleration after interpolation

When bit 5 (PSA) of parameter No.8007 is set to 1, acceleration/deceleration after interpolation is enabled for skip command of PMC axis control. Type of acceleration/deceleration is set to bit 3 (ASL) and bit 4 (ASB) of parameter No. 6210, and time constant is set to parameter No.6280. As a result, different from acceleration/deceleration after interpolation of cutting feed of normal, acceleration/deceleration after interpolation for the skip function is available. Also, in case of type of exponential acceleration/deceleration, acceleration/deceleration after interpolation in cutting feed or continuous feed under PMC axis control is available by setting the time constant to parameter No.8030 and setting FL rate to parameter No.8031. Setting of acceleration/deceleration is shown in Table 16.1.1 (q). In case of CNC skip command (G31), when bit 7 (SKF) of parameter No.6200 is set to 1, acceleration/deceleration after interpolation of cutting feed is enabled. Setting of acceleration/deceleration is shown in Table 16.1.1 (r).

This function is enabled bit 1 (SEB) of parameter No.6201. When parameter SEB is set to 1, Skip position of system variables (#5061 to #5080, #100151 to #100182) in which the accumulated pulses and positional deviation due to acceleration/deceleration was considered and compensated can be read.

Table 16.1.1 (q) Setting of acceleration/deceleration after interpolation of PMC axis control skip, when bit 5 (PSA) of parameter No.8007 = 1.

Acceleration/deceleration setting		Bit 1 (CTBx) of parameter No.1610	Bit 0 (CTLx) of parameter No.1610	Bit 4 (ASB) of parameter No.6210	Bit 3 (ASL) of parameter No.6210	Time constant, FL rate parameter
Exponential acceleration/ deceleration	Same time constant and FL rate as cutting feed	0	0	0	0	No.1622 No.1623
	Time constant and FL rate different from cutting feed	0	0	0	0	No.8030 No.8031
Linear acceleration/ deceleration	Same time constant as cutting feed	0	1	0	0	No.1622
	Time constant different from cutting feed	0 / 1	0 / 1	0	1	No.6280
Bell-shaped acceleration/ deceleration	Same time constant as cutting feed	1	0	0	0	No.1622
	Time constant different from cutting feed	0 / 1	0 / 1	1	0	No.6280

Table 16.1.1 (r) Setting of acceleration/deceleration after interpolation of CNC skip command, when bit 7 (SKF) of parameter No.6200 = 1.

Acceleration/deceleration setting		Bit 1 (CTBx) of parameter No.1610	Bit 0 (CTLx) of parameter No.1610	Bit 4 (ASB) of parameter No.6210	Bit 3 (ASL) of parameter No.6210	Time constant, FL rate parameter
Exponential acceleration/ deceleration	Same time constant and FL rate as cutting feed	0	0	0	0	No.1622 No.1623
	Time constant and FL rate different from cutting feed	This setting does not exist.				
Linear acceleration/ deceleration	Same time constant as cutting feed	0	1	0	0	No.1622
	Time constant different from cutting feed	0 / 1	0 / 1	0	1	No.6280
Bell-shaped acceleration/ deceleration	Same time constant as cutting feed	1	0	0	0	No.1622
	Time constant different from cutting feed	0 / 1	0 / 1	1	0	No.6280

NOTE

1. Setting value of parameters Nos.8030, 8031 are the same as cutting feed under PMC axis control.
2. Setting value of bit 3 (ASL) and bit 4 (ASB) of parameter No.6210, parameter No.6280 are the same as CNC skip command (G31).
3. Multi-step skip function, high-speed skip function, torque limit skip function, skip function for EGB Axis, and dwell skip function can not be used in PMC axis control skip.

Parameter No. 3012
Parameter No. 3019
Bit 1 (SK0) of parameter No. 6200
When Bit 5 (PSA) of parameter No. 8007 is set to 1, Bit 1 (SEB) of parameter No. 6201
When Bit 5 (PSA) of parameter No. 8007 is set to 1, Bit 3 (ASL) of parameter No. 6210 and Bit 4 (ASB) of parameter No. 6210, No. 6280

Related signals

Skip signal SKIP<X0004.7>, SKIP[#2]<X0013.7>, SKIP[#3]<X0011.7>, ESKIP<X0004.6>, ESKIP[#2]<X0013.6>, ESKIP[#3]<X0011.6>

(5) Dwell (04h)

This command performs the same operation as "G04" of the CNC.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Dwell command (04h)
EID0g to EID31g	G146 to 149	Dwell time

Dwell time

Set a dwell time with a binary code.

Valid data range	Unit
1 to 9999999	ms

When diameter specification is selected with bit 3 (DIAx) of parameter No. 1006, whether to specify a radius value or diameter value for dwell operation can be specified using bit 1 (CDI) of parameter No. 8005.

When the increment system is IS-C, the dwell time can be set to a least input increment of 0.1 msec with bit 1 (DWE) of parameter No. 8002.

Related parameters

Bit 3 (DIAx) of parameter No. 1006
Bit 1 (DWE) of parameter No. 8002
Bit 1 (CDI) of parameter No. 8005

(6) Reference position return (05h)

This command performs the same operation as manual reference position return of the CNC after rapid traverse in the reference position return direction set by bit 5 (ZMIx) of parameter No. 1006.

Reference position return without DOG

If bit 1 (DLZx) of parameter No. 1005 for the function for return the reference position without dogs is set for each axis, and reference position return operation is not performed even once after the power is turned on, a reference position return operation (positioning at a grid closest to the current position) can be performed without using the reference position return deceleration signal when a movement (positioning at a location near the reference position) is made in the direction set for each axis with the continuous feed command (EC0g to EC6g: 06h) and the reference position return command (EC0g to EC6g: 05h) is specified.
At the time of positioning at a location near the reference position, the machine needs to be moved in the reference position return direction at such a feedrate that the servo position deviation exceeds the value set in parameter No. 1836.
The direction from a neighborhood point to a grid is set by bit 5 (ZMIx) of parameter No. 1006.
If the reference position return command (EC0g to EC6g: 05h) is issued after reference position establishment, a high-speed reference position return operation is performed, regardless of the reference position return direction set by bit 5 (ZMIx) of parameter No. 1006.
Specify this command after canceling tool radius compensation and tool length compensation.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Reference position return command (05h)

Related parameters

Bit 1 (DLZx) of parameter No. 1005
Bit 5 (ZMIx) of parameter No. 1006
Parameter No. 1836

(7) Continuous feed (06h)

This command performs a continuous feed operation along a controlled axis in a certain direction.
This command performs the same operation as continuous feed in the JOG mode of the CNC.

Continuous feed is performed until a reset. At this time, the remaining amount of travel is 0 at all times.

By setting the reset signal ECLRg to “1”, the command can be ended. At this time, the servo motor is decelerated to a stop, the axis moving signal EGENg is set to “0”, and the control axis selection status signal *EAXSL is also set to “0“.
Before specifying the next command, check that the control axis selection status signal *EAXSL is set to “0”.
Until the control axis selection status signal *EAXSL is set to “0”, ensure that the reset signal ECLRg continues to be set to “1”.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Continuous feed command (06h)
EIF0g to EIF15g	G144,145	Continuous feedrate
EID31g	G149.7	Feed direction (specified with EID31g only)

Continuous feedrate
A feedrate along an axis is set in the same way as for cutting feed - feed per minute (EC0g to EC6g: 01h). A feedrate change can be made during continuous feed.
If a feedrate (EIF0g to EIF15g) is set, and the logical state of the axis control command read signal EBUFg is reversed, a new continuous feedrate is set.
This command is not buffered. So, the axis control command read completion signal EBSYg need not be checked when this command is specified usually.
A set feedrate can be increased by a factor of 10 with bit 3 (F10) of parameter No. 8002. Moreover, a set feedrate can be increased by a factor of up to 200 with bit 2 (JFM) of parameter No. 8004.

⚠ **CAUTION**
A maximum feedrate applicable when override is applied differs from a maximum feedrate applicable when override is canceled. Maximum feedrate data in the two cases is indicated Table 16.1.1 (s) and Table 16.1.1 (t).

Table 16.1.1 (s) Maximum feedrate (when an override of 254% is applied)

	IS-B		IS-C	
	Metric input (mm/min)	Inch input (inch/min)	Metric input (mm/min)	Inch input (inch/min)
1 times	166458	1664.58	16645	166.45
10 times	1664589	16645.89	166458	1664.58
200 times (NOTE 1)	19660500	196605.00	1966050	19660.50

Table 16.1.1 (t) Maximum feedrate (when override is canceled)

	IS-B		IS-C	
	Metric input (mm/min)	Inch input (inch/min)	Metric input (mm/min)	Inch input (inch/min)
1 times	65535	655.35	6553	65.53
10 times	655350	6553.5	65535	655.35
200 times (NOTE 1)	13107000	131070	1310700	13107

NOTE
1 A feedrate increased by a factor of 200 is valid only when the continuous feed command (EC0g to EC6g: 06h) is used.
2 The actual feedrate may not be displayed correctly, depending on the feedrate.

Feed direction
Specify the direction of continuous feed with the signal EID31g.
0: Positive direction
1: Negative direction
The signals EID0g to EID30g are undefined.
To change the feed direction during continuous feed, the signal EID31g is reversed and then the logical state of the axis control command read signal EBUFg is reversed.

Dry run operation follows the specifications of cutting feed - feed per minute.

Related parameters
Bit 1 (JOV) of parameter No. 1402
Bit 2 (OVE) of parameter No. 8001
Bit 3 (F10) of parameter No. 8002
Bit 2 (JFM) of parameter No. 8004

Related signals
Same as for cutting feed - feed per minute

(8) First reference position return (07h)

This command performs the same operation as reference position return from an intermediate position done with "G28" of the CNC.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	First reference position return command (07h)
EIF0g to EIF15g	G144,145	Rapid traverse rate

Rapid traverse rate

The specifications of the rapid traverse command (EC0g to EC6g: 00h) are applicable.
When the first reference position return command is specified, the manual rapid traverse rate set by parameter No. 1424 is used if manual reference position return operation is not performed even once after the power is turned on.

> **NOTE**
> If bit 1 (DLZ) of parameter No. 1005 is set to enable the function for returning the reference position without dogs for each axis, and reference position return operation is not performed even once after the power is turned on, the alarm PS0090, “REFERENCE RETURN INCOMPLETE” is issued when the first reference position return command (EC0g to EC6g: 07h) is specified.

Dry run operation follows the specifications of rapid traverse.

Related parameters

Bit 1 (DLZx) of parameter No. 1005
Parameter No. 1240
Bit 1 (JOV) of parameter No. 1402
Parameter No. 1420

Bit 2 (OVE) of parameter No. 8001
Bit 3 (RDE) of parameter No. 8001
Bit 0 (RPD) of parameter No. 8002

Related signals

Same specification for rapid traverse command

(12) External pulse synchronization – position coder (0Bh)

This command performs a synchronous operation with the position coder. Using position coder of the serial spindle is also available.
When a negative external pulse value is specified, a movement is made in the opposite direction.
The remaining amount of travel is 0 at all times.
If a manual handle interrupt operation is performed for the same axis, an amount of travel based on external pulses added to manual handle interrupt pulses results.

By setting the reset signal ECLRg to "1", the command can be ended. At this time, the servo motor is decelerated to a stop, the axis moving signal EGENg is set to "0", and the control axis selection status signal *EAXSL is also set to "0".
Before specifying the next command, check that the control axis selection status signal *EAXSL is set to "0".
Until the control axis selection status signal *EAXSL is set to "0", ensure that the reset signal ECLRg continues to be set to "1".

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	External pulse synchronization - position coder command (0Bh)
EIF0g to EIF15g	G144,145	Pulse weight
EID0g to EID7g	G146	Spindle number of the serial spindle to be synchronized (common to the system) (*1)

*1: This data is set only during synchronization with the position coder of the serial spindle.

The type of position coder to be synchronized depends on the parameter setting, as shown Table 16.1.1 (u).

Table 16.1.1 (u)

Bit 3 (ESY) of parameter No. 8007	Bit 0 (EOS) of parameter No. 8019	Command of G146	Valid position coder
0	0/1	Not required	Position coder (not a serial spindle)
1	0	Not required	Position coder of the first spindle belonging to path 1 (*2)
1	1	Required	Position coder of an arbitrary spindle (set by G146)

*2: This can be commanded for the servo axis belonging to path 1.

Pulse weight

Set an external pulse weight.

1) In the Case of Manual pulse magnification change signal HNDMP<Gn088.3> is "0"
When setting a weight value, use the higher bits of signal (EIF8g to EIF15g) to specify the integer part of an external pulse weight, and use the lower bits of signal (EIF0g to EIF7g) to specify the fractional part.
The valid range is ±1/256 to ±127.
With EIF0g to EIF7g for the fractional part, specify a weight in steps of 1/256.

Example)
For 0.5: EIF0g to EIF7g = 80h (=80h/100h=128 / 256 = 0.5)
For 0.2: EIF0g to EIF7g = 33h (=33h/100h= 51 / 256 ≒ 0.2)

2) In the Case of Manual pulse magnification change signal HNDMP<Gn088.3> is “1”
When setting a weight value, use the higher bits of signal (EIF5g to EIF15g) to specify the integer part of an external pulse weight, and use the lower bits of signal (EIF0g to EIF4g) to specify the fractional part.
The valid range is ±1/32 to ±1023.
With EIF0g to EIF4g for the fractional part, specify a weight in steps of 1/32.

Example)
For 0.5: EIF0g to EIF4g = 10h (=10h/20h=16 / 32 = 0.5)
For 0.2: EIF0g to EIF4g = 06h (=06h/20h= 6 / 32 ≒ 0.2)

When a negative value is set to pulse weight, a movement is made along the axis in the opposite direction.
If a new pulse weight is set and the logical state of the axis control command read signal EBUFg is reversed during axis movement based on external pulse synchronization, a movement is made along the axis according to the new pulse weight.
This command is not buffered. So, the axis control command read completion signal EBSYg need not be checked when this command is specified normally.

Spindle number of a serial spindle to be synchronized (for synchronization with the position coder of a serial spindle)
The serial spindle to be synchronized is set with a spindle number common to the system.
The valid range extends from 1 to the maximum number of control spindle axes. If the spindle number falls outside the range, external pulse synchronization is disabled.

Example)
When the spindle (serial spindle) of each path is assigned as shown Table 16.1.1 (v) and Fig. 16.1.1 (j)

Table 16.1.1 (v)

Spindle number common to the system	Path number + Spindle number in the path
First spindle (S1)	First spindle in path 1 (S11)
Second spindle (S2)	Second spindle in path 1 (S12)
Third spindle (S3)	Third spindle in path 1 (S13)
Fourth spindle (S4)	First spindle in path 2 (S21)
Fifth spindle (S5)	First spindle in path 3 (S31)
Sixth spindle (S6)	Second spindle in path 3 (S32)

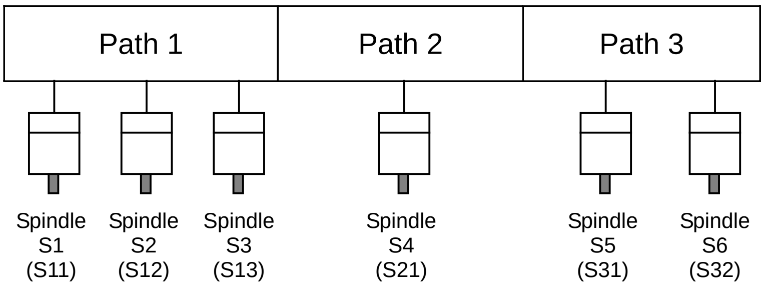

Fig. 16.1.1 (j)

To perform external pulse synchronization with the second spindle (S32) in path 3, set the spindle number of the serial spindle to 6.

NOTE

1. The spindle number to be set does not depend on the path and is common to the system.
2. If the set serial spindle is not present, external pulse synchronization is disabled.
3. Be sure to set EID8g to EID31g (G147 to G149 for group 1) to 0.

Related parameters

Bit 3 (DIAx) of parameter No. 1006
Parameter No. 1424
Bit 1 (CDI) of parameter No. 8005
Bit 3 (ESY) of parameter No. 8007
Bit 0 (EOS) of parameter No. 8019

⚠ **CAUTION**

The feedrate is clamped to the manual rapid traverse rate for each axis (parameter No. 1424).

NOTE

For diameter specification based on bit 3 (DIAx) of parameter No. 1006, whether to specify a radius value or diameter value can be chosen using bit 1 (CDI) of parameter No. 8005. At this time, set the same value with bit 3 (DIAx) of parameter No. 1006 for all axes that belong to the same group.

(13) External pulse synchronization - first manual handle (0Dh)
(14) External pulse synchronization - second manual handle (0Eh)
(15) External pulse synchronization - third manual handle (0Fh)

Each of these commands performs a synchronous operation with a manual handle.

When a negative external pulse value is specified, a movement is made in the opposite direction.
The remaining amount of travel is 0 at all times.
If a manual handle interrupt operation is performed for the same axis, an amount of travel based on external pulses added to manual handle interrupt pulses results. A parameter-set magnification is invalid.

By setting the reset signal ECLRg to “1”, each of these commands can be ended. At this time, the servo motor is decelerated to a stop, the axis moving signal EGENg is set to “0”, and the control axis selection status signal *EAXSL is also set to “0”.
Before specifying the next command, check that the control axis selection status signal *EAXSL is set to “0”. Until the control axis selection status signal *EAXSL is set to “0”, ensure that the reset signal ECLRg continues to be set to “1”.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	External pulse synchronization - manual handle command (0Dh for the first manual handle) (0Eh for the second manual handle) (0Fh for the third manual handle)
EIF0g to EIF15g	G144,145	Pulse weight

Pulse weight

The specifications of the external pulse synchronization - position coder command (EC0g to EC6g: 0Bh) are applicable.

Related parameters

Same as for external pulse synchronization - position coder

> ⚠ **CAUTION**
> The feedrate is clamped to the manual rapid traverse rate for each axis (parameter No. 1424).

> **NOTE**
> For diameter specification based on bit 3 (DIAx) of parameter No. 1006, whether to specify a radius value or diameter value can be chosen using bit 1 (CDI) of parameter No. 8005. At this time, set the same value with bit 3 (DIAx) of parameter No. 1006 for all axes that belong to the same group.

(16) Speed command (10h)

This command performs a continuous feed operation based on a speed command.

By using bit 0 (ROTx) of parameter No. 1006, set a rotation axis as a controlled axis for which this command is executed.
The continuous feed command (EC0g to EC6g: 06h) exercises position control. However, the speed command (EC0g to EC6g: 10h) can exercise speed control on the servo motor to dynamically change the speed during continuous feed. So, this command is suited, for example, to an application where a servo motor drives a rotary tool.
With parameter No. 8028, 8029 and No. 8032, a time constant for linear acceleration/ deceleration or bell-shaped acceleration/deceleration can be set for each axis.
Every coordinate values are not updated during the speed command.
A reference position return operation needs to be performed after a move command is specified upon completion of the speed command. (This operation also needs when an absolute position detector is attached.)

When bit 2 (VCP) of parameter No. 8007 is set to 0, coordinate value is updated during feed operation based on a speed command. (The FS15 type is used for the speed command in PMC axis control.)
When bit 2 (VCP) of parameter No. 8007 is set to 1, the FS16 type is used for the speed command in PMC axis control. With this setting, the speed command is determined by the setting of bit 4 (EVP) of parameter No. 8005.
When the FS16i type (bit 2 (VCP) of parameter No. 8007 is set to 1) and speed control (bit 4 (EVP) of parameter No. 8005 is set to 0) are specified, coordinates are not updated. Reference position return must be performed before a move command is executed after the completion of the speed command since the machine position is lost. (The machine position is also lost when an absolute position detector is attached.)
When the FS16i type (bit 2 (VCP) of parameter No. 8007 is set to 1) and position control (bit 4 (EVP) of parameter No. 8005 is set to 1) are specified, coordinates are updated.

By setting the reset signal ECLRg to “1”, this command can be ended.
At this time, the servo motor is decelerated to a stop, and the axis moving signal EGENg is set to “0”. Before specifying the next command, check that the axis moving signal EGENg is set to “0”.
Until the axis moving signal EGENg is set to “0”, ensure that the reset signal ECLRg continues to be set to “1”.
After the execution of speed command, to execute a move command in an NC block, execute the method (2) of CAUTION 9 in the item "Caution" described in the end of chapter "PMC CONTROL FUNCTION".

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Speed command (10h)
EIF0g to EIF15g	G144,145	Continuous feedrate

Continuous feedrate

Set the speed of the servo motor with a binary code.

Set a positive value when the servo motor rotates in the forward direction. Set a negative value (two's complement) when the servo motor rotates in the reverse direction.

If a new servo motor speed is set as a feedrate, and the logical state of the axis control command read signal EBUFg is reversed, the servo motor is accelerated or decelerated to the new speed.

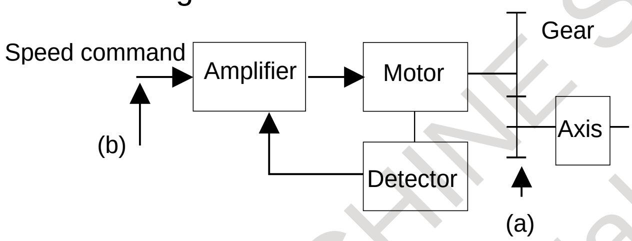
Valid data range	Unit
-32768 to +32767	min^{-1}

Related parameters

Parameter No. 8028
Parameter No. 8029
Parameter No. 8032

NOTE

1 The following feedrate error can occur:



(a) With the speed command based on PMC axis control, a servo motor speed is specified as a feedrate. So, in order to command a feedrate for an axis when a gear is used between the axis and servo motor, the desired feedrate for the axis needs to be converted to a servo motor speed. A feedrate must be specified using an integer, so that when it is converted to a servo motor speed, a rounding error can occur.

(b) The minimum unit of feedrate is given by the expression below. An integer must be specified. No finer value may be specified.
Fmin = P ÷ 1000 (mm/min)
A calculation is made according to IS-B.
Fmin: Minimum feedrate unit
P : Number of pulses per revolution of a detector for speed feedback
A speed is command according to the expression below.
F = N × P ÷ 1000 (mm/min)
A calculation is made according to IS-B.
F : Speed command (integer)
N : Servo motor speed (min^{-1})
P : Number of pulses per revolution of a detector for speed feedback

2 In the speed command mode, a speed after acceleration/deceleration is command for the servo control section. At this time, a position control loop gain is invalid.

3 Machine lock is disabled for the speed command.

Speed command and position control

The PMC axis can be moved at a constant speed by performing the speed command of PMC axis control through position loop control, that is, outputting the command pulses corresponding to a rotation speed to servo position control instead of outputting rotation speed data to the amplifier.

Set the FS16i specification (set bit 2 (VCP) of parameter No. 8007 to 1) and specify either speed loop control or position loop control is used for speed command of PMC axis control using bit 4 (EVP) of parameter No. 8005.

When speed command with position control(bit 4 (EVP) of parameter No. 8005 and bit 2 (VCP) of parameter No. 8007 are set to 1) is selected and uses acceleration/ deceleration, the linear acceleration/deceleration expanded parameter for PMC axis control speed command continuous feed (bit 0 (PTC) of parameter 12730) must be set to 1, and set the linear acceleration/deceleration using following parameters.

Parameter(No.8028):Time constant 1 of linear acceleration/deceleration in feedrate control command under PMC axis control: Unit [msec/1000[min^{-1}]]

Parameter(No.12731):Time constant 2 of linear acceleration/deceleration in feedrate control command under PMC axis control :Unit [msec/1000[min^{-1}]]

Parameter(No.12732):Time constant 3 of linear acceleration/deceleration in feedrate control command under PMC axis control :Unit [msec/1000[min^{-1}]]

Parameter(No.12733):Time constant 4 of linear acceleration/deceleration in feedrate control command under PMC axis control :Unit [msec/1000[min-^{1}]]

Parameter(No.12734):Time constant 5 of linear acceleration/deceleration feedrate control command under PMC axis control :Unit [msec/1000[min^{-1}]]

Parameter(No.12735):1st feedrate for changing time constant of continuous feed operation based on a feedrate control command in PMC axis control :Unit [min^{-1}]

Parameter(No.12736):2nd feedrate for changing time constant of continuous feed operation based on a feedrate control command in PMC axis control :Unit [min^{-1}]

Parameter(No.12737):3rd feedrate for changing time constant of continuous feed operation based on a feedrate control command in PMC axis control :Unit [min^{-1}]

Parameter(No.12738):4th feedrate for changing time constant of continuous feed operation based on a feedrate control command in PMC axis control :Unit [min^{-1}]

When the bell-shaped acceleration/deceleration is used, set the time constant to parameter (No.8029) in addition to the setting of the linear acceleration/deceleration.

For position control (bit 4 (EVP) of parameter No. 8005 is 1), override is enabled.

Set parameter No. 8040 for each axis to the amount of travel per revolution of the motor in terms of the minimum travel unit and convert speed commands to position commands using this value.

As shown in the following block diagram (Fig. 16.1.1 (k)), rotation speed data is not output to the amplifier and the command pulses corresponding to a rotation speed are output to servo position control.

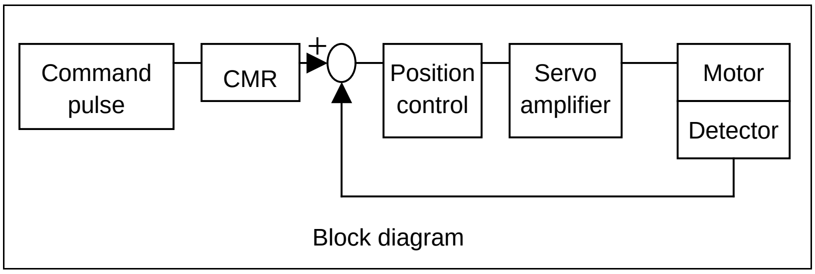


Fig. 16.1.1 (k)

Related parameters

Bit 4 (EVP) of parameter No. 8005
Bit 2 (VCP) of parameter No. 8007
Parameter No. 8040
Bit 0 (PTC) of parameter No. 12730
Parameter No. 12731
Parameter No. 12732

Parameter No. 12733
Parameter No. 12734
Parameter No. 12735
Parameter No. 12736
Parameter No. 12737
Parameter No. 12738

NOTE

1. The commanded control axis to be controlled needs to be set as a rotation axis in bit 0 (ROTx) of parameter No. 1006.
2. When the FS16i specification (bit 2 (VCP) of parameter No. 8007 is 1) and speed control (bit 4 (EVP) of parameter No. 8005 is 0) are specified, coordinates are not updated.
   After execution, the following signal is set to 0 and the position is lost.
   - Reference position establishment signal ZRFx<F120>

   After execution of speed command, establish the reference position.
3. When the FS16i specification (bit 2 (VCP) of parameter No. 8007 is 1) and position control (bit 4 (EVP) of parameter No. 8005 is 1) are specified, coordinates are updated.
4. Only when the FS16i specification (bit 2 (VCP) of parameter No. 8007 is 1) and position control (bit 4 (EVP) of parameter No. 8005 is 1) are specified, feedrate override is enabled.
5. After the execution of speed command, to execute a move command in an NC block, execute the method (2) of CAUTION 9 in the item "Caution" described in the end of chapter "PMC CONTROL FUNCTION".
6. Flexible synchronization control cannot be used together with speed command in PMC axis control (Speed control).

(17) Torque control (11h)

This command performs a continuous feed operation based on torque control.

With this command, position control on a PMC control axis can be switched to torque-based control. The servo motor outputs torque exactly as specified by the NC.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Torque control command (11h)
EIF0g to EIF15g	G144,145	Maximum feedrate
EID0g to EID31g	G146 to 149	Torque data

Maximum feedrate

Command a maximum feedrate during torque control by using the unit min^{-1}.
When there is no torque generation target or the feedrate exceeds the commanded value during torque control, the alarm SV0422, “EXCESS VELOCITY IN TORQUE” is issued.
When updating the maximum feedrate during torque control set in the torque control mode, set new data on the signals and reverse the logical state of the axis control command read signal EBUFg.

Valid data range	Unit
1 to +32767	min^{-1}

NOTE

When a linear motor is used, the unit of data is cm/min.

Torque data

Command torque data.

Command a positive value when the torque direction is positive. Command a negative value when the torque direction is negative.

When updating the torque data set in the torque control mode, set new data on the signals and reverse the logical state of the axis control command read signal EBUFg.

Valid data range	Unit
-999999999 to +999999999 (9-digit)	0.00001 Nm

NOTE

When a linear motor is used, the unit of data is 0.001N.

(1) Switching from position control to torque control

(a) Torque control axis setting
Using bit 7 (TRQ) of parameter No. 2007, set whether an axis is to be placed under torque control. Moreover, for an axis to be placed under torque control, set the torque constant parameter No. 2105. The standard value of the motor is automatically set in this parameter when the power is turned on after setting bit 1 (DGP) of parameter No. 2000 to 0.

(b) Position management in the torque control mode
Whether to perform follow-up operation in the torque control mode can be chosen using bit 4 (TQF) of parameter No. 1803.
If follow-up operation is performed (with bit 4 (TQF) of parameter No. 1803 set to 1), position control is exercised, regardless of whether the torque control mode is set.
If follow-up operation is not performed (with bit 4 (TQF) of parameter No. 1803 set to 0), the operation depends on whether to update the error counter (bit 1 (TRE) of parameter No. 1805).
If the error counter is updated (with bit 1 (TRE) of parameter No. 1805 set to 0), the alarm SV0423, “EXCESS ERROR IN TORQUE” is issued when the value of the error counter exceeds the value set in parameter No. 1885. At the time of switching back to position control, follow-up operation is performed.
If the error counter is not updated (with bit 1 (TRE) of parameter No. 1805 set to 1), no errors are accumulated, so that no servo alarm is issued. However, when the maximum allowable speed is exceeded, the alarm SV0422, “EXCESS VELOCITY IN TORQUE” is issued.
When this setting is selected, a reference position return operation is required to switch back to position control.

Except when bit 4 (TQF) of parameter No. 1803 is set to 0, and bit 1 (TRE) of parameter No. 1805 is se to 1, the CNC always exercises position control even in the torque control mode. So, no reference position return operation needs to be performed even at the time of switching from torque control to position control.

(c) Movement direction and speed in the torque control mode
In the torque control mode, the output of torque commanded by the axis control data signals EID0g to EID31g is attempted. However, when there is no torque generation target or the output has not reached the commanded torque data yet, a movement is made in the same direction as in the case of position control according to the +/- sign of torque data. When the move speed exceeds the commanded value, the alarm SV0422 is issued.

(d) Timing of switching to torque control
Switching to the torque control mode from another mode occurs when the position deviation is decreased to within the in-position width.

(e) In the torque control mode, the torque control mode signal TRQM1 to TRQM8 is set to “1“. (For details of this signal, see "Signal detail".)

(2) Switching from torque control to position control
(Torque control mode cancellation)
When any of the following conditions occurs, the torque control mode ends:
(i) When the reset signal ECLRg is set to "1"
(ii) When a servo alarm is issued
(iii) When an OT alarm is issued with an axis placed under torque control
(iv) At the time of emergency stop
(v) When servo-off occurs due to the servo-off signal ESOFg

(a) Timing of torque control cancellation
The cancellation of torque control based on PMC axis control depends on whether to perform follow-up operation as determined by bit 4 (TQF) of parameter No. 1803.
- When follow-up operation is performed (with bit 4 (TQF) of parameter No. 1803 set to 1).
The torque control mode signal TRQM1 to TRQM8 is set to 0 to return to position control immediately when a cancellation condition occurs. The execution then stops when the position deviation is decreased to within the in-position width.
- When follow-up operation is not performed (with bit 4 (TQF) of parameter No. 1803 set to 0).
The torque control mode signal TRQM1 to TRQM8 is set to 0 when a cancellation condition occurs. If the error counter is updated (with bit 1 (TRE) of parameter No. 1805 set to 0), the control mode is switched back to position control when the position deviation is decreased to below the value of the cancellation limit parameter No. 1886 after the start of follow-up operation. The execution then ends when the position deviation is decreased to within the in-position width. If the error counter is not updated (bit 1 (TRE) of parameter No. 1805 is set to 1), a reference position return operation must be once performed to return to position control.

(b) Command after cancellation
After the torque control mode is canceled, the control mode is switched to normal position control. In the torque control mode, position is controlled, so that machine coordinates are not shifted. However, a shift occurs between the workpiece coordinates and machine coordinates, so that the shift amount needs to be canceled, for example, by executing workpiece coordinate system preset.
After the execution of torque control, to execute a move command in an NC block, execute the method (2) of CAUTION 9 in the item "Caution" described in the end of chapter "PMC CONTROL FUNCTION".

The Table 16.1.1 (w) indicates the operations dependent on the settings of bit 4 (TQF) of parameter No. 1803 and bit 1 (TRE) of parameter No. 1805.

Table 16.1.1 (w)

Bit 4 (TQF) of parameter No. 1803	Bit 1 (TRE) of parameter No. 1805	Position control	Operation in TRQ mode	Reference position return(*)
1	**0/1**	O	Position control is exercised.	Not required
0	**0**	O	The alarm SV0423 is issued when the error counter exceeds the value of parameter No. 1885.	Not required
0	**1**	-	No SV alarm is issued. When the maximum allowable speed is exceeded, however, the alarm SV0422 is issued.	Required

(*) Whether reference position return operation is required or not when the control mode has been switched from torque control back to position control

TORQUE CONTROL FUNCTION

Set following parameters about servo function "torque control function" properly. As to the detail of the parameters, refer to "FANUC AC SERVO MOTOR αi series PARAMETER MANUAL(B-65270EN)".

Parameter No.2007#7
Parameter No.2203#4
Parameter No.2003#3
Parameter No.2105

If the parameter No.2007#7 or No.2105 is not set correctly, the alarm (DS1184), “PARAMETER ERROR IN TORQUE” occurs.

⚠ **CAUTION**

1 If a movement is made along a torque control axis in the torque control mode, set bit 4 (TQF) of parameter No. 1803 for follow-up operation to 1.
2 If a movement has been made along a torque control axis when torque control is canceled, a mechanical shock occurs at the time of return to position control. As a greater speed is used, a larger shock occurs. So, decelerate to a maximum allowable extent or stop before canceling torque control.
3 When commanding torque control after completion of manual reference position return, set the feed direction selection signal to “0“ or switch to a mode other than the manual reference position return mode beforehand.
4 When the control axis selection signal EAXx is switched in the torque control mode, the alarm PS0139, “CANNOT CHANGE PMC CONTROL AXIS” is issued. Before switching the control axis selection signal EAXx, cancel the torque control mode.
5 In the torque control mode, do not detach a controlled axis with the control axis detach signal DTCHx or a setting parameter.
6 When servo-off occurs, the torque control mode is canceled. However, the torque control state remains to be set. So, be sure to set the reset signal ECLRg to “1”.
7 Machine lock is disabled for the torque control command.
8 In case bit 4 (TQF) of parameter No. 1803 is 0 (Follow-up operation is not performed.) and bit 1 (TRE) of parameter No. 1805 is 1 (Servo error counter is not updated.), after execution of torque control, establish the reference position.
9 After the execution of torque control, to execute a move command in an NC block, execute the method (2) of CAUTION 9 in the item "Caution" described in the end of chapter "PMC CONTROL FUNCTION".

Parameter No. 1886
Parameters about servo function "torque control function" (See above description)

Related signals

Control axis detach signal DTCHx <G124>

(18) Auxiliary function 1 (12h)
(19) Auxiliary function 2 (14h)
(20) Auxiliary function 3 (15h)

Each of these commands performs the same operation as an auxiliary function (M code Function) of the CNC.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Auxiliary function command (12h for the auxiliary function 1 command) (14h for the auxiliary function 2 command) (15h for the auxiliary function 3 command)
EID0g to EID15g	G146 to 147	Auxiliary function code

Auxiliary function code

Specify an auxiliary function code to be sent to the PMC with a binary code.
With bit 6 (AUX) of parameter No. 8001, specify a 1-byte or 2-byte code on the signals EID0g to EID15g.

Related parameters

Bit 6 (AUX) of parameter No. 8001

Related signals

Auxiliary function completion signal EFINg <G142.0>
Auxiliary function strobe signal EMFg <F131.0> (for auxiliary function 1)
Auxiliary function 2 strobe signal EMF2g <F131.2> (for auxiliary function 2)
Auxiliary function 3 strobe signal EMF3g <F131.3> (for auxiliary function 3)
Auxiliary function code signals EM11g to EM48g <F132, F142>
Auxiliary function executing signal EDENg <F130.3>

> **NOTE**
> The same auxiliary function cannot be concurrently executed with some groups (For example, command of 12h to 2 groups). Execute a different auxiliary function in each group or execute with another group after the auxiliary function ends.

(21) Machine coordinate system selection (20h)

This command performs the same operation as “G53” of the CNC.

This command performs rapid traverse in the absolute mode to a commanded position in the machine coordinate system. So, this command can be used to move the tool to a specified machine-specific position such as a tool change position.

> **NOTE**
> 1 When using this command with the T series, cancel tool offset and tool-nose radius compensation beforehand.
> 2 When using this command with the M series, cancel tool radius compensation, tool length compensation, and tool offset beforehand.
> 3 Before this command can be specified, a machine coordinate system must be set. So, a manual reference position return operation or reference position return operation based on G28 needs to be performed at least once after the power is turned on. When an absolute-position detector is attached, machine position data is stored, so that a reference position return operation is unnecessary after the power is turned on.
> 4 This command can be specified regardless of the setting (bit 0 (NWZ) of parameter No. 8136) of the workpiece coordinate system.

When the machine coordinate system selection (20h) is commanded with the PMC axis control for the rotary axis to which the roll-over function is valid (bit 0 (ROAx) of parameter No.1008 is set to 1), the direction of the rotation for an absolute command is as follows.

		Bit 4 (R20x) of parameter No.8013	
		0	1
Bit 1 (RABx) of parameter No.1008	0	Direction of the shortest path	Direction of the shortest path
	1	Direction of sign of the amount of the movement to be made	Direction of sign of the command value

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Machine coordinate system selection command (20h)
EIF0g to EIF15g	G144,145	Rapid traverse rate
EID0g to EID31g	G146 to 149	Machine coordinate value

Rapid traverse rate

The specifications of the rapid traverse command (EC0g to EC6g: 00h) are applicable.

Machine coordinate value

For a linear axis, specify a machine coordinate value in the input unit for the axis as an absolute value with a binary code.

Example: For absolute "10000"

Input unit	inch	1.0000	mm	10.000
Output unit	mm	25.400	inch	0.3937

For a rotation axis, a move direction can be selected with a parameter.

Set bit 0 (ROAx) of parameter No. 1008 to 1 to enable the rollover function. Then, select the sign of a commanded value or the shortcut direction with bit 1 (RABx) of parameter No. 1008. Additionally, the amount of travel per revolution needs to be set in parameter No. 1260.

Related parameters

Bit 0 (ROTx) of parameter No. 1006
Bit 0 (ROAx) of parameter No. 1008
Bit 1 (RABx) of parameter No. 1008
Parameter No. 1260

(22) Cutting feed-sec/block specification (21h)

This command performs cutting feed according to a specified period of time. In the sec/block specification, specify a period of time required for ending a block.

Axis control block data

Signal abbreviation	Signal address (group 1)	Data
EC0g to EC6g	G143.0 to G143.6	Cutting feed - sec/block command specification (21h)
EIF0g to EIF15g	G144,145	Cutting feed time
EID0g to EID31g	G146 to 149	Total moving distance

Cutting feed time

Specify a period of time required for ending a block.

[Unit of data] 0.1sec
[Valid data range] 1 to 32767

Total moving distance
The specifications of the rapid traverse command (EC0g to EC6g: 00h) are applicable.

> **NOTE**
> The dry run signal and the override signal are invalid, but the tool stops only when the override signal specifies 0%.

Related parameters and related signals
Basically same as for cutting feed -feed per minute

Notes on the commands

- Display of the remaining amount of travel

When the continuous feed command (EC0g to EC6g: 06h) and the external pulse synchronization commands (EC0g to EC6g: 0Bh, 0Dh to 0Fh) are specified, the remaining amount of travel indicates 0 at all times.

- Command buffering

The continuous feed command (EC0g to EC6g: 06h) and the external pulse synchronization commands (EC0g to EC6g: 0Bh, 0Dh to 0Fh) are not buffered. So, the axis control command read completion signal EBSYg need not be checked at usual command specification time.
When the continuous feed command (EC0g to EC6g: 06h) is specified, the feedrate is changed to a specified value by specifying a value with EIFg and reversing EBUFg. (However, the direction remains unchanged.)

- Acceleration/deceleration

The valid acceleration/deceleration type varies from one command to another.
See Table 16.1.1 (x), "Valid acceleration/deceleration types (for each command)".

Table 16.1.1 (x) Valid acceleration/deceleration types (for each command)

Command	Operation	Acceleration/deceleration type
00h 05h 07h 08h 09h 0Ah 20h	Rapid traverse Reference position return 1st reference position return 2nd reference position return 3rd reference position return 4th reference position return Machine coordinate system selection	The settings of rapid traverse parameters of exponential type, linear type after interpolation, and bell-shaped type after interpolation used with the NC are valid.
01h 02h 0Bh 0Dh 0Eh 0Fh 21h	Cutting feed - feed per minute Cutting feed - feed per revolution External pulse - Position coder - 1st manual handle - 2nd manual handle - 3rd manual handle Cutting feed - sec / block	The settings of cutting parameters of exponential type, linear type after interpolation, and bell-shaped type after interpolation used with the NC are valid. However, when exponential type and value is set in parameters Nos. 8030 and 8031, these value are valid instead of parameters Nos. 1622 and 1623.
06h	Continuous feed	The settings of jog feed parameters of exponential type, linear type after interpolation, and bell-shaped type after interpolation used with the NC are valid. However, when exponential type and value is set in parameters Nos. 8030 and 8031, these value are valid instead of parameters Nos. 1624 and 1625.
10h	Speed command	Set linear-type parameters Nos.8028 and 8032. Set bell-shaped type parameters Nos.8028, 8029 and 8032.

- Immediate commands

The commands listed below are not buffered. The commands are referred to as immediate commands.

(1) Continuous feed(EC0g to EC6g : 06h)
(2) External pulse synchronization - Position coder (EC0g to EC6g : 0Bh)
(3) External pulse synchronization - 1st manual handle (EC0g to EC6g : 0Dh)
(4) External pulse synchronization - 2nd manual handle (EC0g to EC6g : 0Eh)
(5) External pulse synchronization - 3rd manual handle (EC0g to EC6g : 0Fh)
(6) Speed command(EC0g to EC6g : 10h)
(7) Torque control (EC0g to EC6g : 11h)

When an immediate command is prepared and the axis control command read signal EBUFg is reversed during execution of the same type of command, the command being executed is terminated, and the next command is executed immediately.
Suppose, for example, that when continuous feed is being executed at 100 mm/min, another continuous feed command with only the feedrate changed to 300 mm/min is specified and the axis control command read signal EBUFg is reversed. The feedrate changes to 300 mm/min.

To end an immediate command, input the reset signal ECLRg.
When specifying a command other than the immediate commands, set the reset signal ECLRg to “1” and check that the command is terminated, then reverse EBUFg.
(If both of the block being executed and a block being prepared are immediate commands, but the types of commands differ from each other, set the reset signal ECLRg to “1” once.)

- To detect an alarm for unselected PMC axis control

If the controlled axis selection signals EAX1 to EAX8 are “0“, execution of PMC axis control command is ignored. When the bit 2 (EZC) of parameter No.8019 is set to 1, controlled axis selection signals EAX1 to EAX8 state are “0”, alarm DS1451, “IMPROPER PMC AXIS COMMAND” is detected when the PMC axis control command is executed. Unexpected operation of the machine can be prevented by alarm stop.
Alarm DS1451 is detected in the path that belongs to group of PMC axis control. Automatic operation of the path is stopped, operation of PMC axis control of the group is stopped. Further, in the alarm signal AL<Fn001.0> and alarm signal EIALg <F130.2, F133.2, F136.2, F139.2> is set to “1”. If PMC axis control command from the different path, stop the automatic operation by setting the bit 1 (IAL) of parameter No.8100 to 0.

- To detect an alarm for incorrect command after PMC axis control

After the move command of PMC axis control is interrupted by reset signal ECLRg, execution of next command requires the following operations.
(1) Reset signal ECLRg is set to “1”.
(2) Until the control axis selection status signal *EAXSL is set to “0“, ensure that the reset signal ECLRg continues to be set to “1”.
(3) Execution of next PMC axis control command.

Without waiting for the condition (2), the following command can not be executed. When the bit 1 (PIA) of parameter No.8019 is set to 1, As shown in Table 16.1.1 (y) and Table 16.1.1 (z), alarm DS1451, ”IMPROPER PMC AXIS COMMAND” is generated by different acceleration/deceleration type command during deceleration. Incorrect behavior can be suppressed by alarm generating DS1451.

Table 16.1.1 (y) PMC axis control command and acceleration/deceleration type

PMC axis control command	Acceleration/deceleration type
Rapid traverse(00h) Reference position return(05h) First reference position return(07h) Second reference position return(08h) Third reference position return(09h) Fourth reference position return(0Ah) Machine coordinate system selection(20h)	Acceleration/deceleration in rapid traverse
Cutting feed - feed per minute(01h) Cutting feed - feed per revolution(02h) External pulse synchronization - position coder(0Bh) External pulse synchronization - first manual handle(0Dh) External pulse synchronization - second manual handle(0Eh) External pulse synchronization - third manual handle(0Fh) Cutting feed - sec/block specification(21h)	Acceleration/deceleration in cutting feed
Continuous feed(06h)	Acceleration/deceleration in jog feed
Skip - feed per minute(03h)	Acceleration/deceleration disabled

Table 16.1.1 (z) Alarm generated by combination of acceleration /deceleration type (parameter PIA (No.8019#1)=1)

Reset PMC axis control command acceleration/deceleration type	Next PMC axis control command acceleration/deceleration type			
	Rapid traverse	Cutting feed	Jog feed	Disabled
Acceleration/deceleration in Rapid traverse	Commendable	Alarm	Alarm	Alarm
Acceleration/deceleration in Cutting feed	Alarm	Commendable	Alarm	Alarm
Acceleration/deceleration in Jog feed	Alarm	Alarm	Commendable	Alarm

Signal

Signal list (PMC axis control)

Number	Symbol	Signal name
(1)	EAX1 to EAX8	Controlled axis selection signals
(2)	EC0g to EC6g	Axis control command signals
(3)	EIF0g to EIF15g	Axis control feedrate signals
(4)	EID0g to EID31g	Axis control data signals
(5)	EBUFg	Axis control command read signal
(6)	EBSYg	Axis control command read completion signal
(7)	ECLRg	Reset signal
(8)	ESTPg	Axis control temporary stop signal
(9)	ESBKg	Block stop signal
(10)	EMSBKg	Block stop disable signal
(11)	EM11g to EM48g	Auxiliary function code signals
(12)	EMFg	Auxiliary function strobe signal
(13)	EMF2g	Auxiliary function 2 strobe signal
(14)	EMF3g	Auxiliary function 3 strobe signal
(15)	EFINg	Auxiliary function completion signal
(16)	ESOFg	Servo-off signal
(17)	EMBUFg	Buffering disable signal
(18)	*EAXSL	Control axis selection status signal
(19)	EINPg	In-position signal
(20)	ECKZg	Following zero checking signal
(21)	EIALg	Alarm signal
(22)	EGENg	Axis moving signal
(23)	EDENg	Auxiliary function executing signal
(24)	EOTNg	Negative-direction overtravel signal

Number	Symbol	Signal name
(25)	EOTPg	Positive-direction overtravel signal
(26)	*EFOV0g to *EFOV7g	Feedrate override signals
(27)	*EROV0g to *EROV7g	1% step rapid traverse override signals
(28)	EOVCg	Override cancellation signal
(29)	EROV1, EROV2	Rapid traverse override signals
(30)	EDRN	Dry run signal
(31)	ERT	Manual rapid traverse selection signal
(32)	EOV0	Override 0% signal
(33)	ESKIP	Skip signal
(34)	EADEN1 to EADEN32	Distribution completion signals
(35)	EABUFg	Buffer full signal
(36)	EACNT1 to EACNT32	Controlling signals
(37)	ELCKZg	Accumulated zero check signal
(38)	TRQM1 to TRQM8	Torque control mode signal

Signal list (Related signals)

Number	Symbol	Signal name
(1)	*+ED1 to *+ED8 *- ED1 to *- ED8	External deceleration signal 1
(2)	*+ED21 to *+ED28 *- ED21 to *- ED28	External deceleration signal 2
(3)	*+ED31 to *+ED38 *- ED31 to *- ED38	External deceleration signal 3
(4)	*+ED41 to *+ED48 *- ED41 to *- ED48	External deceleration signal 4
(5)	*+ED51 to *+ED58 *- ED51 to *- ED58	External deceleration signal 5
(6)	HROV	1% rapid traverse override select signal
(7)	*HROV0 to *HROV6	1% rapid traverse override signals
(8)	FHROV	0.1% rapid traverse override select signal
(9)	*FHRO0 to *FHRO9	0.1% rapid traverse override signals
(10)	ROV1, 2	Rapid traverse override signals
(11)	ZP1 to ZP8	First reference position return completion signal
(12)	ZP21 to ZP28	Second reference position return completion signal
(13)	ZP31 to ZP38	Third reference position return completion signal
(14)	ZP41 to ZP48	Fourth reference position return completion signal
(15)	NDCAL1 to NDCAL8	A/B phase detector disconnection alarm ignore signal
(16)	HNDMP	Manual pulse magnification change signal

Signal address

The method of counting the addresses of the input/output signals G and F is described below. (See Table 16.1.1 (b), "Allocation of group-by-group signals".)

For group-by-group signals, the addresses of group 5 and up are determined in such a way that 1000 is incremented for every four groups.

For axis-by-axis signals, the addresses of the 9th axis and up are determined in such a way that 1000 is incremented for every eight axes.

For axis-by-axis signals in a path, the addresses for path 2 and up are determined in such a way that 1000 is incremented for each path.

Example:

The address of the EBUFg signal for group 10 is G2154.7.

The address of the EAX signal is determined as follows:

Path 1:	1st axis	G136.0
	2nd axis	G136.1
	3rd axis	G136.2
Path 2:	1st axis	G1136.0
	2nd axis	G1136.1

Signal Detail

Each signal is detailed below.
"<>" in the title of each signal indicates a signal address. For group-by-group signals, addresses for group 1 to group 4 are indicated. For axis-by-axis signals, addresses for the 1st axis to 8th axis are indicated.

Signal Detail (PMC axis control)

(1) Controlled axis selection signals EAX1 to EAX8 <Gn136>

[Classification] Input signal, axis-by-axis signal

[Function] Exercises PMC axis control.

[Function] When the signal is set to “1”, PMC axis control becomes valid.
When the signal is set to “0”, PMC axis control becomes invalid. Changing the setting of the control axis selection signal is possible only when control axis selection status signal *EAXSL is set to “0”. Changing the setting when *EAXSL is set to “1” results in the issue of an alarm PS0139, “CANNOT CHANGE PMC CONTROL AXIS”. Alarm signal EIALg is set to “1”. When the bit 5 (NCC) of parameter No. 8001, is set to 0, a command issued from the CNC is executed while the control axis selection signal is set to “1” and signal *EAXSL is set to “0”. When the parameter is set to “1”, the same attempt results in the issue of an alarm PS0139.
If the control axis selection signal is set to “1” while the CNC is currently executing a command, an alarm is generated.
While *EAXSL is set to “0”, the status of alarm signal EIALg does not change to “1” when the control axis selection signal is set to “1” and an alarm PS0139 is generated. In this case, the axis can be controlled from the PMC, even when the CNC is in the alarm status.

> **NOTE**
> After setting control axis selection signals EAX1 to EAX8 to “1”, it takes at least 8 msec before the PMC can issue commands to the CNC.

(2) Axis control command signals EC0g to EC6g<G143.0 to 143.6, G155.0 to 6, G167.0 to 6, G179.0 to 6>

[Classification] Input signal, group-by-group signal

[Function] One of the axis control block data signals

[Operation] Specifies a type of command with 7 bits.
For the meaning of each command, see Table 16.1.1 (g), "Command list".

(3) Axis control feedrate signals EIF0g to EIF15g <G144 to 145, G156 to 157, G168 to 169, G180 to 181>

[Classification] Input signal, Group-by-group signal

[Function] One of the axis control block data signals

[Operation] Two-byte command interface area
Each command has a different function. For details, see Table 16.1.1 (g), "Command list".

(4) Axis control data signals
EID0g to EID31g <G146 to 149, G158 to 161, G170 to 173, G182 to 185>

[Classification] Input signal, group-by-group signal

[Function] One of the axis control block data signals

[Operation] Four-byte command interface area
Each command has a different function. For details, see Table 16.1.1 (g), "Command list".

(5) Axis control command read signal EBUFg <G142.7, G154.7, G166.7, G178.7>

[Classification] Input signal, group-by-group signal

[Function] Directs the CNC to read a block of command data for PMC axis control.

[Operation] For the operation and procedure applicable when the level of this signal is changed from “0” to “1” or from “1” to “0”, see Fig. 16.1.1 (l), "Timing chart of command operation" and Table 16.1.1 (f), "Buffering status in PMC axis control".

(6) Axis control command read completion signal
EBSYg <F130.7, F133.7, F136.7, F139.7>

[Classification] Output signal, group-by-group signal

[Function] Notifies the system that the CNC has read a block of command data for PMC axis control and has stored the block in the input buffer.

[Operation] For the operation and procedure applicable when the level of this signal is changed from “0” to “1” or from “1” to “0”, see Fig. 16.1.1 (m), "Timing chart of command operation" and Table 16.1.1 (f), "Buffering status in PMC axis control".

(7) Reset signal ECLRg <G142.6, G154.6, G166.6, G178.6>

[Classification] Input signal, group-by-group signal

[Function] Resets a PMC axis control command.

[Operation] Resets the corresponding PMC-controlled axis.
When this signal is set to “1”, the following is performed:

(1) When the tool is moving along the axis: decelerates and stops the tool.
(2) When the tool is dwelling: Stops the operation.
(3) When an auxiliary function is being executed: Stops the operation.
Simultaneously, all buffered commands are canceled. Any control command is ignored while this signal is set to “1”.

The continuous feed command (EC0g to EC6g: 06h) and external pulse synchronization command (EC0g to EC6g: 0Bh, 0Dh to 0Fh) can be terminated by setting reset signal ECLRg to “1”. When these commands are terminated, the servo motor decelerates and stops, the axis moving signal EGENg is set to “0”, and the controlled axis selection status signal *EAXSL is set to “0”.
Confirm that the controlled axis selection status signal *EAXSL has been set to “0” before issuing the next command. Do not set reset signal ECLRg to “0” until the controlled axis selection status signal *EAXSL has been set to “0”.

The speed command (EC0g to EC6g: 10h) can also be terminated by setting the reset signal ECLRg to “1”. When this command is terminated, the servo motor decelerates and stops, and the axis moving signal EGENg is set to “0”. Confirm that the axis moving signal EGENg has been set to “0” before issuing the next command. Do not attempt to set the reset signal ECLRg to “0” until the axis moving signal EGENg has been set to “0”.

(8) Axis control temporary stop signal ESTPg <G142.5, G154.5, G166.5, G178.5>

[Classification] Input signal, group-by-group signal

[Function] Temporarily stops a movement before the execution of a block is completed.

[Operation] When this signal is set to “1”, the following is performed:

(1) When the tool is moving along the axis: Decelerates and stops the tool.
(2) When the tool is in dwell: Stops the operation.
(3) When an auxiliary function is being executed: Stops the operation when auxiliary function completion signal EFINg is input.

The stopped operation can be restarted by setting this signal to “0”.

(9) Block stop signal ESBKg <G142.3, G154.3, G166.3, G178.3>
(10)Block stop disable signal EMSBKg <G143.7,G155.7, G167.7, G179.7>

[Classification] Input signal, group-by-group signal

[Function] Enables a stop for each command block, or disables a stop for each block.

[Operation] When block stop signal ESBKg is set to “1” during the execution of a command issued from the PMC, axis control is stopped after the block being executed is completed. When this signal is set to “0”, the buffered command is executed. Block stop signal ESBKg is disabled when block stop disable signal EMSBKg is set to 1 for the block.

Fig. 16.1.1 (l), "Timing chart of block stop related signals" shows the timing chart of command operation.

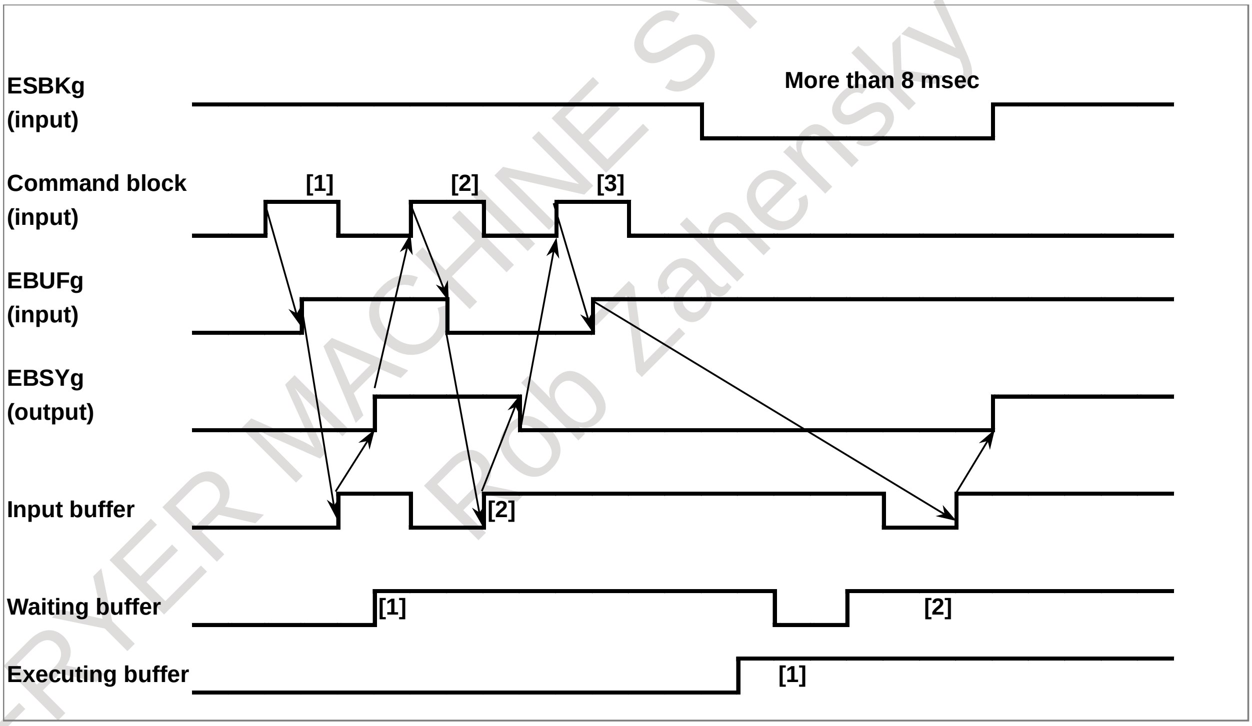

Fig. 16.1.1 (l) Timing chart of block stop related signals

(11) Auxiliary function code signals
EM11g to EM48g <F132, F142, F135, F145, F138, F148, F141, F151>

[Classification] Output signal, group-by-group signal

(12) Auxiliary function strobe signal EMFg <F131.0, F134.0, F137.0, F140.0>

[Classification] Output signal, group-by-group signal

(13) Auxiliary function 2 strobe signal EMF2g <F131.2, F134.2, F137.2, F140.2>

[Classification] Output signal, group-by-group signal

(14) Auxiliary function 3 strobe signal EMF3g <F131.3, F134.3, F137.3, F140.3>

[Classification] Output signal, group-by-group signal

(15) Auxiliary function completion signal EFINg <G142.0, G154.0, G166.0, G178.0>

[Classification] Input signal, group-by-group signal

[Function] Completes an auxiliary function

[Operation] When an auxiliary function command (EC0g to EC6g: 12h) is issued by the PMC, the auxiliary function code is specified in a byte (using signals EID0g to EID7g) or two bytes (using signals EID0g to EID15g), depending on the setting of bit 6 (AUX) of parameter No. 8001.

The CNC sends the auxiliary function code specified in signals EID0g to EID7g and EID8g to EID15g to auxiliary function code signals EM11g to EM28g and EM31g to EM48g and awaits the auxiliary function completion signal EFINg. When the auxiliary function completion signal EFINg is returned, the CNC starts executing the next block.

The timings for sending the auxiliary function code signals and auxiliary function strobe signal, as well as for receiving the auxiliary function completion signal, are the same as those for the auxiliary functions (M functions) under the control of the CNC. See "Auxiliary function executing signal" for details.

(16) Servo-off signal ESOFg <G142.4, G154.4, G166.4, G178.4>

[Classification] Input signal, group-by-group signal

[Function] Changes the servo-off state.

[Operation] When this signal is set to “1”, the servo motor for the corresponding PMC-controlled axis is turned off (servo-off state). When this signal is set to “0”, the servo motor is turned on.

When a torque control command (EC0g to EC6g: 11h) is specified, entering the servo-off state cancels torque control mode, but the torque control state remains set. In such a case, set reset signal ECLRg to “1”.

(17) Buffering disable signal EMBUFg <G142.2, G154.2, G166.2, G178.2>

[Classification] Input signal, group-by-group signal

[Function] Changes the buffering disabled state.

[Operation] When this signal is set to “1”, commands from the PMC are not read while the executing, waiting, or input buffer contains a block. If this signal is set to “1” when any of these buffers contain a block, that block is executed but subsequent commands are read only when the buffers are all empty.

To discriminate the buffering disabled condition, the CNC outputs the axis control command read completion signal (EBSYg) only when a command is read when all buffers are empty.

Fig. 16.1.1 (m), "Timing chart of buffering related signals" shows the timing chart of command operation.

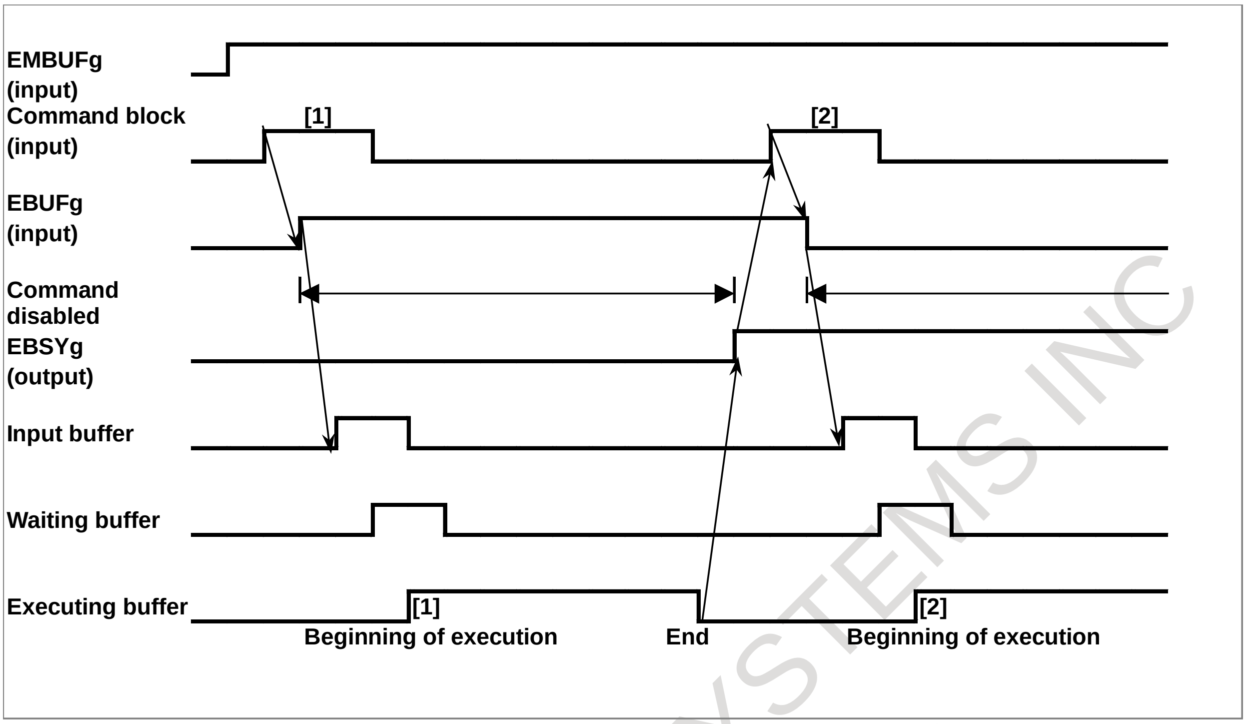

Fig. 16.1.1 (m) Timing chart of buffering related signals

Buffering is disabled, regardless of the buffering disable signal EMBUFg, for the following commands:
(1) Skip-feed per minute (EC0g to EC6g : 03h)
(2) Reference position return (EC0g to EC6g : 05h)
(3) 1st reference position return (EC0g to EC6g : 07h)
(4) 2nd reference position return (EC0g to EC6g : 08h)
(5) 3rd reference position return (EC0g to EC6g : 09h)
(6) 4th reference position return (EC0g to EC6g : 0Ah)
(7) Machine coordinate system selection (EC0g to EC6g : 20h)

---

(18) Controlled axis selection status signal *EAXSL <F129.7>

[Classification] Output signal, path-by-path signal

[Function] Indicates whether PMC axis control is being exercised.

[Operation] When this signal is set to “0”, controlled axis selection signals EAX1 to EAX8 can be changed.

This signal is set to “1” in the following cases:
(1) When the tool is moving along a PMC-controlled axis
(2) When a block is being read into a buffer
(3) When the servo-off signal ESOFg is set to “1”

When this signal is set to “1”, controlled axis selection signals EAX1 to EAX8 cannot be changed. Any attempt to change these signals results in the output of an alarm PS0139, “CANNOT CHANGE PMC CONTROL AXIS”.

If an attempt to change signals EAX1 to EAX8 is made when servo-off signal ESOFg is “1”, an alarm PS0139 occurs and cannot be released simply by setting reset signal ECLRg to “1”. In such a case, restore signals EAX1 to EAX8 or set servo-off signal ESOFg to “0” before setting reset signal ECLRg to “1”. When a command is issued for any of the four groups with PMC axis control, signal *EAXSL is set to “1” to disable axis selection. Thus, changing signals EAX1 to EAX8 results in the output of an alarm PS0139. For groups for which commands are not issued, however, axis selection is enabled if bit 5 (DSL) of parameter No. 8004 is set accordingly.

(19) In-position signal EINPg <F130.0, F133.0, F136.0, F139.0>

[Classification] Output signal, group-by-group signal

[Function] Indicates the in-position state.

[Operation] This signal is set to “1” when the corresponding PMC-controlled axis is in the in-position state.
When the tool is decelerated, in-position check is performed to disable the next command until the tool enters the in-position area. The in-position check, however, can be skipped using bit 6 (NCI) of parameter No. 8004 to reduce the cycle time.

> **NOTE**
> When the axis is fed at a very low speed, the in -position signal might turn to “1”.

(20) Following zero checking signal ECKZg <F130.1, F133.1, F136.1, F139.1>

[Classification] Output signal, group-by-group signal

[Function] Indicates the following zero state.

[Operation] This signal is set to “1” when following zero check or in-position check is being performed for the corresponding PMC-controlled axis.
The following zero state means that the acceleration/deceleration delay amount is zero.

(21) Alarm signal EIALg <F130.2, F133.2, F136.2, F139.2>

[Classification] Output signal, group-by-group signal

[Function] Indicates the alarm state related to PMC axis control.

[Operation] This signal is set to “1” when a servo alarm, overtravel alarm, or alarm PS0130, “NC AND PMC AXIS ARE CONFLICTED” or PS0139, “CANNOT CHANGE PMC CONTROL AXIS” occurs for the corresponding PMC-controlled axis. This signal is set to “0“ when the reset signal ECLRg is set to “1” after the alarm is released, as described below.

Servo alarm

Eliminate the cause of the alarm, then reset the CNC.

Overtravel alarm

Move the tool into the area within the stored stroke limit, then reset the CNC.
The following commands can be used to move the tool into the area within the stored stroke limit during an overtravel alarm:

(1) Rapid traverse (EC0g to EC6g : 00h)
(2) Cutting feed - feed per minute (EC0g to EC6g : 01h)
(3) Cutting feed - feed per rotation(EC0g to EC6g : 02h)
(4) Continuous feed (EC0g to EC6g : 06h)
(5) External pulse synchronization - first manual handle (EC0g to EC6g : 0Dh)
(6) External pulse synchronization - second manual handle (EC0g to EC6g : 0Eh)
(7) External pulse synchronization - third manual handle (EC0g to EC6g : 0Fh)

Alarm (PS0130, PS0139)

Reset the CNC.
See "Alarms and messages" for details.

Reset signal ECLRg cannot be used to reset the CNC in the above cases. Use the reset button on the setting panel, external reset signal ERS, or emergency stop signal *ESP.

Even if an alarm occurs on an axis not related to the group, alarm signal EIALx does not generally change from “0” to “1”.

(22) Axis moving signal EGENg <F130.4, F133.4, F136.4, F139.4>

[Classification] Output signal, group-by-group signal

[Function] Indicates the state of movement on an axis.

[Operation] This signal is set to “1” when the tool is moving along the corresponding PMC-controlled axis according to commands such as rapid traverse (EC0g to EC6g: 00h) and cutting feed (EC0g to EC6g: 01h).
When the dwell command (EC0g to EC6g: 04h) is specified, this signal remains to be set to “0”.

> **NOTE**
> This signal is set to “0” when distribution for the axis is completed (the signal is set to “0” during deceleration).

(23) Auxiliary function executing signal EDENg <F130.3, F133.3, F136.3, F139.3>

[Classification] Output signal, group-by-group signal

[Function] Indicates the state of auxiliary function execution.

[Operation] When an auxiliary function (EC0g to EC6g: 12h) is specified by the PMC, this signal is set to “1” during the period from when auxiliary function codes EID0g to EID15g are sent to auxiliary function code signals EM11g to EM48g until the auxiliary function completion signal EFINg is returned.
Fig. 16.1.1 (n), "Timing chart of auxiliary function related signals" shows the timing chart of command operation.
TMF and TFIN in the table are set in parameters Nos. 3010 and 3011.

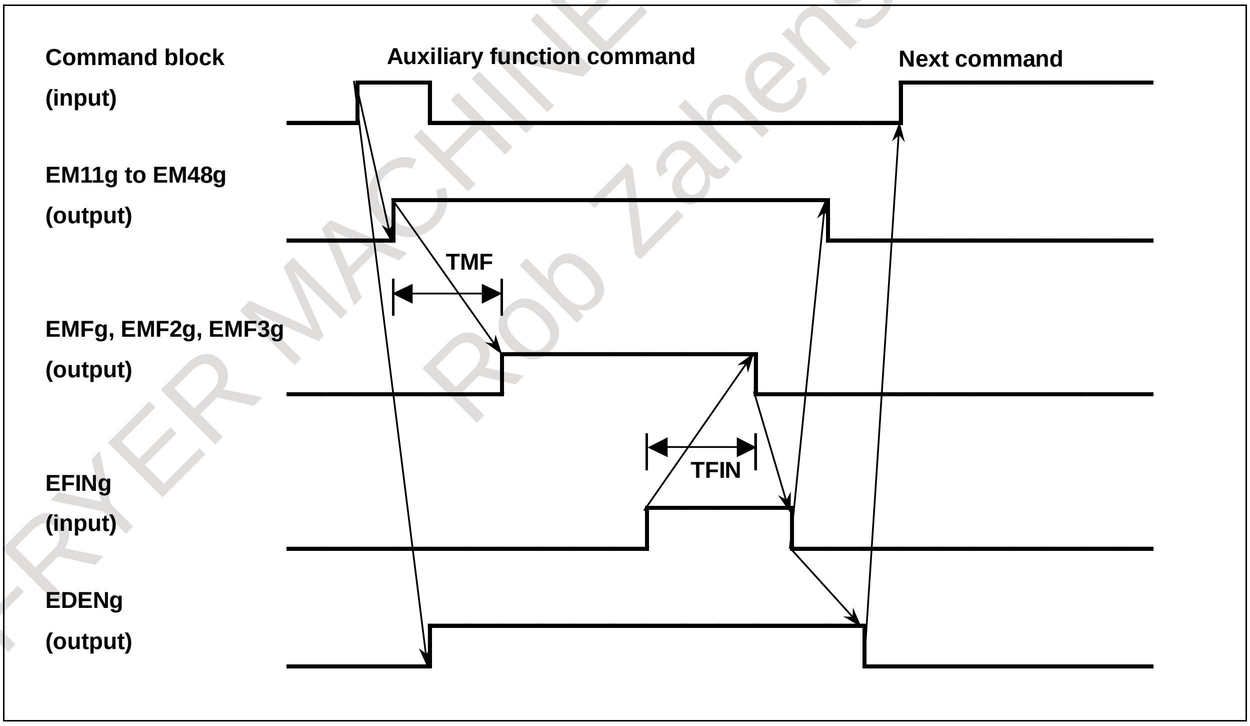

Fig. 16.1.1 (n) Timing chart of auxiliary function related signals

(24) Negative-direction overtravel signal EOTNg <F130.6, F133.6, F136.6, F139.6>
(25) Positive-direction overtravel signal EOTPg <F130.5, F133.5, F136.5, F139.5>

[Classification] Output signal, group-by-group signal

[Function] Indicates the overtravel state.

[Operation] These signals are set to “1” when an overtravel alarm is detected. When the stroke limit in the negative direction is exceeded, signal EOTNg is set to “1”. When the stroke limit in the positive direction is exceeded, signal EOTPg is set to “1”. Simultaneously, alarm signal EIALg is set to “1”.
These signals are set to “0“ when the overtravel alarm is released and reset signal ECLRg is set to “1”. See "Alarm signal EIALg" for details of how to release an overtravel alarm.

(26) Feedrate override signals *EFOV0g to *EFOV7g <G151 (, G163, G175, G187)>

[Classification] Input signal, path-by-path signal (group-by-group signal)

[Function] Applies cutting override.

[Operation] Like the CNC's feedrate override signals *FV0 to *FV7, these signals can be used to select the override for the cutting feedrate, in steps of 1% from 0 to 254%, independently of the CNC using the bit 2 (OVE) of parameter No. 8001.
These signals form an eight-bit binary code and correspond to the override value as follows:

$$\text{Override value} = \sum_{i=0}^{7} \left| 2^{i} \times Vi \right| \%$$

Vi = 0 when signal *EFOVi is “1”
Vi = 1 when signal *EFOVi is “0”
That is, each signal has the following significance:

*EFOV7 = 128%,	*EFOV3 = 8% ,
*EFOV6 = 64%,	*EFOV2 = 4% ,
*EFOV5 = 32%,	*EFOV1 = 2% ,
*EFOV4 = 16%,	*EFOV0 = 1%

When all signals are set to “0”, the override is regarded as being 0%, as well as when all signals are “1”.
Bit 5 (IFV) of parameter No. 8005 is used to determine whether these signals are path-by-path signals or group-by-group signals.
When the IFV parameter is set to 0, these signals are path-by-path signals. When the IFV parameter is set to 1, these signals are group-by-group signals.

(27) 1% step rapid traverse override signals *EROV0g to *EROV7g<G151 (, G163, G175, G187)>

[Classification] Input signal, path-by-path signal (group-by-group signal)

[Function] These signals use the same addresses as the feedrate override signals. When bit 1 (OVR) of parameter No. 8013 is set to 1, these signals are used for rapid traverse override.

[Operation] When bit 2 (OVE) of parameter No. 8001 is set to 1 and bit 1 (OVR) of parameter No. 8013 is set to 1, these signals can be used to select the override for the rapid traverse rate, in steps of 1% from 0% to 100%, independently of the CNC. The override is clamped to 100%.
Each corresponding signal has the following significance:

*EROV7 = 100%	*EROV3 = 8%
*EROV6 = 64%	*EROV2 = 4%
*EROV5 = 32%	*EROV1 = 2%
*EROV4 = 16%	*EROV0 = 1%

For example, to set an override of 5%, set signals *EFOV7 to *EFOV0 to 11111010, which corresponds to a binary code of 00000101.

When bit 7 (IFH) of parameter No. 11850 is set to 0, these signals are used as path-by-path signals. When the bit is set to 1, they are used as group-by-group signals.

> **NOTE**
> When all signals are set to “0”, an override of 100% is assumed, while an override of 0% is assumed for *EFOVg.

(28) Override cancellation signal EOVCg <G150.5 (G162.5, G174.5, G186.5)>

[Classification] Input signal, path-by-path signal (group-by-group signal)

[Function] Disables override.

[Operation] When override is enabled, independently of the CNC, by setting the bit 2 (OVE) of parameter No. 8001, setting this signal to “1” fixes the cutting feed override to 100%. This signal does not affect the rapid traverse override.
Bit 5 (IFV) of parameter No. 8005 is used to determine whether these signals are path-by-path signals or group-by-group signals.
When the IFV parameter is set to 0, these signals are path-by-path signals. When the IFV parameter is set to 1, these signals are group-by-group signals.

(29) Rapid traverse override signals EROV1, EROV2 <Gn150.0,1>

[Classification] Input signal, path-by-path signal

[Function] Applies rapid traverse override.

[Operation] These signals can be used to select the override for the rapid traverse rate, independently of the CNC, by setting of the bit 2 (OVE) of parameter No. 8001.

Rapid traverse override signals		Override value
EROV2	EROV1	
0	0	100%
0	1	50%
1	0	25%
1	1	F0

F0 is the minimum feedrate specified with parameter No. 1421.

(30) Dry run signal EDRN <G150.7>
(31) Manual rapid traverse selection signal ERT <G150.6>

[Classification] Input signal, path-by-path signal

[Function] Applies dry run, or chooses whether to apply dry run.

[Operation] These signals can be used to perform dry run or manual rapid traverse, independently of the CNC, by setting the bit 2 (OVE) of parameter No. 8001. When the dry run signal EDRN is set to “1”, the specified rapid traverse rate and cutting feedrate are ignored and the tool moves at the dry run speed (set in parameter No. 1410) multiplied by the specified manual feedrate override. Bit 3 (RDE) of parameter No. 8001 can be used to specify whether to enable or disable dry run for rapid traverse.
When the manual rapid traverse selection signal ERT is set to “1” during dry run, the tool moves at the rapid traverse rate for rapid traverse and at the maximum jog feedrate for cutting feed. When the signal is set to “0”, the tool moves at the jog feedrate. When the dry run signal EDRN is set to “0”, the specified rapid traverse rate or cutting feedrate is restored.

Manual rapid traverse select signal	Command from PMC	
	At rapid traverse	At Cutting feed
1	Rapid traverse rate	Cutting feedrate
0	Dry run feedrate x JV (NOTE) or Rapid traverse rate *	Dry run feedrate x JV (NOTE)

* Dry run feedrate × JV when bit 3 (RDE) of parameter No. 8001 is 1. Rapid traverse rate when parameter RDE is 0.

> **NOTE**
> When bit 1 (JOV) of parameter No. 1402 is set to 1, the manual feedrate override signal *JV is not applied, but the dry run feedrate is just applied.

---

(32) Override 0% signal EOV0 <F129.5>

[Classification] Output signal, path-by-path signal
[Function] Indicates whether the override value is 0%.
[Operation] This signal is set to “1” when the feedrate override is 0%.

---

(33) Skip signal ESKIP <X0004.6>, ESKIP$^{\#2}$ <X0013.6>, ESKIP$^{\#3}$ <X0011.6>

[Classification] Direct input signal, path-by-path signal
[Function] Applies skip.
[Operation] When this signal is set to “1” during execution of the skip cutting command, the block being executed is immediately stopped and the next block is executed. This signal is unique during PMC axis control. Bit 7 (SKE) of parameter No. 8001 can be used to select whether to use signal SKIP, which is the common skip signal for the PMC and CNC, or PMC-specific skip signal ESKIP.

This skip signal is valid for those axes that are assigned to path 1 to path 3.
For those axes that are assigned to path 1, ESKIP (X004.6) is valid.
For those axes that are assigned to path 2, ESKIP$^{\#2}$ (X013.6) is valid.
For those axes that are assigned to path 3, ESKIP$^{\#3}$ (X011.6) is valid.
This skip signal cannot be used for those axes that are assigned to path 4.

---

(34) Distribution completion signals EADEN1 to EADEN32 <F112>

[Classification] Output signal, axis-by-axis signal
[Function] Indicates the state of distribution based on PMC axis control.
[Operation] These signals are set to “0” when the tool is moving with a command from the PMC. The signals are set to “1” when the tool is not moving, except when it is stopped by an axis control temporary stop signal ESTPg during the execution of a move command.

---

(35) Buffer full signal EABUFg <F131.1, F134.1, F137.1, F140.1>

[Classification] Output signal, group-by-group signal
[Function] Indicates the PMC axis control command buffering state.
[Operation] When the group input buffer holds a command block, this signal is set to “1”. When no command is buffered, this signal is set to “0”.

---

(36) Controlling signals EACNT1 to EACNT32 <F182>

[Classification] Output signal, axis-by-axis signal
[Function] Indicates that PMC axis control is being exercised.
[Operation] When the control axis selection status signal *EAXSL is set to “1”, the bit signal corresponding to an axis being controlled is set to “1”.
A bit signal is set to “1“ also when the servo-off signal ESOFg is set to “1”.

---

(37) Accumulated zero check signal ELCKZg <G142.1, G154.1, G166.1, G178.1>

[Classification] Input signal, group-by-group signal
[Function] Makes an accumulated zero check.
[Operation] Setting this signal to “1” causes an accumulated zero check between blocks to be made at a subsequent cutting feed command. The accumulated zero state means that the acceleration/deceleration delay amount is zero.

(1) Cutting feed - feed per minute (EC0g to EC6g: 01h)
(2) Cutting feed -feed per rotation (EC0g to EC6g: 02h)
(3) Cutting feed - sec/block (EC0g to EC6g : 21h)
This signal can be used, for example, with the chopping function.

---

(38) Torque control mode signal
TRQM1 to TRQM8 <F190>

[Classification] Output signal, axis-by-axis signal

[Function] Indicates an axis in the torque control mode.

[Operation] When this signal is set to "1", which axis is placed in the torque control mode by the torque control command (EC0g to EC6g: 11h) based on PMC axis control is indicated.

Signal detail (Related signals)

The signals related to PMC axis control are detailed below.
The [Function] field and [Operation] field provide descriptions related to PMC axis control. For the general functions of the signals, see the description of each signal.

---

(1) External deceleration signals 1
*+ED1 to *+ED8 <G118>, *-ED1 to *-ED8 <G120>
(2) External deceleration signals 2
*+ED21 to *+ED28 <G101>, *-ED21 to *-ED28 <G103>
(3) External deceleration signals 3
*+ED31 to *+ED38 <G107>, *-ED31 to *-ED38 <G109>
(4) External deceleration signals 4
*+ED41 to *+ED48 <G341>, *-ED41 to *-ED48 <G342>
(5) External deceleration signals 5
*+ED51 to *+ED58 <G343>, *-ED51 to *-ED58 <G344>

[Classification] Input signal, axis-by-axis signal

[Function] Decelerates the movement along a specified axis to a parameter-set feedrate.

[Operation] While a signal is set to "0" for an axis, the feedrate along the axis in the specified direction can be forcibly decelerated to a certain feedrate (external deceleration feedrate) set by a parameter (dependent on the type of command).
If the feedrate is lower than the external deceleration feedrate, however, the specified feedrate continues to be used.
The feedrate for other axes with these signals not set to "0" is not affected.
For details, refer to the specifications of the external deceleration function.
A signal is available for each controlled axis and for each direction. Each signal name includes the sign + or - for direction indication, and the number at the end of each signal name indicates a controlled axis number. These signals are shared by the CNC.

* x ED y z

z
1 : Feed along the first axis is decelerated.
2 : Feed along the second axis is decelerated.
3 : Feed along the third axis is decelerated.

y
None: Follows external deceleration setting 1.
2 : Follows external deceleration setting 2.
3 : Follows external deceleration setting 3.
4 : Follows external deceleration setting 4.
5 : Follows external deceleration setting 5.

x
+ : Feed in the positive direction is decelerated.
- : Feed in the negative direction is decelerated.

When any of the following axis control command is specified while the bit 0 (EDC) of parameter No. 8005 is held at 1, the external deceleration function becomes effective:

(1)	Rapid traverse	(EC0g to EC6g : 00h)
(2)	Cutting feed - feed per minute	(EC0g to EC6g : 01h)
(3)	Reference position return	(EC0g to EC6g : 05h)
(4)	Continuous feed	(EC0g to EC6g : 06h)
(5)	First reference position return	(EC0g to EC6g : 07h)
(6)	Second reference position return	(EC0g to EC6g : 08h)
(7)	Third reference position return	(EC0g to EC6g : 09h)
(8)	Fourth reference position return	(EC0g to EC6g : 0Ah)
(9)	Machine coordinate system selection	(EC0g to EC6g : 20h)
(10)	Cutting feed - sec/block	(EC0g to EC6g : 21h)

For each command above, the external deceleration feedrate settings for axis-by-axis rapid traverse (parameters Nos. 1427, 1441, 1444, 12752, and 12755) are valid.
To cutting feed - feed per minute (EC0g to EC6g: 01h) and cutting feed - sec/block (EC0g to EC6g: 21h) as well, the settings for rapid traverse are applied instead of the external deceleration feedrate settings for cutting feed (parameters Nos. 1426, 1440, 1443, 12751, and 12754).

---

(6) 1% rapid traverse override select signal HROV <G96.7>

[Classification] Input signal, path-by-path signal

---

(7) 1% rapid traverse override signal *HROV0 to *HROV6 <G96.0 to G96.6>

[Classification] Input signal, path-by-path signal
[Function] Enables override to be applied in steps of 1%. Shared by the CNC.
[Operation] If the 1% rapid traverse override select signal HROV <G96.7> is set to “1” when bit 2 (OVE) of parameter No. 8001 is set to 0, rapid traverse override can be specified in steps of 1% by using the 1% rapid traverse override signals *HROV0 to *HROV6 <G96.0 to G96.6>.

---

(8) 0.1% rapid traverse override select signal FHROV <G353.7>

[Classification] Input signal, path-by-path signal

---

(9) 0.1% rapid traverse override signal *FHRO0 to *FHRO9 <G352.0 to G352.7, G353.0 to G353.1>

[Classification] Input signal, path-by-path signal
[Function] An override can be applied in steps of 0.1%. This signal is used with the CNC as well.
[Operation] If bit 2 (OVE) of parameter No. 8001 is set to 0, the 0.1% rapid traverse override signals *FHRO0 to *FHRO9 <G352.0 to G352.7, G353.0 to G353.1> enable a rapid traverse override to be specified in steps of 0.1% when the 1% rapid traverse override select signal HROV <G96.7> and the 0.1% rapid traverse override select signal FHROV <G353.7> are set to “1”.

---

(10) Rapid traverse override signal ROV1 <G14.0>, ROV2 <G14.1>

[Classification] Input signal, path-by-path signal
[Function] Overrides the rapid traverse rate. Shared by the CNC.
[Operation] This signal is a two-bit code signal, and sets an override value as indicated Table 16.1.1 (aa).

Table 16.1.1 (aa)

Rapid traverse override signal		Override value
ROV2	ROV1	
0	0	100%
0	1	50%
1	0	25%
1	1	F0 (parameter No. 1421)

(11) First reference position return completion signals ZP1 to ZP8 <F94>
(12) Second reference position return completion signals ZP21 to ZP28 <F96>
(13) Third reference position return completion signals ZP31 to ZP38 <F98>
(14) Fourth reference position return completion signals ZP41 to ZP48 <F100>

[Classification] Output signal, axis-by-axis signal

[Function] Posts that the tool is at the reference position on a controlled axis. Shared by the CNC.

[Operation] The number at the end of a signal name indicates the number of a controlled axis.
Each of these signals is set to “1” when reference position return is completed, and the tool enters the in-position area.
Each of these signals is set to “0” when a movement is made from the reference position, an emergence stop occurs, or a servo alarm is issued.

(15) A/B phase detector disconnection alarm ignore signal NDCAL1 to NDCAL8 <Gn202>

[Classification] Input signal, axis-by-axis signal

[Function] Does not output the A/B phase detector hard disconnection alarm.

[Operation] While this signal is set to “1”, the A/B phase detector hard disconnection alarm is not output during speed specification based on PMC axis control. Fig. , "Timing chart of A/B phase detector disconnection alarm ignore signal" shows a timing chart.

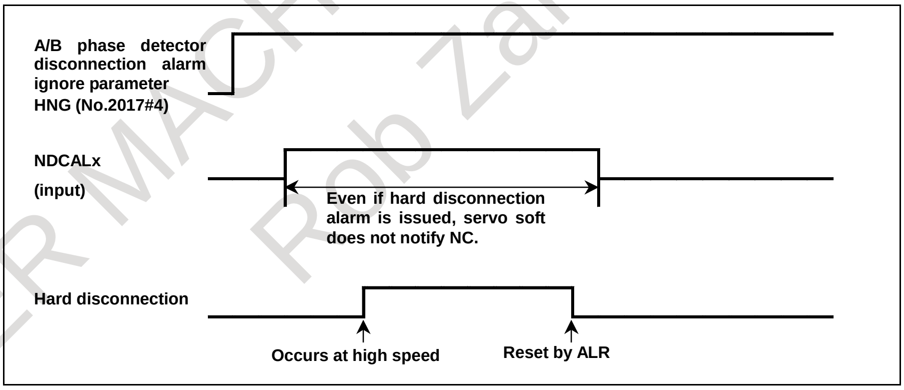

Fig. 16.1.1 (o) Timing chart of A/B phase detector disconnection alarm ignore signal

NOTE
1. Change the level of this signal from “1” to “0” before switching from a speed command to a position command.
2. After switching from a speed command to a position command, be sure to perform a manual reference position return operation before making a movement on the axis.
3. This function cannot be used when an absolute-position detector is attached.
4. To enable this signal, set bit 4 (HTN) of parameter No. 2017 to 1.

(16) Manual pulse magnification change signal HNDMP<Gn088.3>

[Classification] Input signal, path-by-path signal

[Function] In an external pulse synchronization function of the PMC axis control, the setting range of the weight of an external pulse (multiplier) is selected.
"±1/256 to ±127" or "±1/32 to ±1023" can be selected as a setting range.

This signal becomes effective for the following the axis control command signals (EC0g to EC6g <Gn143.0 to 6, Gn155.0 to 6, Gn167.0 to 6, Gn179.0 to 6>).

axis control command (Hexadecimal Code)	Operation
0Bh	External pulse synchronization - position coder
0Dh	External pulse synchronization - first manual handle
0Eh	External pulse synchronization - second manual handle
0Fh	External pulse synchronization - third manual handle

[Operation] In the Case of HNDMP<Gn088.3> is "0":

When setting a weight value, use the higher bits (EIF8g to EIF15g) to specify the integer part of an external pulse weight, and use the lower bits (EIF0g to EIF7g) to specify the fractional part.
The valid range is ±1/256 to ±127.

Integer part : Higher bits EIF8g to EIF15g (-127 to 127)

15	14	13	12	11	10	9	8
EIF15g	EIF14g	EIF13g	EIF12g	EIF11g	EIF10g	EIF9g	EIF8g

Fractional part : Lower bits EIF0g to EIF7g (0/256 to 255/256)

7	6	5	4	3	2	1	0
EIF7g	EIF6g	EIF5g	EIF4g	EIF3g	EIF2g	EIF1g	EIF0g

In the Case of HNDMP<Gn088.3> is "1":

When setting a weight value, use the higher bits (EIF5g to EIF15g) to specify the integer part of an external pulse weight, and use the lower bits (EIF0g to EIF4g) to specify the fractional part.
The valid range is ±1/32 to ±1023.

Integer part : Higher bits EIF5g to EIF15g (-1023 to 1023)

15	14	13	12	11	10	9	8	7	6	5
EIF15g	EIF14g	EIF13g	EIF12g	EIF11g	EIF10g	EIF9g	EIF8g	EIF7g	EIF6g	EIF5g

Fractional part : Lower bits EIF0g to EIF4g (0/32 to 31/32)

4	3	2	1	0
EIF4g	EIF3g	EIF2g	EIF1g	EIF0g

NOTE

The manual handle feed amount selection signals (MP1,MP2<Gn019.4,5>, MP21,MP22<Gn087.0,1>, MP31, MP32<Gn087.3,4>) do not influence external pulse synchronization weight.

Example of setting weight of pulse)

In the Case of HNDMP<Gn088.3> is “0”:

Setting of weight in fractional part

Set the lower bits (EIF0g to EIF7g) to specify the fractional part. (0/256 to 255/256)

Example) For weight 0.5

0.5 → 128/256 → “1000 0000”

“1000 0000” that converts 128 into a binary number is set to EIF0g-EIF7g.

Setting of negative weight

The two's complement expression is used for the setting of negative weight.

Example) For weight -2.5

2.5: “0000 0010 1000 0000”

↓ : The bit is reversed.

“1111 1101 0111 1111”

↓ : 1 is added to the 0th bit.

-2.5: “1111 1101 1000 0000”

List of example of setting weight of pulse

Axis control feedrate signal		Pulse weight
<EIF15g - EIF8g>	<EIF7g - EIF0g>	
00000000	00000000	× 0
00000000	00000001	× 1/256
00000000	00001000	× 1/32
00000001	00000000	× 1
00001010	00000000	× 10
01111111	00000000	× 127
11111111	11111111	× -1/256
11111111	11111000	× -1/32
11111111	00000000	× -1
11110110	00000000	× -10
10000001	00000000	× -127

In the Case of HNDMP<Gn088.3> is “1”:

Setting of weight in fractional part

Set the lower bits (EIF0g to EIF4g) to specify the fractional part. (0/32 to 31/32)

Example) For weight 0.5

0.5 → 16/32 → “1 0000”

“1 0000” that converts 16 into a binary number is set to EIF0g-EIF4g.

Setting of negative weight

The two's complement expression is used for the setting of negative weight.

Example) For weight -2.5

2.5: “0000 0000 0101 0000”

↓ : The bit is reversed.

“1111 1111 1010 1111”

↓ : 1 is added to the 0th bit.

-2.5: “1111 1111 1011 0000”

List of example of setting weight of pulse

Axis control feedrate signal		Pulse weight
<EIF15g – EIF5g>	<EIF4g - EIF0g>	
00000000000	00000	× 0
00000000000	00001	× 1/32
00000000001	00000	× 1
00000001010	00000	× 10
01111111111	00000	× 1023
11111111111	11111	× -1/32
11111111111	00000	× -1
11111110110	00000	× -10
10000000001	00000	× -1023

Signal address

- Signals for PMC axis control

DI → CNC

The signals below are direct signals for PMC axis control.
For the relationships with groups assigned to signals, see Table 16.1.1 (c), "Example of Path-by-path signal (PMC axis control override signal) allocation".

	#7	#6	#5	#4	#3	#2	#1	#0
X0004		ESKIP						
X0011		ESKIP#3						
X0013		ESKIP#2						

> **NOTE**
> The ESKIP signal is valid only for the axes assigned to paths 1 to 3.

PMC → CNC

Signals common to all groups (path-by-path signals)

The signals below are assigned on a path-by-path basis. For details of relationships with groups assigned to signals, see Table 16.1.1 (c).
Example:
EDRN#1 is valid for the axes assigned to groups 1 to 4.
ERT#3 is valid for the axes assigned to groups 9 to 12.

	#7	#6	#5	#4	#3	#2	#1	#0
G150	EDRN#1	ERT#1	EOVC#1				EROV2#1	EROV1#1
G151	*EFOV7#1 *EROV7#1	*EFOV6#1 *EROV6#1	*EFOV5#1 *EROV5#1	*EFOV4#1 *EROV4#1	*EFOV3#1 *EROV3#1	*EFOV2#1 *EROV2#1	*EFOV1#1 *EROV1#1	*EFOV0#1 *EROV0#1

NOTE
1. The bits other than the override cancellation signal EOVC at the address where EOVC is positioned are path-by-path signals. In the case of group 1, for example, the bits <G150.0 to 4,6,7> other than G150.5 are path-by-path signals.
2. Whether EOVC and *EFOV are group-by-group signals or path-by-path signals is determined by bit 5 (IFV) of parameter No. 8005.

The signals below are output signals related to PMC axis control.
For axis-type signals, addresses for the 1st axis to 8th axis are indicated.

	#7	#6	#5	#4	#3	#2	#1	#0
F094	ZP8	ZP7	ZP6	ZP5	ZP4	ZP3	ZP2	ZP1
F096	ZP28	ZP27	ZP26	ZP25	ZP24	ZP23	ZP22	ZP21
F098	ZP38	ZP37	ZP36	ZP35	ZP34	ZP33	ZP32	ZP31
F100	ZP48	ZP47	ZP46	ZP45	ZP44	ZP43	ZP42	ZP41

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
0000						INI		

[Input type] Setting input
[Data type] Bit path

#2 INI Unit of input
0: In metrics
1: In inches

	#7	#6	#5	#4	#3	#2	#1	#0
0012								MIRx

[Input type] Setting input
[Data type] Bit axis

#0 MIRx Mirror image for each axis
0: Mirror image is off. (Normal)
1: Mirror image is on. (Mirror)

	#7	#6	#5	#4	#3	#2	#1	#0
1001								INM

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 INM Least command increment on the linear axis
0: In mm (metric system machine)
1: In inches (inch system machine)

	#7	#6	#5	#4	#3	#2	#1	#0
1005							DLZx	

[Input type] Parameter input
[Data type] Bit axis

#1 DLZx Function for setting the reference position without dogs
0: Disabled
1: Enabled

	#7	#6	#5	#4	#3	#2	#1	#0
1006			ZMIx		DIAx			

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#3 DIAx The move command for each axis is based on:
0: Radius specification
1: Diameter specification

#5 ZMIx The direction of manual reference position return is:
0: + direction
1: - direction

	#7	#6	#5	#4	#3	#2	#1	#0
1008							RABx	ROAx

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 ROAx The rotary axis roll-over is
0: Invalid
1: Valid

> **NOTE**
> ROAx specifies the function only for a rotary axis (for which bit 0 (ROTx) of parameter No. 1006 is set to 1)

#1 RABx In the absolute programming, the axis rotates in the direction
0: In which the distance to the target is shorter.
1: Specified by the sign of command value.

> **NOTE**
> RABx is valid only when ROAx is 1.

	#7	#6	#5	#4	#3	#2	#1	#0
1201								ZPR

[Input type] Parameter input
[Data type] Bit path

#0 ZPR Automatic setting of a coordinate system when the manual reference position return is performed
0: Not set automatically
1: Set automatically

> **NOTE**
> ZPR is valid when the workpiece coordinate system is not used (when bit 0 (NWZ) of parameter No. 8136 is 1). If a workpiece coordinate system function is provided, making a manual reference position return always causes the workpiece coordinate system to be established on the basis of the workpiece zero point offset (parameters Nos. 1220 to 1226), irrespective of this parameter setting.

1240	Coordinate value of the reference position in the machine coordinate system

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm, inch, deg (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
Set the coordinate values of the reference position in the machine coordinate system.

1241	Coordinate value of the second reference position in the machine coordinate system
1242	Coordinate value of the third reference position in the machine coordinate system
1243	Coordinate value of the fourth reference position in the machine coordinate system

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm, inch, deg (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)
Set the coordinate values of the second to fourth reference positions in the machine coordinate system.

1250	Coordinate system of the reference position used when automatic coordinate system setting is performed

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm, inch, deg (input unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 9 digit of minimum unit of data (refer to standard parameter setting table (A))
(When the increment system is IS-B, -999999.999 to +999999.999)

Set the coordinate system of the reference position on each axis to be used for performing automatic coordinate system setting.

1260	The shift amount per one rotation of a rotary axis

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Real axis
[Unit of data] deg
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] 0 or positive 9 digit of minimum unit of data (refer to the standard parameter setting table (B))
(When the increment system is IS-B, 0.0 to +999999.999)

Set the shift amount per one rotation of a rotary axis.
For the rotary axis used for cylindrical interpolation, set the standard value.

	#7	#6	#5	#4	#3	#2	#1	#0
1402							JOV	

[Input type] Parameter input
[Data type] Bit path

#1 JOV Jog override is:
0: Enabled
1: Disabled (tied to 100%)

1420	Rapid traverse rate for each axis

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

Set the rapid traverse rate when the rapid traverse override is 100% for each axis.

1421	F0 rate of rapid traverse override for each axis

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
Set the F0 rate of the rapid traverse override for each axis.

1424	Manual rapid traverse rate for each axis

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
Set the rate of manual rapid traverse when the rapid traverse override is 100% for each axis.

NOTE
1 If 0 is set, the rate set in parameter No. 1420 (rapid traverse rate for each axis) is assumed.
2 When manual rapid traverse is selected (bit 0 (RPD) of parameter No. 1401 is set to 1), manual feed is performed at the feedrate set in this parameter, regardless of the setting of bit 4 (JRV) of parameter No. 1402.

1430	Maximum cutting feedrate for each axis

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
Specify the maximum cutting feedrate for each axis.

	#7	#6	#5	#4	#3	#2	#1	#0
1803				TQF				

[Input type] Parameter input
[Data type] Bit path

#4 TQF When torque control is performed by the PMC axis control, follow-up operation is:
0: Not performed.
1: Performed.

	#7	#6	#5	#4	#3	#2	#1	#0
1805							TRE	

[Input type] Parameter input
[Data type] Bit path

#1 TRE When bit 4 (TQF) of parameter No. 1803 is set to 0 (not to perform follow-up operation with a torque control command in PMC axis control), the servo error counter is:

0: Updated.
When the error count exceeds the maximum allowable cumulative travel value (parameter No. 1885), the alarm SV0423, “EXCESS ERROR INTORQUE” is issued.

1: Not updated.
No errors are accumulated, so that the alarm SV0423 is not issued. When the maximum allowable feedrate is exceeded, however, the alarm SV0422, “EXCESS VELOCITY IN TORQUE” is issued.

To return to position control when this parameter bit is set to 1, a reference position return operation needs to be performed.

1826	In-position width for each axis

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] Detection unit
[Valid data range] 0 to 99999999

The in-position width is set for each axis.
When the deviation of the machine position from the specified position (the absolute value of the positioning deviation) is smaller than the in-position width, the machine is assumed to have reached the specified position. (The machine is in the in-position state.)

1827	In-position width in cutting feed for each axis

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] Detection unit
[Valid data range] 0 to 99999999

Set an in-position width for each axis in cutting feed. This parameter is used when bit 4 (CCI) of parameter No. 1801=1.

1836	Servo error amount where reference position return is possible

[Input type] Parameter input
[Data type] Word axis
[Unit of data] Detection unit
[Valid data range] 0 to 32767

This parameter sets a servo error used to enable reference position return.
In general, set this parameter to 0. (When 0 is set, 128 is assumed as the default.)

When the servo error amount never exceeds this parameter value before leaving the limit switch for the deceleration in reference position return, alarm (PS0090), "REFERENCE RETURN INCOMPLETE" occurs.

1885	Maximum allowable value for total travel during torque control

[Input type] Parameter input
[Data type] Word axis
[Unit of data] Detection unit
[Valid data range] 0 to 32767

Set a maximum allowable cumulative travel value (error counter value) during torque control. If the cumulative travel value exceeds the set value, the servo alarm SV0423, “EXCESS ERROR INTORQUE” is issued.

> **NOTE**
> This parameter is enabled when the bit 4 (TQF) of parameter No. 1803 is 0 (follow-up is not performed during torque control).

1886	Positional deviation when torque control is canceled

[Input type] Parameter input
[Data type] Word axis
[Unit of data] Detection unit
[Valid data range] 1 to 32767

Set a positional deviation value when torque control is canceled to return to positional deviation. After the positional deviation has fallen to the parameter-set value, switching to position control is performed.

> **NOTE**
> This parameter is enabled when the bit 4 (TQF) of parameter No. 1803 is 0 (follow-up is not performed during torque control).

	#7	#6	#5	#4	#3	#2	#1	#0
2000							DGP	

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Bit axis

#1 DGP Upon power-up, the digital servo parameter specific to a motor is:
0: Set.
1: Not set.

When this parameter is set to 0 after the motor type is set, the digital servo parameter is automatically set to the standard value appropriate for the motor type and this parameter is set to 1 at the same time.

	#7	#6	#5	#4	#3	#2	#1	#0
2007	TRQ							

[Input type] Parameter input
[Data type] Bit axis

#7 TRQ Torque control is:
0: Disabled.
1: Enabled.

	#7	#6	#5	#4	#3	#2	#1	#0
2017				HTN				

[Input type] Parameter input
[Data type] Bit axis

#4 HTN In the speed command mode, the hardware broken wire alarm for the separate detector is:
0: Detected.
1: Ignored.

2105	Torque constant

[Input type] Parameter input
[Data type] Bit axis
[Unit of data] 0.00001Nm/ (torque command)
[Valid data range] 1 to 32767
This parameter is set for each torque characteristic.

> **NOTE**
> When a linear motor is used, the data unit is 0.001 N/(1 torque command).

	#7	#6	#5	#4	#3	#2	#1	#0
3002				IOV				

[Input type] Parameter input
[Data type] Bit path

#4 IOV Override-related signal logic is:
0: Used without modification
(A signal of negative logic is used as a negative logic signal, and a signal of positive logic is used as a positive logic signal.)
1: Inverted
(A signal of negative logic is used as a positive logic signal, and a signal of positive logic is used as a negative logic signal.)

The signals indicated below are affected.
Signal of negative logic:
- Feedrate override signals *FV0 to *FV7<Gn012>
- Second feedrate override signals*AFV0 to *AFV7<Gn013>
- 0.01% step second feedrate override signals*APF00 to *APF15<Gn094, Gn095>
- Feedrate override signals (for PMC axis control)
  *EFOV0g to *EFOV7g<G0151/G0163/G0175/G0187>

- Software operator's panel signals *FV0O to *FV7O<Fn078>

Signals of positive logic:

- Rapid traverse override signals ROV1,ROV2<Gn014.0, Gn014.1>
- Software operator's panel signals ROV1O,ROV2O<Fn076.4, Fn076.5>
- Rapid traverse override signals (for PMC axis control) EROV1g,EROV2g<G0150.0, G0150.1/G0162.0, G0162.1/G0174.0, G0174.1/G0186.0, G0186.1>

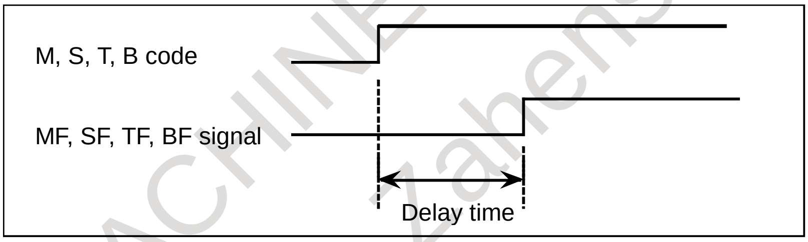
The signals indicated below are not affected.

- 1% step rapid traverse override selection signal HROV <Gn096.7>
- 1% step rapid traverse override signals *HROV0 to *HROV6 <Gn096.0 to Gn096.6>
- 0.1% step rapid traverse override selection signal FHROV <Gn353.7>
- 0.1% step rapid traverse override signals *FHRO0 to *FHRO9 <Gn352.0 to Gn352.7, Gn353.0 to Gn353.1>

3010	Time lag in strobe signals MF, SF, TF, and BF

[Input type] Parameter input
[Data type] Word path
[Unit of data] msec
[Valid data range] 0 to 32767

The time required to send strobe signals MF<Fn007.0>, SF<Fn007.2>, TF<Fn007.3>, and BF<Fn007.7> after the M, S, T, and B codes are sent, respectively.



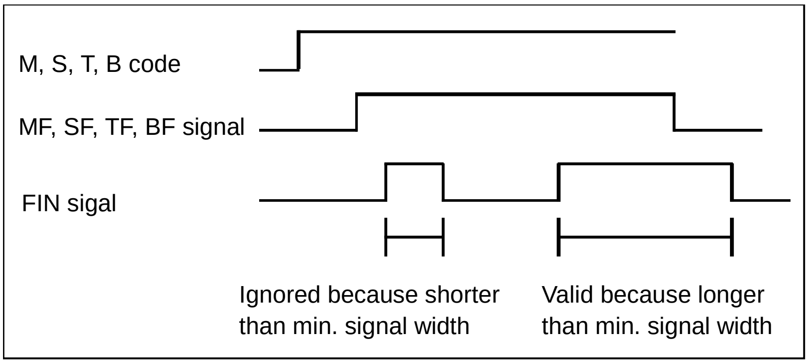
NOTE

The time is counted in units of 8 ms. If the set value is not a multiple of eight, it is raised to the next multiple of eight.
Example
When 30 is set, 32 ms is assumed.
When 0 is set, 8 ms is assumed.

3011	Acceptable width of M, S, T, and B function completion signal (FIN)

[Input type] Parameter input
[Data type] Word path
[Unit of data] msec
[Valid data range] 0 to 32767

Set the minimum signal width of the valid M, S, T, and B function completion signal (FIN).



> **NOTE**
> The time is counted in units of 8 ms. If the set value is not a multiple of eight, it is raised to the next multiple of eight
> Example
> When 30 is set, 32ms is assumed.
> When 0 is set, 8ms is assumed.
> The time count period may change, depending on the system.

	#7	#6	#5	#4	#3	#2	#1	#0
3104					PPD			

[Input type] Parameter input
[Data type] Bit path

#3 PPD Relative position display when a coordinate system is set
0: Not preset
1: Preset

> **NOTE**
> If any of the following is executed when PPD is set to 1, the relative position display is preset to the same value as the absolute position display:
> (1) Manual reference position return
> (2) Coordinate system setting based on G92 (G50 for G code system A on the lathe system)
> (3) Workpiece coordinate system presetting based on G92.1 (G50.3 for G code system A on the lathe system)
> (4) When a T code for the lathe system is specified.

	#7	#6	#5	#4	#3	#2	#1	#0
3105							PCF	

[Input type] Parameter input
[Data type] Bit path

#1 PCF Addition of the movement of the PMC-controlled axes to the actual speed display
0: Added
1: Not added

	#7	#6	#5	#4	#3	#2	#1	#0
3115					NDFx			

[Input type] Parameter input
[Data type] Bit axis

#3 NDFx In calculation for actual cutting feedrate display, the feedrate of a selected axis is:
0: Considered.
1: Not considered.

	#7	#6	#5	#4	#3	#2	#1	#0
8001	SKE	AUX	NCC		RDE	OVE		MLE

[Input type] Parameter input
[Data type] Bit path

#0 MLE Whether all axis machine lock signal MLK <Gn044.1> is valid for PMC-controlled axes
0: Valid
1: Invalid
The axis-by-axis machine lock signal MLKx <Gn108> depends on the setting of bit 1 of parameter No. 8006.

#2 OVE Signals related to dry run and override used in PMC axis control
0: Same signals as those used for the CNC
1: Signals specific to the PMC
The signals used depend on the settings of these parameter bits as indicated below.

Signals	Bit 2 (OVE) of parameter No. 8001 = 0 (same signals as those used for the CNC)		Bit 2 (OVE) of parameter No. 8001 = 1 (signals specific to the PMC)	
Feedrate override signals	*FV0 to *FV7	<G012>	*EFOV0 to *EFOV7	<G151>
Override cancellation signal	OVC	<G006.4>	EOVC	<G150.5>
Rapid traverse override signals	ROV1,2	<G014.0,1>	EROV1,2 or *EROV0 to *EROV7	<G150.0,1> <G151>
Dry run signal	DRN	<G46.7>	EDRN	<G150.7>
Manual rapid traverse selection signal	RT	<G19.7>	ERT	<G150.6>

(The listed signal addresses when PMC signals are selected are for the 1st group. Actual addresses differs depending on the used group.)

> **NOTE**
> When PMC control is performed with more than four times as many groups as the number of NC paths, the signals shown in "same signals as those used for the CNC" cannot be used for the excess paths and groups. Therefore, set this parameter to 1 for this case.

#3 RDE Whether dry run is valid for rapid traverse in PMC axis control
0: Invalid
1: Valid

#5 NCC When the program specifies a move command for a PMC-controlled axis (with the controlled axis selection signal EAX <G0136> set to “1”) not placed under PMC axis control:
0: CNC command is valid.
1: The alarm PS0130, “NC AND PMC AXIS ARE CONFLICTED” is issued.

#6 AUX In PMC axis control, the auxiliary function command (12H) output size is:
0: 1 byte (0 to 255)
1: 2 bytes (0 to 65535)

#7 SKE Skip signal during axis control by the PMC
0: Uses the same signal SKIP <X004.7, X013.7, or X011.7> as CNC.
1: Uses dedicated axis control signal ESKIP <X004.6, X013.6, or X011.6> used by the PMC.

> ⚠ **WARNING**
> If signal ESKIP<X004.6, X013.6, or X011.6> is used by another usage when you set 1 to this parameter, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used X address.

	#7	#6	#5	#4	#3	#2	#1	#0
8002	FR2	FR1	PF2	PF1	F10		DWE	RPD

[Input type] Parameter input
[Data type] Bit path

#0 RPD Rapid traverse rate for PMC-controlled axes
0: Feedrate specified with parameter No. 1420
1: Feedrate specified with the feedrate data in an axis control command by PMC

#1 DWE Minimum time which can be specified in a dwell command in PMC axis control when the increment system is IS-C
0: 1ms
1: 0.1ms

#3 F10 Least increment for the feedrate for cutting feed (per minute) in PMC axis control
The following settings are applied when bit 4 (PF1) of parameter No. 8002 is set to 0 and bit 5 (PF2) of parameter No. 8002 is set to 0.

	F10	IS-A	IS-B	IS-C
Millimeter input (mm/min)	0	10	1	0.1
	1	100	10	1
Inch input (inch/min)	0	0.1	0.01	0.001
	1	1	0.1	0.01

#4 PF1
#5 PF2 Set the feedrate unit of cutting feedrate (feed per minute) for an axis controlled by the PMC.

Bit 5 (PF2) of parameter No. 8002	Bit 4 (PF1) of parameter No. 8002	Feedrate unit
0	0	1 / 1
0	1	1 / 10
1	0	1 / 100
1	1	1 / 1000

#6 FR1
#7 FR2 Set the feedrate unit for cutting feedrate (feed per rotation) for an axis controlled by the PMC.

(1)T series
[Unit of data]
Unit of data depending on the setting of bits 6 (FR1) and bit 7 (FR2) of parameter No. 8002.

Parameter		Metric input (mm/rev)	Inch input (inch/rev)	Rotation axis (deg/rev)
FR2	FR1			
1	1	0.0001	0.000001	0.0001
0	0			
0	1	0.001	0.00001	0.001
1	0	0.01	0.0001	0.01

[Valid data range] 1 to 65535 (However, data within the ranges indicated following table must be specified.)

		Valid data range	Unit
		IS-A to IS-C	
Linear axis	Metric input	0.0001 to 500.0000	mm/rev
	Inch input	0.000001 to 9.999999	inch/rev
Rotation axis		0.0001 to 500.0000	deg/rev

(2)M series
[Unit of data]
Unit of data depending on the setting of bits 6 (FR1) and bit 7 (FR2) of parameter No. 8002.

Parameter		Metric input (mm/rev)	Inch input (inch/rev)	Rotation axis (deg/rev)
FR2	FR1			
1	1	0.01	0.0001	0.01
0	0			
0	1	0.1	0.001	0.1
1	0	1	0.01	1

[Valid data range] 1 to 65535 (However, data within the ranges indicated following table must be specified.)

		Valid data range	Unit
		IS-A to IS-C	
Linear axis	Metric input	0.01 to 500.00	mm/rev
	Inch input	0.0001 to 9.9999	inch/rev
Rotation axis		0.01 to 500.00	deg/rev

	#7	#6	#5	#4	#3	#2	#1	#0
8003					FEX			

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When this parameter bit is set, the power must be turned off before operation is continued.

#3 FEX The maximum feedrate that can be achieved by the machine during cutting feed or continuous feed in PMC axis control, or spindle control with servo motor is:
0: Not extended.
1: Extended.

Restrictions

- Parameters for setting the time constants for linear acceleration/deceleration after interpolation and bell-shaped acceleration/deceleration after interpolation
  When as the acceleration/deceleration type, linear acceleration/ deceleration after interpolation or bell-shaped acceleration/ deceleration after interpolation is used for each of rapid traverse, cutting feed, and manual feed, the maximum allowable time constant is a half of the maximum value that can be set conventionally.
  The time constant parameters used are as follows:

Parameter No.	Meaning
1620	Time constant (T) used for linear acceleration/deceleration in rapid traverse for each axis, or time constant (T1) used for bell-shaped acceleration/deceleration in rapid traverse for each axis
1621	Time constant (T2) used for bell-shaped acceleration/deceleration in rapid traverse for each axis
1622	Time constant for acceleration/deceleration in cutting feed for each axis
1624	Time constant for acceleration/deceleration in jog feed for each axis
1626	Time constant for acceleration/deceleration in threading cycles for each axis
1769	Time constant for acceleration/deceleration after cutting feed interpolation in the mode of look-ahead acceleration/deceleration before interpolation
5271 to 5274	Time constant for acceleration/deceleration in rigid tapping extraction (first to fourth gears)
5365 to 5368	Time constant for bell-shaped acceleration/deceleration in rigid tapping (first to fourth gears)

- The waveform display function of VCMD on the SERVO GUIDE or the SERVO GUIDE Mate.
  As the feedrate increases, more data is acquired for VCMD waveform display, which can prevent waveforms from being displayed correctly.

⚠ CAUTION

1. When this function is enabled, the feedrate is extended to the maximum value that can be specified for cutting feed or continuous feed in PMC axis control if CMR is 1. If CMR is greater than 1, the feedrate is limited to a value smaller than the maximum value that can be specified.
2. Note that the maximum motor speed may be exceeded depending on the feedrate specified.

	#7	#6	#5	#4	#3	#2	#1	#0
8004		NCI	DSL			JFM		

[Input type] Parameter input
[Data type] Bit path

#2 JFM This parameter sets the units used to specify feedrate data when continuous feed is specified in axis control by the PMC.

Increment system	Bit 2 (JFM) of No. 8004	Millimeter input (mm/min)	Inch input (inch/min)	Rotation axis (deg/min)
IS-B	0	1	0.01	1
	1	200	2.00	200
IS-C	0	0.1	0.001	0.1
	1	20	0.200	20

#5 DSL If the selection of an axis is changed when PMC axis selection is disabled:
0: An alarm PS0139, "CANNOT CHANGE PMC CONTROL AXIS" is issued.
1: The change is valid, and no alarm is issued for an unspecified group.

#6 NCI In axis control by the PMC, a position check at the time of deceleration is:
0: Performed.
1: Not performed.

	#7	#6	#5	#4	#3	#2	#1	#0
8005			IFV	EVP	DRR	R10	CDI	EDC

[Input type] Setting input
[Data type] Bit path

#0 EDC In axis control by the PMC, an external deceleration function is:
0: Disabled.
1: Enabled.

#1 CDI In axis control by the PMC, when diameter programming is specified for a PMC-controlled axis:
0: The amount of travel and feedrate are each specified with a radius.
1: The amount of travel is specified with a diameter while the feedrate is specified with a radius.
This parameter is valid when bit 3 (DIA) of parameter No. 1006 is set to 1 (A move command for each axis is based on diameter specification.)

#2 R10 When the bit 0 (RPD) of parameter No. 8002 is set to 1, the unit for specifying a rapid traverse rate for the PMC axis is:
0: 1 mm/min.
1: 10mm/min.

#3 DRR For cutting feed per rotation in PMC axis control, the dry run function is:
0: Disabled.
1: Enabled.

#4 EVP Speed command in PMC axis control is executed by:
0: Velocity control.
1: Position control.
This bit is available when speed command in PMC axis control is FS16 type (bit 2 (VCP) of parameter No. 8007 is 1).

#5 IFV When bit 2 (OVE) of parameter No. 8001 is set to 1 in PMC axis control, the feedrate override signal *EFOVx and the override cancel signal OVC are:
0: Used on a path-by-path basis. (The start groups (1st group, 5th group, 9th group, 13th group) of each path are used.)
1: Used on a group-by-group basis.

	#7	#6	#5	#4	#3	#2	#1	#0
8006		EZR		EFD			MLS	

[Input type] Parameter input
[Data type] Bit path

#1 MLS When bit 0 (MLE) of parameter No. 8001 is set to 1 (to disable the all axis machine lock signal) in PMC axis control, axis-by-axis machine lock is:
0: Disabled.
1: Enabled.

#4 EFD When cutting feed (feed per minute) is used in PMC axis control, the specification unit of feedrate data is:
0: Unchanged (1 times).
1: 100 times greater.

> **NOTE**
> When this parameter is set to 1, bit 3 (F10) of parameter No. 8002 is invalid.

#6 EZR In PMC axis control, bit 0 (ZRNx) of parameter No. 1005 is:
0: Invalid.
With a PMC controlled axis, the alarm PS0224, "ZERO RETURN NOT FINISHED" is not issued.
1: Valid.
A reference position return state check is made on a PMC controlled axis as with an NC axis according to the setting of bit 0 (ZRNx) of parameter No. 1005.

	#7	#6	#5	#4	#3	#2	#1	#0
8007			PSA		ESY	VCP		

[Input type] Parameter input
[Data type] Bit path

#2 VCP Speed command in PMC axis control is:
0: FS15 type.
1: FS16 type.

#3 ESY In PMC axis control, external pulse synchronization (serial spindle synchronization) is:
0: Disabled.
1: Enabled.

#5 PSA Acceleration/deceleration after interpolation for skip command of PMC axis control is
0: Invalid
1: Valid

> **NOTE**
> Skip position of system variables (#5061 to #5080, #100151 to #100182) are behavior such as the following.
> - In case of parameter PSA = 0, coordinate value of bit 1 (SEB) of parameter No.6201= 0 equivalent is stored.
> - In case of parameter PSA = 1, coordinate value in accordance with the setting of parameter SEB is stored.

	#7	#6	#5	#4	#3	#2	#1	#0
8008								**EMRx**

[Input type] Parameter input
[Data type] Bit axis

#0 EMRx When a PMC axis control command is issued in mirror image state, the mirror image is:
0: Not considered.
1: Considered.

This parameter is valid in the mirror image mode set with the mirror image signals MI1 to MI8 <G106.0 to .7> set to 1 or bit 0 (MIRx) of parameter No. 12 set to 1.
If a movement is made along the same axis by doubly specifying a command with the CNC and PMC axis control when this parameter is set to 0, and the mirror image mode is set, a coordinate shift can occur afterwards. So, do not attempt to make such a movement.

8010	Selection of the DI/DO group for each axis controlled by the PMC

[Input type] Parameter input
[Data type] Byte axis
[Valid data range] 1 to 16

Specify the DI/DO group to be used to specify a command for each PMC-controlled axis.

For addresses of the fifth group and up, 1000 is added in steps of 4 groups.
For example:
The start address of the 10th group is G2154.

Parameter No.8010	Description
1	DI/DO 1st group <G142 to G153> is used.
2	DI/DO 2nd group <G154 to G165> is used.
3	DI/DO 3rd group <G166 to G177> is used.
4	DI/DO 4th group <G178 to G189> is used.
5	DI/DO 5th group <G1142 to G1153> is used.
6	DI/DO 6th group <G1154 to G1165> is used.
:	:
13	DI/DO 13th group <G3142 to G3153> is used.
14	DI/DO 14th group <G3154 to G3165> is used.
15	DI/DO 15th group <G3166 to G3177> is used.
16	DI/DO 16th group <G3178 to G3189> is used.

NOTE
When a value other than the above is set, the axis is not controlled by the PMC.

	#7	#6	#5	#4	#3	#2	#1	#0
8013				R20x	ROP		OVR	

[Input type] Parameter input
[Data type] Bit axis

#1 OVR When bit 2 (OVE) of parameter No. 8001 is set to 1, for rapid traverse command override in PMC axis control:

0: Rapid traverse override signals EROV2 and EROV1 <G150.1 and G150.0> for PMC axis control are used.
1: 1% step rapid traverse override signals *EROV7 to *EROV0 <G151> for PMC axis control are used.

(The listed signal addresses when PMC signals are selected are for the 1st group. Actual addresses differs depending on the used group.)

#3 ROP When rotation axis rollover is enabled for an axis controlled in PMC axis control, the direction in which a movement (rotation) is performed to reach an end point by a reference position return command 07H to 0AH (equivalent to G28, G30P2/P3/P4) is:

0: Determined by the sign of the commanded value.
1: The direction in the shortest path.

> **NOTE**
> ROPx is valid only when bit 0 (ROAx) of parameter No. 1008 is set to 1 and bit 1 (RABx) of parameter No. 1008 is set to 0.

#4 R20x When the machine coordinate system selection (20h) is commanded with the PMC axis control for the rotary axis to which the roll-over function is valid (bit 0 (ROAx) of parameter No. 1008 is set to 1), setting the bit 1 (RABx) of parameter No. 1008 which specifies the direction of the rotation for an absolute command is:

0: Invalid.
1: Valid.

The above direction of the rotation is as follows by setting the bit 1 (RABx) of parameter No. 1008 and the bit 4 (R20x) of parameter No. 8013.

<table>
<tr><th colspan="2" rowspan="2"></th><th colspan="2">Bit 4 (R20x) of parameter No.8013</th></tr>
<tr><th>0</th><th>1</th></tr>
<tr><td rowspan="2">Bit 1 (RABx) of parameter No.1008</td><td>0</td><td>Direction of the shortest path</td><td>Direction of the shortest path</td></tr>
<tr><td>1</td><td>Direction of sign of the amount of the movement to be made</td><td>Direction of sign of the command value</td></tr>
</table>

	#7	#6	#5	#4	#3	#2	#1	#0
8019						EZC	PIA	EOS

[Input type] Parameter input
[Data type] Bit

#0 EOS In external pulse synchronization (serial spindle synchronization) in PMC axis control, the serial spindle to be synchronized is:

0: The first spindle of path 1.
1: Any spindle.

> **NOTE**
> If Bit 0 (EOS) of parameter No. 8019 is set to 0, only the servo axis of path 1 can be commanded.

#1 PIA After the move command of PMC axis control is interrupted by reset signal ECLRg, if different acceleration/deceleration type command without waiting for a deceleration stop generates:
0: Not alarm.
1: Alarm DS1451, "IMPROPER PMC AXIS COMMAND".

> **NOTE**
> This parameter is automatic setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

#2 EZC If the controlled axis selection signals EAX1 to EAX8 <Gn136> are "0" or PMC controlled-axis selection variable (#8700) is 0, the PMC axis control command generates:
0: Not alarm.
1: Alarm DS1451, "IMPROPER PMC AXIS COMMAND".

> **NOTE**
> This parameter is automatic setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

8020	FL rate for reference position return along each axis in PMC axis control

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
For each axis, this parameter sets a feedrate (FL rate) after deceleration for reference position return in PMC axis control.

> **NOTE**
> If 0 is specified, the value of parameter No. 1425 is used.

8022	Upper limit rate of feed per revolution during PMC axis control

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)
This parameter sets the upper limit rate of feed per revolution during PMC axis control.

8028	Time for acceleration/deceleration calculation when a feedrate is commanded under PMC axis control

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 32767

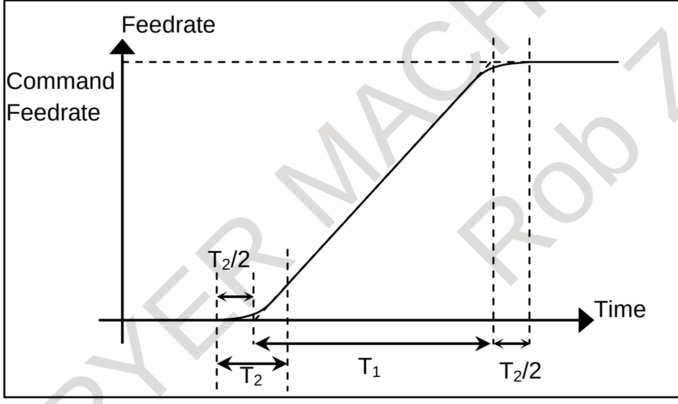
When a feedrate is commanded under PMC axis control, acceleration/deceleration can be set for parameter No. 8032 or this parameter. When 0 is set in parameter No. 8032, the specification of 1000 min^{-1} is assumed. When 0 is set in this parameter, the acceleration/deceleration function for feedrate specification is disabled.

8029	Acceleration change time of bell-shaped acceleration/deceleration for the speed command under PMC axis control

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec
[Valid data range] 0 to 512

Set an acceleration change time of bell-shaped acceleration/deceleration for the speed command under PMC axis control for each axis.
To enable bell-shaped acceleration/deceleration, acceleration/deceleration function for the speed command must be valid (Parameter (No. 8028) is set to other than 0). When the acceleration/deceleration is enabled, set the acceleration change time corresponding to the acceleration in this parameter.

If this parameter is set to 0 or less of the value, bell-shaped acceleration/deceleration is disabled.
If this parameter is set 512 or more, the value is clamped to 512.



T_1 : Acceleration time in the acceleration that has been set by linear acceleration/deceleration
(This time will vary depending on the setting and command value of speed command)
T_2 : Acceleration change time (Parameter No. 8029)
Total time = $T_1 + T_2$
Time for the linear section = $T_1 - T_2$
Time for the bell-shaped section = T_2

8030	Time constant for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] msec
[Valid data range] 0 to 4000

For each axis, this parameter sets a time constant for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control.

> **NOTE**
> When either of the following conditions is satisfied, the value set in parameter No. 1622 is used.
> - 0 is set in this parameter.
> - Acceleration/deceleration after cutting interpolation is linear type.
> - Advanced preview feed forward is enabled.

8031	FL rate for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

For each axis, this parameters sets a lower feedrate limit (FL rate) for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control.

> **NOTE**
> 1 When either of the following conditions is set, the value set in parameter No. 1623 is used.
> - 0 is set in this parameter.
> - Advanced preview feed forward is enabled.
>
> 2 Be sure to set 0 in this parameter and parameter No. 1623 for all axes at all times except for special purposes. If a value other than 0 is specified, correct linear or circular figures cannot be obtained.

8032	Feedrate for acceleration/deceleration calculation when a feedrate is commanded under PMC axis control

[Input type] Parameter input
[Data type] Word axis
[Unit of data] min^{-1}
[Valid data range] 0 to 32767

When a feedrate is specified under PMC axis control, acceleration/deceleration can be set for this parameter or parameter No. 8028. When 0 is set in this parameter, the specification of 1000 min^{-1} is assumed. When 0 is set in parameter No. 8028, the acceleration/deceleration function for feedrate specification is disabled.

8040	Amount of a shift per one rotation of a servo motor of least input increment when speed command in PMC axis control is position control

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] mm, inch, deg (machine unit)
[Valid data range] 1 to 99999999

Set the amount of a shift per one rotation of a servo motor of least input increment when speed command in PMC axis control is position control.
This parameter is available when speed command in PMC axis control is FS16 type (bit 2 (VCP) of parameter No. 8007 is 1) and is executed by position control (bit 4 (EVP) of parameter No. 8005 is 1).

	#7	#6	#5	#4	#3	#2	#1	#0
11216						TPM		

[Input type] Parameter input
[Data type] Bit path

#2 TPM In PMC axis control and 3-dimensional coordinate system conversion / Tilted working plane indexing, NC command not involving a movement :

0: Disable to command (Alarm (PS5131) "NC COMMAND IS NOT COMPATIBLE" occurs).
1: Enabled to command.

> **NOTE**
> 1 When this parameter bit is set, the power must be turned off before operation is continued.
> 2 When the coordinate conversion axis (X,Y,Z) is PMC axis control mode, this function is disabled in following program command block.
> - Tilted working plane indexing start block (G68.2)
> - 3-dimensional coordinate start block (G68)
> - Tilted working plane indexing / 3-dimensional coordinate cancel block (G69)

	#7	#6	#5	#4	#3	#2	#1	#0
11850	IFH							CMI

[Input type] Parameter input
[Data type] Bit path

#0 CMI If, in PMC axis control, a rapid traverse rate is commanded with the axis control block data signal, with bit 0 (RPD) of parameter No. 8002 being set to 1, the rapid traverse rate is:

0: Always treated as being in millimeters.
1: Dependent on the setting of bit 0 (INM) of parameter No. 1001.

#7 IFH When bit 2 (OVE) of parameter No. 8001 is set to 1 in PMC axis control, the 1% rapid traverse override signals *EROVs are:

0: On a path-by-path basis. (The first groups in the individual paths (1st, 4th, 9th, 13th groups) are used.)
1: On a group-by-group basis.

Depending on this parameter and bit 1 (OVR) of parameter No. 8013, selected signals are as given in the table below.
(The signal addresses are those in the first path, and the actual addresses differ depending on the group used.)

	Bit 7 (IFH) of No. 11850 = 0 (*EROVs are on a path-by-path basis.)	Bit 7 (IFH) of No. 11850 = 1 (*EROVs are on a group-by-group basis.)
Bit 1 (OVR) of No. 8013 = 0	EROV1, EROV2 <G150.0, G150.1>	EROV1, EROV2 <G150.0, G150.1>
Bit 1 (OVR) of No. 8013 = 1	*EROV<G151>	*EROVA<G151> *EROVB<G163> *EROVC<G175> *EROVD<G187>

NOTE
Overrides are clamped at up to 100%.

	#7	#6	#5	#4	#3	#2	#1	#0
12730								**PTC**

[Input type] Parameter input
[Data type] Bit path

#0 PTC Linear acceleration/deceleration time constant of continuous feed operation based on a speed command in PMC axis control is:
0: Normal.
1: Extended.
This bit is available when speed command in PMC axis control is FS16 type (bit 2 (VCP) of parameter No. 8007 is 1).

12731	**2nd time constant of linear acceleration/deceleration of continuous feed operation based on a speed command in PMC axis control**

12732	**3rd time constant of linear acceleration/deceleration of continuous feed operation based on a speed command in PMC axis control**

12733	**4th time constant of linear acceleration/deceleration of continuous feed operation based on a speed command in PMC axis control**

12734	**5th time constant of linear acceleration/deceleration of continuous feed operation based on a speed command in PMC axis control**

[Input type] Parameter input
[Data type] Word axis
[Unit of data] msec/1000min^{-1}
[Valid data range] 0 to 32767

If 0 is specified, the time constant at a given feedrate becomes invalid, and acceleration/deceleration is not performed.
This parameter is available when speed command in PMC axis control is FS16 type (bit 2 (VCP) of parameter No. 8007 is 1) and linear acceleration/deceleration time constant of continuous feed operation based on a speed command in PMC axis control is extended (bit 0 (PTC) of parameter No. 12730 is 1).

12735	**1st feedrate for changing time constant of continuous feed operation based on a speed command in PMC axis control**

12736	**2nd feedrate for changing time constant of continuous feed operation based on a speed command in PMC axis control**

12737	**3rd feedrate for changing time constant of continuous feed operation based on a speed command in PMC axis control**

12738	**4th feedrate for changing time constant of continuous feed operation based on a speed command in PMC axis control**

[Input type] Parameter input
[Data type] Word axis
[Unit of data] min^{-1}
[Valid data range] 0 to 32767

Set feedrate parameters as following.
No. 12735 < No. 12736 < No. 12737 < No. 12738.
This parameter is available when speed command in PMC axis control is FS16 type (bit 2 (VCP) of parameter No. 8007 is 1) and linear acceleration/deceleration time constant of continuous feed operation based on a speed command in PMC axis control is extended (bit 0 (PTC) of parameter No. 12730 is 1).

	#7	#6	#5	#4	#3	#2	#1	#0
18050	**OTW**							

[Input type] Parameter input
[Data type] Bit path

#7 OTW If an axis move command is executed with PMC axis control during automatic operation, and the NC block under execution is stopped by a feed hold when the axis moving due to PMC axis control is completed, the amount of movement due to PMC axis control in that block is:
0: Not reflected in the NC coordinate system.
1: Reflected in the NC coordinate system.

Alarm and message

Servo and overtravel alarms for PMC axis control are detected in the same way as for CNC controlled axes.
When an alarm is issued, the alarm signal EIALg is set to “1” for notification to the PMC in addition to normal alarm processing.
(When an overtravel alarm is issued, the negative-direction overtravel signal EOTNg or the positive-direction overtravel signal EOTPg is also set to “1”.)

The alarm signal EIALg is reset using the reset signal ECLRg.

> ⚠ **CAUTION**
> If an alarm is issued by a PMC axis control command or in connection with PMC axis control, be sure to set the reset signal ECLRg to “1” in addition to a reset operation on the NC.

- Alarms related to conflict with the NC

Alarm PS0130

In general, if the CNC and PMC attempt to simultaneously control an axis not subject to superimposition, the alarm PS0130 is issued.

This alarm is issued in the following cases:

- When cutting feed with an override of 0% is performed along the axis, or the tool is temporarily stopped along the axis (with the axis control temporary stop signal ESTPg set to "1"), this alarm is issued. (During feed hold or single block stop, a PMC axis control command is valid, not resulting in an alarm.)
- When a command is issued from the CNC for an axis controlled by the PMC
- When a move command is issued from the PMC for an axis on the polar coordinate interpolation plane in the polar coordinate interpolation mode (G12.1 command)

Alarm PS5131

If a command related to 3-dimensional coordinate conversion / tilted working plane indexing or polar coordinate interpolation is specified during PMC axis control, the alarm PS5131 is issued.

However, when 3-dimensional coordinate conversion / tilted working plane indexing mode and the bit 2 (TPM) of parameter No. 11216 is "1", CNC axis move commands to the same coordinate (no move command) can be commanded.

- Alarms due to setting modifications made during PMC axis control

Alarm PS0139

If parameter No. 8010 is modified during PMC axis control, or the level of the control axis selection signal EAXx for an axis under PMC axis control is changed, the alarm PS0139 is issued.

- Other alarms

Alarm PS0224

If a PMC axis control command is specified without performing a reference position return operation even once after the power is turned off when bit 0 (ZRNx) of parameter No. 1005 is set to 0, the alarm PS0224 is issued.

Alarm PS5065

If a PMC axis control command is executed by assigning axes with different increment systems to the same group, the alarm PS5065 is issued.

Number	Message	Description
PS0130	NC AND PMC AXIS ARE CONFLICTED	The NC command and the PMC axis control command were conflicted. Modify the program or ladder.
PS0139	CANNOT CHANGE PMC CONTROL AXIS	The PMC axis was selected for the axis for which the PMC axis is being controlled.
PS0224	ZERO RETURN NOT FINISHED	Reference position return has not been performed before the automatic operation starts. Perform reference position return only when the bit 0 (ZRNx) of parameter No. 1005 is set to 0.
PS5065	DIFFERRENT AXIS UNIT(PMC AXIS)	Axes having different increment systems have been set in the same DI/DO group for PMC axis control. Modify the setting of parameter No. 8010.
PS5131	NC COMMAND IS NOT COMPATIBLE	The PMC axis control and 3-dimensional coordinate conversion or a polar coordinate interpolation were specified simultaneously. Check the program or the ladder.
PS0220	ILLEGAL COMMAND IN SYNCHR-MODE	In the synchronous operation, movement is commanded by the NC program or PMC axis control interface for the synchronous axis. Modify the program or check the PMC ladder.
DS1184	PARAMETER ERROR IN TORQUE	An invalid parameter was set for torque control. The torque constant parameter is set to 0.

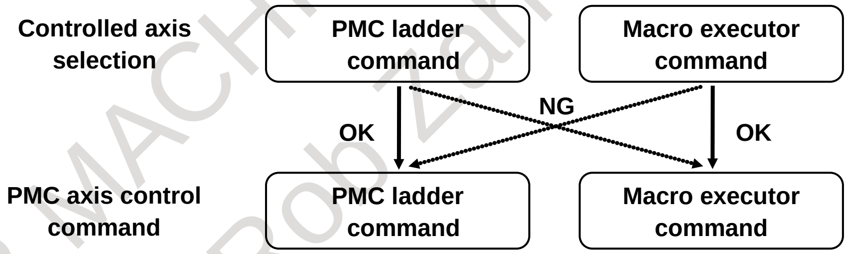
Number	Message	Description
SV0422	EXCESS VELOCITY IN TORQUE	In torque control, the commanded permissible velocity was exceeded.
SV0423	EXCESS ERROR IN TORQUE	In torque control, the maximum allowable cumulative travel value by the parameter was exceeded.
DS1451	IMPROPER PMC AXIS COMMAND	1. During deceleration of PMC axis control, next PMC axis control command is commanded. Correct PMC ladder sequence to execute the next command after the PMC axis control is stopped. 2. While the controlled axis selection signals EAX1 to EAX8 <Gn136> or PMC controlled-axis selection variable (#8700) are “0”, PMC axis control command is commanded. Correct PMC ladder sequence or macro executor program so that the signal or variable is set to 1.

Warning

⚠ WARNING

1 PMC axis control must be executed while the controlled axis selection signals EAX1 to EAX8 are "1". If controlled axis selection signals EAX1 to EAX8 are "0", the command cannot be accepted.

2 PMC axis control is able to command by PMC ladder and macro executor.
In case of use PMC axis control, “controlled axis selection” and “PMC axis control command”, use the same command method. If you use the different command method to “controlled axis selection” and “PMC axis control command”, “PMC axis control command” may be ignored, or the command may execute incorrect axis motion. Therefore, the machine may behave in an unexpected manner.



Caution

⚠ **CAUTION**

1 The mode selection, CNC reset, and other CNC statuses have no effect.
2 CNC-controlled feed hold *SP, single block stop SBK, reset signal ERS, and interlock of all axes or each axis are invalid for PMC axis control, but similar control is enabled by operating the PMC signals (ESTPg, ESBKg, and ECLRg).
3 Emergency stop is enabled.
4 If cutting feed blocks are specified in succession, deceleration is not performed between blocks (acceleration/deceleration is applied, however, when the specification of a feedrate changes), and cutting proceeds to the next block without waiting for the tool to enter the in-position area. At the end of a block other than for cutting feed, the tool is temporarily decelerated. The next block is then executed after waiting for the tool to enter the in-position area. When bit 6 (NCI) of parameter No. 8004 is set to 1, cutting can proceed to the next block without making an in-position check for each block.
5 Under PMC axis control, manual absolute mode is always set. If the PMC starts control of an axis after manual intervention (manual continuous feed, manual handle feed, etc.) is performed during automatic operation while manual absolute mode is not set (*ABSM is set to "1"), manual absolute mode is set.
6 Under PMC axis control, all commands are handled as axis commands. Even for the auxiliary functions, the position check is effective.
7 When the CNC executes the command to set the workpiece coordinate system setting (G54 to G59) during an axial movement by PMC axis control command, a valid coordinate system cannot be set.
8 If the alarm PS0139 is issued due to a modification to parameter No. 8010, the alarm is issued with all paths. After resetting the alarm, input the reset signal ECLRg for all groups before a start.

⚠ **CAUTION**

9 After the execution of a move command in PMC axis control during NC automatic operation, to execute a move command (in the absolute or incremental mode) for the relevant axis in an NC block during the same operation, execute the following method (1) or (2).
Note that in case of speed command or torque control, execute the method (2) because the method (1) can not be executed.

(1) Execute the PMC axis command by M code preventing buffering.

Execute the PMC axis command while the system is waiting for the FIN signal for an M code preventing buffering. Then, after the completion of that PMC axis command, return the FIN signal for the M code preventing buffering.
For example, in the following program, to execute the move command (N40) after the tool is moved along the Y-axis using a PMC axis command, the PMC axis command must be controlled within the M code preventing buffering (N20):
When the speed command (10h) or torque control command (11h) in PMC axis control is specified, execute the method (2) instead of this method.

O0001
N10 G94 G90 G01 X20. Y30. F3000 ;
N20 M55 ; → Y axis moves by PMC axis command.
N30 X70.0 ;
N40 Y50.0 ;
N50 M02 ;
Control under the following setting.

- Set an M code preventing buffering for the M55 block (Example: set 55 in parameter No. 3411).
- During M55 block, start PMC axis command. And, after the PMC axis command ends, the FIN signal for M55 is returned.

To perform the feed hold stop during PMC axis control, set bit 7 (OTW) of parameter No. 18050 to 1.

⚠ **CAUTION**

(2)-1 After the PMC axis command ends, command M code which turn on each axis workpiece coordinate system preset signal.
After the PMC axis command ends, command M code which turn on each axis workpiece coordinate system preset signal before the move command of NC block. Refer to "Each axis workpiece coordinate system preset signal" for details.

(2)-2 After the PMC axis command ends, command workpiece coordinate system preset.

As well as (2)-1, after the PMC axis command ends, command workpiece coordinate system preset before the move command of NC block.

For example, in the following program, to execute the move command(N50) after the tool is moved along the Y-axis using a PMC axis command, M code which turn on each axis workpiece coordinate system preset signal or workpiece coordinate system preset must be commanded in N40.

```
O0002
N10 G94 G90 G01 X20.0 Y30.0 F3000 ;
N20 M55 ; → Y axis moves start by PMC axis command.
N30 X70.0 ;
N40 M60 ; → M code which turn on each axis workpiece coordinate system
             reset signal is commanded.
            Or, workpiece coordinate system preset (G92.1Y0)
            is commanded.
N50 Y50. ;
N60 M02 ;
```

When the speed command (10h) or torque control command (11h) in PMC axis control is specified, this method is only applicable to the setting that the coordinates are updated.

10 Both feed-forward and advanced preview feed-forward function are unavailable for PMC axis.

11 For the axis under Cs contour control, PMC axis control can be used only following command.

- Rapid traverse (00h)
- Cutting feed (01h)
- Continuous feed (06h)
- Machine coordinate system selection (20h)
- Speed command (10h) for FS16*i* type position control
  (bit 2 (VCP) of parameter No. 8007 is set to 1 and bit 4 (EVP) of parameter No. 8005 is set to 1)

Note

NOTE
1 The actual speed excluding the effect of movement along a PMC-controlled axis can be displayed if the bit 3 (ZDF) of parameter No. 3115 is set to 1.
2 If an absolute pulse coder is used, a specified reference position is retained in memory, even after the power is turned off.
3 For an index table indexing axis, no PMC axis control command can be specified.
4 The individual output of the auxiliary function is provided by adding a signal for individual output. The timing diagram of controlling and commanding the auxiliary function is not changed. The normal specifications of the auxiliary functions for PMC axis control function are applied.

16.1.2 Advanced preview feed forward for PMC axis control

Overview

Advanced preview feed forward can be enabled for the commands executed by PMC axis control.
As a result, servo delay that becomes large as the feedrate becomes fast is reduced, and the command follow-up performance is improved.

Explanation

By setting bit 3 (G8C) and bit 4 (G8R) of parameter No.8004, advanced preview feed forward can be enabled for the commands executed by PMC axis control. (Table 16.1.2 (a))

Table 16.1.2 (a) Parameter setting and advanced preview feed forward

Parameter		Advanced preview feed forward
Bit 3 (G8C) of No.8004	Bit 4 (G8R) of No.8004	
0	0	Disable
0	1	Disable
1	0	Enable for cutting feed (Disable for rapid traverse)
1	1	Enable for cutting feed and rapid traverse

It is necessary to set bit 1 (FEEDx) of parameter No.2005 and parameter No.2092.

Command list of PMC axis control

PMC axis control enables the commands indicated in Table "Command list" to be specified.

In Table "Command list", "Command" represents the axis control command signals (EC0g to EC6g).
For the detail of the axis control command signals (EC0g to EC6g), refer to "PMC CONTROL FUNCTION".

"Advanced preview feed forward" shows enable or disable of advanced preview feed forward.
- Disable
  Advanced preview feed forward is disabled.
- Enable (Cutting feed)
  Advanced preview feed forward is enabled when the parameters are set to enable for cutting feed.
- Enable (Rapid traverse)
  Advanced preview feed forward is enabled when the parameters are set to enable for rapid traverse.

Table 16.1.2 (b) Command list

No.	Command	Operation	Advanced preview feed forward
(1)	00h	Rapid traverse	Enable (Rapid traverse)
(2)	01h	Cutting feed - feed per minute	Enable (Cutting feed)
(3)	02h	Cutting feed - feed per revolution	Enable (Cutting feed)
(4)	03h	Skip - feed per minute	Disable
(5)	04h	Dwell	Disable
(6)	05h	Reference position return	Disable
(7)	06h	Continuous feed	Enable (Cutting feed)
(8)	07h	First reference position return	Enable (Rapid traverse) (NOTE 1)
(9)	08h	Second reference position return	Enable (Rapid traverse)
(10)	09h	Third reference position return	Enable (Rapid traverse)
(11)	0Ah	Fourth reference position return	Enable (Rapid traverse)
(12)	0Bh	External pulse synchronization - position coder	Enable (Cutting feed)
(13)	0Dh	External pulse synchronization - first manual handle	Enable (Cutting feed)
(14)	0Eh	External pulse synchronization - second manual handle	Enable (Cutting feed)
(15)	0Fh	External pulse synchronization - third manual handle	Enable (Cutting feed)
(16)	10h	Speed command	Disable (NOTE 2)
(17)	11h	Torque control	Disable
(18)	12h	Auxiliary function 1	Disable
(19)	14h	Auxiliary function 2	Disable
(20)	15h	Auxiliary function 3	Disable
(21)	20h	Machine coordinate system selection	Enable (Rapid traverse)
(22)	21h	Cutting feed - sec/block specification	Enable (Cutting feed)

NOTE

1 If the axis that satisfies the both following conditions exists, advanced preview feed forward is disabled for all axes that belong to the same group.
   - Bit 1 (DLZx) of parameter No. 1005 for the function for setting the reference position without dogs is set to 0.
   - Reference position return operation is not performed even once after the power is turned on.

2 If the both following conditions are satisfied, advanced preview feed forward is “Enabled (Cutting feed)”.
   - FS16 type (Bit 2 (VCP) of parameter No.8007 is set to 1)
   - Position control (Bit 4 (EVP) of parameter No.8005 is set to 1)

Limitation

- Composite control
  PMC axis control enabled advanced preview feed forward cannot be used for the axes under composite control.
  Alarm PS0563 "CANNOT USE PMC AXIS (ADFF)" occurs if PMC axis control enabled advanced preview feed forward is specified for the axes under composite control.

- Superimposed control
  When PMC axis control enabled advanced preview feed forward is used for the axes under superimposed control, it is necessary to set superimposed ahead signal OVLN <Gn531.4> to 1 in all paths related to superimposed control and place the paths in the superimposed ahead mode.
  Alarm PS0563 "CANNOT USE PMC AXIS (ADFF)" occurs if PMC axis control enabled advanced preview feed forward is specified for the axes under superimposed control not in the superimposed ahead mode.

NOTE

NOTE

1. In this function, the settings of bit 2 (AOFF) of parameter No.1611 and bit 3 (FFR) of parameter No.1800 are disabled.
2. When the same operation is performed on the multiple axes by assigning the axes to one group, set the parameters to be the same condition about advanced preview feed forward in the axes. If the settings are different in the axes, it may not be the same movement.
3. When advanced preview feed forward is enabled, the settings of parameter No.8030 and No.8031 are disabled.
4. When the cutting/rapid feed-forward switching function is used for PMC axis control, set bit 6 (NCI) of parameter No.8004 to 0, and check in-position in the appropriate in-position range.
5. By setting bit 1 (PFE) of parameter No.8008 to 1, it is also possible to enable advanced preview feed forward for PMC axis control. However, it is necessary to set superimposed ahead signal OVLN <Gn531.4> to "1" and set to the superimposition preceding mode. Also, the valid commands for advanced preview feed forward are limited to rapid traverse (00h), cutting feed - feed per minute (01h), cutting feed - feed per revolution (02h), and cutting feed - sec / block specification (21h). Since it is a parameter of the old specification, basically use bit3 (G8C) and bit 4 (G8R) of parameter No.8004.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
8004		NCI		G8R	G8C			

[Input type] Parameter input
[Data type] Bit path

#3 G8C In PMC axis control, advanced preview feed forward is :
0: Disabled.
1: Enabled.

#4 G8R In PMC axis control, advanced preview feed forward is :
0: Enabled for cutting feed. (Disabled for rapid traverse.)
1: Enabled for cutting feed and rapid traverse.

#6 NCI In axis control by the PMC, a position check at the time of deceleration is:

0: Performed.
1: Not performed.

	#7	#6	#5	#4	#3	#2	#1	#0
8008							PFE	

[Input type] Parameter input
[Data type] Bit axis

#1 PEF If superimposed ahead signal OVLN <Gn531.4> is set to "1", advanced preview feed forward for PMC axis control rapid traverse (00h), cutting feed – feed per minute (01h), cutting feed – feed per revolution (02h), and cutting feed – sec/block specification (21h) is:

0: Disabled.
1: Enabled.

> **NOTE**
> 1 This parameter is valid for rapid traverse (00h) when bit3 (FFR) of parameter No. 1800 is 1 (advanced preview feed forward is enabled for rapid traverse).
> 2 This parameter is a parameter of the old specification. It is recommended not to use this parameter, but to use bit3 (G8C) and bit 4 (G8R) of parameter No.8004. If both this parameter and G8C are set to 1, G8C has priority.

8030	Time constant for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control

[Input type] Parameter input
[Data type] 2-word axis
[Unit of data] msec
[Valid data range] 0 to 4000

For each axis, this parameter sets a time constant for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control.

> **NOTE**
> When either of the following conditions is satisfied, this parameter is invalid and the value set in parameter No.1622 is used.
> - 0 is set in this parameter.
> - Acceleration/deceleration after cutting interpolation is linear type.
> - Advanced preview feed forward is enabled.

8031	FL rate for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control

[Input type] Parameter input
[Data type] Real axis
[Unit of data] mm/min, inch/min, deg/min (machine unit)
[Min. unit of data] Depend on the increment system of the applied axis
[Valid data range] Refer to the standard parameter setting table (C)
(When the increment system is IS-B, 0.0 to +999000.0)

For each axis, this parameter sets a lower feedrate limit (FL rate) for exponential acceleration/deceleration in cutting feed or continuous feed under PMC axis control.

NOTE
1 When either of the following conditions is satisfied, this parameter is invalid and the value set in parameter No.1623 is used.
  - 0 is set in this parameter.
  - Advanced preview feed forward is enabled.
2 Be sure to set 0 in this parameter and parameter No. 1623 for all axes at all times except for special purposes. If a value other than 0 is set, correct linear or circular figures cannot be obtained.

	#7	#6	#5	#4	#3	#2	#1	#0
1611						AOFF		

[Input type] Parameter input
[Data type] Bit path

#2 AOFF When AI contour control mode is off and the parameter of the advanced preview feed forward function is valid, the advanced preview feed forward function is:
0: Enabled.
1: Disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
1800					FFR			

[Input type] Parameter input
[Data type] Bit path

#3 FFR Feed-forward control in rapid traverse is:
0: Disabled
1: Enabled
Feed-forward is enabled only in normal cutting feed. When this parameter is set to 1, feed-forward is enabled in rapid traverse as well. This capability reduces the servo positional deviation, thus reducing the time required to enter the in-position width at the time of positioning.

NOTE
The parameter setting becomes valid after reference position return is completed.

> **NOTE**
> This parameter is Initial setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

Servo parameter

	#7	#6	#5	#4	#3	#2	#1	#0
2005							**FEEDx**	

[Input type] Parameter input
[Data type] Bit axis

#1 FEEDx Feed forward function is:
0: Disabled.
1: Enabled.

2092	**Advanced preview feed-forward coefficient (ADFF1)**

[Input type] Parameter input
[Data type] Word axis
[Unit of data] 0.01%
[Valid data range] 0 to 10000

Specify advanced preview feed-forward coefficient.

	#7	#6	#5	#4	#3	#2	#1	#0
2214				**FFCHG**				

[Input type] Parameter input
[Data type] Bit axis

#4 FFCHG The cutting/rapid feed-forward switching function is:
0: Disabled.
1: Enabled.

> **NOTE**
> When the cutting/rapid feed-forward switching function is used for PMC axis control, set bit 6 (NCI) of parameter No.8004 to 0, and check in-position in the appropriate in-position range.

Signal

Superimposed ahead signal OVLN <Gn531.4>

[Classification] Input signal
[Function] Start superimposed ahead mode.
[Operation] When this signal is 1, the control device operates as follows:
- The corresponding path enters the superimposed ahead mode.

To switch superimposed ahead signal to 1 or 0, it is necessary to stop all axes (except for PMC axes) of path where this signal is switched. When axis moves, alarm DS0071 “START OR RELEASE OF SUPERIMPOSED AHEAD CANNOT BE DONE” is generated. When bit 1 (PFE) of parameter No.8008 is set to 1, change this signal after stopping the PMC axes.

Superimposed ahead under way signal OVLNS <Fn545.1>

[Classification] Output signal

[Function] Indicates that superimposed ahead mode is executing.

[Output cond.] This signal becomes 1 when:

- The corresponding path is executing superimposed ahead mode.

  This signal becomes 0 when:

- The corresponding path is not executing superimposed ahead mode.

Alarm and message

Number	Message	Description
PS0563	CANNOT USE PMC AXIS (ADFF)	Change the related path to superimposed ahead mode when PMC axis control (enabled advanced preview feed forward) is used for the axes related to the following functions. - Composite control - Superimposed control

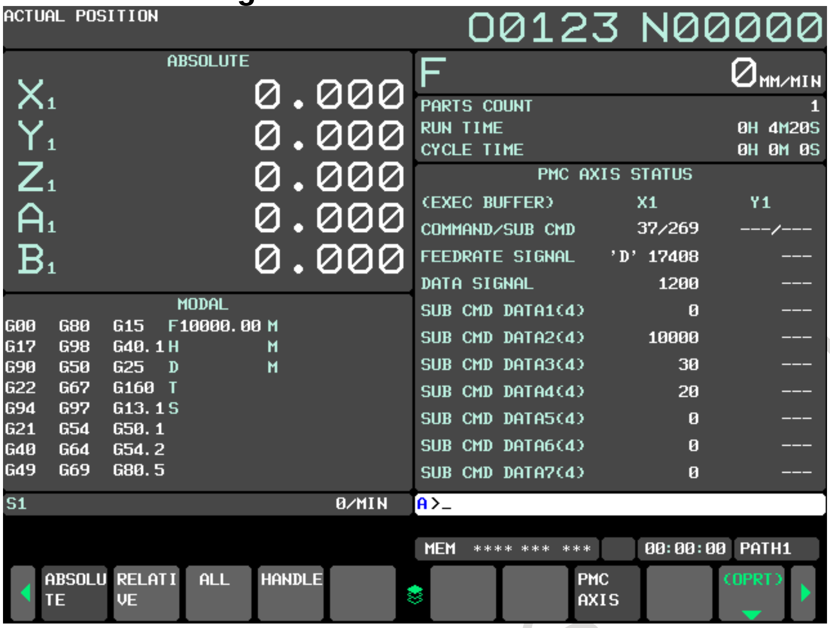
16.1.3 PMC Axis Status Display Function

Overview

This function displays the status of a command specified by PMC axis control and the status of signals related to PMC axis control. This function can be used to easily identify the reason why PMC axis control does not operate normally or to easily check what is specified in PMC axis control in progress.

- PMC axis control signal status screen

- **PMC axis control executing buffer status screen**



Explanation

- **Screen display procedure**

1 Set the bit 7 (EAC) of parameter No. 3137 =1.

2 Press the function key  .

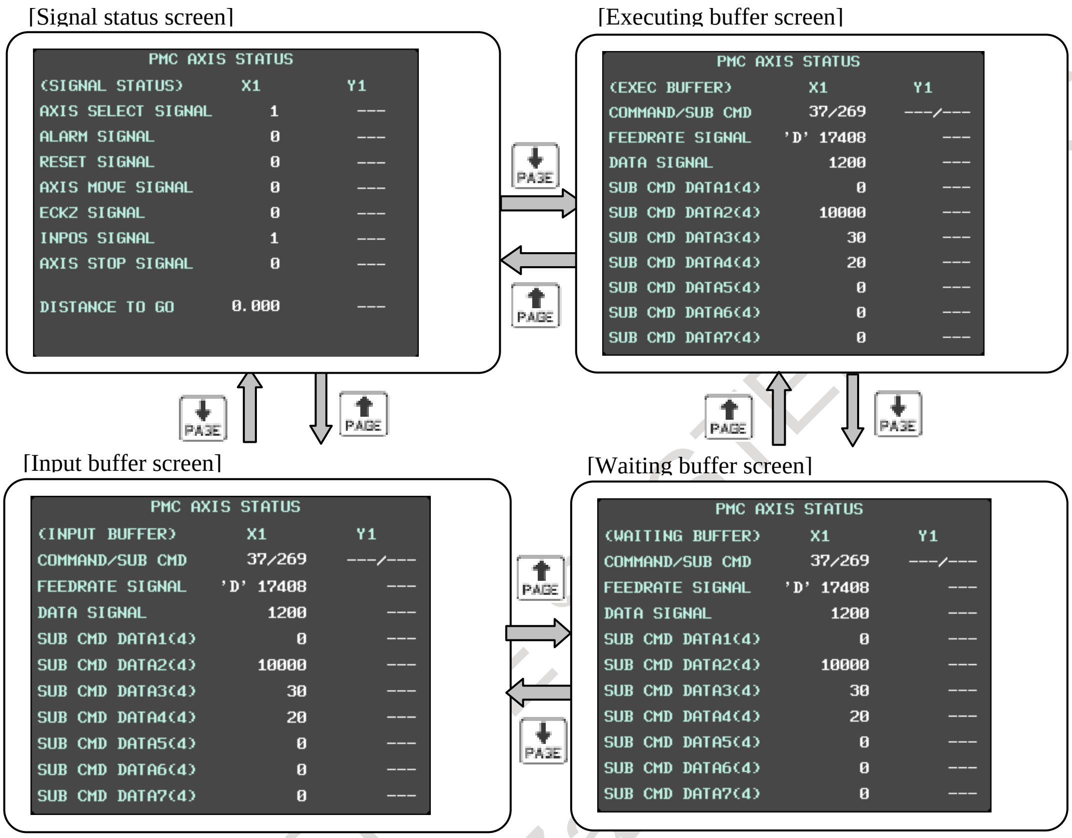
3 Press the continuous menu key several times, then press the chapter selection soft key [PMC AXIS].

4 “Signal status screen for PMC axis control” screen appears.

- Screen configuration and switching to each screen

There are four screens: signal status screen, executing buffer display screen, operation waiting buffer display screen, and input buffer display screen.

Pressing the PAGE key switches between these screens.



- Display operation on a screen

- Switching display axes
  The axis information currently displayed can be switched to the next axis information. Press soft key [AXIS-L NEXT] to switch to the left-hand axis information or press soft key [AXIS-R NEXT] to switch to the right-hand axis information. Each time soft key [AXIS-L NEXT]/[AXIS-R NEXT] is pressed, the axis is changed as shown below.
  First axis -> Second axis -> Third axis -> ...
  The axis information currently displayed can be switched to the previous axis information. Press soft key [AXIS-L PREV] to switch to the left-hand axis information or press soft key [AXIS-R REV] to switch to the right-hand axis information. Each time soft key [AXIS-L PREV]/[AXIS-R PREV] is pressed, the axis is changed reversely as shown below.
  Fourth axis → Third axis → Second axis → ...

- Switching between decimal display and hexadecimal display
  The value of each item can be switched between decimal display and hexadecimal display. Soft key [HEX DISP] appears when the screen is displayed in decimal or soft key [DEC DISP] appears when the screen is displayed in hexadecimal.

- Signal status screen

- Control axis select signal — Displays the status of control axis select signal EAX <Gn136>.
- Alarm signal — Displays the status of alarm signal EIALg.
- Reset signal — Displays the status of reset signal ECLRg.
- Axis move signal — Displays the status of axis moving signal EGENg.
- ECKZ signal — Displays the status of following zero checking signal ECKZg.
- In-position signal — Displays the status of in-position signal EINPg.
- Aixs stop signal — Displays the status of axis control temporary stop signal ESTPg.
- Distance to go — Displays the remaining traverse distance of the command being executed.

NOTE
1. When the control axis select signal is 0, the remaining traverse distance is indicated as "---".
2. When the associated axis is being moved by other than the ladder or macro executor, the remaining traverse distance is indicated as "---".

- Executing buffer display screen

- Command — Displays axis control command signals EC0g to EC6g in the executing buffer.
- Subcommand — Displays a subcommand number in the executing buffer.
- Feedrate signal — Displays axis control feedrate signals EIF0g to EIF5g in the executing buffer.
- Data signal — Displays axis control data signals EID0g to EID31g in the executing buffer.
- Subcommand data 1 (4) — Four-byte information beginning with [subcommand start address + 4] in the executing buffer is displayed.
- Subcommand data 2 (4) — Four-byte information beginning with [subcommand start address + 8] in the executing buffer is displayed.
- Subcommand data 3 (4) — Four-byte information beginning with [subcommand start address + 12] in the executing buffer is displayed.
- Subcommand data 4 (4) — Four-byte information beginning with [subcommand start address + 16] in the executing buffer is displayed.
- Subcommand data 5 (4) — Four-byte information beginning with [subcommand start address + 20] in the executing buffer is displayed.
- Subcommand data 6 (4) — Four-byte information beginning with [subcommand start address + 24] in the executing buffer is displayed.
- Subcommand data 7 (4) — Four-byte information beginning with [subcommand start address + 28] in the executing buffer is displayed.

NOTE
1. What was specified is displayed only when the buffer is valid. When execution is completed or the buffer is invalid, "---" is displayed.
2. If the PMC axis does not move due to an invalid command etc. or an alarm is issued during execution, what was specified is displayed on this screen. This indication is cleared when the ECLRg signal turns on or an emergency stop occurs. After that "---" is displayed.
3. When the associated axis is being moved by other than the ladder or macro executor, "---" is displayed.
4. The speed signal is displayed in decimal with no sign.

- Waiting buffer display screen

- Command — Displays axis control command signals EC0g to EC6g in the waiting buffer.
- Subcommand — Displays a subcommand number in the waiting buffer.
- Feedrate signal — Displays axis control feedrate signals EIF0g to EIF5g in the waiting buffer.
- Data signal — Displays axis control data signals EID0g to EID31g in the waiting buffer.
- Subcommand data 1 (4) — Four-byte information beginning with [subcommand start address + 4] in the waiting buffer is displayed.
- Subcommand data 2 (4) — Four-byte information beginning with [subcommand start address + 8] in the waiting buffer is displayed.
- Subcommand data 3 (4) — Four-byte information beginning with [subcommand start address + 12] in the waiting buffer is displayed.
- Subcommand data 4 (4) — Four-byte information beginning with [subcommand start address + 16] in the waiting buffer is displayed.
- Subcommand data 5 (4) — Four-byte information beginning with [subcommand start address + 20] in the waiting buffer is displayed.
- Subcommand data 6 (4) — Four-byte information beginning with [subcommand start address + 24] in the waiting buffer is displayed.
- Subcommand data 7 (4) — Four-byte information beginning with [subcommand start address + 28] in the waiting buffer is displayed.

NOTE
1. What was specified is displayed only when the buffer is valid. When the buffer is invalid, "---" is displayed.
2. When the associated axis is being moved by other than the ladder or macro executor, "---" is displayed.
3. The speed signal is displayed in decimal with no sign.

- Input buffer display screen

- Command — Displays axis control command signals EC0g to EC6g in the input buffer.
- Subcommand — Displays a subcommand number in the input buffer.
- Feedrate signal — Displays axis control feedrate signals EIF0g to EIF5g in the input buffer.
- Data signal — Displays axis control data signals EID0g to EID31g in the input buffer.
- Subcommand data 1 (4) — Four-byte information beginning with [subcommand start address + 4] in the input buffer is displayed.
- Subcommand data 2 (4) — Four-byte information beginning with [subcommand start address + 8] in the input buffer is displayed.
- Subcommand data 3 (4) — Four-byte information beginning with [subcommand start address + 12] in the input buffer is displayed.
- Subcommand data 4 (4) — Four-byte information beginning with [subcommand start address + 16] in the input buffer is displayed.
- Subcommand data 5 (4) — Four-byte information beginning with [subcommand start address + 20] in the input buffer is displayed.
- Subcommand data 6 (4) — Four-byte information beginning with [subcommand start address + 24] in the input buffer is displayed.
- Subcommand data 7 (4) — Four-byte information beginning with [subcommand start address + 28] in the input buffer is displayed.

NOTE
1 What was specified is displayed only when the buffer is valid. When the buffer is invalid, "---" is displayed.
2 If an alarm occurs due to a command error, what was specified is displayed on this screen. This indication is cleared when the ECLRg signal turns on or an emergency stop occurs. Then, "---" is displayed.
3 When the associated axis is being moved by other than the ladder or macro executor, "---" is displayed.
4 The speed signal is displayed in decimal with no sign.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0

[Input type] Parameter input
[Data type] Bit

#7 EAC The PMC axis status display screen is:
0: Not displayed.
1: Displayed.

16.2 EXTERNAL DATA INPUT

Overview

In the external data input function, the CNC can be operated by the external data which use the signal of PMC.
This function is an optional function.

There are following functions in the external data input.
- External tool offset
- External program number search
- External work coordinate system shift
- External machine zero point shift
- External alarm message
- External operator message
- Substitution of the number of machined parts and number of required parts

NOTE
Ladder sequence of the external data input can be easily incorporated by using PMC function. Functional instruction EXIN(External Data Input: SUB 42) and functional instruction DISPB(Display Message: SUB 41) that can be easily implemented the external data input are provided.
For details on functional instruction EXIN and functional instruction DISPB, refer to the PMC Programming Manual (B-64513EN).

Explanation

- The basic external data input procedure

The following signals in the Table 16.2 (a) are used to send data from the PMC to the CNC.

Table 16.2 (a)

Signal name	Input signal	Output signal
Address signal for external data input	EA0 to EA6	
Data signal for external data input	ED0 to ED31	
Read signal for external data input	ESTB	
Read completion signal for external data input		EREND
Search completion signal for external data input		ESEND

The basic external data input procedure is described below:

(1) The PMC sets the address signals, EA0 to EA6 that indicate the data type and data signals ED0 to ED31.
(2) The PMC sets the read signal ESTB to “1”.
(3) When the ESTB signal is set to “1”, the control unit reads the address.
(4) After reading the address, the control unit sets the read completion signal EREND to “1”.
(5) When the EREND signal is set to “1”, the PMC sets the ESTB signal to “0”.
(6) When the ESTB signal is set to “0”, the control unit sets the EREND signal to “0”. This completes the data input procedure. New data can now be entered.

The timing diagram is shown below (Fig. 16.2 (a)):

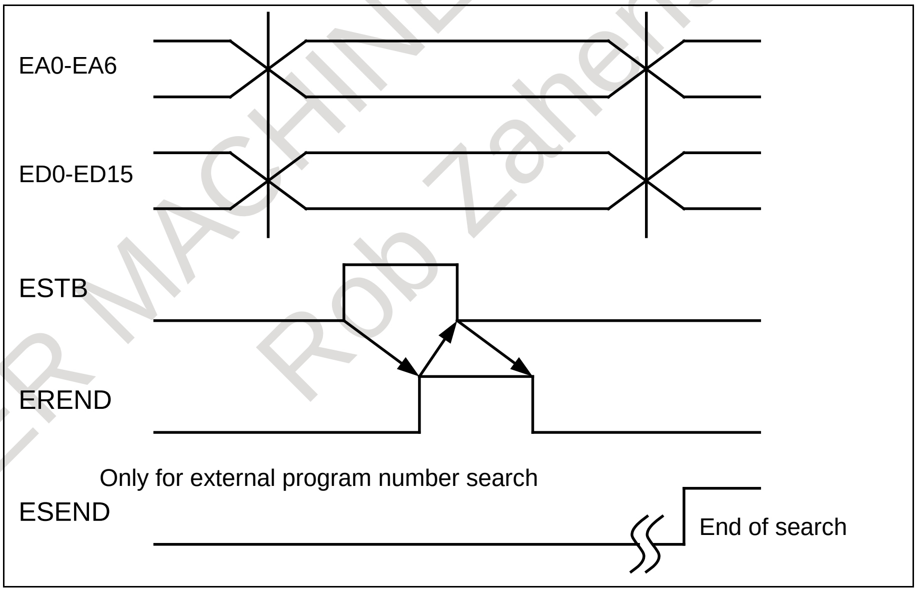

Fig. 16.2 (a) Timing diagram of External data input

Table 16.2 (b)

No.	Item	ESTB	EA6	EA5	EA4	EA3	EA2	EA1	EA0	ED31 to ED16	ED15 to ED0
1	External program number	1	0	0	0	X	X	X	X	Program number (BCD 8 digits with unsign)	
2	External tool offset	1	0	0	1	X	X	X	X	Offset value (BCD 8 digits with sign *1)	
3	Extended external machine zero point shift	1	0	1	0	axis code				Shift value (BCD 8 digits with sign *1)	

No.	Item	ESTB	EA6	EA5	EA4	EA3	EA2	EA1	EA0	ED31 to ED16	ED15 to ED0
4	External machine zero point shift	1	0	1	1	axis code					Extended external machine zero point shift value(binary) -9999 to +9999 *2
5	Alarm set	1	1	0	0	0	0	0	0		Alarm No. (binary) 0 to 999 (0 to 4095)
	Alarm clear	1	1	0	0	0	0	0	1		Alarm No. (binary) 0 to 999 (0 to 4095)
	Operator message set	1	1	0	0	0	1	0	0		message No. (binary) 0 to 999 (0 to 4095)
	Operator message clear	1	1	0	0	0	1	0	1		message No. (binary) 0 to 999 (0 to 4095)
	Message	1	1	0	0	0	X	1	1		character(Character code)
6	Substitute No. of parts required	1	1	1	0	0	0	0	0		No. of parts required (BDC4 digits with unsign)
	Substitute No. of parts machined	1	1	1	0	0	0	0	1		No. of parts machined (BDC4 digits with unsign)

NOTE

1. When bit 3 (EED) of parameter No. 6301 is set to 0, BCD 4 digits are used.
2. By setting bit 7 (EEX) of parameter No. 6300 to 1, a shift value of ±0 to 999999999 can be specified using ED0 to ED31.

NOTE

For axis code, refer to the Table 16.2 (c).

Table 16.2 (c)

Axis	Axis code			
	EA3	EA2	EA1	EA0
1st axis	0	0	0	0
2nd axis	0	0	0	1
3rd axis	0	0	1	0
4th axis	0	0	1	1
5th axis	0	1	0	0
6th axis	0	1	0	1
7th axis	0	1	1	0
8th axis	0	1	1	1
9th axis	1	0	0	0
10th axis	1	0	0	1
11th axis	1	0	1	0
12th axis	1	0	1	1
13th axis	1	1	0	0
14th axis	1	1	0	1
15th axis	1	1	1	0
16th axis	1	1	1	1

- External Program Number Search

A program number (1 to 9999) is specified from an extended source and is selected in the CNC memory.

For machines that can load several kinds of workpieces, this function can automatically select the program to be executed corresponding to a specific workpiece.

Data for the external program number search is accepted regardless of CNC mode, but the search execution can be made only in the reset state in MEM mode.

The ESEND signal switches from “0” to “1” on completion of external program number search. This signal does not turn to “0” unless the cycle start or reset signal is input, or another search is made. Use ESEND to initiate a cycle start signal after the search.

Because a search operation is deferred until a reset occurs in the MEM mode, an external program number search attempted during a CNC operation (the OP signal is “1”) results in the program being started immediately after the end of an automatic operation in a sequence in which the automatic operation is started by checking only the ESEND signal (search completion signal for external data input).

For this reason, using the bit 3 (ESC) of parameter No. 6300 enables an external program number search to be canceled at a CNC reset. Concretely, if a reset signal is input between the time the ESTB signal (read signal for external data input) is input and the time a search would be executed, setting the bit 3 (ESC) of parameter No. 6300 to 1 keeps the search from being executed. At the same time, the controller uses the ESCAN (search cancel signal for external data input) signal to inform the PMC that the search has been canceled.

The ESEND signal (search completion signal for external data input) will not become “1”, because the search is canceled.

The controller checks the state of the RST (NC reset) signal for a reset input between the rising edge of the ESTB signal (read signal for external data input) and the start of the search. Concretely, the controller cancels the external program number search if the RST (NC reset) signal becomes “1” even momentarily in this period. The ESCAN signal (search cancel signal for external data input) becomes “1” at the beginning of the search.

However, it becomes “0” when the next search is executed (for example, when a cycle start or reset signal is input), similarly to the ESEND signal (search completion signal for external data input).

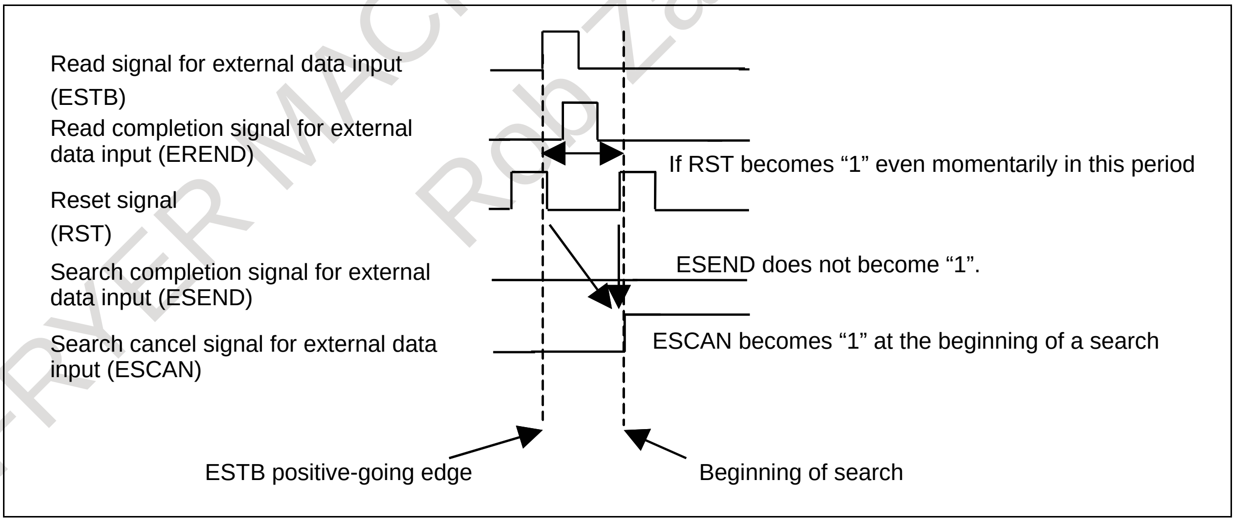

Fig. 16.2 (b) Timing diagram of External data input

This function searches the following folder for a target program:

When parameter No. 3467 is set to 0:

Searches the default foreground folder for the program.

When parameter No. 3467 is set to other than 0:

Searches the initial folder specified in parameter No. 3467 for the program.

NOTE

1. The external program number search is available when bit 4 (ESR) of parameter No. 6300 is set to 1.
2. In reset state the automatic operation lamp is off. If the start button is pushed in the cycle operation stop or hold state, search execution starts from the actual position indicated by the pointer.
3. When there is no program stored in memory corresponding to the set program number, the alarm DS1128 occurs.
4. When the program number search is set to 0, the alarm DS0059 occurs.
5. Data for the external program number search is accepted regardless of the mode, but the search execution can be made only in the reset state. Therefore, in case that the PMC sequence, which the cycle start is executed by checking search completion signal for external data input only, is used, if the external program number search is commanded twice, the program is executed twice.
   (When CNC accepts a command of the program number search, the command is not cancelled even if CNC becomes reset state by external reset signal and so on.) (See Fig. 16.2 (c).)
   If the program execution after reset becomes a problem, make the PMC sequence not to execute the cycle start after reset.
6. Parameter No. 3467 is also used by the “external workpiece number search”.
7. Parameter No. 3467 is also used by the “macro executor program reference and write function”.

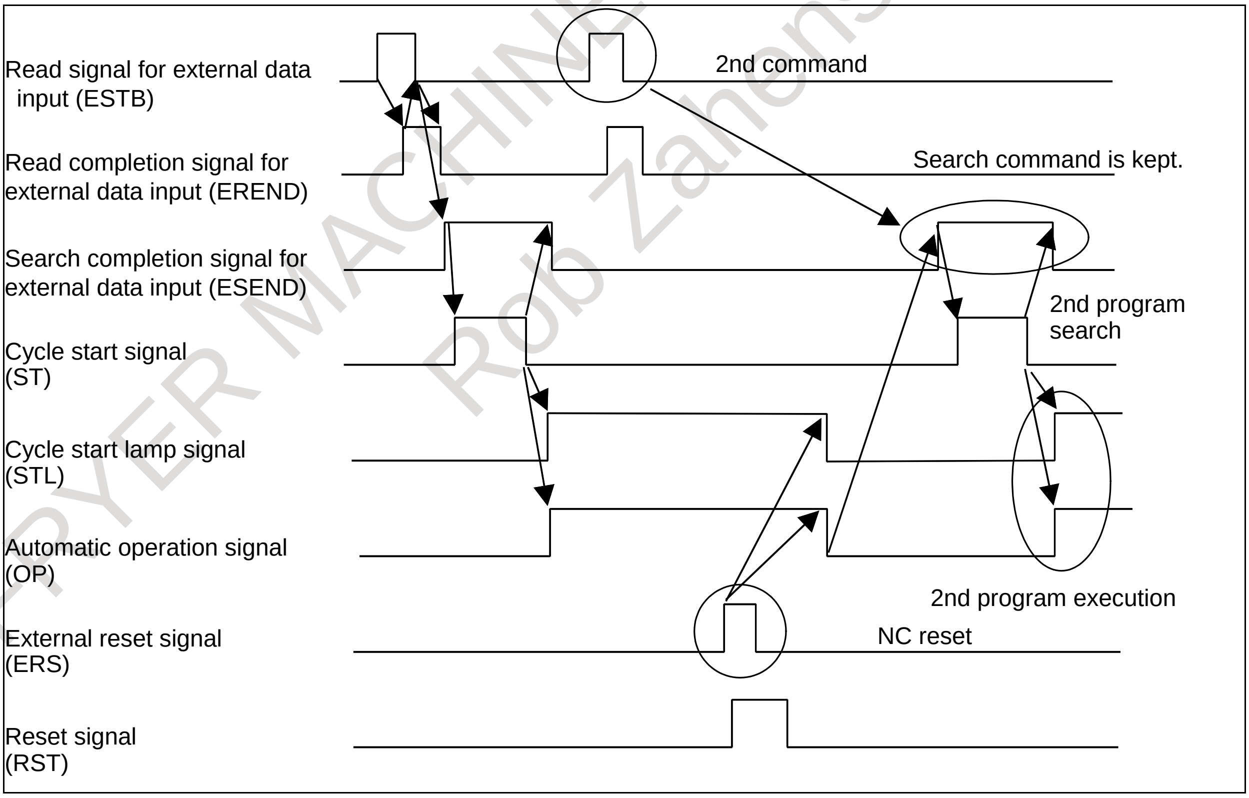

Fig. 16.2 (c) External program search and program execution after NC reset

- External Tool offset

These signals provide for changing the tool compensation value via the PMC. When the offset number is specified by a part program, data input from the PMC is added to the offset value. The offset value can also be used as input data itself by specifying the input signal.

When the machine tool is equipped with automatic tools or workpiece measuring functions, the offset value can be corrected using this function, by inputting the error from the correct value into the CNC via PMC.

If the tool compensation value is externally input when offset number 0 is specified in a part program (an offset cancel) in the lathe turning machine, the workpiece coordinate system shifts by the entered quantity.

The external tool offset range is +/ - 79999999.

> **NOTE**
> 1 When data is out of range, the alarm DS1128 occurs.
> 2 When the data of ineffective function is specified, the alarm DS1121 occurs.
> 3 If bit 3 (EED) of parameter No. 6301 is set to 1, the Data area can be specified by 32bit data specification.
> Under the setting, the external tool offset range is up to +/ - 79999999.

Data specification for external tool offset (For M series)

Address							Data *Note				
EA6	EA5	EA4	EA3	EA2	EA1	EA0	ED31	ED30	. . .	ED1	ED0
0	0	1	a/i	g/w	0	r/l	Sign	Offset value			

Sign: 0: + / 1: -

Offset value: Specified by BCD 8-digit code (0 to +/- 79999999) *Note

a/i	0	Incremental specification
	1	Absolute specification
g/w	0	Specification of tool wear offset value
	1	Specification of tool geometry offset value
r/l	0	Specification of tool length compensation value
	1	Specification of cutter compensation value

*Note: If the bit 3 (EED) of parameter No. 6301 is set to 0, the offset value is specified by using signals ED0 to ED14, the sign is decided by the signal ED15.
The range of data is available to specify the data from 0 to +/- 7999.

Data specification for external tool offset (For T series)

Address							Data *Note				
EA6	EA5	EA4	EA3	EA2	EA1	EA0	ED31	ED30	. . .	ED1	ED0
0	0	1	a/i	g/w	X/Z/R		Sign	Offset value			

Sign: 0: + / 1: - ; Offset value: Specified by BCD 8-digit code (0 to +/- 79999999) *Note

a/i	0	Incremental specification
	1	Absolute specification
g/w	0	Specification of tool wear offset value
	1	Specification of tool geometry offset value
X/Z/R	EA1=0, EA0=0	Specification of X axis offset
	EA1=0, EA0=1	Specification of Z axis offset
	EA1=1, EA0=0	Specification of tool nose radius compensation value

*Note: If the bit 3 (EED) of parameter No.6301 is set to 0, the offset value is specified by using signals ED0 to ED14, the sign is decided by the signal ED15.
The range of data is available to specify the data from 0 to +/- 7999.

NOTE
The Y-axis offset cannot be specified.

- External workpiece coordinate system shift

In the external workpiece coordinate system shift, the shift value can be externally modified by the signal of PMC.
Each axis has this shift value (parameter No. 1220), and this shift value is added to all the workpiece coordinate systems in common.
The shift value is not lost by cutting off the power supply.
The shift value can not only be added to the current work coordinate system shift but also be substituted for the current value.
The value range is 0 to + / - 79999999.
The unit and setting range are the same as the Tool offset.

NOTE
If bit 3 (EED) of parameter No. 6301 is set to 1, the data area can be specified by 32bit data specification.
Under the setting, the external tool compensation range is up to +/ - 79999999.

- External machine zero point shift

The machine coordinate system can be externally shifted by inputting a shift value.
When the shift value is input, compensation is immediately applied to the corresponding axis and the axis moves. The position accuracy can be improved by combining this function with sensors.
The specification to shift the axis is the same as the external workpiece coordinate system shift.
The compensation value is specified in signals ED0 to ED15 using a binary code ranging from 0 to ±9999. This compensation value must be specified in absolute value. The value which the machine actually moves at input is the difference from the previously stored value.
After the Reference point is established, this function becomes effective. The shift amount is memorized though the machine is not moved when the shift amount is input before the Reference point is established. When the Reference point is established afterwards, the machine is moved for the memorized shift amount.

NOTE

If bit 7 (EEX) of parameter No. 6300 is set to 1, the Data area can be specified by 32bit data specification.
Under the setting, the external machine zero point shift range is up to +/ - 999999999.

⚠ CAUTION

When a large value of compensation is applied at one time, an alarm such as "excessive error on stop" may occur. In this case, input the compensation in several smaller increments.

- External message

(a) External alarm message

By sending alarm number from PMC, the CNC is brought to an alarm status; an alarm message is sent to the CNC, and the message is displayed on the screen of the CNC.
Reset of alarm status is also done with external data.
Up to 4 alarm numbers (16 alarm numbers when bit 1 (M16) of parameter No. 11931 is set to 1) and messages can be sent at a same time. A message consisting of up to 63 ASCII characters can be sent for one alarm number.
In case of using a multi-path system, the alarm will be set separately for each path.
Also the alarm is set separately for one.
It is available to select the range of alarm number and the display form by setting the bit 0 (EXA) of parameter No. 6301.

<u>Bit 0 (EXA) of parameter No. 6301 = 0</u>

- Alarm number 0 to 999 can be sent. To distinguish these alarms from other alarms, the CNC displays them by adding 1000 to an alarm number.

<u>Bit 0 (EXA) of parameter No. 6301 = 1</u>

- Alarm number 0 to 4095 can be sent. The CNC displays them with prefix characters “EX” to an alarm number for display.

(b) External operator message

Message to the operator is given by the signal of PMC, and the message is displayed.

The operator messages can be cleared by external data.

Up to 4 message numbers (bit 1 (M16) of parameter No. 11931) can be sent at a same time. Up to 256 characters can be sent in an operator message.

In case of using a multi-path system, the operator message is common resource for plural path of machine group. It is set each machine group. It is available to display the operator message by using the primary path signal of machine group.

It is available to select the range of message number and the display form by setting the bit 1 (EXM) of parameter No. 6301.

Bit 1 (EXM) of parameter No. 6301 = 0

The message numbers 0 to 999 can be sent.

The message numbers 0 to 99 are displayed along with the message.

To distinguish these alarms from other alarms, the CNC displays them by adding 2000 to an alarm number.

When a message from 100 to 999 is displayed, the message number is not displayed; only its text is displayed.

Bit 1 (EXM) of parameter No. 6301 = 1

The message numbers 0 to 4095 can be sent.

The message numbers 0 to 99 are displayed along with the message.

The CNC displays them with prefix characters "EX" to an alarm for display.

When a message number from 100 to 4095 is displayed, the message number is not displayed; only its text is displayed.

Data specification method in external message

Table 16.2 (d)

Item	EA6	EA5	EA4	EA3	EA2	EA1	EA0	ED15 to ED0(binary)
Alarm set	1	0	0	0	0	0	0	Alarm No.
Alarm clear	1	0	0	0	0	0	1	Alarm No.

Signals

Address signals for external data input EA0 to EA6 <Gn002.6 – Gn002.0>

[Classification] Input signal

[Function] These signals indicate the type of the entered data.

Data signals for external data input ED0 to ED31 <Gn211, Gn210,Gn000, Gn001>

[Classification] Input signal

[Function] These signals indicate the entered data.
The use of the 32 code signals (16 code signals) varies with the data type.

Read signal for external data input ESTB <Gn002.7>

[Classification] Input signal

[Function] The signal reports that the address and data are set in external data input.
When the signal is set to "1", the control unit reads the address and data for external data input.

Read completion signal for external data input EREND <Fn060.0>

[Classification] Output signal

[Function] This signal reports that the control unit has finished reading the entered data.

Search completion signal for external data input ESEND <Fn060.1>

[Classification] Output signal

[Function] This signal report that program number search, specified by external data input, has been completed.

[Output cond.] This signal is set to "1" when:

- The program number search specified by external data input is completed.

The signal is set to "0" when:

- An automatic operation is started.
- A reset occurs.

Search cancel signal for external data input ESCAN<Fn060.2>

[Classification] Output signal

[Function] This signal notifies PMC of the cancellation of a program number search.

[Output cond.] When a reset is input between the time read signal for external data input ESTB is input and the time a search is executed in the external program number search function, if bit 3 (ESC) of parameter No. 6300 is 1, the search is not executed. At this time, the control unit sets search cancel signal for external data input ESCAN to "1" instead of setting search completion signal for external data input ESEND to "1".

NOTE
This signal is enabled when bit 3 (ESC) of parameter No. 6300 is 1.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn000	ED7	ED6	ED5	ED4	ED3	ED2	ED1	ED0
Gn001	ED15	ED14	ED13	ED12	ED11	ED10	ED9	ED8
Gn002	ESTB	EA6	EA5	EA4	EA3	EA2	EA1	EA0
Gn210	ED23	ED22	ED21	ED20	ED19	ED18	ED17	ED16
Gn211	ED31	ED30	ED29	ED28	ED27	ED26	ED25	ED24

	#7	#6	#5	#4	#3	#2	#1	#0
Fn060						ESCAN	ESEND	EREND

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
6300	EEX			ESR	ESC			

[Input type] Parameter input
[Data type] Bit path

#3 ESC When a reset is input between the input of the external data input read signal ESTB and the execution of a search, the external program number search function:
0: Performs a search.
1: Does not perform a search.

#4 ESR The external program number search function is:
0: Disabled.
1: Enabled.

#7 EEX PMC EXIN function
0: Conventional specifications
1: Extended specifications
If you want to use external machine coordinate system shift which handles ±10.000 or more shift unavailable with the PMC/EXIN command in the conventional specifications, set 1.
When this function is used for a multi-path system, the setting for path 1 is used.
For details of EXIN and how to change ladder software, refer to the PMC manuals.

	#7	#6	#5	#4	#3	#2	#1	#0
6301					EED	NNO	EXM	EXA

[Input type] Parameter input
[Data type] Bit machine group

#0 EXA This bit selects an external alarm message specification.
0: A message number from 0 to 999 can be sent. When displaying an alarm number, the CNC prefixes the character string "EX" to the alarm number obtained by adding 1000 to the message number.
1: A message number from 0 to 4095 can be sent. The CNC prefixes the character string "EX" to a alarm number for display.

#1 EXM This bit selects an external operator message specification.
0: A message number from 0 to 999 can be sent. The message of a message number from 0 to 99 is displayed together with its number. The CNC adds 2000 to a number for distinction. A message number from 100 to 999 is not displayed on the screen, but only the corresponding message is displayed on the screen.
1: A message number from 0 to 4095 can be sent. The message of a message number from 0 to 99 is displayed together with its number. The CNC prefixes the character string "EX" to a message number for display. A message number from 100 to 4095 is not displayed on the screen, but only the corresponding message is displayed on the screen.

#2 NNO When operator messages are set by external data input, a new line operation between one message set with a number and another message set with a different number is:
0: Performed.
1: Not performed.

#3 EED To specify data for external tool compensation and external workpiece coordinate system shift, use:
0: Signals ED15 to ED0.
(The value which can be specified for tool compensation and workpiece coordinate system shift is from 0 to ±7999.)
1: Signals ED31 to ED0.
(The value which can be specified for tool compensation and workpiece coordinate system shift is from 0 to ±79999999.)

6310	Setting for number addition to external operator messages

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Word machine group
[Valid data range] 0 to 4096
This parameter sets the number of messages to which message numbers are to be prefixed in external operator message display.
When 0 is set, the same operation as when 100 is set is performed.
[Example] When 500 is set in this parameter, the messages of message numbers 0 to 499 are displayed together with their numbers on the screen. A message number of 500 and up is not displayed on the screen, but only the corresponding message is displayed on the screen.

	#7	#6	#5	#4	#3	#2	#1	#0
11931							M16	

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#1 M16 In the external data input and external messages, the maximum number of external alarm messages and external operator messages that can be displayed is:
0: 4.
1: 16.

3467	Selection of the target folder among initial folders

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 7, 11 to 20
This parameter selects a folder to be used for the external workpiece number search function, external program number search function, and macro executor program reference and write function among the following initial folders:
0: No specification
1: Root folder (//CNC_MEM)
2: System folder (//CNC_MEM/SYSTEM)
3: MTB-dedicated folder 1 (//CNC_MEM/MTB1)
4: MTB-dedicated folder 2 (//CNC_MEM/MTB2)

5: User folder (//CNC_MEM/USER)
6: Path folder (//CNC_MEM/USER/PATHn) (Note)
(NOTE) PATHn: n is the selected path number (1 to the maximum number of paths).
7: Common program folder (//CNC_MEM/USER/LIBRARY)
8 to 10: Not specified.
11: Path 1 folder (//CNC_MEM/USER/PATH1)
12: Path 2 folder (//CNC_MEM/USER/PATH2)
13: Path 3 folder (//CNC_MEM/USER/PATH3)
14: Path 4 folder (//CNC_MEM/USER/PATH4)

When “0: No specification” is selected, the following folder is used for each function:

- External program number search function
- External workpiece number search function
  (Default foreground folder)
- Macro executor program reference and write function
  (Default background folder)

NOTE
Any user-created folder cannot be specified.
For example, assume that a user folder named PATH3 is created in //CNC_MEM/USER in a 2-path system. User-created folder //CNC_MEM/USER/PATH3 cannot be specified by specifying 13 in this parameter.

Alarm and message

Number	Message	Description
DS0059	SPECIFIED NUMBER NOT FOUND	The No. specified for a program No. or sequence No. search could not be found. There was an I/O request issued for a pot No. or offset (tool data), but either no tool numbers have been input since power ON or there is no data for the entered tool No.
DS0131	TOO MANY MESSAGE	An attempt was made to display an external operator message or external alarm message, but five or more displays were required simultaneously.
DS0132	MESSAGE NUMBER NOT FOUND	An attempt to cancel an external operator message or external alarm message failed because the specified message number was not found.
DS0133	TOO LARGE NUMBER	A value other than 0 to 4095 was specified as the external operator message or the external alarm message number.
DS1120	UNASSIGNED ADDRESS (HIGH)	The upper 4 bits (EIA4 to EIA7) of an external data I/O interface address signal are set to an undefined address (high bits).
DS1121	UNASSIGNED ADDRESS (LOW)	The lower 4 bits (EIA0 to EIA3) of an external data I/O interface address signal are set to an undefined address (low bits).
DS1128	DI.EIDLL OUT OF RANGE	The numerical value input by external data input signals EID0 to EID31 has exceeded the permissible range.
DS1130	SEARCH REQUEST NOT ACCEPTED	No requests can be accepted for a program No. or a sequence No. search as the system is not in the memory mode or the reset state.
DS1131	EXT-DATA ERROR (OTHER)	[External Data I/O] An attempt was made to input tool data for tool offset by a tool No. during loading by the G10 code.

16.3 EXTENDED EXTERNAL MACHINE ZERO POINT SHIFT

Overview

The conventional external machine zero point shift value function cannot make shifts on multiple axes simultaneously.
With this extended function, external machine zero point shifts can be performed on all controlled axes.
An external machine zero point shift value is to be set in a parameter-set R area. A shift value must be specified using a binary code, and the absolute value of a number from -32767 to 32767 must be specified.

Explanation

- Setting

This function is enabled by setting bit 0 (EMS) of parameter No. 1203 to 1. Enter a desired external machine zero point shift value at the location starting at the address (R area of the PMC) set in parameter No. 1280.
If 100 is set in parameter No. 1280, enter shift values at the location starting at R100 of the PMC. Set an even number in parameter No. 1280.

Example) When 100 is set in parameter No. 1280

R0100	External machine zero point shift value for the 1st axis (Low)
R0101	External machine zero point shift value for the 1st axis (High)
R0102	External machine zero point shift value for the 2nd axis (Low)
R0103	External machine zero point shift value for the 2nd axis (High)
:	:
R(0100+2(n-1))	External machine zero point shift value for the n-th axis (Low)
R(0100+2(n-1)+1)	External machine zero point shift value for the n-th axis (High)

- Shift value

Specify a shift value by using a two-byte binary code for each axis.
A value from -32767 to 32767 can be specified.
A shift value is assumed to be specified as an absolute value.
The unit is the detection unit.

Example)

Suppose that the incremental system is IS-B, the machine is a millimeter machine (bit 0 of parameter No. 1001 = 0),
the detection unit is 0.0002 mm (CMR (parameter No. 1820) = 10),
and parameter No. 1280 is set to 100.
When the following values are written to the R area :
R102 = 11001100 (CCh)
R103 = 11101101 (EDh)
the machine position on the second axis is shifted, and the shift value at that time is:

EDCCh [pulse] * 0.0002 [mm/pulse] = -0.932 mm

- Relationship with the error compensation functions

This function is superposed on error compensation functions such as the pitch error compensation function and straightness compensation function.

- Coordinate system

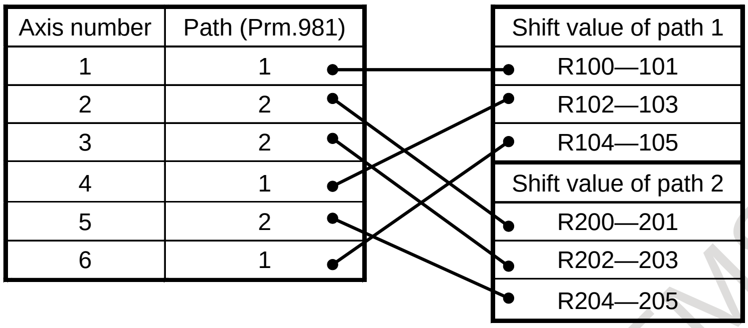
If the machine is moved by this function, the coordinates are not updated.

- Multi-path control

In multi-path control, the locations of the R area are used in ascending order of axis numbers in the paths as shown in the example below.

Example)

When, in parameter No. 1280, 100 is set for path 1 and 200 is set for path 2

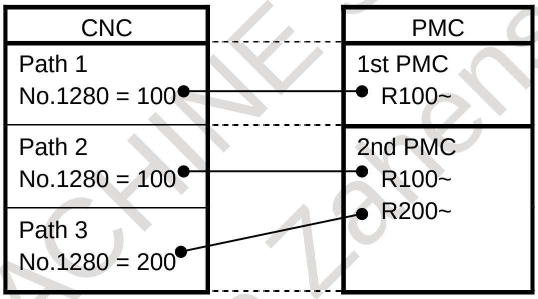


- Multi-path PMC

With a multi-path PMC, the PMC R area allocated to each path is used.

Example)

When the first PMC is assigned to path 1, and the second PMC is assigned to paths 2 and 3, the R area of the first PMC is assigned to shift values for path 1, and the R area of the second PMC is assigned to shift values for paths 2 and 3.



Signal

Extended external machine zero point shift signal
EMZ0 to EMZ15 <Rn to Rn+2*controlled axis count-1>

[Classification] Input signal

[Function] Sets an external machine zero point shift value.

[Operation] When an external machine zero point shift value is set with this signal, the machine position is shifted by the specified value.
A set value is regarded as an absolute value.
As a signal address, specify an arbitrary R address with parameter No. 1280.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Rn	EMZ7	EMZ6	EMZ5	EMZ4	EMZ3	EMZ2	EMZ1	EMZ0
Rn+1	EMZ15	EMZ14	EMZ13	EMZ12	EMZ11	EMZ10	EMZ9	EMZ8
:								
Rn+2*controlled axis count-1	EMZ15	EMZ14	EMZ13	EMZ12	EMZ11	EMZ10	EMZ9	EMZ8

n represents the value set in parameter No. 1280.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
1203								EMS

[Input type] Parameter input
[Data type] Bit path

#0 EMS The extended external machine zero point shift function is:
0: Disabled.
1: Enabled.

> **NOTE**
> 1 To use the extended external machine zero point shift function, the external machine zero point shift function or the external data input function is required.
> 2 When the extended external machine zero point shift function is enabled, the conventional external machine zero point shift function is disabled.

> ⚠ **WARNING**
> Set an appropriate value to parameter No.1280 beforehand when you set 1 to this parameter.
> If an internal relay of the set address in parameter No.1280 is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used internal relay.

1280	Start address of signals used with the extended external machine zero point shift function

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] Even number from 0 to 59999

Set the start address of signals used with the extended external machine zero point shift function. If a nonexistent address value is specified, this function is disabled.
If 100 is set, for example, this function uses R100 and up. The last R address to be used depends on the number of controlled axes. When eight controlled axes are used, R100 to R115 are used.

> **NOTE**
> 1 If a nonexistent R address or an address in the system area is set, this function is disabled.
> 2 Set an even number in this parameter.
> 3 When this parameter is 0, an internal relay from address R0 is used.

> ⚠ **WARNING**
> If an internal relay of the set address in this parameter is used by another usage, it may cause an unexpected machine behavior. Be careful enough that you must prevent the competition of the used internal relay.

Warning and Note

> ⚠ **WARNING**
> 1 When writing an external machine zero point shift value to the R area, write a shift value for one axis as a word. If data for one axis is written in two operations, one byte in one operation, an incorrect shift operation can result.
> 2 When writing data with the PMC or FOCAS2 function, provide an interval of about 8 ms after one write operation before starting the next write operation. If this write timing is not observed, an incorrect shift operation can result.

> **NOTE**
> This function can not use together with flexible path axis assignment function.

16.4 IMPROVEMENT OF EXTERNAL MACHINE ZERO POINT SHIFT

Overview

In case of the external machine zero point shift or the extended external machine zero point shift, the maximum shift value per one execution cycle is extended.

Explanation

In case of the external machine zero point shift or the extended external machine zero point shift, when all of following conditions are satisfied, the maximum shift value per one execution cycle is multiplied by 10. (The positive side is 1270. The negative side is -1280.)

- Bit 1 (EMF) of parameter No. 1814 = 1
- Increment system is B or C.
- Bit 2 (HPE) of parameter No. 1816 = 1

> **NOTE**
> 1 In case of the compensation functions, when this function is valid, the maximum compensation value per one execution cycle is multiplied by 10. (The positive side is 1270. The negative side is -1280.)
> - Stored pitch error compensation
> - Bi-directional pitch error compensation
> - Interpolation type pitch error compensation
> - Smooth backlash compensation
>
> 2 Bit 1 (EMF) of parameter No.1814 is invalid on the following axes.
> - Axis for Cs contour control
> - Axis for Spindle positioning

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
1814							EMF	

[Input type] Parameter input
[Data type] Bit axis

#1 EMF In case of the external machine zero point shift or the extended external machine zero point shift, the maximum shift value per one execution cycle is:
0: Conventional specification. (The positive side is 127. The negative side is -128.)
1: Multiplied by 10. (The positive side is 1270. The negative side is -1280.)
When all of following conditions are satisfied, this parameter is valid.
- Increment system is B or C.
- Bit 2 (HPE) of parameter No. 1816 = 1

NOTE
1 In case of the compensation functions, when this parameter is valid, the maximum compensation value per one execution cycle is multiplied by 10. (The positive side is 1270. The negative side is -1280.)
- Stored pitch error compensation
- Bi-directional pitch error compensation
- Interpolation type pitch error compensation
- Smooth backlash compensation
2 This parameter is invalid on the following axes.
- Axis for Cs contour control
- Axis for Spindle positioning

	#7	#6	#5	#4	#3	#2	#1	#0
1013							ISCx	ISAx

[Input type] Parameter input
[Data type] Bit axis

NOTE
When at least one of these parameters is set, the power must be turned off before operation is continued.

#0 ISAx
#1 ISCx Increment system of each axis

Increment system	Bit 1 (ISC)	Bit 0 (ISA)
IS-A	0	1
IS-B	0	0
IS-C	1	0

	#7	#6	#5	#4	#3	#2	#1	#0
1816						HPE		

[Input type] Parameter input
[Data type] Bit axis

#2 HPE The compensation amount by the error compensation can be output based on:
0: Detection unit
1: 1/1000 of the detection unit (same unit as for nano compensation)

NOTE
1 This parameter is valid in the following error compensation.
- Smooth backlash compensation
- Interpolation type straightness compensation
- Interpolation type straightness compensation 3072 points
- Interpolation type pitch error compensation

2 In error compensation, set compensation data such as pitch error data by the detection unit regardless of the setting of this parameter.
3 This parameter is valid on the following axes.
- Servo axis
- Axis for which Cs contour control or Spindle positioning is enabled

4 When this parameter is 1, the compensation amount by following error compensation can be output based on the detection unit.
- Backlash compensation
- Stored pitch error compensation
- Straightness compensation
- Inclination compensation
- Bi-directional pitch error compensation

16.5 EXTERNAL WORKPIECE NUMBER SEARCH

Overview

A machining program stored in the part program memory can be started by an external signal.
When automatic operation is started in the memory operation mode during the reset state, the program is searched for from a specified workpiece number and then executed from the beginning.
For a machine with a function for automatically loading several types of workpieces, this function can be used to automatically select and execute the program according to the workpiece.
This function searches the following folder for a target program:
When parameter No. 3467 is set to 0:
Searches the default foreground folder for the program.
When parameter No. 3467 is set to other than 0:
Searches the initial folder specified in parameter No. 3467 for the program.

> **NOTE**
> 1 Parameter No. 3467 is also used by the “external program number search”.
> 2 Parameter No. 3467 is also used by the “macro executor program reference and write function”.

Signal

External workpiece number search signals
PN1,PN2,PN4,PN8,PN16 <Gn009.0 to Gn009.4>

[Classification] Input signal

[Function] These signals specify a workpiece number to be executed in the memory operation mode. These are 5-bit code signals and correspond to the workpiece numbers as shown Table 16.5 (a) (binary codes).

Table 16.5 (a)

External workpiece number search signals					Workpiece number
PN16	PN8	PN4	PN2	PN1	
0	0	0	0	0	00
0	0	0	0	1	01
0	0	0	1	0	02
Omission					
1	1	1	1	0	30
1	1	1	1	1	31

Of these numbers, workpiece number 00 has special meaning "making no search". Therefore, a number from 01 to 31 can be specified as a workpiece number.

> **NOTE**
> The signals are also used to specify a file number for finding the beginning of the file in inputting an external program.

[Operation] Searches the program number corresponding to the workpiece number specified by these signals when:
Automatic operation is started (the automatic operation start signal (ST) changes from “1” to “0”) in the memory operation mode if automatic operation is in the reset state (the automatic operation signal (OP) is “0”).
When the workpiece number is 00, however, no search is carried out.
The searched program is used in:
- Automatic operation in the memory operation mode
- Foreground edit in the memory edit mode

Extended external workpiece number search signals
EPN0 to EPN13 <Gn024.0 to Gn025.5>

[Classification] Input signal

[Function] These signals specify a workpiece number to be executed in the memory operation mode. The correspondence with the workpiece numbers is shown Table 16.5 (b) (binary codes).

Table 16.5 (b)

Extended external workpiece number search signals														Workpiece number
EPN13	EPN12	EPN11	EPN10	EPN9	EPN8	EPN7	EPN6	EPN5	EPN4	EPN3	EPN2	EPN1	EPN0	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0000
0	0	0	0	0	0	0	0	0	0	0	0	0	1	0001
0	0	0	0	0	0	0	0	0	0	0	0	1	0	0002
Omission														
1	0	0	1	1	1	0	0	0	0	1	1	1	0	9998
1	0	0	1	1	1	0	0	0	0	1	1	1	1	9999

Of these numbers, workpiece number 0000 has special meaning "making no search". Therefore, a number from 0001 to 9999 can be specified as a workpiece number.
These signals are used in place of the external workpiece number search signals (PN1 to PN16) when the signal is selected by bit 1 (EPN) of parameter No. 3006.

[Operation] Operation of these signals is same as operation of external workpiece number search signals.

External workpiece number search start signal EPNS <Gn025.7>

[Classification] Input signal

[Function] This signal executes only the search function of the workpiece number search and does not perform automatic operation. When this signal changes from ”1” to ”0”, the search function is executed.
When bit 2 (EPS) of parameter No. 3006 is set to 1, this signal is enabled and the search function by ST is disabled.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn009				PN16	PN8	PN4	PN2	PN1
Gn024	EPN7	EPN6	EPN5	EPN4	EPN3	EPN2	EPN1	EPN0
Gn025	EPNS		EPN13	EPN12	EPN11	EPN10	EPN9	EPN8

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
3006						EPS	EPN	

[Input type] Parameter input
[Data type] Bit

#1 EPN As signals for specifying workpiece numbers for external workpiece number search:
0: The external workpiece search signals (PN1 to PN16) are used. (A number from 1 to 31 can be specified.)
1: The extended external workpiece number search signals (EPN0 to EPN13) are used. (A number from 1 to 9999 can be specified.)

#2 EPS As the signal for starting external workpiece number search:

0: The automatic operation start signal ST is used. When automatic operation (memory operation) is started, a search is made.

1: The external workpiece number search start signal EPNS is used. ST does not start a search.

3020	Correspondence between workpiece numbers and program numbers in external workpiece number search (PN)

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] -1 to 99

This parameter has the following meaning according to the value set.

- When a value from 0 to 99 is set
  (Program number) = (setting)*100+(workpiece number)
  This means that the setting specifies the higher 2 digits of a program number.
- When the value -1 is set
  The higher 2 digits of a program number represent the minimum of the existing program numbers.

<u>Example</u>

When workpiece number 21 is specified, program numbers such as O0021, O0121, and O0221 are searched for. If O0021 is not found, but O0121 and O0221 are found, O0121 is selected as the program number.

> **NOTE**
> This parameter is valid when a workpiece number is specified using the PN1 to PN16 signals (when bit 1 (EPN) of parameter No. 3006 is set to 0).

3467	Selection of the target folder among initial folders

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 7, 11 to 20

This parameter selects a folder to be used for the external workpiece number search function, external program number search function, and macro executor program reference and write function among the following initial folders:

0:	No specification	
1:	Root folder	(//CNC_MEM)
2:	System folder	(//CNC_MEM/SYSTEM)
3:	MTB-dedicated folder 1	(//CNC_MEM/MTB1)
4:	MTB-dedicated folder 2	(//CNC_MEM/MTB2)
5:	User folder	(//CNC_MEM/USER)
6:	Path folder	(//CNC_MEM/USER/PATHn) (Note)
	(NOTE) PATHn: n is the selected path number (1 to the maximum number of paths).	
7:	Common program folder	(//CNC_MEM/USER/LIBRARY)
8 to 10:	Not specified.	
11:	Path 1 folder	(//CNC_MEM/USER/PATH1)
12:	Path 2 folder	(//CNC_MEM/USER/PATH2)
13:	Path 3 folder	(//CNC_MEM/USER/PATH3)
14:	Path 4 folder	(//CNC_MEM/USER/PATH4)

When “0: No specification” is selected, the following folder is used for each function:

- External program number search function
- External workpiece number search function
  (Default foreground folder)
- Macro executor program reference and write function
  (Default background folder)

NOTE
Any user-created folder cannot be specified.
For example, assume that a user folder named PATH3 is created in //CNC_MEM/USER in a 2-path system. User-created folder //CNC_MEM/USER/PATH3 cannot be specified by specifying 13 in this parameter.

Alarm and message

Number	Message	Description
DS0059	SPECIFIED NUMBER NOT FOUND	The program corresponding to the specified workpiece No. could not be found.

16.6 EXTERNAL KEY INPUT

Overview

MDI key codes can be sent from the PMC to CNC by means of interface signals. This allows the CNC to be controlled in the same way as when the operator performs MDI key operation.

Signal

- Signal list

Control is realized by exchanging the following interface signals (Table 16.6 (a)) between the PMC and CNC:

Table 16.6 (a)

Signal name	Abbreviation
External key input mode selection signal (input)	ENBKY
Key code signals (input)	EKC0 to EKC7
Key code read signal (input)	EKSET
Key code read completion signal (output)	EKENB
Key input disable signal (output)	INHKY
Program screen display mode signal (output)	PRGDPL

- Signal detail

The processing flow in the PMC is shown Fig. 16.6 (a).

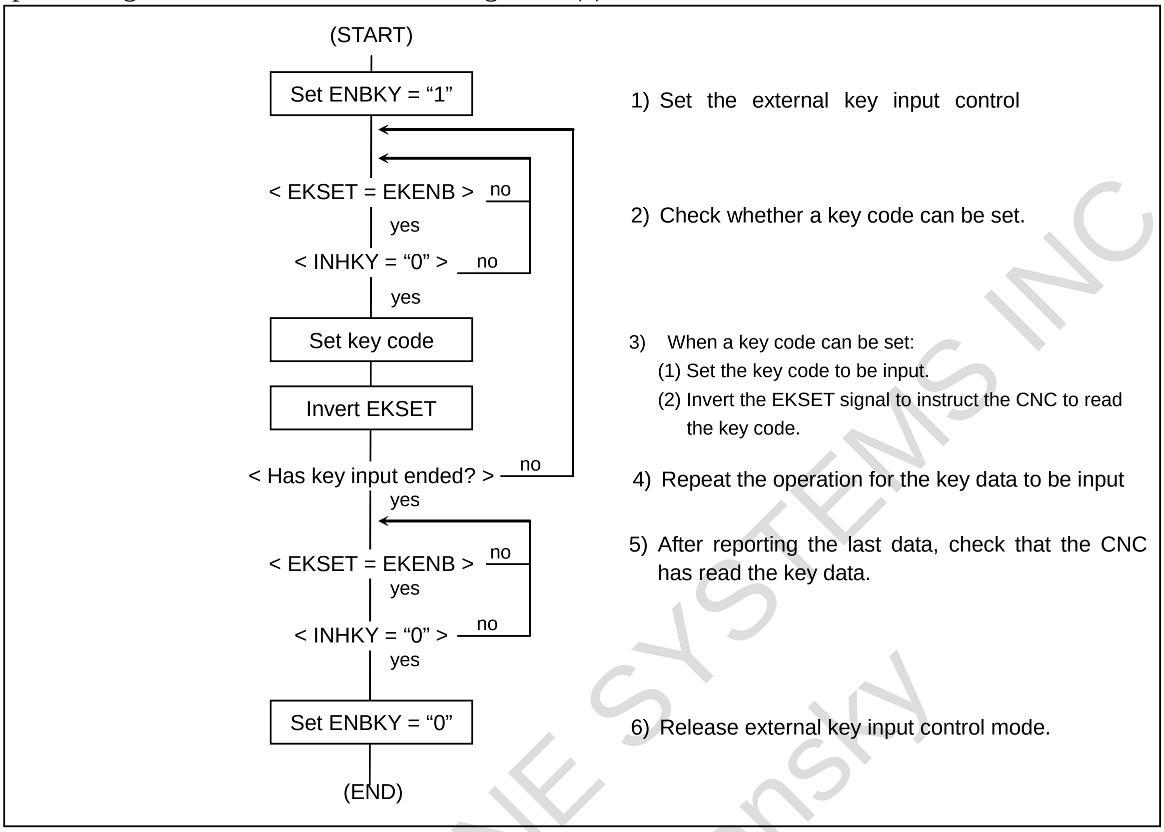


Fig. 16.6 (a)

> **NOTE**
> Read processing is controlled by exclusive-ORing (XOR) the key code read signal (EKSET) with the read completion signal (EKENB). When the EKSET and EKENB signals differ in their logic, the CNC reads the input key code. Once reading has been completed, the CNC inverts the EKENB signal to match its logic with that of the EKSET signal.
> In the PMC, on the other hand, a new key code cannot be set while the EKSET and EKENB signals differ in their logic.

External key input mode selection signal ENBKY<G066.1>

[Classification] Input signal

[Function] While this signal is turned on "1", external key input control is enabled. In external key input control mode, any MDI key operations are ignored.

> **NOTE**
> 1 When ENBKY is set to "1" to enable external key input control, key code input based on the C Language Executor is also ignored.
> 2 Key codes input with the external key input function can be read by the macro executor and C Language Executor.

NOTE

3 Even when external key input control is enabled, pressing the SHIFT key on the MDI keyboard for 5 seconds can produce a hard copy of the screen.

Pressing the CAN key while a hard copy of the screen is being produced can cancel the production of a hard copy of the screen.

Even if the key code of the CAN key is input with the external key input function, the production of a hard copy of the screen cannot be stopped.

Key code read signal EKSET<G066.7>

[Classification] Input signal

[Function] This signal instructs the CNC to read the input key code.
If the logical state of this signal is opposite to the logical sate of the key code read completion signal EKENB, a key code read is specified.

Key code signals EKC0 to EKC7<G098>

[Classification] Input signal

[Function] These signals set an input key code.

Key input disable signal INHKY<F053.0>

[Classification] Output signal

[Function] While this signal is “1”, no key code is accepted in external key input control mode.

[Output cond.] This signal is set to “1” during program editing or program input/output.

Program screen display mode signal PRGDPL<F053.1>

[Classification] Output signal

[Function] This signal posts whether the CNC is displaying the program screen.

[Output cond.] This signal is set to “1” when the program screen is displayed.

Key code read completion signal EKENB<F053.7>

[Classification] Output signal

[Function] This signal reports that the CNC has read a key code.

[Output cond.] When the CNC completes key code read operation, the logical state of this signal is set to the same state as for the key code read signal EKSET.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G066	EKSET						ENBKY	
G098	EKC7	EKC6	EKC5	EKC4	EKC3	EKC2	EKC1	EKC0

	#7	#6	#5	#4	#3	#2	#1	#0
F053	EKENB						PRGDPL	INHKY

MDI key code

Codes in the table are given in hexadecimal. For example,

A corresponds to 41H in hexadecimal.

corresponds to 90H in hexadecimal.

- MDI Key Code Table (00H to 7FH)

	0	1	2	3	4	5	6	7
0			Space	0	@	P		
1			!	1	A	Q		
2			“ (Double-quote)	2	B	R		
3			#	3	C	S		
4			$	4	D	T		
5				5	E	U		
6			&	6	F	V		
7			‘ (Single-quote)	7	G	W		
8			(	8	H	X		
9	TAB		)	9	I	Y		
A	; (EOB)		*	: (Colon)	J	Z		
B			+	; (Semicolon)	K	[		
C			, (Comma)	<	L	¥		
D			- (Minus)	=	M	]		
E			. (Period)	>	N			~
F			/	?	O	_ (Underline)		

- MDI Key Code Table (80H to FFH)

	8	9	A	B	C	D	E	F
0		RESET	[VF9] (Note 3)					[F0] (Note 2)
1			[VF8] (Note 3)					[F1] (Note 2)
2			[VF7] (Note 3)					[F2] (Note 2)
3			[VF6] (Note 3)					[F3] (Note 2)
4	SHIFT	INSERT	[VF5] (Note 3)				AUX	[F4] (Note 2)
5		DELETE	[VF4] (Note 3)					[F5] (Note 2)
6	CAN	ALTER	[VF3] (Note 3)					[F6] (Note 2)
7		ALT	[VF2] (Note 3)					[F7] (Note 2)
8	Cursor →	INPUT	[VF1] (Note 3)				POS	[F8] (Note 2)
9	Cursor ←						PROG	[F9] (Note 2)
A	Cursor ↓	HELP					OFFSET SETTING	
B	Cursor ↑	CTRL					SYSTEM	
C		ABC/abc					MESSAGE	
D							GRAPH (CUSTOM) (Note 1)	
E	PAGE ↓						CUSTOM (Note 1)	[FR] (Note 2)
F	PAGE ↑						CUSTOM2	[FL] (Note 2)

NOTE

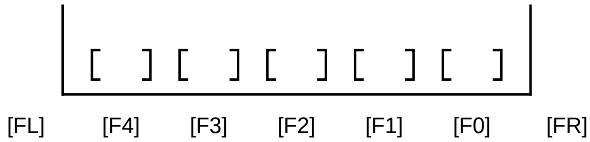
1 For the small keyboard, 0EDH is assigned to 
.

For the standard keyboard, 0EDH is assigned to 
. 0EEH is assigned to 

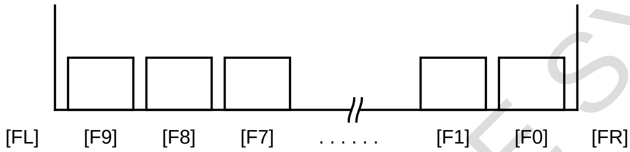
.

2 Handling of the soft keys
[F0] to [F9], [FR], and [FL] in the key code table are the key codes for the soft keys. They are associated with the MDI keys as shown below.

Key configuration for 7-soft key type LCD, or etc. : 5 keys + 2 keys ([F0] to [F4] and [FR], [FL])



Key configuration for 12-soft key type LCD, or etc.: 10 keys + 2 keys ([F0] to [F9] and [FR], [FL])



3 Handling of the vertical soft keys
[VF1] to [VF9] in the key code table are the key codes for the vertical soft keys. From the top to the bottom, [VF1] to [VF9] are arranged.

16.7 ONE TOUCH MACRO CALL

Overview

This function enables the following three operations in pushing the switch installed in the machine only by the change in a minimum LADDER program.

(1) Changes to MEM mode.
(2) Execution of macro program registered in memory.
(3) Return to the mode before macro program is executed.
And the program which had been selected before macro program is executed is automatically selected.

This function is enabled only in the reset status (not during a reset). That is, this function cannot be used during automatic operation (including stopping and suspending of automatic operation), a reset, or an emergency stop.

Explanation

- Sequence between PMC and CNC

The signal must be processed between PMC and CNC according to the following procedures.

Start

(1) The macro call start signal MCSTx <Gn512.0 to Gn513.7> is input from PMC to CNC based on the signal from the macro call switch installed in the machine.

Mode change

(2) CNC outputs the mode notification signal and the mode change request signal MCRQ <Fn512.1> when the macro call start signal (MCSTx) is detected. At this time, MEM mode is notified as the mode notification signal. The macro call executing signal MCEXE <Fn512.0> and Call program confirmation signal MCEXx <Fn514.0 toFn515.7> are output at the same time.
(3) PMC must change the mode based on the signal output in the step of above (2).
(4) Set “1” in the mode change completion signal MCFIN <Gn514.0> by PMC when the mode change is completed. If this mode is different from that specified from the CNC in (2) or the reset mode, an alarm PS5306 occurs.

Execution of macro program

(5) When MCFIN signal is set to “1”, CNC executes the macro program.

End of macro program

(6) Instruct M02 or M30 at the end of the macro program.
Moreover, input external reset signal (ERS) or reset&rewind signal (RRW) with M02 or M30 on the PMC side.
Upon completion of the reset, the program selected before execution of the macro is automatically selected. The mode change request signal(MCRQ) and mode notification signals are output at the same time. At this time, the mode when macro call start signal (MCSTx) is input is notified as the mode notification signal.

Return of mode

(7) Change the mode on the PMC side based on the signal output in the step of above (6).
(8) Set “1” in Mode change completion signal (MCFIN) on the PMC side when the mode change is completed. On the CNC side, the Mode change request signal (MCRQ), the Macro call executing signal (MCEXE) and the Call program confirmation signal(MCEXx) are set to “0” concurrently with asserting of the Mode change completion signal (MCFIN). The PS5306 alarm is not checked at this time.

The Fig. 16.7 (a) shows the above-mentioned sequence.

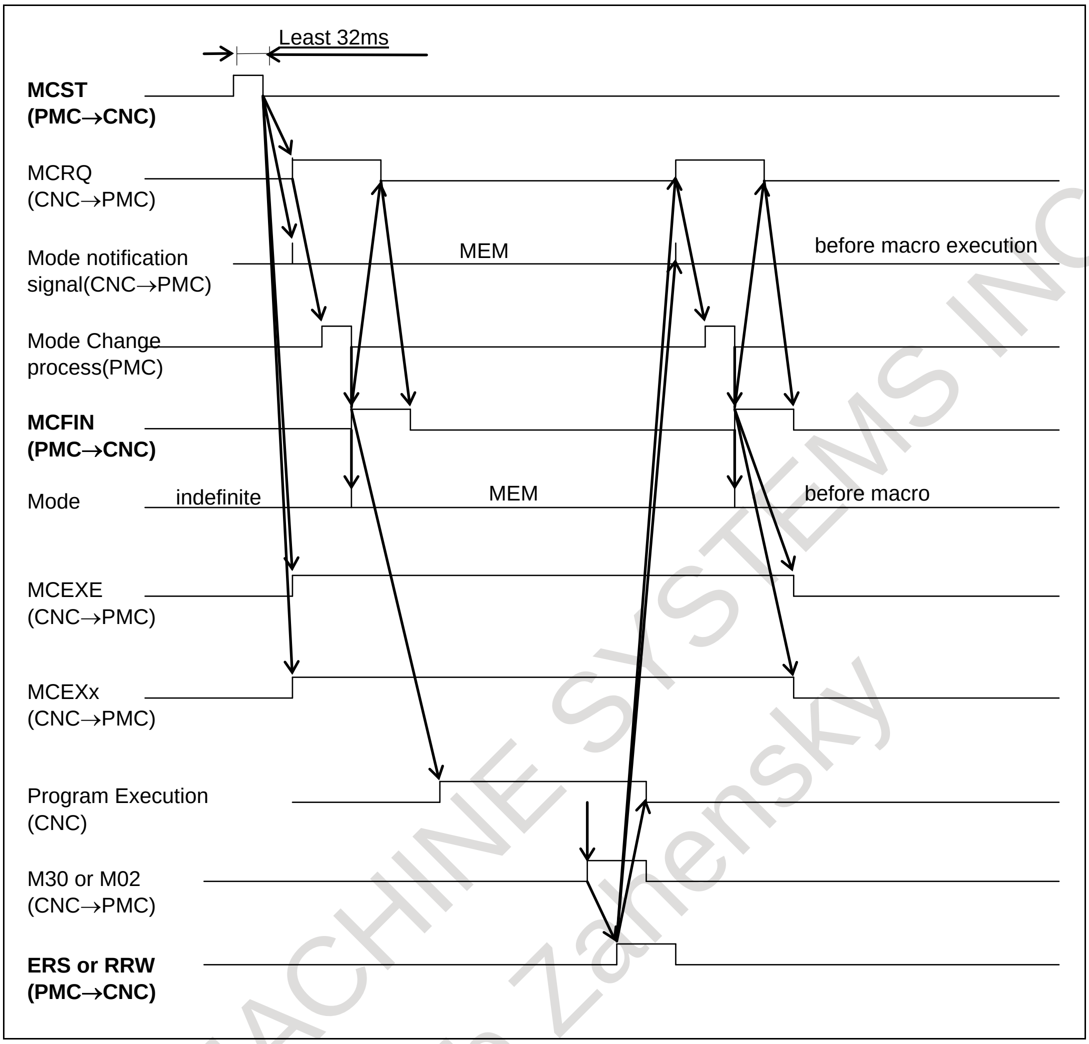


Fig. 16.7 (a)

- Interruption of sequence

Interruption by reset or emergency stop

When the started macro is interrupted by a reset or emergency stop before being completed, the abnormal end signal (MCSP) becomes “1” and stops the execution of the program. Then, when the reset is completed or the emergency stop is cleared, if the MEM mode is entered, the mode change request signal (MCRQ) and the mode notification signal are output for mode recovery and the selection program is recovered. (In a non-MEM mode, the system waits until the MEM mode is entered.) On the PMC side, be sure to set the mode change completion signal (MCFIN) to “1” to complete the sequence, regardless of whether mode recovery is made.

Feed hold or single block

The abnormal end signal (MCSP) is not output when stopping in feed hold or single block. Under such a condition, when the cycle start signal (ST) is turned on and off, the continuity of the macro program is executed.

Under such a condition, even if macro call start signal (MCSTx) is turned on and off, it is not effective.

Under such a condition, when reset or emergency stop are input, the operation which is described in “Interruption by reset or emergency stop” is executed.

Stop by alarm

When the execution of macro program is stopped by alarm, the abnormal end signal (MCSP) is output. Under such a condition, when reset or the emergency stop are input, the operation which is described in "Interruption by reset or emergency stop" is executed.

Fig. 16.7 (b) shows the timing chart of each signal when the sequence is interrupted by alarm.

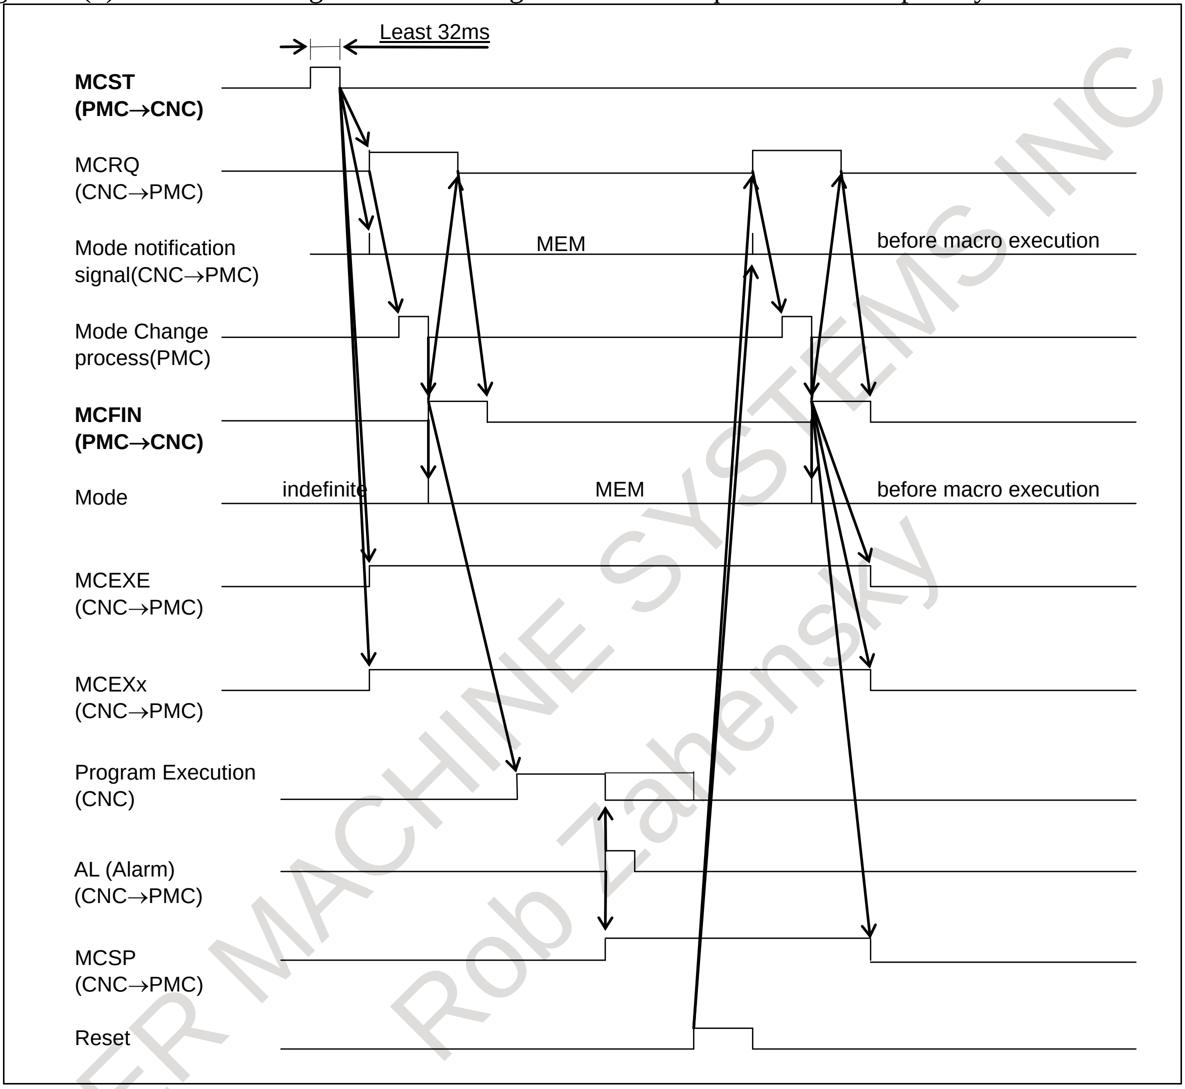

Fig. 16.7 (b)

Notes

NOTE

1. Even if the macro call is being executed, mode selection signal (MD1,MD2,MD4) is effective. Therefore, change the LADDER program to disable the mode change when the macro call executing signal (MCEXE) is "1" when the inconvenience is caused if the mode change is done.
2. The macro call start signal (MCSTx) is effective only the reset state. The macro call cannot be started during automatic operation (automatic operation stop state, automatic operation suspend state, and automatic operation start state), a reset, or an emergency stop. If an attempt is made to start macro program during automatic operation, a reset, or an emergency stop, an alarm PS5306 occurs.

NOTE

3 The called macro program must end with M02 or M30. And input external reset signal (ERS) or reset & rewind signal (RRW) from the PMC side when these M codes are executed. If above two condition is not implemented, neither the return of the mode nor the return of the selection program are done after the program ends.

4 When the specified program is not registered in the memory, the alarm PS0059 is generated. The operation in this case becomes the shown in “Stop by alarm”.

5 If a main program had been not selected when the one touch macro call function is started, the alarm DS0059 occurs at the end of execution of macro program. At this time, current folder becomes the folder where an one-touch macro exists, and the called one-touch macro remains being selected.

6 One Touch Macro programs need to be install to any folder among LIBRARY/, MTB2/, MTB1/, and SYSTEM/. When One Touch Macro program does not exist in any folder among LIBRARY/, MTB2/, MTB1/, and SYSTEM/, the alarm DS0059 "SPECIFIED NUMBER NOT FOUND" occurs at searching program. These folders to be searched are set in the bits 3 (SYS), bit 2 (MC1), bit 1 (MC2), and bit 0 (LIB) of parameter No. 3457 in advance. Even when a folder which a program is install to is LIBRARY/, MTB2/, MTB1/, or SYSTEM/, if the folder is not set as the search targets, the program is not searched for.

Signal

Macro call start signal MCSTx <Gn512.0 to Gn513.7>

[Classification] Input signal

[Function] This signal starts the macro call sequence.
When the fall of this signal is detected, CNC starts the corresponding macro program. O number of the program started by the MCST1 signal is specified by parameter No. 6096.

[Operation] The sequence is shown in “**Sequence between PMC and CNC**”.

Mode change completion signal MCFIN <Gn514.0>

[Classification] Input signal

[Function] This signal notifies the completion of the mode change to CNC.

[Operation] CNC begins the execution of the macro program or complete the sequence.

Macro call executing signal MCEXE <Fn512.0>

[Classification] Output signal

[Function] This signal notifies the macro call function is being executed.

[Output cond.] This signal is set to 1 in the following case:

- When CNC detects the fall of Macro call start signal (MCSTx).

This signal is set to “0” in the following case:

- When the sequence is completed with the mode change completion signal MCFIN set to “1” after macro execution is terminated or is interrupted by a reset, emergency stop, or alarm.

Mode change request signal MCRQ <Fn512.1>

[Classification] Output signal
[Function] This signal requests the change of the mode.
[Output cond.] This signal is set to “1” in the following case:

- When CNC detects the fall of Macro call start signal (MCSTx).
- When M30 or M02 is executed in the macro program, and external reset signal (ERS) or reset&rewind signal (RRW) is input.
- When the sequence is interrupted by reset or emergency stop.

This signal is set to “0” in the following case:

- When Mode change completion signal (MCFIN) becomes ”1”.

Mode notification signal MD1R,MD2R,MD4R,DNCIR,ZRNR<Fn513.0,Fn513.1,Fn513.2,Fn513.5,Fn513.7>

[Classification] Output signal
[Function] This signal notifies the mode which should be changed.
[Output cond.] This signal is output in the following case:

- When CNC detects the fall of Macro call start signal (MCSTx).
- When M30 or M02 is executed in the macro program, and external reset signal (ERS) or reset&rewind signal (RRW) is input.
- When the sequence is interrupted by reset or emergency stop.

Abnormal end signal MCSP <Fn512.2>

[Classification] Output signal
[Function] This signal notifies the sequence of the macro call is terminated abnormally.
[Output cond.] This signal is set to “1” in the following case:

- When the sequence is interrupted by reset or emergency stop or alarm.

This signal is set to “0” in the following case:

- When the mode change completion signal (MCFIN) becomes “1”, and the sequence is completed.

Call program confirmation signal MCEXx <Fn514.0 toFn515.7>

[Classification] Output signal
[Function] This signal notifies the program number called by the macro call.
The signal which corresponds to macro call start signal (MCSTx) is output.
[Output cond.] This signal is set to “1” in the following case:

- While executing the sequence.

This signal is set to “0” in the following case:

- When the sequence is completed.

Signal Address

	#7	#6	#5	#4	#3	#2	#1	#0

Parameter

6095	The number of programs used by the one touch macro call function

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 16

Specify the number of programs used by the one touch macro call function.
For instance, when three is set, macro call start signal MCST1, MCST2, and MCST3 is valid.
When 0 is specified, this function is invalid.

6096	The first O number of the program used by the one touch macro call function

[Input type] Parameter input
[Data type] 2-word path
[Valid data range] 1 to 9999

Specify the first O number of the program used by the one touch macro call function.
When 9000 is set, for example, the relationship between macro call start signal MSCTx and the program number of a program started by the signal is as follows:

MCST1 signal : Starts O9000 (when 1 or a greater value is set in parameter No. 6095).
MCST2 signal : Starts O9001 (when 2 or a greater value is set in parameter No. 6095).
MCST3 signal : Starts O9002 (when 3 or a greater value is set in parameter No. 6095).
: : :
MCST15 signal: Starts O9014 (when 15 or a greater value is set in parameter No. 6095).
MCST16 signal: Starts O9015 (when 16 is set in parameter No. 6095).

3457					SYS	MC1	MC2	LIB

[Input type] Parameter input
[Data type] Bit path

> **NOTE**
> The parameters LIB, MC2, MC1, and SYS are used to set a search folder for the following subprogram/macro calls:
> - Subprogram call based on an M code
> - Subprogram call based on a particular address
> - Subprogram call based on a second auxiliary function code
> - Macro call based on a G code
> - Macro call based on an M code
> - Macro call based on a T code
> - One-touch macro call

#0 LIB The common program directory "//CNC_MEM/USER/LIBRARY/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

#1 MC2 MTB dedicated directory 2 "//CNC_MEM/MTB2/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

#2 MC1 MTB dedicated directory 1 "//CNC_MEM/MTB1/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

#3 SYS The system directory "//CNC_MEM/SYSTEM/" of the initial directories is:
0: Set as a search directory.
1: Not set as a search directory.

Alarm and message

Number	Message	Description
DS0021	START ERROR(ONE TOUCH MACRO)	An One Touch Macro can not be start for the following reasons: (1) Feed hold signal *SP is0. (2) During alarm status. (3) Program restart signal SRN is "1". etc.
DS0059	SPECIFIED NUMBER NOT FOUND	The program of the specified O number is not registered in the memory.
PS5306	MODE CHANGE ERROR	The mode is not changed correctly at start of sequence. An one touch macro was started during a state other than the reset state, a reset, or an emergency stop.

16.8 PMC WINDOW PARAMETER WRITE

16.8.1 Parameter Write

Overview

You can write parameters by using PMC window function (function instruction WINDW: SUB52). You can also use FOCAS2 or C Language Executor to write parameters. However, all parameters cannot be written at any time. The following parameters cannot be written when any axes move.
Even if all axis have stopped, the following parameters cannot be written when beginning and ending automatic operation.
When the control axis is selected by the manual handle feed axis selection signals (HS1A - HS1D) in the manual handle feed mode, the axis is movement state and the following parameters cannot be written.
The error code is returned when the following parameter is written by PMC window function.
The error code EW_NUMBER(3) is returned when the following parameter is written by FOCAS2 or C Language Executor.
Refer to the parameter manual for the meaning of each parameter.
Examine it enough not to occur any trouble when the parameter is changed in operation even if any axes are not moving.

NOTE
The following list might be changed or added by adding new CNC function.

Table 16.8 (b) The list of parameters which cannot be written when any axes move

0	1	12	981	982	1000	1001	1002	1005	1006	1007

16.8.2 Parameter (No. 2092, Bit 0 of No. 8162) Write

Overview

This function allows you to write the following parameters using a PMC window function (function instruction WINDW: SUB52) as long as a relevant axis is stopped. You can also use FOCAS2 or C Language Executor to write parameters. The function can be used to write the following parameters:

- Parameter No. 2092
  Advanced preview feed forward coefficient

- Bit 0 (SMR) of parameter No. 8162
  Synchronous mirror-image control is:
  0 : Not applied. (The master and slave axes move in the same direction.)
  1 : Applied. (The master and slave axes move in opposite directions.)

This function can reduce the machining cycle time as it can write parameters without all of the axes stopped.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11502	IPW							

[Input type] Parameter input
[Data type] Bit

#7 IPW The advanced preview feed-forward coefficient (parameter No. 2092) and bit 0 (SMR) of parameter No. 8162 for specifying whether to apply a mirror image during synchronization control are:
0: Write-disabled during axis moving.
1: Write-enabled if the corresponding axis is stopped.

Limitation

- Axis synchronous control

Under axis synchronous control, this function is disabled when slave axis parameter automatic setting is enabled (bit 4 (SYP) of parameter No. 8303 = 1). (All the axes must be stopped before parameters can be written.)

- AI contour control

Under AI contour control, no parameter can be written even when the relevant axis is stopped.

16.8.3 Parameter (No. 1620) Write

Overview

This function allows you to write a time constant (parameter No. 1620) for rapid-traverse linear acceleration/deceleration during axial movement. You can write the parameter using the PMC window function (function instruction WINDW: SUB52), FOCAS2, or C Language Executor.

If you change the time constant during axial movement, the new setting take effect from the move command encountered first after the axis stops. This function can reduce the machining cycle time as it can change the time constant without all of the axes stopped.

Example)

G00 X50.0 ;

G00 X150.0 ;

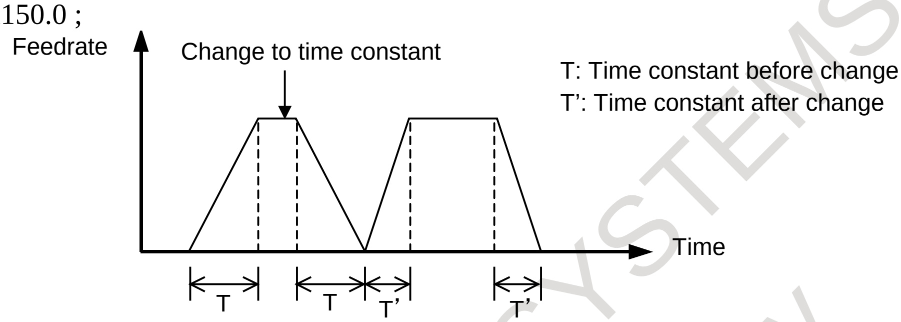

Fig. 16.8.3 (a)

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11502		CTC						

[Input type] Parameter input
[Data type] Bit

#6 CTC During axis moving, the time constant of rapid traverse linear acceleration/deceleration for each axis (parameter No. 1620) is:

0: Write-disabled.
1: Write-enabled.

Restrictions

- Axis of time constant 0

Do not use this function for an axis of time constant 0.

- Axis synchronous control

Under axis synchronous control, this function is disabled when slave axis parameter automatic setting is enabled (bit 4 (SYP) of parameter No. 8303 = 1). (All the axes must be stopped before the parameter can be written.)

Note

NOTE

1 Set the time constants of the master and slave axes under axis synchronous control to the same value.
2 Set the time constants of the master and slave axes under tandem control to the same value.

16.8.4 Parameter (No. 1825, No. 1826) Write

Overview

This function allows you to write the following parameters using a PMC window function (function instruction WINDW: SUB52) as long as a relevant axis is stopped. You can also use FOCAS2 or C Language Executor to write parameters. The function can be used to write the following parameters:

- Parameter No. 1825
  Servo loop gain for each axis

- Parameter No. 1826
  In-position width for each axis

This function can reduce the machining cycle time as it can write parameters without all of the axes stopped.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
10350							PWR	

[Input type] Parameter input
[Data type] Bit

#1 IPW The servo loop gain for each axis (parameter No. 1825) and the In-position width for each axis (parameter No. 1826) are:
0: Write-disabled during axis moving.
1: Write-enabled if the corresponding axis is stopped.

> **NOTE**
> This parameter is Automatic setting parameter. For details, refer to the appendix "Automatic setting / Initial setting parameter" in this manual.

Limitation

- **Axis synchronous control**

Under axis synchronous control, this function is disabled when slave axis parameter automatic setting is enabled (bit 4 (SYP) of parameter No. 8303 = 1). (All the axes must be stopped before parameters can be written.)

16.9 DATA TRANSFER BETWEEN PMC AND DCSPMC

Overview

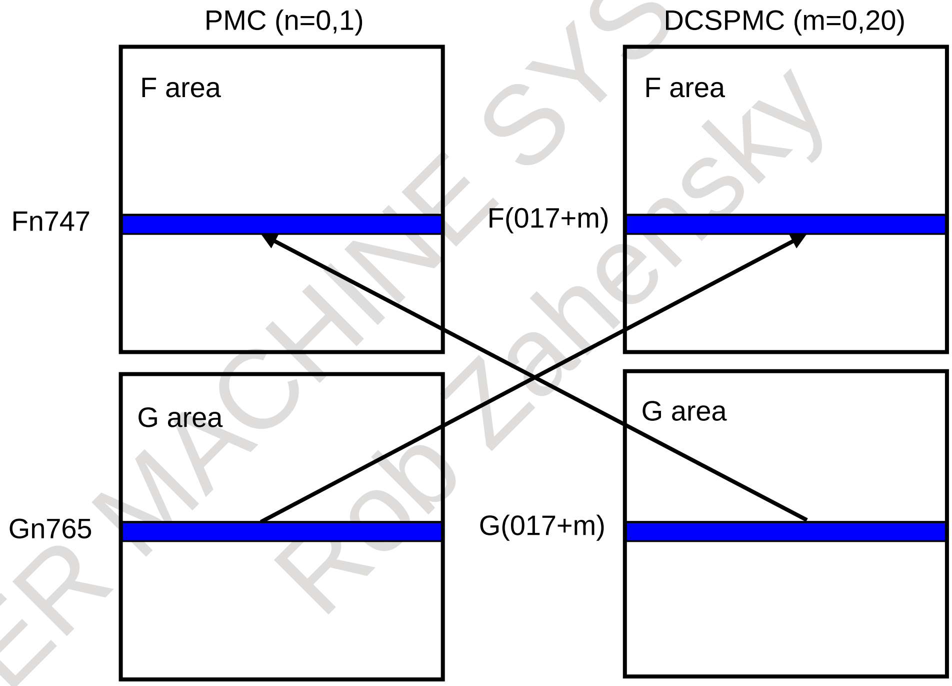
The signal data are transferred between PMC and DCSPMC. As a result, PMC data can be referred from DCSPMC and DCSPMC data can be referred from PMC.
Regardless of 1-path or the multi path system, 2 bytes (16 points) data are transferred.

Explanation

The signal data are transferred between PMC and DCSPMC as follows.

Data transfer area

PMC	G0765	→	DCSPMC	F0017	(1byte)
	G1765	→		F0037	(1byte)
DCSPMC	G0017	→	PMC	F0747	(1byte)
	G0037	→		F1747	(1byte)



> **NOTE**
> Regardless of 1-path or the multi path system, 2 bytes (16 points) are transferred.

Signal

DI signal for Data transfer between PMC and DCSPMC
TPMG00 to TPMG07 <PMC:Gn765> (n=0,1)
TDCG00 to TDCG07 <DCSPMC:G(017+m)> (m=0,20)

[Classification] Input signal

[Function] These signals are transferred between PMC and DCSPMC. PMC signals can be referred from DCSPMC and DCSPMC signals can be referred from PMC. The signals are transferred as follows.
- From TPMGxx(G765) to TPMFxx(F017).
- From TDCGxx(G017) to TDCFxx(F747).

[Operation] (1) DI signal(TPMG00 to TPMG07) are transferred to DO signal(TPMF00 to TPMF07)
(2) DI signal(TDCG00 to TDCG07) are transferred to DO signal(TDCF00 to TDCF07)

DO signal for Data transfer between PMC and DCSPMC
TDCF00 to TDCF07 <PMC:Fn747> (n=0,1)
TPMF00 to TPMF07 <DCSPMC:F(017+m)> (m=0,20)

[Classification] Output signal

[Function] These signals are transferred between PMC and DCSPMC. PMC signals can be referred from DCSPMC and DCSPMC signals can be referred from PMC. The signals are transferred as follows.
- From TPMGxx(G765) to TPMFxx(F017).
- From TDCGxx(G017) to TDCFxx(F747).

[Operation] (1) DI signal(TPMG00 to TPMG07) are transferred to DO signal(TPMF00 to TPMF07)
(2) DI signal(TDCG00 to TDCG07) are transferred to DO signal(TDCF00 to TDCF07)

Signal address

PMC (n=0,1)

	#7	#6	#5	#4	#3	#2	#1	#0
Gn765	TPMG07	TPMG06	TPMG05	TPMG04	TPMG03	TPMG02	TPMG01	TPMG00
Fn747	TDCF07	TDCF06	TDCF05	TDCF04	TDCF03	TDCF02	TDCF01	TDCF00

DCSPMC (m=0,20)

	#7	#6	#5	#4	#3	#2	#1	#0
G(017+m)	TDCG07	TDCG06	TDCG05	TDCG04	TDCG03	TDCG02	TDCG01	TDCG00
F(017+m)	TPMF07	TPMF06	TPMF05	TPMF04	TPMF03	TPMF02	TPMF01	TPMF00

⚠ **WARNING**

1 The safety related signal such as the protection door lock/unlock signal is input(or output) to PMC/DCSPMC respectively and monitored in redundant mode. If this transfer function is applied to the safety related signal, the independence between PMC/DCSPMC is lost. Do not use this data transfer function to control the safety related function.

2 The error of ladder program cannot be checked by safety function itself. The confirmation of the safety related ladder program should be done enough by the machine tool builder. The safety related ladder program should be guaranteed by the machine tool builder.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
13805		PDTR	NPDT					

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When at least one of these parameters is set, the power must be turned off before operation is continued.

#5 NPDT While the Dual Check Safety function is inactive (parameter DCE=0), Data transfer between PMC and DCSPMC is:
0: Not available
1: Available

#6 PDTR Data transfer between PMC and DCSPMC is:
0: Not available
1: Available

16.10 KEY HIT STATUS SIGNAL OUTPUT FUNCTION

Overview

This function outputs the status of key hit to PMC signal when the soft key and MDI key are hit.

> ⚠ **CAUTION**
> 1 The delay from hitting key to outputting of PMC signal is 100ms or less. Therefore, this function can not be used to operation that is required to quick key response.
> 2 Only when a CNC hardware key is pushed, the PMC signal is output.
> 3 When CNC hardware key is pushed while using CNC screen display function with PC connected by HSSB or Ethernet, the PMC signal is output.
> 4 On Stand-alone type CNC (Windows CE), when display and CNC are connected by Ethernet, the PMC signal is not output.
> 5 This function is not available on NCGuide / NCGuidePro.

Explanation

Key hit status is output to PMC signal when soft key and MDI key are hit.

- Key which outputs the hit status

Key which outputs hit status by this function is as follows.

Kind of key	Key	PMC signal (Symbol)
Digit key	0	KEY_DG0
	1	KEY_DG1
	2	KEY_DG2
	3	KEY_DG3
	4	KEY_DG4
	5	KEY_DG5
	6	KEY_DG6
	7	KEY_DG7
	8	KEY_DG8
	9	KEY_DG9

Kind of key	Key	PMC signal (Symbol)
Horizontal soft key (See Fig. 17.11)	HSKY1	KEY_HS1
	HSKY2	KEY_HS2
	HSKY3	KEY_HS3
	HSKY4	KEY_HS4
	HSKY5	KEY_HS5
	HSKY6	KEY_HS6
	HSKY7	KEY_HS7
	HSKY8	KEY_HS8
	HSKY9	KEY_HS9
	HSKY10	KEY_HS10
	HSKYL	KEY_HSL
	HSKYR	KEY_HSR
Vertical soft key (See Fig. 17.11)	VSKY1	KEY_VS1
	VSKY2	KEY_VS2
	VSKY3	KEY_VS3
	VSKY4	KEY_VS4
	VSKY5	KEY_VS5
	VSKY6	KEY_VS6
	VSKY7	KEY_VS7
	VSKY8	KEY_VS8
	VSKY9	KEY_VS9
Cursor key	→	KEY_CRR
	←	KEY_CRL
	↓	KEY_CRD
	↑	KEY_CRU
Page key	⇊	KEY_PGD
	⇈	KEY_PGU
Other key	SHIFT	KEY_SFT

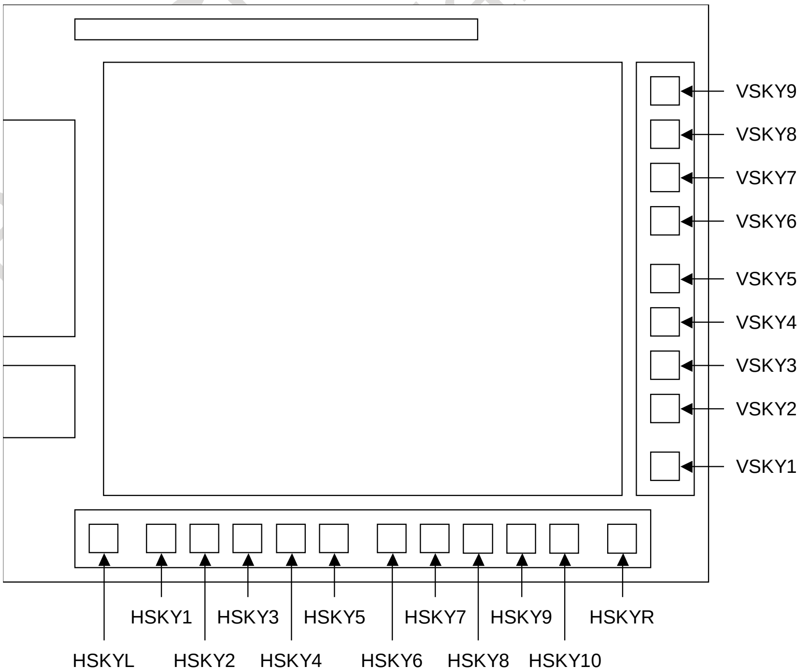


Fig. 16.10 (a) Arrangement of soft key (10.4” display unit, 15” display unit)

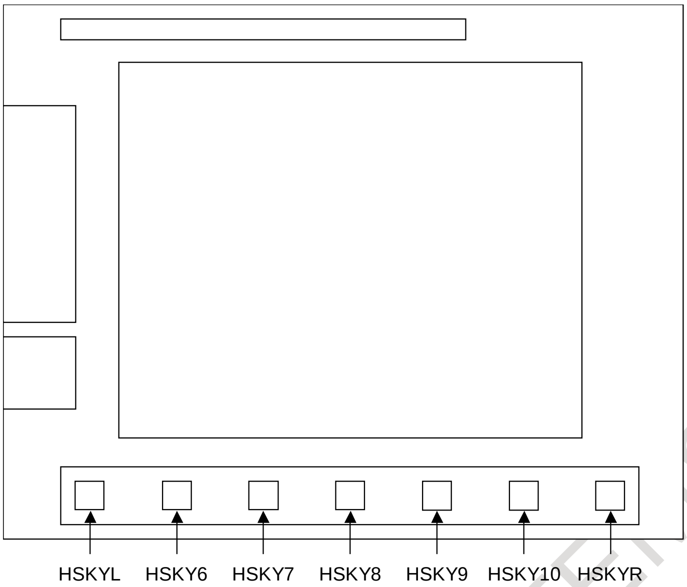

Fig. 16.10 (b) Arrangement of soft key (8.4” display unit)

> **NOTE**
> Hit status is not output to PMC signal if the key which is not supported is hit.

- Output format of PMC signal

The key hit status is output to PMC signal which address kind is set by parameter No.13125 and which address offset is set by parameter No.13126 as follows.

	#7	#6	#5	#4	#3	#2	#1	#0
+0	KEY_DG7	KEY_DG6	KEY_DG5	KEY_DG4	KEY_DG3	KEY_DG2	KEY_DG1	KEY_DG0
+1							KEY_DG9	KEY_DG8
+2	KEY_HS8	KEY_HS7	KEY_HS6	KEY_HS5	KEY_HS4	KEY_HS3	KEY_HS2	KEY_HS1
+3					KEY_HSL	KEY_HSR	KEY_HS10	KEY_HS9
+4	KEY_VS1	KEY_VS2	KEY_VS3	KEY_VS4	KEY_VS5	KEY_VS6	KEY_VS7	KEY_VS8
+5								KEY_VS9
+6	KEY_SFT		KEY_PGU	KEY_PGD	KEY_CRU	KEY_CRD	KEY_CRL	KEY_CRR
+7								

> **NOTE**
> 1 Blank bit in above table is not used.
> 2 Key hit status is not output to PMC signal when 3 or more keys are hit in same time.

- Supported hardware

This function is available on the following hardware.

- Soft key

  Hit status of the soft key is output to PMC signal if the following display unit are used.

CNC type	Kind of display unit
LCD mounted type CNC	8.4” color LCD (without Touch panel) 10.4” color LCD A (without Touch panel) 10.4” color LCD A (with Touch panel) 10.4” color LCD B (without Touch panel) 10.4” color LCD B (with Touch panel) 15” color LCD (without Touch panel) 15” color LCD (with Touch panel)

CNC type	Kind of display unit
LCD mounted type CNC (Windows CE function)	10.4” color LCD (without Touch panel) 10.4” color LCD (with Touch panel) 12.1” color LCD (without Touch panel) 12.1” color LCD (with Touch panel) 15” color LCD (without Touch panel) 15” color LCD (with Touch panel)
Stand-alone type CNC	10.4” color LCD A (without Touch panel) 10.4” color LCD A (with Touch panel) 10.4” color LCD B (without Touch panel) 10.4” color LCD B (with Touch panel) 15” color LCD (without Touch panel) 15” color LCD (with Touch panel)
Stand-alone type CNC (Windows CE function)	Display Unit with WindowsCE (10.4” LCD without Touch panel) Display Unit with WindowsCE (10.4” LCD with Touch panel) Display Unit with WindowsCE (12.1” LCD without Touch panel) Display Unit with WindowsCE (12.1” LCD with Touch panel) Display Unit with WindowsCE (15” LCD without Touch panel) Display Unit with WindowsCE (15” LCD with Touch panel)

NOTE

The hit status of soft key is not output to PMC signal in the following case.

- Soft key on touch panel is hit.
- The display unit that is not supported is used.
- On Stand-alone type CNC (Windows CE), the display and the CNC are connected by Ethernet.

- MDI key

  Hit status of the MDI key is output to PMC signal if the following MDI unit is used.

CNC type	Kind of MDI unit
LCD mounted type CNC	MDI unit (Turning, ONG, vertical) MDI unit (Milling, ONG, vertical) MDI unit (QWERTY type A, vertical) MDI unit (QWERTY type B, vertical) MDI unit (Turning, ONG, horizontal) MDI unit (Milling, ONG, horizontal) MDI unit (Turning, ONG, vertical/horizontal) MDI unit (Milling, ONG, vertical/horizontal) MDI unit (Turning, small type, horizontal) MDI unit (Milling, small type, horizontal)
LCD mounted type CNC (Windows CE function)	MDI unit (Turning, ONG, vertical) MDI unit (Milling, ONG, vertical) MDI unit (QWERTY type A, vertical) MDI unit (QWERTY type B, vertical) MDI unit (Turning, ONG, horizontal) MDI unit (Milling, ONG, horizontal) MDI unit (Turning, ONG, vertical/horizontal) MDI unit (Milling, ONG, vertical/horizontal)
Stand-alone type CNC	MDI unit (Turning, ONG, vertical) MDI unit (Milling, ONG, vertical) MDI unit (QWERTY type A, vertical) MDI unit (QWERTY type B, vertical) MDI unit (Turning, ONG, horizontal) MDI unit (Milling, ONG, horizontal)

CNC type	Kind of MDI unit
Stand-alone type CNC (Windows CE function)	MDI unit (Turning, ONG, vertical) MDI unit (Milling, ONG, vertical) MDI unit (QWERTY type A, vertical) MDI unit (QWERTY type B, vertical) MDI unit (Turning, ONG, horizontal) MDI unit (Milling, ONG, horizontal)

NOTE

The hit status of MDI key is not output to PMC signal in the following case.
- Key was hit on touch panel.
- The MDI unit or keyboard that is not supported is used.
- The MDI unit which is connected via PANEL *i* is used.

Parameter

13125	Address type of PMC signal area which outputs the key hit status

[Input type] Parameter input
[Data type] Byte
[Valid data range] 1、2、11、21、31、41

Set the address type of PMC signal area which outputs the key hit status.
The relation between the setting value and the address type is as follows.

Setting value	Address type
1	R address in 1st PMC
2	E address in 1st to 5th PMC
11	R address in 2nd PMC
21	R address in 3rd PMC
31	R address in 4th PMC
41	R address in 5th PMC

NOTE

1 The key hit status is not output if the setting value is out of range.
2 When this parameter is set, the power must be turned off before operation is continued.

13126	Top address of PMC signal area which outputs the key hit status

[Input type] Parameter input
[Data type] 2-word
[Valid data range] 0 to Maximum address

Set the Top address of PMC signal area which outputs the key hit status.
A continuous area in 8 bytes is necessary to output the key hit status.

The maximum address in the PMC address is as follows.

	1st-5th PMC			
	PMC memory A	PMC memory B	PMC memory C	PMC memory D
R address	R0 to R1499	R0 to R7999	R0 to R15999	R0 to R59999
E address	E0 to E9999	E0 to E9999	E0 to E9999	E0 to E9999

> **NOTE**
> 1 The key hit status is not output if the setting value is out of range.
> 2 When this parameter is set, the power must be turned off before operation is continued.

16.11 SCREEN NUMBER NOTIFICATION FUNCTION

Overview

This function outputs the screen number (Large classification number and Small classification number) of the screen that is currently displayed to PMC signal.

Signal

Screen large classification notification signal SCRNL0 to SCRNL7<F523>

[Classification] Output signal
[Function] Large classification of screen number is notified.
[Operation] The following screen numbers (Large classification number) can be read.

Large classification	Screen	Function key
0	Position screen	POSITION
1	Program screen	PROGRAM
2	Offset/setting screen	OFFSET
3	System screen	SYSTEM
4	Message screen	MESSAGE
5	Graphics screen	GRAPHIC
6	Custom screen 1	CUSTOM1
7	Custom screen 2	CUSTOM2
8	Main menu	—

Screen small classification notification signal SCRNS0 to SCRNS7<F524>

[Classification] Output signal
[Function] Small classification of screen number is notified.
[Operation] The following screen numbers (Small classification number) can be read.

Large classification	Small classification	Content
0	01H	Current position (absolute coordinate) screen
	02H	Current position (relative coordinate) screen
	03H	Current position (overall) screen
	04H	Handle interruption screen
	06H	Operating monitor screen
	07H	3-dimensional Manual Feed Screen
	0BH	Current position (absolute coordinate) screen (15inch,19inch)

17 EMBEDDED ETHERNET FUNCTION

17.1 EMBEDDED ETHERNET PORT AND PCMCIA ETHERNET CARD

The embedded Ethernet function can be used by selecting one of two types of devices: the embedded Ethernet port and PCMCIA Ethernet card.
A selection can also be made to stop the embedded Ethernet function.
The PCMCIA Ethernet card is to be inserted into the memory card slot for temporary communication.

⚠ **CAUTION**

1 When using the embedded Ethernet function for the first time, set an IP address and other items carefully as instructed by the network administrator, then perform a sufficient communication test.
Note that an incorrect IP address or other setting may cause a communication failure on the entire network or system error in the CNC.

2 A unit such as a PC situated in the same network can increase the communication processing load on the CNC even if the unit is not communicating with the CNC.
Avoid connecting the CNC to a factory-wide network. Use a router or the like to separate the network including the CNC from the other networks.

3 The PCMCIA Ethernet card is inserted into a memory card slot, with a part of the card left uninserted. When using the PCMCIA Ethernet card, take great care not to damage the card by hitting the protruding part of the card.
When the card becomes unnecessary, remove the card immediately, in order to prevent any damage to the card.

NOTE

1 Use the PCMCIA Ethernet card designated by FANUC. General Ethernet cards available on the market cannot be used.
2 The PCMCIA Ethernet card is used for FANUC LADDER-III or a SERVO GUIDE.
3 Use the PCMCIA Ethernet card just for temporary communication as described above. Avoid using the card for continuous communication.

Related parameters

	#7	#6	#5	#4	#3	#2	#1	#0
14880								ETH

[Input type] Parameter input
[Data type] Bit

#0 ETH The embedded Ethernet function (a built-in port or PCMCIA LAN card) is:
0: Used.
1: Not used.

17.2 SETTING UP THE EMBEDDED ETHERNET FUNCTION

This section describes the setting of parameters for the embedded Ethernet function.

17.2.1 Setting of the FOCAS2/Ethernet Function

This subsection describes the settings required to operate the FOCAS2/Ethernet function.

> ⚠ **WARNING**
> When using the FOCAS2/Ethernet function, thoroughly confirm the content of "GENERAL WARNINGS FOR CNC APPLICATION DEVELOPMENT" in "SAFETY PRECAUTIONS" at the beginning of this manual.
> If the machine is operated without confirmation of above explanation, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

Notes on using the FOCAS2/Ethernet function for the first time

> **NOTE**
> 1 When running user's original application software created by using the FOCAS2/Ethernet function, use the embedded Ethernet port.
> 2 The FOCAS2/Ethernet function allows up to five FOCAS2/Ethernet clients to be connected to one CNC.
> 3 Concurrent access by multiple applications or personal computers may overload the CNC, reducing the communication speed.
> 4 For the FOCAS2/Ethernet functions, the machine tool builder or end user can create desired software operated on each personal computer using the FOCAS2 library software.
> Communication timing and other factors may vary depending on the personal computer environment. Before starting communication, completely confirm that there is no problem with the entire system including communication with the personal computer.

Notes on using the CNC Screen Display function for the first time

> **NOTE**
> With the CNC screen display functions, up to 1 CNC screen display function client can be connected to one CNC.

17.2.1.1 Operation on the FOCAS2/Ethernet setting screen

On the Ethernet parameter setting screen, set the parameters for operating the FOCAS2/Ethernet function.

Procedure

1 Press the function key 
.

2 Soft keys [EMBED] and [PCMCIA LAN] appear.
(When there is no soft keys, press the continue key.)

3 To display the Ethernet Setting screen for the embedded Ethernet port or the PCMCIA Ethernet card, press soft key [EMBED] or [PCMCIA LAN], respectively.

4 Press soft keys [COMMON] and [FOCAS2] and then enter parameters for the items that appear.

NOTE
1. The parameters for the embedded Ethernet port and the parameters for the PCMCIA Ethernet card are independent of each other.
2. The settings of the FOCAS2/Ethernet function for the PCMCIA Ethernet card are made when a connection to the SERVO GUIDE and FANUC LADDER-III is established.

COMMON screen (BASIC)

Press soft key [COMMON]. The COMMON screen (BASIC) (Fig. 17.2.1.1 (a)) is displayed.

Fig. 17.2.1.1 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify a mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item when the network contains a router. (Example of specification format: "192.168.0.253")
DHCP CLIENT	The value of parameter No.14880#6(DHC) related to the DHCP client function is displayed, and the setting is also possible. For details, see Subsection, "Setting Up the DNS/DHCP Function".

Display items

Item	Description
MAC ADDRESS	Embedded Ethernet MAC address
AVAILABLE DEVICE	Enabled device of the embedded Ethernet. Either the embedded Ethernet port or the PCMCIA Ethernet card is displayed.

FOCAS2 screen

Press soft key [FOCAS2]. The FOCAS2 screen (Fig. 17.2.1.1(b)) is displayed.

Fig. 17.2.1.1 (b) FOCAS2 screen

Setting items

Item	Description
PORT NUMBER (TCP)	Specify a port number to be used with the FOCAS2/Ethernet function. The valid input range is 5001 to 65535.
PORT NUMBER (UDP)	Set this item to 0.
TIME INTERVAL	Set this item to 0.

Initial setting of the PCMCIA Ethernet card

The PCMCIA Ethernet card is factory-set to the following standard setting values, for ease of connection with a SERVO GUIDE or FANUC LADDER-III.

IP ADDRESS	: 192.168.1.1
SUBNET MASK	: 255.255.255.0
ROUTER IP ADDRESS	: None
PORT NUMBER (TCP)	: 8193
PORT NUMBER (UDP)	: 0
TIME INTERVAL	: 0

If a specified IP address is changed to a blank (space), the specified setting is reset to the standard setting value.
The embedded Ethernet port does not have a standard setting value.

17.2.1.2 Example of setting the FOCAS2/Ethernet function

The following shows a setting example required for the FOCAS2/Ethernet function to operate. (when Windows 10 is used as the OS for the personal computer).
In this example, one personal computer is connected to two CNCs through FOCAS2/Ethernet.

	CNC 1	CNC 2
IP address	192.168.0.100	192.168.0.101
Subnet mask	255.255.255.0	255.255.255.0
Router IP address	None	None
TCP port number	8193	8193
UDP port number	0	0
Time interval	0	0

The Ethernet parameter screen is used for setting.

		PC 1
IP address		192.168.0.200
Subnet mask		255.255.255.0
Default gateway		None
CNC 1	NC IP address	192.168.0.100
	NC TCP port number	8193
CNC 2	NC IP address	192.168.0.101
	NC TCP port number	8193

"Internet Protocol Version 4 (TCP/IPv4) Properties" of the personal computer (Windows 10) is used for setting.

The arguments of the data window library function cnc_allclibhndl3 are used for setting.

17.2.2 Setting of the FTP File Transfer Function

This section describes the settings required for the FTP file transfer function to operate using the embedded Ethernet function.

Notes on using the FTP file transfer function for the first time

NOTE
1 When using the FTP file transfer function, use the embedded Ethernet port.
2 The number of FTP communications to which one CNC can be connected using the FTP file transfer function is one.
3 Before communicating with the host computer using the FTP file transfer function, completely confirm that there is no problem with the entire system including communication with the personal computer because the personal computer environment may affect communication operation.
4 To operate the host computer as the FTP server, FTP server software must be operated on the host computer.
5 When a lot of files are registered in the host computer, the display processing of host file list display might become slow. In this case, divide the folder that registers the files.

17.2.2.1 Operation on the FTP file transfer setting screen

On the Ethernet setting screen, set the parameters for operating the FTP file transfer function.

Procedure

1 Press the function key SYSTEM.
2 Soft keys [EMBED] appear.
(When there is no soft keys, press the continue key.)
3 By pressing the [EMBED] soft key, the Ethernet Setting screen for the embedded Ethernet port is displayed.
4 Press soft keys [COMMON] and [FTP TRANS] and then enter parameters for the items that appear.

NOTE
The parameters for the embedded Ethernet port and the parameters for the PCMCIA Ethernet card are independent of each other.
If the [PCMCIA LAN] soft key is pressed, the PCMCIA Ethernet card can be set up. However, the card setup is carried out for maintenance and is not necessary usually.

COMMON screen (BASIC)

Press soft key [COMMON]. The COMMON screen (BASIC) (Fig. 17.2.2.1(a)) is displayed.

Fig. 17.2.2.1 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify a mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item when the network contains a router. (Example of specification format: "192.168.0.253")
DHCP CLIENT	The value of parameter No.14880#6(DHC) related to the DHCP client function is displayed, and the setting is also possible. For details, see Subsection, “Setting Up the DNS/DHCP Function”.

Display items

Item	Description
MAC ADDRESS	Embedded Ethernet MAC address
AVAILABLE DEVICE	Enabled device of the embedded Ethernet. Either the embedded Ethernet port or the PCMCIA Ethernet card is displayed.

FTP transfer screen (CONNECT1, CONNECT2, CONNECT3)

1 Press soft key [FTP TRANS]. The FTP transfer screen (Fig. 17.2.2.1(b) and (c)) is displayed.

2 Page keys  can be used to make settings for the three host computers for connection destinations 1 to 3.

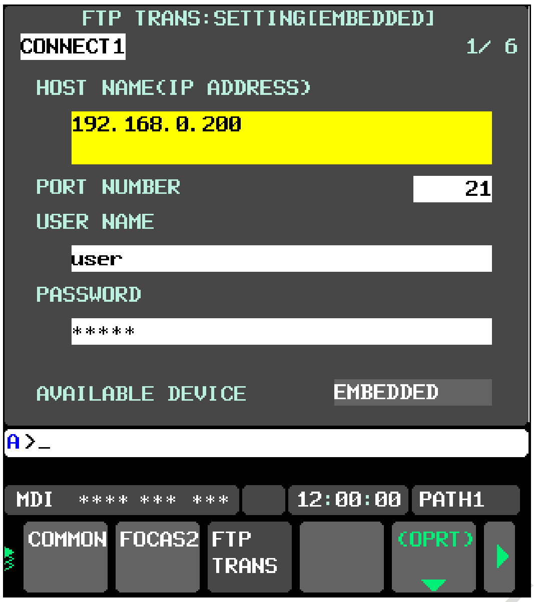

Fig. 17.2.2.1 (b) FTP transfer screen (1st page)

Fig. 17.2.2.1 (c) FTP transfer screen (2nd page)

Item	Description
HOST NAME	Specify the IP address of the host computer. (Example of specification format: "192.168.0.200")
PORT NUMBER	Specify a port number to be used with the FTP file transfer function. An FTP session is used, so that "21" is to be specified usually.
USER NAME	Specify a user name to be used for logging in to the host computer with FTP. (Up to 31 characters can be specified.)
PASSWORD	Specify a password for the user name specified above. (Up to 31 characters can be specified.) Be sure to set a password.
LOGIN FOLDER	Specify a work folder to be used when logging in to the host computer. (Up to 127 characters can be specified.) If nothing is specified, the home folder specified in the host computer becomes the log-in folder.

Operation

Select a destination.

1 Pressing the [(OPRT)] soft key causes soft key [HOST SELECT] to be displayed. Pressing this soft key causes soft keys [CONECT 1], [CONECT 2], and [CONECT 3] to be displayed. (Fig. 17.2.2.1(d))

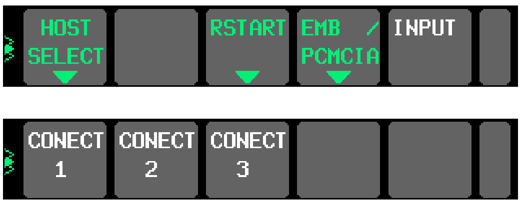

Fig. 17.2.2.1 (d)

2 Depending on the host computer to be connected, press soft key [CONECT 1], [CONECT 2], or [CONECT 3]. CONNECT 1, 2, or 3 is highlighted in the screen title field. The computer corresponding to the highlighted destination is selected as the target computer to be connected.

When CONNECT 1 is selected

17.2.2.2 Related parameters

The parameters related to the FTP file transfer function are described below.

0020	I/O CHANNEL : Input/output device selection, or interface number for a foreground input device

[Input type] Setting input
[Data type] Byte
[Valid data range] 9 : Select the embedded Ethernet as the input/output device.

For embedded Ethernet port

	#7	#6	#5	#4	#3	#2	#1	#0
14880							PCH	

[Input type] Parameter input
[Data type] Bit

#1 PCH When communication based on the FTP file transfer function starts, an FTP server presence check based on PING is:
0: Made.
1: Not made.

> **NOTE**
> Usually, set this parameter to 0 (to make a check).
> If this parameter is set to 1 (not to make an FTP server presence check based on PING), several tens of seconds may be required until an error is recognized when no FTP server is present on the network.
> Mainly for security, a personal computer may be set to ignore the PING command. When communicating with such a personal computer, set this parameter to 1 (not to make an FTP server presence check based on PING).

	#7	#6	#5	#4	#3	#2	#1	#0
14883	PSV							

[Input type] Parameter input
[Data type] Bit

#7 PSV FTP client of FTP file transfer function:
0: Operates as the active mode.
1: Operates as the passive mode.

17.2.2.3 Example of setting the FTP file transfer function

The following shows a setting example required for the FTP file transfer function to operate.
(when Windows 10 is used as the OS for the personal computer).
In this example, one personal computer is connected to two CNCs through the FTP file transfer function.

- On Personal Computer 1, the FTP server function operates.
- On CNC 1 and CNC 2, the FTP client operates as the FTP file transfer function.

		CNC 1	CNC 2
IP address		192.168.0.100	192.168.0.101
Subnet mask		255.255.255.0	255.255.255.0
Router IP address		None	None
Connection host 1	Port number	21	21
	IP address	192.168.0.200	192.168.0.200
	User name	user	user
	Password	user	user
	Login DIR	None	None
Parameter No. 20		9	9

The Ethernet parameter screen is used for setting.

The parameter screen is used for setting.

	PC 1
IP address	192.168.0.200
Subnet mask	255.255.255.0
Default gateway	None
User name	user
Password	user
Login DIR	Default

"Internet Protocol Version 4 (TCP/IPv4) Properties" of the personal computer (Windows 10) is used for setting.

"Accounts" of the personal computer (Windows 10) is used for setting.

"Internet Information Service (IIS) Manager" of the personal computer (Windows 10) is used for setting.

17.2.3 Setting Up the DNS/DHCP Function

The DNS/DHCP function is set up by using the COMMON screen (DETAIL) and parameters.

17.2.3.1 Setting up DNS

This subsection describes the procedure for setting up a DNS.

Procedure

1 Enable the DNS client function, with reference to "Related Parameters," which will be seen later.
2 Set up the DNS server of the host computer.
3 Connect the host computer on which the DNS server is working (hereafter referred to as a DNS server), reboot the CNC, then press function key 

.
4 Press soft keys [EMBED] and [COMMON] in that order. The COMMON screen (DETAIL) appears.
5 Enter the IP address of the DNS server in the corresponding DNS IP address field.

COMMON screen (DETAIL)

After pressing soft key [COMMON], press either page key 
to call a desired COMMON screen (DETAIL) (Fig. 17.2.3.1(a)). Specify a DNS IP address.

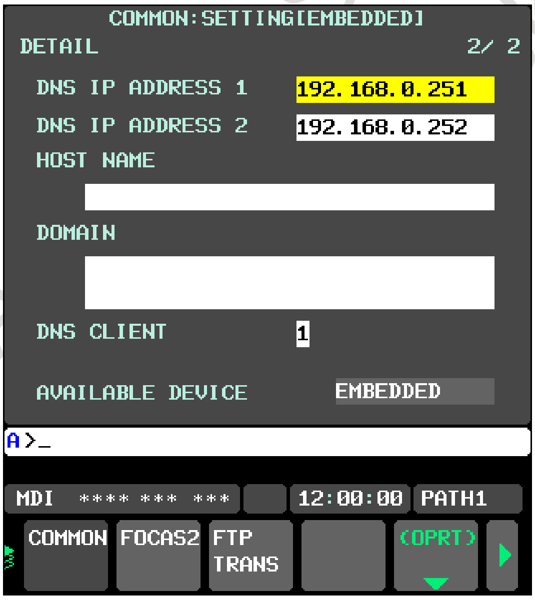

Fig. 17.2.3.1 (a) COMMON screen (DETAIL)

Display items

Item	Description
DNS IP ADDRESS 1, 2	Up to two DNS IP addresses can be specified. The CNC searches for the DNS server using DNS IP addresses 1 and 2 in that order.

17.2.3.2 Setting up DHCP

This subsection describes the procedure for setting up a DHCP.

Procedure

1 Enable the DHCP client function, with reference to "Related Parameters," which will be seen later. Also this function can be enabled by setting “1” to the DHCP CLIENT in the COMMON screen (BASIC).
2 Set up the DHCP server of the host computer.
3 Connect the host computer on which the DHCP server is working (hereafter referred to as a DHCP server), reboot the CNC, then press function key 

.
4 Press soft keys [EMBED] and [COMMON] in that order. The COMMON screen appears.
5 If the DHCP client function of the CNC has been enabled and if the DHCP server is connected successfully, the DHCP server automatically specifies the following items.
 - IP ADDRESS
 - SUBNET MASK
 - ROUTER IP ADDRESS
 - DNS IP ADDRESS
 - DOMAIN

 If the DHCP server cannot be connected, "DHCP ERROR" is displayed in each field.
6 If the DNS client function has also been enabled and if the DHCP server and the DNS server work together (if the DNS server supports dynamic DNS), enter a host name.

COMMON screen (BASIC and DETAIL)

After pressing soft key [COMMON], press either page key 
to call desired Ethernet common setting screens (BASIC and DETAIL).
If the DHCP server is connected successfully and if the setting data can be obtained, the screens are displayed as shown Fig. 17.2.3.2(a).

Fig. 17.2.3.2 (a) When the DHCP server is connected successfully

If the host name is not specified, the CNC automatically assigns a host name in the "NC-<MAC-address>" format.

Example of automatically assigned host name

If the DHCP server cannot be connected, the screens are displayed as shown Fig. 17.2.3.2(b).

Fig. 17.2.3.2 (b) When the DHCP server cannot be connected

Check items

Item	Description
IP ADDRESS SUBNET MASK ROUTER IP ADDRESS DNS IP ADDRESS 1,2 DOMAIN	If the DHCP server is connected successfully, the items obtained from the DHCP server are displayed. If the DHCP server cannot be connected, "DHCP ERROR" is displayed.

Setting items

Item	Description
HOST NAME	Enter the host name of the CNC. If a DHCP server and a DNS server work together, the DHCP server notifies the DNS server of this host name. If the host name is left blank, a host name is automatically assigned in the "NC-<MAC-address>" format. Example of automatically assigned host name: NC-080019000001
DNS CLIENT	The value of parameter No.14880#5(DNS) related to the DNS client function is displayed, and the setting is also possible. See “Related Parameters”, which will be seen later.

Display items

Item	Description
MAC ADDRESS	MAC address of embedded Ethernet

17.2.3.3 Related parameters

For embedded Ethernet port

	#7	#6	#5	#4	#3	#2	#1	#0
14880		DHC	DNS					

[Input type] Parameter input
[Data type] Bit

#5 DNS With a built-in port, the DNS client function is:
0: Not used.
1: Used.
This value is also displayed to the DNS CLIENT in the COMMON screen (DETAIL), and the setting is also possible.

#6 DHC With a built-in port, the DHCP client function is:
0: Not used.
1: Used.
This value is also displayed to the DHCP CLIENT in the COMMON screen (BASIC), and the setting is also possible.

A change in these parameters becomes effective after the power is turned off and on or after the embedded Ethernet function is restarted.

17.2.4 Setting of the CNC Screen Display Function

CNC Screen Display function is a software that allows performing display and operation similar to a CNC on the Windows PC. Refer to "CNC Screen Display Function OPERATOR’S MANUAL (B-63164EN)" for the method of use.

NOTE

1 The screen update interval of CNC Screen Display function is slower than that of a CNC-dedicated display unit. Therefore, use this function as an auxiliary display unit.
2 When high-load machining such as high-speed and high-precision machining is performed or the functions that require the CPU power are specified, the screen update interval might be slower. Even if a higher-performance personal computer is used, the screen update interval is not improved.
Therefore, the CNC Screen Display function on Embedded Ethernet might not show the full performance according to the system configuration of the machine.
3 On Embedded Ethernet, when other network functions (FOCAS2/Ethernet function etc.) are used simultaneously with CNC Screen Display function, it affects the screen update interval. Therefore, do not use other network functions at the same time on Embedded Ethernet when using CNC Screen Display function.

17.2.4.1 Operation on the Setting screen

This section describes the setting screen for operating the CNC Screen Display function.

Procedure

1 Press the function key 
.

2 Soft key [EMBED PORT] appears. (When there is not this soft keys, press the continue key.)

3 Press soft key [EMBED PORT] to display the Ethernet Setting screen.

4 Press soft keys [COMMON] and [FOCAS2], and then enter parameters for the items that appear.

COMMON screen (BASIC)

Press soft key [COMMON] to display the COMMON screen (BASIC).

Fig. 17.2.4.1 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify a mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item when the network contains a router. (Example of specification format: "192.168.0.253")
DHCP CLIENT	The value of parameter No.14880#6(DHC) related to the DHCP client function is displayed, and the setting is also possible. For details, see Subsection, "Setting Up the DNS/DHCP Function".

Display items

Item	Description
MAC ADDRESS	Embedded Ethernet MAC address
AVAILABLE DEVICE	Enabled device of the embedded Ethernet. Either the embedded Ethernet port or the PCMCIA Ethernet card is displayed.

FOCAS2 screen

Press soft key [FOCAS2] to display the FOCAS2 screen.

Fig. 17.2.4.1 (b) FOCAS2 screen

Setting items

Item	Description
PORT NUMBER (TCP)	Specifies the port No. to be used by the CNC screen Display function (FOCAS2/Ethernet function), within a range of 5001 to 65535.
PORT NUMBER (UDP)	Set this item to 0.
TIME INTERVAL	Set this item to 0.

17.2.5 Setting of the Machine Remote Diagnosis package

Machine Remote Diagnosis package is a tool designed for the machine tool builder to provide remote support of machines easily. Machine Remote Diagnosis function works on Embedded Ethernet or Fast Ethernet board in order to communicate with Machine Remote Diagnosis package.
Refer to "Machine Remote Diagnosis Package OPERATOR'S MANUAL (B-63734EN)" for the method of use.

> **NOTE**
> Refer to the notes of “Setting of the CNC Screen Display function” when using CNC Screen Display function for MRDP (Machine Remote Diagnosis Package).The notes are applied to this function, too.

17.2.5.1 Related NC parameters

When using Machine Remote Diagnosis package on Embedded Ethernet, the following parameters must be set.

0024	Setting of communication with the PMC ladder development tool

[Input type] Setting input
[Data type] Word
[Valid data range] 10: The high-speed interface (Ethernet) is used for PMC online editing.

	#7	#6	#5	#4	#3	#2	#1	#0
8706		MRD						

[Input type] Parameter input
[Data type] Bit

#6 MRD Machine Remote Diagnosis function is used:
0: On Embedded Ethernet.
1: On Fast Ethernet board.

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

	#7	#6	#5	#4	#3	#2	#1	#0
14880							PCH	

[Input type] Parameter input
[Data type] Bit
#1 PCH At the start of communication of the Data Server, FTP file transfer function, or machine remote diagnosis functions, checking for the presence of the server using PING is:
0: Performed.
1: Not performed.

> **NOTE**
> When connecting with the host computer (machine remote diagnosis accepting server) on Intranet, set 0.
> When the presence of the server using PING is not checked by setting 1, it may take several tens of seconds until an error is recognized due to no server on the network.
> When connecting with the host computer (machine remote diagnosis accepting server) via Internet, set 1.

	#7	#6	#5	#4	#3	#2	#1	#0
14882								ERD

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> Re-setting this parameter requires turning the power off and on again or restarting the embedded Ethernet interface.

#0 ERD On Embedded Ethernet, Machine Remote Diagnosis is:
0: Not used.
1: Used.

17.2.5.2 Operation on the Setting screen

Procedure

1 Press the function key .

2 Soft key [EMBED PORT] appears. (When there is not this soft keys, press the continue key.)

3 Press soft key [EMBED PORT] to display the Ethernet Setting screen.

4 Press soft keys [COMMON], [FOCAS2], and [REMOTE DIAG] and then enter parameters for the items that appear.

> **NOTE**
> 1 The parameters for the embedded Ethernet port and the parameters for the PCMCIA Ethernet card are independent of each other.
> 2 If the [PCMCIA LAN] soft key is pressed, the PCMCIA Ethernet card can be set up. However, the card setup is carried out for maintenance and is not necessary usually.

COMMON screen (BASIC)

Press soft key [COMMON] to display the COMMON screen (BASIC).

Fig. 17.2.5.2 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify a mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item when the network contains a router. (Example of specification format: "192.168.0.253")
DHCP CLIENT	The value of parameter No.14880#6(DHC) related to the DHCP client function is displayed, and the setting is also possible. For details, see Subsection, "Setting Up the DNS/DHCP Function".

Display items

Item	Description
MAC ADDRESS	Embedded Ethernet MAC address
AVAILABLE DEVICE	Enabled device of the embedded Ethernet. Either the embedded Ethernet port or the PCMCIA Ethernet card is displayed.

FOCAS2 screen

Press soft key [FOCAS2] to display the FOCAS2 screen.

Fig. 17.2.5.2 (b) FOCAS2 screen

Setting items

Item	Description
PORT NUMBER (TCP)	Specifies the port No. to be used by the machine remote diagnosis functions (FOCAS2/Ethernet functions), within a range of 5001 to 65535.
PORT NUMBER (UDP)	Set this item to 0.
TIME INTERVAL	Set this item to 0.

MACHINE REMOTE DIAG screen (COMMON)

Press soft key [REMOTE DIAG] to display the MACHINE REMOTE DIAG screen (COMMON).

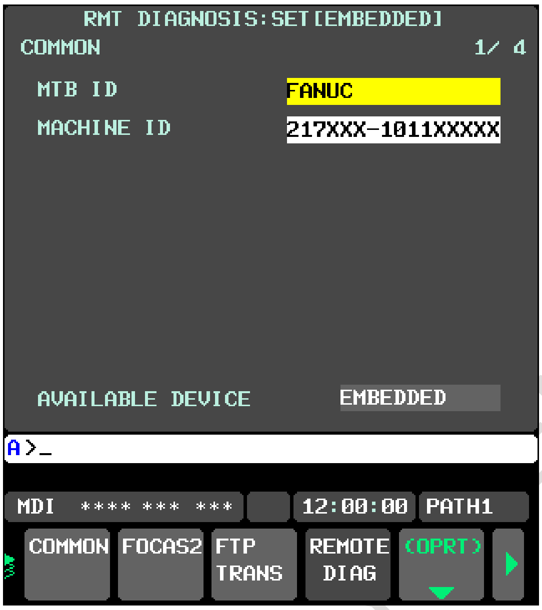

Fig. 17.2.5.2 (c) Machine remote diagnosis screen (COMMON)

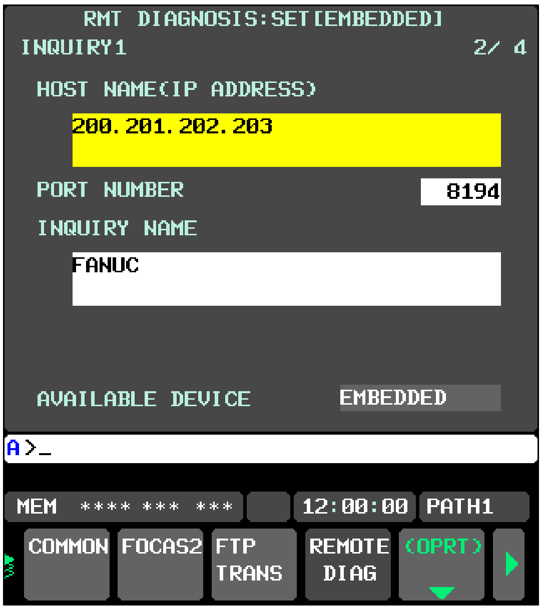
Setting items

Item	Description
MTB ID	This information is required by the machine remote diagnosis package to confirm that the diagnosis request is issued from a machine manufactured by the machine tool builder. The MTB identification information on the diagnosis accepting server of the machine remote diagnosis package can be set to accept diagnosis requests only from the machines manufactured by the machine tool builder. (Example of specification format: "FANUC")
MACHINE ID	Information required by the machine remote diagnosis package to identify the machine under diagnosis (Example of specification format: "217xxx-1011xxxxx")

MACHINE REMOTE DIAG screen (INQUIRY1, INQUIRY2, INQUIRY3)

Press soft key [RMTDIAG] to display the MACHINE REMOTE DIAG screen.

By using page keys PAGE PAGE, the three host computers at inquiry destinations 1, 2, and 3 can be set.



(When the DNS function is disabled)

(When the DNS function is enabled)

Fig. 17.2.5.2 (d) Machine Remote Diagnosis screens (INQUIRY1)

Setting item

Item	Description
HOST NAME	Specify the IP address of the host computer (machine remote diagnosis accepting server) when the DNS function is disabled. (Example of specification format: "200.201.202.203") Specify the host name of the host computer (machine remote diagnosis accepting server) when the DNS function is enabled. (You can specify up to 63 characters.) (Example of specification format: "RMTDIAG.FANUC.CO.JP")
PORT NUMBER	Specify a port number. Usually, specify "8194" because the machine remote diagnosis functions are used.
INQUIRY NAME	Specify information for identifying the host computer (machine remote diagnosis accepting server). (You can specify up to 63 characters.) (Example of specification format: "FANUC")

17.2.5.3 Controlling Machine Remote Diagnosis function from PMC

You can use signals from the PMC to control the start and forced termination of the machine remote diagnosis functions and post the status of the machine remote diagnosis functions and error numbers to the PMC ladder.

Signals

No.	#7	#6	#5	#4	#3	#2	#1	#0
G0141			DIAREQ	DIASTP		INQU2	INQU1	INQU0

DIAREQ <G0141.5>
[Name] Signal to request machine remote diagnosis
[Classification] Input signal
[Function] Requests the start of machine remote diagnosis.
[Operation] When this signal is set to "1", it requests the start of machine remote diagnosis to the inquiry destination according to the signals indicating the number of the inquiry destination (INQU0<G0141.0> to INQU2<G0141.2>). When the acceptance completion signal (RMTEND<F0083.6>) or acceptance reject signal (RMTCAN<F0083.7>) is set to "1", this signal is set to "0".

DIASTP <G0141.4>
[Name] Signal to request machine remote diagnosis cancellation
[Classification] Input signal
[Function] Requests the forced termination of machine remote diagnosis.
[Operation] When this signal is set to "1", it requests forced termination to the machine remote diagnosis accepting server. When the completion signal for machine remote signal cancel acceptance (RMTCLS<F0082.3>) is set to "1", this signal is set to "0".

INQU2 <G0141.2>
INQU1 <G0141.1>
INQU0 <G0141.0>
[Name] Inquiry number select signals
[Classification] Input signal
[Function] Inquiry destination for which to start machine remote diagnosis
[Operation] Select an item from the table below as an inquiry destination for which to start machine remote diagnosis.

INQU2	INQU1	INQU0	Status
0	0	0	No selection
0	0	1	Inquiry destination 1
0	1	0	Inquiry destination 2
0	1	1	Inquiry destination 3

No.	#7	#6	#5	#4	#3	#2	#1	#0
F0082					RMTCLS			

RMTCLS <F0082.3>
[Name] Completion signal for machine remote diagnosis cancel acceptance
[Classification] Output signal
[Function] Notifies that a request to cancel machine remote diagnosis has been accepted.
[Output condition] When machine remote diagnosis is canceled after the signal to request machine remote diagnosis cancellation (DIASTP<G0141.4>) is set to "1", this signal is set to "1". When the signal to request machine remote diagnosis cancellation (DIASTP<G0141.4>) is set to "0", this signal is set to "0".

No.	#7	#6	#5	#4	#3	#2	#1	#0
F0083	RMTCAN	RMTEND	DIAST5	DIAST4	DIAST3	DIAST2	DIAST1	DIAST0

RMTCAN <F0083.7>

[Name] Reject signal for machine remote diagnosis acceptance

[Classification] Output signal

[Function] Notifies that a machine remote diagnosis request has been rejected.

[Output condition] When the signal to request machine remote diagnosis (DIAREQ<G0141.5>) is set to "1", a request to start machine remote diagnosis is issued to the machine remote diagnosis accepting server. When the server rejects the request, this signal is set to "1". When the signal to request machine remote diagnosis (DIAREQ<G0141.5>) is set to "0", this signal is set to "0".

RMTEND <F0083.6>

[Name] Completion signal for machine remote diagnosis acceptance

[Classification] Output signal

[Function] Notifies that a machine remote diagnosis request has been accepted by the machine remote diagnosis accepting server.

[Output condition] When the signal to request machine remote diagnosis (DIAREQ<G0141.5>) is set to "1", a request to start machine remote diagnosis is issued to the machine remote diagnosis accepting server. When the server accepts the request, this signal is set to "1". When the signal to request machine remote diagnosis (DIAREQ<G0141.5>) is set to "0", this signal is set to "0".

DIAST5 <F0083.5>
DIAST4 <F0083.4>
DIAST3 <F0083.3>
DIAST2 <F0083.2>
DIAST1 <F0083.1>
DIAST0 <F0083.0>

[Name] Notification signals for the machine remote diagnosis status

[Classification] Output signal

[Function] Report the status of machine remote diagnosis.

[Output condition] The status of machine remote diagnosis is reported as listed in the following table.

DIAST5	DIAST4	DIAST3	DIAST2	DIAST1	DIAST0	Description
0	0	0	0	0	0	No status
0	0	0	0	0	1	OPEN
0	0	0	0	1	0	OPENING
0	0	0	0	1	1	ACCEPTED
0	0	0	1	0	0	REFUSED
0	0	0	1	0	1	DIAGNOSING
0	0	0	1	1	0	DIAGNOSING
0	0	0	1	1	1	CLOSE
0	0	1	0	0	0	FORCE CLOSING
0	0	1	0	0	1	ERROR

No.	#7	#6	#5	#4	#3	#2	#1	#0
F0088	DIAER7	DIAER6	DIAER5	DIAER4	DIAER3	DIAER2	DIAER1	DIAER0

DIAER7 <F0088.7>
DIAER6 <F0088.6>
DIAER5 <F0088.5>
DIAER4 <F0088.4>
DIAER3 <F0088.3>
DIAER2 <F0088.2>
DIAER1 <F0088.1>
DIAER0 <F0088.0>

[Name] Notification signals for a machine remote diagnosis error number

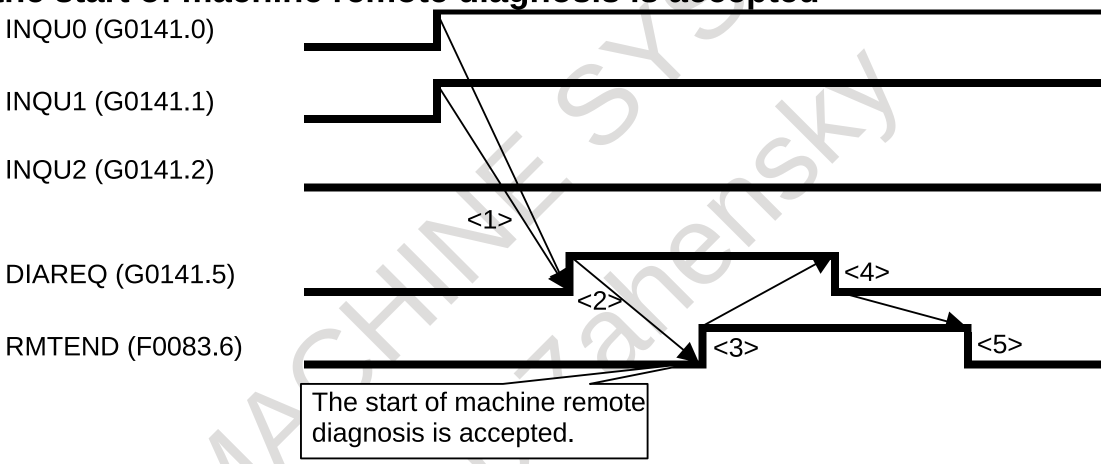
[Classification] Output signal

[Function] Report an error number of machine remote diagnosis.

[Output condition] These signals indicate an error number of machine remote diagnosis. The error number is 0 to 255 in binary format.

Signal Timing Charts

When the start of machine remote diagnosis is accepted



<1> Before the signal to request machine remote diagnosis (DIAREQ) is set to "1", an inquiry destination for which to start the remote diagnosis functions is selected using the inquiry destination number signals (INQU0, INQU1, and INQU2). In this example, "inquiry destination 3" is selected by setting INQU0 = 1, INQU1 = 1, and INQU2 = 0.

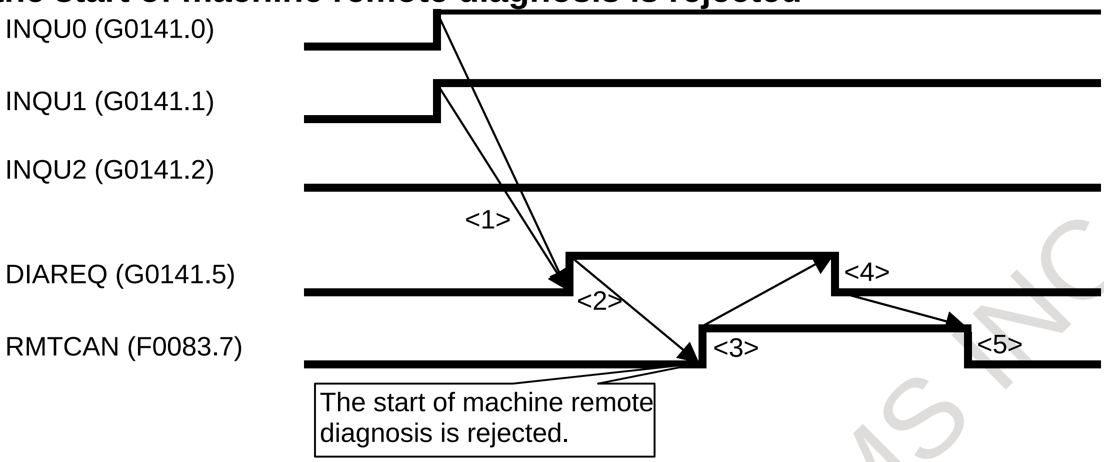
<2> The signal to request machine remote diagnosis (DIAREQ) is set to "1".

<3> When the machine remote diagnosis package accepts the request to start diagnosis, the completion signal for machine remote diagnosis acceptance (RMTEND) is set to "1".

<4> When the completion signal for machine remote diagnosis acceptance (RMTEND) is set to "1", the signal to request machine remote diagnosis (DIAREQ) is set to "0".

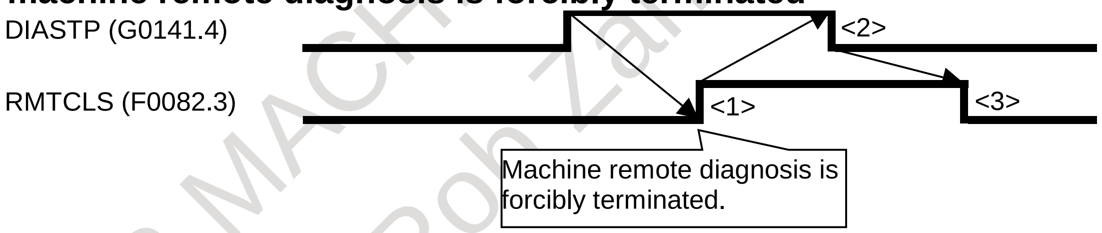
<5> When the signal to request machine remote diagnosis (DIAREQ) is set to "0", the completion signal for machine remote diagnosis acceptance (RMTEND) is set to "0".

When the start of machine remote diagnosis is rejected



<1> Before the signal to request machine remote diagnosis (DIAREQ) is set to "1", an inquiry destination for which to start the remote diagnosis functions is selected using the inquiry destination number signals (INQU0, INQU1, and INQU2). In this example, "inquiry destination 3" is selected by setting INQU0 = 1, INQU1 = 1, and INQU2 = 0.
<2> The signal to request machine remote diagnosis (DIAREQ) is set to "1".
<3> When the machine remote diagnosis package rejects the request to start diagnosis, the reject signal for machine remote diagnosis acceptance (RMTCAN) is set to "1".
<4> When the reject signal for machine remote diagnosis acceptance (RMTCAN) is set to "1", the signal to request machine remote diagnosis (DIAREQ) is set to "0".
<5> When the signal to request machine remote diagnosis (DIAREQ) is set to "0", the reject signal for machine remote diagnosis acceptance (RMTCAN) is set to "0".

When machine remote diagnosis is forcibly terminated



<1> When the signal to request machine remote diagnosis cancellation (DIASTP) is set to "1", the completion signal for machine remote diagnosis cancel acceptance (RMTCLS) is set to "1".
<2> When the completion signal for machine remote diagnosis cancel acceptance (RMTCLS) is set to "1", the signal to request machine remote diagnosis cancellation (DIASTP) is set to "0".
<3> When the signal to request machine remote diagnosis cancellation (DIASTP) is set to "0", the completion signal for machine remote diagnosis cancel acceptance (RMTCLS) is set to "0" and the machine remote diagnosis functions are forcibly terminated.

17.2.5.4 Operating Machine Remote Diagnosis screen

Procedure

1 Press the function key .

2 Soft key [REMOTE DIAG] appear. (When there is no soft keys, press the continue key.)

3 Press soft key [REMOTE DIAG] to display the machine remote diagnosis screen.

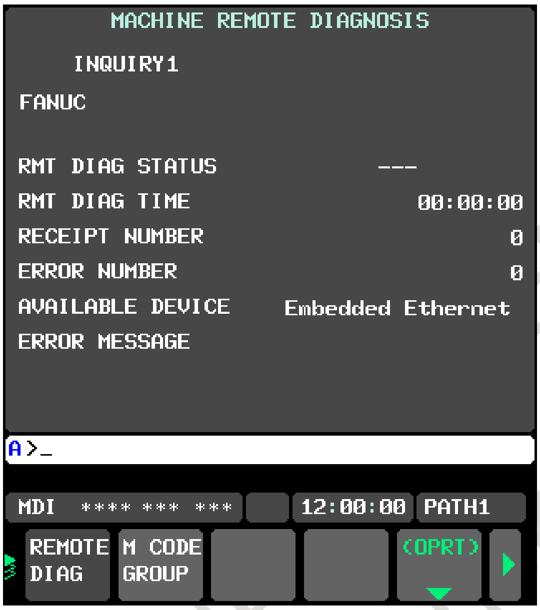


Fig. 17.2.5.4 (a) Machine Remote Diagnosis screen

4 Press soft key [(OPRT)] to display available soft keys.

Fig. 17.2.5.4 (b) Soft keys of Machine Remote Diagnosis screen

Display items

INQUIRY NUMBER

Displays the inquiry number indicating the machine remote diagnosis accepting server: "INQUIRY1," "INQUIRY2," or "INQUIRY3."

INQUIRY

Displays information for identifying the machine remote diagnosis accepting server.

RMT DIAG STATUS

Displays the status of machine remote diagnosis.

RMT DIAG TIME

Displays the time until the machine remote diagnosis status changes from "OPEN" to "CLOSE," "FORCE CLOSING," or "ERROR."
At each start of diagnosis, the time is accumulated from "00:00:00."

RECEIPT NUMBER

Displays the receipt number issued by the machine remote diagnosis accepting server.

ERROR NUMBER

Displays the number of an error which occurs in operation of the machine remote diagnosis functions.

AVAILABLE DEVICE
Displays the type of communication device for which the machine remote diagnosis functions can operate.

ERROR MESSAGE
Displays the message indicating an error which occurs in operation of the machine remote diagnosis functions.

Operation list

DIAG OPEN
Starts machine remote diagnosis.

DIAG CLOSE
Forcibly terminates machine remote diagnosis.

INQUIRY1
Selects inquiry destination 1.

INQUIRY2
Selects inquiry destination 2.

INQUIRY3
Selects inquiry destination 3.

Selecting an Inquiry Destination

Select an inquiry destination among inquiry destinations 1 to 3.

1. Press soft key [(OPRT)].
2. Press soft key [INQUIRY1] to select inquiry destination 1.
3. Similarly, press soft key [INQUIRY2] to select inquiry destination 2 and soft key [INQUIRY3] to select inquiry destination 3.

Starting Diagnosis

Start diagnosis.
1. Press soft key [(OPRT)].
2. Press soft key [DIAG OPEN] to send the start request to the machine remote diagnosis
3. When the machine remote diagnosis accepts the start request, the diagnosis begins.

Diagnosis status

Status	Description
---	No operation
OPEN	Soft key [DIAG OPEN] was pressed.
OPENING	An attempt is being made to connect the machine remote diagnosis accepting server.
ACCEPTED	The machine remote diagnosis accepting server accepted diagnosis.
REFUSED	The machine remote diagnosis accepting server rejected diagnosis.
DIAGNOSING	This message flashes in synchronization with data flowing on the communication line.
FORCE CLOSING	Soft key [DIAG CLOSE] was pressed. After the completion of forced termination processing, "CLOSE" is indicated in the RMT DIAG STATUS field.
CLOSE	The machine remote diagnosis accepting server terminated diagnosis.
ERROR	An error occurred on the communication line.

Error numbers and error messages

Number	Error message	Meaning and action to be taken
1	Diagnosis is busy	Soft key [DIAG OPEN] was pressed during diagnosis.
2	Router isn't alive	The IP address of the router may be invalid or the power to the router may be off. Check whether the IP address of the router is valid and whether the power to the router is on.
3	Receipt Server isn't alive	The IP address of the machine remote diagnosis accepting server may be invalid or the machine remote diagnosis accepting server may not be operating. Check whether the IP address of the machine remote diagnosis accepting server is valid and whether the machine remote diagnosis accepting server is operating.
4	System error	A system error occurred. Check the log messages on the ETHERNET LOG screen and contact FANUC.
5	Invalid Inquiry number.	A value outside the valid setting range may be set for the inquiry destination. Check whether the correct inquiry destination is set.
6	Invalid IP Address	Set the IP address according to the IP address specification format.
7	Invalid PORT number	A value outside the valid setting range may be set for the port number. Check whether the correct port number is set.
8	Invalid Router IP Address	Set the IP address of the router according to the IP address specification format.
9	Socket error	A communication error occurred due to a cause as listed below. Check the network wiring and anti-noise measures. → The network quality degraded, data could not be received from the personal computer with which to communicate, and the logical communication path was disconnected. → The software component on the personal computer with which to communicate forcibly disconnected the logical communication path. → The Ethernet cable was disconnected.
11	Invalid Request	An internal error related to machine remote diagnosis occurred in the CNC. Check the log messages on the ETHERNET LOG screen and contact FANUC.
12	Invalid Packet	An unrecognizable packet was received. Check the log messages on the ETHERNET LOG screen and contact FANUC.
13	Diagnosis was already stopped	Soft key [DIGA CLOSE] was pressed not during diagnosis.
17	Receive error	An attempt to receive data failed. See Number 9 and check the network wiring and anti-noise measures.
19	HeartBeat timeout	Communication with the machine remote diagnosis accepting server stopped. See Number 9 and check the network wiring and anti-noise measures.
20	HeartBeat error	An attempt was failed to send a heartbeat packet for machine remote diagnosis. See Number 9 and check the network wiring and anti-noise measures.
22	DNS error	An attempt was failed to connect the machine remote diagnosis accepting server using the DNS function. The IP address of the DNS server may be invalid or the power to the DNS server may be off. Check whether the IP address of the DNS server is valid and whether the power to the DNS server is on.

Forcibly Terminating Diagnosis

Forcibly terminate diagnosis.

1 Press soft key [(OPRT)].
2 Press soft key [DIAG CLOSE] to forcibly terminate diagnosis.

17.2.6 Setting of the Unsolicited Messaging Function

This subsection describes the setting required to operate the unsolicited messaging function with the embedded Ethernet function.

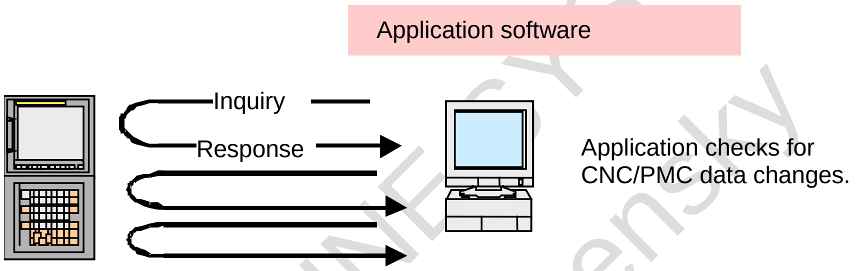
17.2.6.1 Overview

This subsection provides an overview of the unsolicited messaging function and describes the execution procedure.

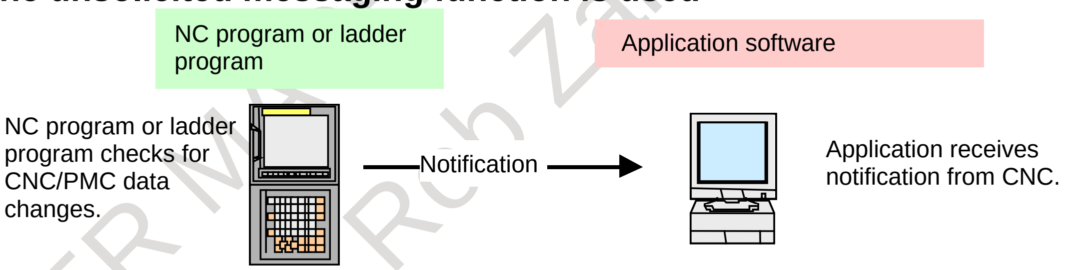
Overview of the unsolicited messaging function

An overview of the unsolicited messaging function is provided below.
With the unsolicited messaging function, the CNC transmits messages (CNC/PMC data) in an unsolicited manner to application software on the personal computer according to a command from an NC program or ladder program. By using this function, the need for application processing on the personal computer to periodically inquire about the state of the CNC can be eliminated.

When the conventional function is used



When the unsolicited messaging function is used



> **NOTE**
> The unsolicited messaging function is a part of the FOCAS2/Ethernet function.

Unsolicited messaging function execution procedure

The execution procedure for the unsolicited messaging function is described below.

1 Preparation on the personal compute
Create an application using the FOCAS2 function for the unsolicited messaging function and install the unsolicited message server on a personal computer. For information on creating an application with FOCAS2 functions for the unsolicited messaging function and installing the unsolicited message server, refer to Chapter 5, "UNSOLICITED MESSAGING FUNCTION" in "Data Window Library Specifications" that comes with the FOCAS1/2 library.

2 Preparation on the CNC
Create an NC program or ladder program for controlling unsolicited messaging.
For the method of creating an NC program or ladder program, see Subsection 17.2.6.6, "Execution methods".

3 Setting of the communication parameters for the unsolicited messaging function
To use the unsolicited messaging function, the following communication parameter settings are needed:
(1) Setting for using the FOCAS2/Ethernet function
(2) Setting of the parameters for the unsolicited messaging function
For (2), a choice can be made from two modes of setting: CNC mode for setting on the CNC screen and the PC mode for setting on the personal computer.
For the setting method of (1) and (2), see Subsection 17.2.6.2, "Setting of the FOCAS2/Ethernet function" through Subsection 17.2.6.5, "Setting on the personal computer".

4 Starting the NC program or ladder program
Start the NC program or ladder program created in step 2, "Preparation on the CNC". At this time, no unsolicited message is transmitted to the personal computer until step 5, "Starting the unsolicited messaging function", is executed.

5 Starting the unsolicited messaging function
Execute the FOCAS2 function cnc_unsolicstart on the personal computer. This execution places the CNC in the state (named "Ready") where a transmission request from the NC program or ladder program is awaited. Each time a transmission request is made from the NC program or ladder program, an unsolicited message is automatically transmitted to the personal computer.

6 Ending the unsolicited messaging function
To end unsolicited message transmission, execute the FOCAS2 function cnc_unsolicstop on the personal computer. This execution places the CNC in the state (named "Not Ready") where no unsolicited message is transmitted even when a request for transmission is made from the NC program or ladder program.

17.2.6.2 Setting of the FOCAS2/Ethernet function

This subsection describes the setting of the FOCAS2/Ethernet function for operating the unsolicited messaging function.

Procedure

1 Enable the unsolicited messaging function according to "Related parameters" described later.
2 Start the CNC again then press function key 
.
3 Soft key [EMBED] is displayed. (Press the continuous menu key until the soft key is displayed.)
4 Press soft key [EMBED]. The Ethernet Setting screen for the embedded Ethernet port is displayed.
5 Press soft keys [COMMON] and [FOCAS2] then make settings on each screen.
6 Press soft key [UNSOLI MSG]. The Unsolicited Message screen is displayed. (Press the continuous menu key until the soft key [UNSOLI MSG] is displayed.) For details of the Unsolicited Message screen, see Subsections starting with Subsection 17.2.6.3, "Mode selection".

COMMON screen (BASIC)

Press soft key [COMMON]. The COMMON screen (BASIC) (Fig. 17.2.6.2(a)) is displayed.

Fig. 17.2.6.2 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify a mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item when the network contains a router. (Example of specification format: "192.168.0.253")

Display items

Item	Description
MAC ADDRESS	Embedded Ethernet MAC address
AVAILABLE DEVICE	Enabled device of the embedded Ethernet. Either the embedded Ethernet port or the PCMCIA Ethernet card is displayed.

> **NOTE**
> Set page 2 (DETAIL screen) of the COMMON screen when using the DNS/DHCP function. For details, see Subsection 17.2.3, "Setting Up the DNS/DHCP Function".

COMMON screen (DETAIL)

When using the DNS client function, press soft key [COMMON] then press page key . The COMMON screen (DETAIL) (Fig. 17.2.6.2(b)) is displayed. Set the DNS IP address setting items.

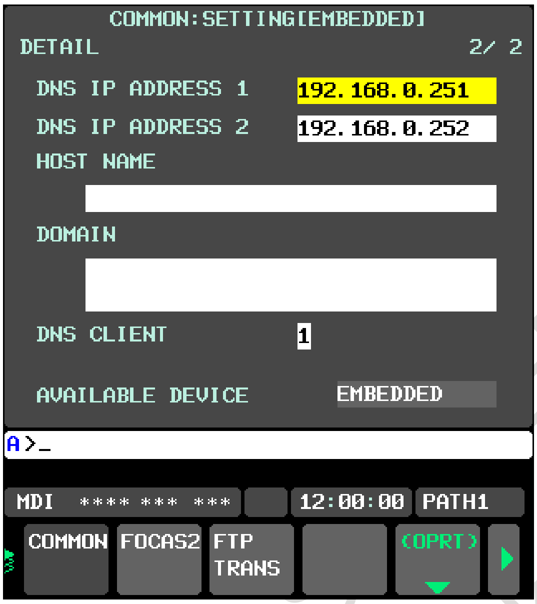


Fig. 17.2.6.2 (b) COMMON screen (DETAIL)

Display items

Item	Description
DNS IP ADDRESS 1, 2	Up to two DNS IP addresses can be specified. The CNC searches for the DNS server using DNS IP addresses 1 and 2 in that order.

FOCAS2 screen

Press soft key [FOCAS2]. The FOCAS2 screen (Fig. 17.2.6.2(c)) is displayed.

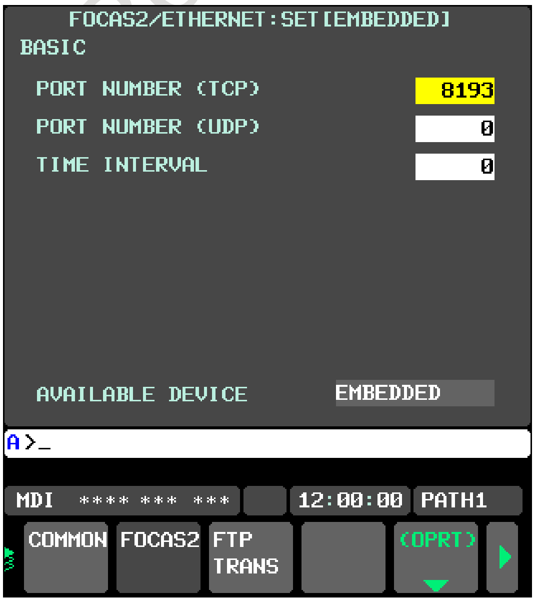

Fig. 17.2.6.2 (c) FOCAS2 screen

Setting items

Item	Description
PORT NUMBER (TCP)	Specify a port number to be used with the unsolicited messaging function (FOCAS2/Ethernet function). The valid input range is 5001 to 65535.
PORT NUMBER (UDP)	Set this item to 0.
TIME INTERVAL	Set this item to 0.

17.2.6.3 Mode selection

This subsection describes the selection of a mode for setting the unsolicited messaging function.

Unsolicited Message screen (BASIC)

Press soft key [UNSOLI MSG]. The Unsolicited Message screen (BASIC) (Fig. 17.2.6.3(a)) is displayed.

Fig. 17.2.6.3 (a) Unsolicited Message screen 1 (BASIC)

Setting items

Item	Description
MODE	Select a mode for setting the unsolicited messaging function. For the method of selection, see "**Operation**" described later. - When "CNC MODE" is selected This mode enables setting on the CNC screen. In this case, setting on the personal computer is disabled. For details, see Subsection 18.2.4.4, "Setting on the CNC screen". - When "PC MODE" is selected This mode enables setting on the personal computer. In this case, setting on the CNC screen is disabled. For details, see Subsection 18.2.4.5, "Setting on the personal computer".

NOTE

1. The mode is set to "PC MODE" at the time of initial use.
2. The mode can be switched only in the "Not Ready" state. For the "Not Ready" state, see "**Display items**" provided later.
3. If the mode is switched from "CNC MODE" to "PC MODE", all parameters set on the CNC screen are cleared.
4. The mode can be switched on the available device side only.

Operation

The mode can be switched as described below.

1 Press soft key [(OPRT)]. Soft key [MODE] is displayed. (Fig. 17.2.6.3(b))

Fig. 17.2.6.3 (b)

2 Press soft key [MODE]. Soft keys [CNC MODE] and [PC MODE] are displayed. (Fig. 17.2.6.3(c))

Fig. 17.2.6.3 (c)

Display items

Item	Description
IP ADDRESS	Displays the IP address of the personal computer currently connected. (Example of display format: "192.168.0.1")
STATUS	Displays the current state. The following five states are available: <1> Not Ready State where data is not transmitted even when a request for data transmission is made from an NC program or ladder program <2> Ready State where data is transmitted when a request for data transmission is made from an NC program or ladder program <3> Sending... State present from the acceptance of a request for data transmission from an NC program or ladder program until data transmission is completed <4> Receiving... State present from completion of data transmission until response data is received <5> Completed State present from reception of response data until response data processing is completed [Supplement] - Data transmission Means unsolicited message transmission (CNC→PC). - Response data Means a response to an unsolicited message (PC→CNC).
AVAILABLE DEVICE	Device where embedded Ethernet is currently enabled. The embedded Ethernet port or PCMCIA Ethernet card is displayed.

NOTE

1. To switch the state from "Not Ready" to "Ready", the FOCAS2 function cnc_unsolicstart needs to be executed on the personal computer.
2. To switch the state from other than "Not Ready" to "Not Ready", the FOCAS2 function cnc_unsolicstop needs to be executed on the personal computer.
3. For the timing charts of the states, see Subsection 18.2.6.6, "Execution methods".

17.2.6.4 Setting on the CNC screen

This subsection describes the method of setting on the Unsolicited Message screen.

NOTE

1 To enable the settings on the CNC screen and perform unsolicited messaging, the procedure below needs to be used.
   (1) Set all setting items on the Unsolicited Message screen (CONNECT).
   (2) Press soft key [(OPRT)] then press soft key [APPLY].
   (3) Start unsolicited messaging (execute the FOCAS2 function cnc_unsolicstart) on the personal computer.

2 Setting of the setting items on the Unsolicited Message screen (CONNECT) and execution of the soft keys ([(OPRT)] then [APPLY]) are possible only in the "Not Ready" state. For the "Not Ready" state, see "**Display items**" in Subsection 18.2.6.3, "Mode selection".

3 On the setting screen on the unavailable device side, the setting items can be set. However, execution of the soft keys ([(OPRT)] then [APPLY]) is possible on the available device side only.

Unsolicited Message screen (CONNECT)

Press soft key [UNSOLI MSG] then open page 2 and page 3 with page keys PAGE PAGE. The Unsolicited Message screen (CONNECT) (Figs. 17.2.6.4(a) and (b)) is displayed.

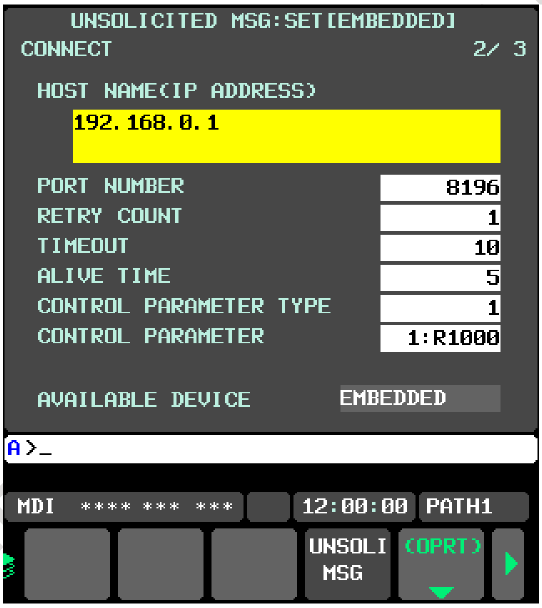

Fig. 17.2.6.4 (a) Unsolicited Message screen 2 (CONNECT)

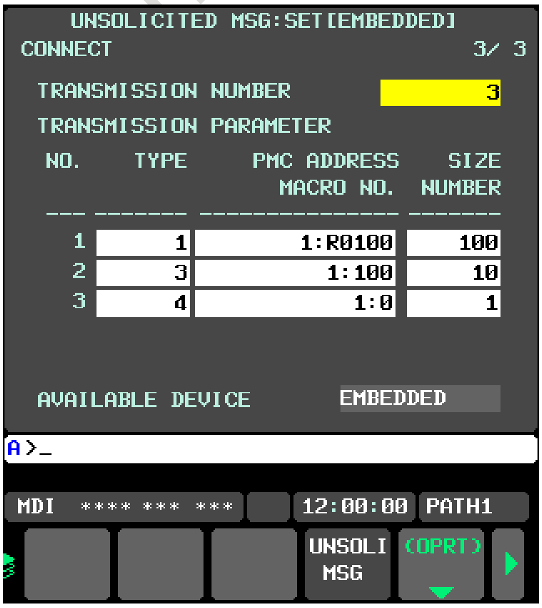

Fig. 17.2.6.4 (b) Unsolicited Message screen 3 (CONNECT)

Setting items

Item	Description
HOST NAME (IP ADDRESS)	When the DNS client function is disabled, specify the IP address of the communication destination personal computer. (Example of specification format: "192.168.0.1") When the DNS client function is enabled, specify the host name of the communication destination personal computer. (Up to 63 characters can be specified.) (Example of specification format: "UNSOLI-SRV.FACTORY")
PORT NUMBER	Specify the TCP port number and UDP port number of the communication destination personal computer. Usually, specify "8196". The valid input range is 5001 to 65535.
RETRY COUNT	Specify the number of retries to be made when there is no response to data transmitted by the communication function. The valid input range is 0 to 32767.
TIMEOUT	Specify a time-out period (in sec) from the transmission of data by the communication function until a response is made to the transmitted data. The valid input range is 1 to 32767.
ALIVE TIME	Specify the time interval (in sec) of the alive signal to be transmitted while the communication function is operating normally. Specify a value not greater than the value of TIMEOUT. The valid input range is 1 to 32767.
CONTROL PARAMETER TYPE	Specify a type of control parameter. When this parameter is set to 0, the control parameter is invalid. - When set to 1: PMC address (response notification method) - When set to 2: PMC address (simplified method) - When set to 3: Custom macro variable (simplified method) - When set to 4: Volatile RTM variable (simplified method) **(Note)** The RTM variable is a real-time custom macro variable.
CONTROL PARAMETER	Specify a control parameter for executing data transmission. When CONTROL PARAMETER TYPE is set to 1 Specify a PMC address for control. A PMC address in the R area or E area may be specified. Two bytes starting at a specified address are allocated in the area. When CONTROL PARAMETER TYPE is set to 2 Specify a PMC address for control. A PMC address in the R area or E area may be specified. Only a specified address (one byte) is allocated in the area. When CONTROL PARAMETER TYPE is set to 3 Specify a custom macro variable number for control. Only a volatile common variable may be specified as a custom macro variable. Only the variable with a specified variable number is allocated in the area. When CONTROL PARAMETER TYPE is set to 4 Specify a RTM variable number for control. Only a volatile RTM variable may be specified as a RTM variable. Only the variable with a specified variable number is allocated in the area.
TRANSMISSION NUMBER	Specify the number of data items to be transmitted. The valid input range is 1 to 3.

Item		Description	
TRANSMISSION PARAMETER (No.1 to 3)		Specify each parameter for transmission data.	
	TYPE	Specify a transmission data type. When this parameter is set to 0, the transmission parameter is invalid. - When set to 1 or 2: PMC address - When set to 3: Custom macro variable - When set to 4: Volatile RTM variable - When set to 5: Nonvolatile RTM variable	
	PMC ADDRESS or MACRO NO.	Specify the start of a transmission data area	
		When TYPE is set to 1 or 2	
			Specify a PMC address for transmission.
		When TYPE is set to 3	
			Specify a custom macro variable number for transmission.
		When TYPE is set to 4 or 5	
			Specify a RTM variable number for transmission.
	SIZE or NUMBER	Specify the size of a transmission data area or the number of variables. The maximum specifiable number of bytes is as follows: - When TRANSMISSION NUMBER is set to 1: 2890 bytes - When TRANSMISSION NUMBER is set to 2: 2874 bytes in total - When TRANSMISSION NUMBER is set to 3: 2858 bytes in total When using macro variables (custom macro variables or RTM variables), use a conversion rate of one variable for eight bytes.	
		When TYPE is set to 1 or 2	
			Specify a PMC area size (bytes) for transmission.
		When TYPE is set to 3	
			Specify the number of custom macro variables for transmission. When a macro variable number of 1000 or greater (system variable) is used, this parameter can be set to 1 only.
		When TYPE is set to 4 or 5	
			Specify the number of RTM variables for transmission.

⚠ **WARNING**

When setting PMC address or macro variable for the unsolicited messaging function, thoroughly confirm the content of “GENERAL WARNINGS FOR CNC APPLICATION DEVELOPMENT” in “SAFETY PRECAUTIONS” at the beginning of this manual.
Ensure that a PMC address area for control never overlaps PMC areas used for a purpose other than the unsolicited messaging function and that a macro variable for control never be doubly specified as a variable to be used for a purpose other than the unsolicited messaging function.
If the machine is operated without confirmation of above explanation, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

> ⚠ **CAUTION**
> 1 Immediately after the power is turned on, all R area and E area as volatile memory in the PMC area are 0.
> 2 The E area in the PMC area is normally allocated to volatile memory. However, it can also be used as nonvolatile memory.
> When the area is used as nonvolatile memory, the contents of the area are retained even after the power is turned off. So, special attention should be paid not to cause an unpredictable operation when the power is turned on next time.

> **NOTE**
> 1 Two methods are available for PMC address specification in CONTROL PARAMETER TYPE: response notification method and simplified method. For details of the methods, see Subsection 18.2.6.6, "Execution methods".
> 2 The valid setting range of PMC addresses depends on the usable PMC memory type. For details, refer to "PMC PROGRAMMING MANUAL (B-64513EN)".
> 3 The valid setting ranges of custom macro variable numbers and RTM variable numbers depend on the selected options. For details, refer to "OPERATOR'S MANUAL (COMMON TO LATHE SYSTEM/MACHINING CENTER SYSTEM) (B-64694EN)".
> 4 Ensure that the setting of TRANSMISSION NUMBER matches the settings of TRANSMISSION PARAMETER (No. 1 to No. 3). If TRANSMISSION NUMBER is set to 3, and an invalid value is specified in any of TRANSMISSION PARAMETER No. 1 to No. 3, for example, execution of soft key [APPLY] results in an error.

Setting PMC address

To setting a PMC address for control or a PMC address for transmission, specify it as follows:

Input format) <Path number>:<PMC address>

For example, for R0500 on the second path of the PMC, input "2:R500".
If <Path number> is omitted (R500), the first path is assumed (1:R0500).
If the <:> key is not available, it can be substituted with the </> key or the <EOB> key. ":" is optional.
To clear "<Path number>:<PMC address>" previously set, input " " (blank). ("---" will be displayed). In this case, it is assumed that no PMC area is used.

Setting macro variable

To setting a macro variable for control or a macro variable for transmission, specify it as follows:

Input format) <Path number>:<Variable No>

For example, for No.100 on the second path of the Macro, input "2:100".
If <Path number> is omitted (100), the first path is assumed (1:100).
If the <:> key is not available, it can be substituted with the </> key or the <EOB> key. ":" is optional.
To clear "<Path number>:<Variable No>" previously set, input " " (blank). ("---" will be displayed). In this case, it is assumed that no macro variable is used.

Operation

The settings of all setting items on the Unsolicited Message screen (CONNECT) can be made effective as follows:

1 Press soft key [(OPRT)]. Soft key [APPLY] is displayed. (Fig. 17.2.6.4(c))

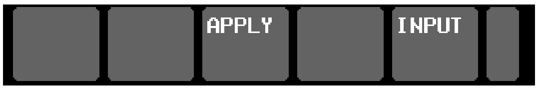

Fig. 17.2.6.4 (c)

2 Press soft key [APPLY].

17.2.6.5 Setting on the personal computer

For setting on the personal computer, create and set an application by using the following FOCAS2 functions:

- cnc_wrunsolicprm2 Parameter setting 2 for unsolicited messaging
- cnc_unsolicstart Start of unsolicited messaging

For details, refer to Chapter 5, "UNSOLICITED MESSAGING FUNCTION" in "Data Window Library Specifications" that comes with the FOCAS1/2 library.

> ⚠ **WARNING**
> When setting PMC address or macro variable for the unsolicited messaging function, thoroughly confirm the content of “GENERAL WARNINGS FOR CNC APPLICATION DEVELOPMENT” in “SAFETY PRECAUTIONS” at the beginning of this manual.
> Ensure that a PMC address area for control never overlaps PMC areas used for a purpose other than the unsolicited messaging function and that a macro variable for control never be doubly specified as a variable to be used for a purpose other than the unsolicited messaging function.
> If the machine is operated without confirmation of above explanation, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

> **NOTE**
> 1 To start unsolicited messaging, the FOCAS2 function cnc_wrunsolicprm2 needs to be executed first then the FOCAS2 function cnc_unsolicstart needs to be executed.
> 2 The FOCAS2 function cnc_wrunsolicprm2 can be executed only in the "Not Ready" state. For details of the state, see "**Display items**" in Subsection 17.2.6.3, "Mode selection".
> 3 When the FOCAS2 function cnc_wrunsolicprm2 is executed, the Unsolicited Message screen (CONNECT) displays the settings made on the personal computer.

17.2.6.6 Execution methods

How to execute the unsolicited messaging function is described below.
To execute the unsolicited messaging function, three methods are available:

- Using a PMC address for control based on the response notification method in a ladder program
- Using a PMC address for control based on the simplified method in a ladder program
- Using a macro variable for control based on the simplified method in an NC program

> **NOTE**
> 1 When a ladder program is used, the response notification method and the simplified method are available. A major difference is that the response notification method sends RES_CODE to the ladder program in response to data transmission but the simplified method does not send a response.
> To utilize a ladder program based on logic used with the Series 16*i*, for example, use the response notification method. When RES_CODE is unnecessary or a new ladder program is created, the simplified method can be used.
> 2 RES_CODE is recorded on the Ethernet log screen when a value other than 0x00 and 0x01 is detected.
> 3 For details of RES_CODE, refer to Chapter 5, "UNSOLICITED MESSAGING FUNCTION" in "Data Window Library Specifications" that comes with the FOCAS1/2 library.

When a PMC address for control is used (response notification method)

A description of using a PMC address for control in a ladder program according to the response notification method is provided below.

> **NOTE**
> A combination of a PMC address for control and a macro variable for transmission is also usable. In this case, note that the read timing of the value of a macro variable to be transmitted cannot be identified when viewed from the ladder program.
> In the description below, a PMC address is used for both of control and transmission.

Explanation of PMC address signals for control

A detailed description of PMC address signals for control used to execute the unsolicited messaging function is provided below. A PMC address area for control consists of 2 bytes.
The description below assumes that Rxxxx (with no PMC path number specified) is used as a PMC address for control.

No.	#7	#6	#5	#4	#3	#2	#1	#0
Rxxxx	REQ							

REQ <Rxxxx.7>

[Name] Message transmission request signal
[Classification] Input signal
[Function] Requests transmission of an unsolicited message.
[Operation] After preparing a transmission message at a PMC address for transmission, the ladder program sets this signal to “1”. The message is then transmitted to the personal computer.

No.	#7	#6	#5	#4	#3	#2	#1	#0
Rxxxx+1	RES	COM	RES_CODE					

RES <Rxxxx+1.7>
[Name] Message response reception signal
[Classification] Output signal
[Function] Posts the reception of a response to an unsolicited message.
[Output condition] Upon reception of a message by the personal computer, a response to the message is transmitted to the CNC (communication function). When the CNC (communication function) receives the response, this signal is set to “1”. When this signal is set to “1”, the ladder program reads RES_CODE then clears REQ to “0”. Next, the CNC (communication function) clears RES_CODE to “0” then sets this signal to “0”.

COM <Rxxxx+1.6>
[Name] Message transmission start signal
[Classification] Output signal
[Function] Posts the start of transmission of an unsolicited message.
[Output condition] When transmission of a message to the personal computer is started, this signal is set to “1”. Upon completion of message transmission, this signal is set to “0”.

RES_CODE <Rxxxx+1.0> to <Rxxxx+1.5>
[Name] Message response reception result signal
[Classification] Output signal
[Function] Posts the reception result of a response to an unsolicited message.
[Output condition] The reception result of a response to a message is set. After reading this signal, the ladder program clears REQ to “0”. The CNC (communication function) then clears this signal to “0”.

> **NOTE**
> For details of RES_CODE, refer to Chapter 5, "UNSOLICITED MESSAGING FUNCTION" in "Data Window Library Specifications" that comes with the FOCAS1/2 library.

Timing chart of PMC address signals for control

The timing chart of PMC address signals for control based on the response notification method is described in the Fig. 17.2.6.6 (a).
In the example below, an unsolicited message is transmitted once after reception of the FOCAS2 function cnc_unsolicstart then the FOCAS2 function cnc_unsolicstop is received.

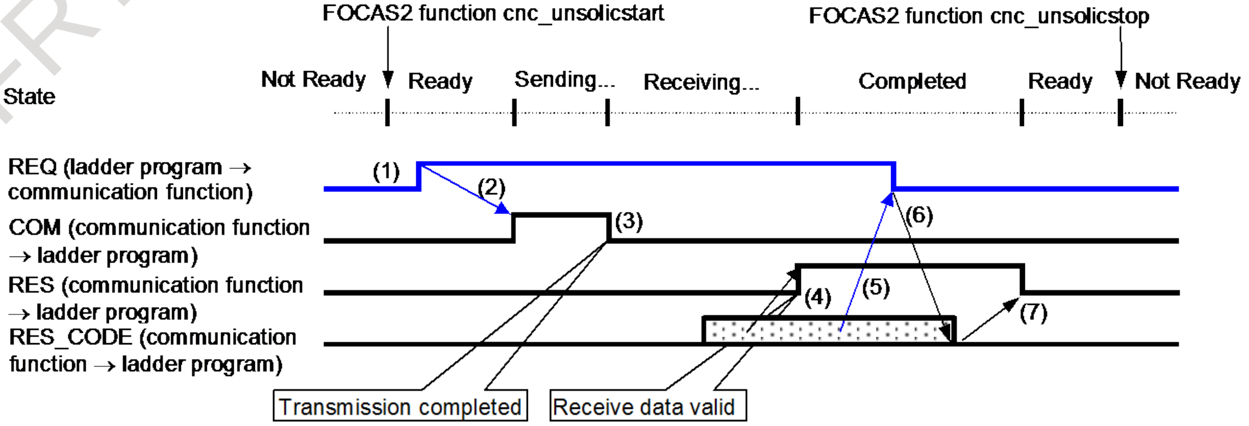

Fig. 17.2.6.6 (a)

(1) After checking that RES is set to “0”, the ladder program prepares a message then sets REQ to “1”.
(2) Because of REQ set to “1”, the communication function sets COM to “1” then transmits the message.
(3) Upon completion of message transmission, the communication function sets COM to “0”.
(4) Upon reception of a response to the message, the communication function sets RES_CODE then sets RES to “1”.
(5) Because of RES set to “1”, the ladder program reads RES_CODE then sets REQ to “0”.
(6) Because of REQ set to “0”, the communication function clears RES_CODE to “0”.
(7) The communication function sets RES to “0”.

NOTE
For details of the states, see "**Display items**" in Subsection 17.2.6.3, "Mode selection".

When a PMC address for control is used (simplified method)

A description of using a PMC address for control in a ladder program according to the simplified method is provided below.

NOTE
A combination of a PMC address for control and a macro variable for transmission is also usable. In this case, note that the read timing of the value of a macro variable to be transmitted cannot be identified when viewed from the ladder program.
In the description below, a PMC address is used for both of control and transmission.

Explanation of PMC address signals for control

A detailed description of PMC address signals for control used to execute the unsolicited messaging function is provided below. A PMC address area for control consists of 1 byte.
The description below assumes that Rxxxx (with no PMC path number specified) is used as a PMC address for control.

No.	#7	#6	#5	#4	#3	#2	#1	#0
Rxxxx	REQ							

REQ <Rxxxx.7>
[Name] Message transmission request signal
[Classification] Input/Output signal
[Function] Requests transmission of an unsolicited message.
[Operation] After preparing a transmission message at a PMC address for transmission, the ladder program sets this signal to 1. The message is then transmitted to the personal computer. Upon reception of a response to the message, the CNC (communication function) clears this signal to 0.

Timing chart of PMC address signals for control

The timing chart of PMC address signals for control based on the simplified method is described below. In the example below (Fig. 17.2.6.6 (b)), an unsolicited message is transmitted once after reception of the FOCAS2 function cnc_unsolicstart then the FOCAS2 function cnc_unsolicstop is received.

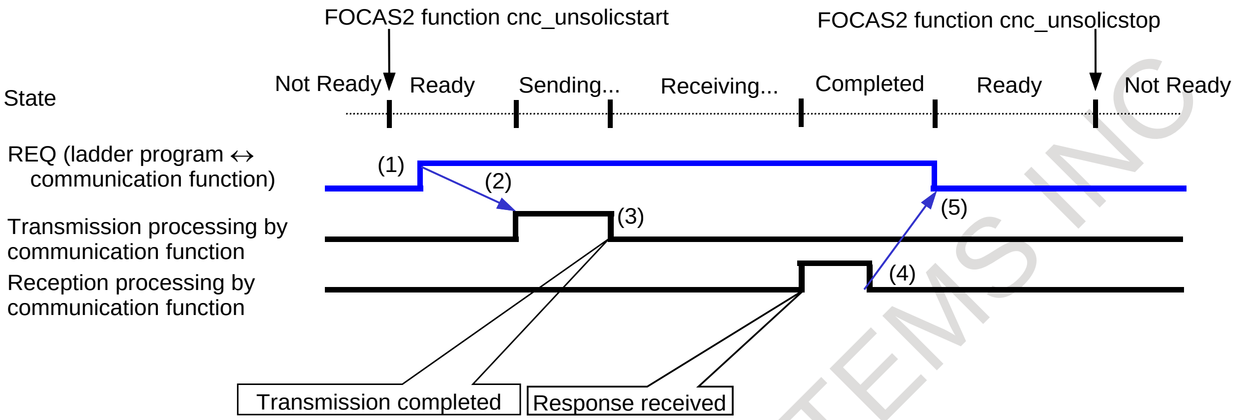

Fig. 17.2.6.6 (b)

(1) After checking that REQ is set to 0, the ladder program prepares a message then sets REQ to 1.
(2) Because of REQ set to 1, the communication function transmits the message.
(3) The communication function completes message transmission processing.
(4) Upon reception of a response to the message, the communication function completes reception processing.
(5) Because of reception processing completed, the communication function sets REQ to 0.

> **NOTE**
> For details of the states, see "**Display items**" in Subsection 17.2.6.3, "Mode selection".

When a macro variable for control is used (simplified method)

A description of using a macro variable for control in an NC program according to the simplified method is provided below.
Macro variables for control are classified as custom macros and RTM macros, but the same execution method is applicable.

> **NOTE**
> A combination of a macro variable for control and a PMC address for transmission is also usable. In this case, note that the read timing of the value of PMC data to be transmitted cannot be identified when viewed from the NC program.
> In the description below, a macro variable is used for both of control and transmission.

Explanation of a macro variable for control

A detailed description of a macro variable for control used to execute the unsolicited messaging function is provided below. One macro variable for control is used.
The description below assumes that #xxxx (with no CNC path number specified) is used as a macro variable number for control.

REQ <#xxxx>

[Name] Message transmission request signal
[Classification] Input/Output signal
[Function] Requests transmission of an unsolicited message.
[Operation] After preparing a transmission message in a macro variable for transmission, the NC program sets this signal to 1. The message is then transmitted to the personal computer. Upon reception of a response to the message, the CNC (communication function) clears this signal to 0.

> **NOTE**
> A REQ input/output value is a real number. So, "0" means "0.0", and "1" means "1.0".

Timing chart of a macro variable for control

The timing chart of a macro variable for control based on the simplified method is described below.
In the example below (Fig. 17.2.6.6 (c)), an unsolicited message is transmitted once after reception of the FOCAS2 function cnc_unsolicstart then the FOCAS2 function cnc_unsolicstop is received.

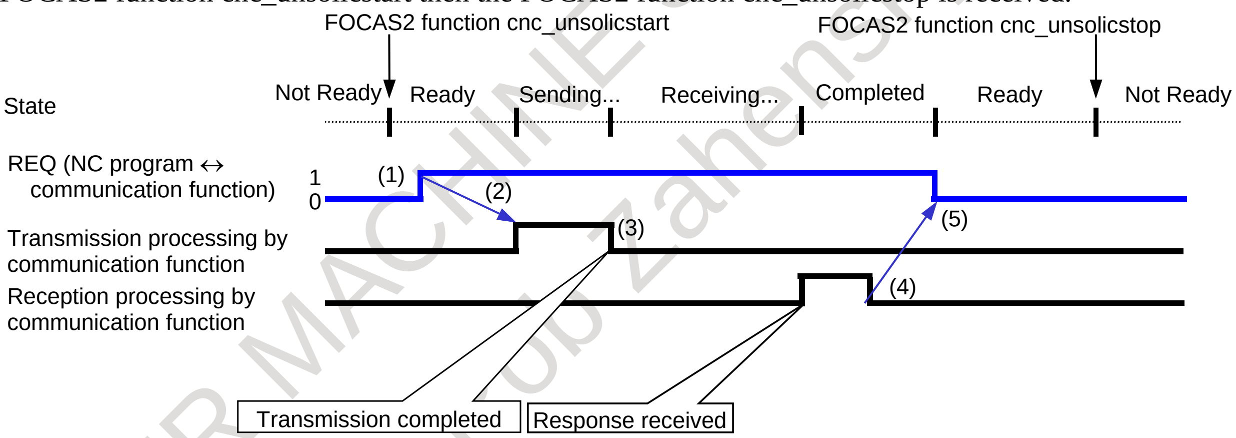

Fig. 17.2.6.6 (c)

(1) After checking that REQ is set to 0, the NC program prepares a message then sets REQ to 1.
(2) Because of REQ set to 1, the communication function transmits the message.
(3) The communication function completes message transmission processing.
(4) Upon reception of a response to the message, the communication function completes reception processing.
(5) Because of reception processing completed, the communication function sets REQ to 0.

> **NOTE**
> For details of the states, see "**Display items**" in Subsection 17.2.6.3, "Mode selection".

Example of using a macro variable for control

An example of using a macro variable for control is provided below.

- Example

[Description]

An NC program on CNC path number 1 posts NC command start date and time information as an unsolicited message to the personal computer.

[Setting]

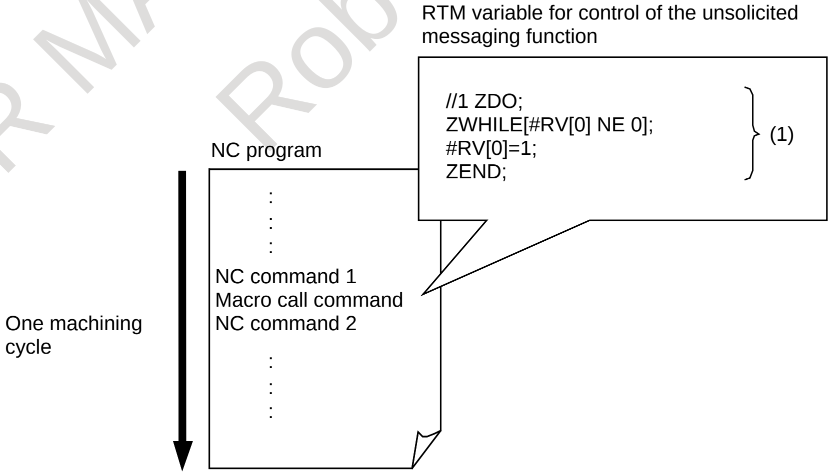
As a macro variable for control, volatile RTM variable number #0 (REQ) is used. On the other hand, macro variables for transmission are used for date and time information managed inside the CNC (system variable numbers #3011 and #3012).

Setting item		Set value
CONTROL PARAMETER TYPE		4
CONTROL PARAMETER		1:0
TRANSMISSION NUMBER		2
TRANSMISSION PARAMETER (NO.1)		
	TYPE	3
	MACRO NO.	1:3011
	NUMBER	1
TRANSMISSION PARAMETER (NO.2)		
	TYPE	3
	MACRO NO.	1:3012
	NUMBER	1

[Example of NC program]

A RTM variable is executed in synchronism with the immediately following NC command according to the RTM variable specification. At this time, the operation timing of the immediately following NC command is not affected.

So, the NC program indicated below posts NC command 2 start date and time information as an unsolicited message to the personal computer.



(Tip) (1) in the example above corresponds to the number in the timing chart provided earlier.

NOTE
1. Note that if a custom macro is used as a macro for control, the operation timing of an NC command is affected. If the RTM variable in the example above is replaced with a custom macro, for example, NC command 2 becomes unexecutable unless the macro variable for control is changed.
2. For details of custom macros and RTM variables, refer to "OPERATOR'S MANUAL (Common to Lathe System/Machining Center System) (B-64694EN)".

17.2.6.7 Related parameters

For embedded Ethernet port

	#7	#6	#5	#4	#3	#2	#1	#0
14880				UNM				

[Input type] Parameter input
[Data type] Bit

#4 UNM With an embedded Ethernet port, the CNC Unsolicited Messaging function is:
0: Not used.
1: Used.

	#7	#6	#5	#4	#3	#2	#1	#0
14882				UNS				

[Input type] Parameter input
[Data type] Bit

#4 UNS In the CNC Unsolicited Messaging function of an embedded Ethernet port, when the end of the function is requested by other than the CNC Unsolicited Messaging server currently connected:
0: The request for the end of the function is rejected.
1: The request for the end of the function is accepted.

After these parameters are modified, the power must be turned off then back on or the embedded Ethernet function must be terminated then restarted for the settings to become effective.

17.2.7 Setting of the CNC Screen Web Server Function

This subsection describes the setting required to operate the CNC screen Web server function with the embedded Ethernet function.

17.2.7.1 Overview

This subsection provides an overview of the CNC screen Web server function and describes the execution procedure.

Overview of the CNC screen Web server function

An overview of the CNC screen Web server function is provided below.
This function enables screen display and screen switch of CNC on a Web browser of a Tablet-type device that connects with CNC through Ethernet.
The screen which is displayed on a Web browser is the same as the screen displayed on a standard CNC Display unit.
The screen switch operation at a Web browser is reflected in a standard CNC Display unit.

NOTE
1. A Tablet-type device cannot be used instead of a standard CNC Display unit.
2. It is also possible to use a Web browser of the personal computer.
3. Behavior might be different according to a Tablet-type device and a Web browser.
4. The update cycle of the screen on a Tablet-type device slows more than a standard CNC Display unit. In addition, it might become slower in the following cases.
   - System configuration with high CPU load, such as multi-path/multi-axes control.
   - Operation condition with high CPU load, such as program operation of small blocks.
   - Bad condition of communication between CNC and Tablet-type device.

⚠ **WARNING**
On the screen of Web browser, do not perform the operation which relates to the machine operation, e.g. Virtual MDI key function, the data input by soft key, or a machine operator's panel screen made by machine tool builder.
The bad condition of communication might cause an unexpected machine operation. For example, the off operation of a button on the screen might be lost, or the response of a button might be slow. Such an unexpected machine operation may damage the tool, the machine itself, the workpiece, or cause injury to the user.
Therefore, when connecting with Web browser by this function, perform the sequences that check Web browser connection status signal WBCNT <F0578.2> and prohibit the operation such as the data input and the operation from the screen.

Connection status of the CNC screen Web server function

CNC connects a Tablet-type device via the embedded Ethernet and a wireless LAN equipment.
Refer to the manual of each equipment for the method of connecting the Tablet-type device and wireless LAN equipment.

By starting a Web browser on the Tablet-type device and then inputting a URI, the Tablet-type device is connected with CNC.

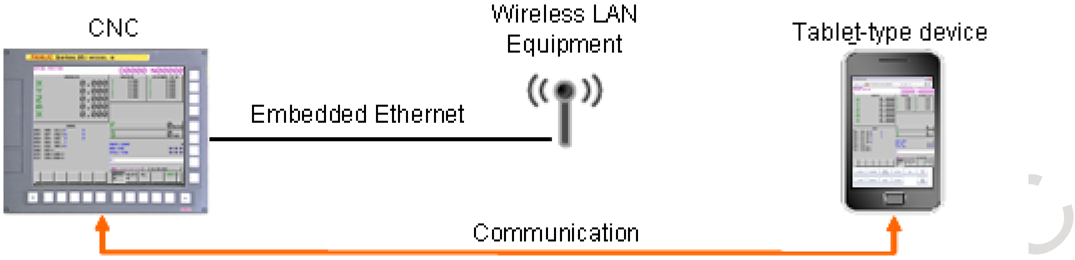


Fig.17.2.7.1 Connection

> **NOTE**
> 1 It is not possible to connect CNC with two or more Tablet-type devices at the same time. Only the first Tablet-type device can be connected.
> 2 It is not possible to connect CNC while the CNC screen is displayed on a personal computer by using CNC screen display function.

The display units of CNC that can be used are as follows.

Table17.2.7.1 (a) Display unit of CNC

CNC	Display unit
LCD Mounted Type	10.4" color LCD

> **NOTE**
> 1 The update of CNC screen on a Tablet-type device might stop temporarily according to the CNC system configuration and the operation status. However, it doesn't influence automatic operation of CNC.
> 2 This function cannot be used in CNC that uses the following display.
> - Without standard CNC Display unit (Use PC connecting)
> - FANUC *i*HMI display unit (Use PANEL *i*H/*i*H Pro)
> - The secondary display unit for Ethernet connection
> - The shared display unit for Ethernet connection
> 3 This function cannot be used while connecting *i*Pendant.
> 4 This function cannot be used by connecting via a PCMCIA Ethernet card.

17.2.7.2 Setting of the WEB SERVER function

This subsection describes the setting of the WEB SERVER function for operating the CNC screen Web server function.

Procedure

1 Enable the CNC screen Web server function according to "Related parameters" described later.

2 Start the CNC again then press function key  .

3 Soft key [EMBED] is displayed. (Press the continuous menu key until the soft key is displayed.)

4 Press soft key [EMBED]. The Ethernet Setting screen for the embedded Ethernet port is displayed.

5 Press soft key [WEB]. The WEB SERVER screen is displayed. (Press the continuous menu key until the soft key [WEB] is displayed.)

6 After setting items, restart the embedded Ethernet function.

WEB SERVER screen

Press soft key [WEB]. The WEB SERVER screen (Fig. 17.2.7.2(a)) is displayed.

Fig.17.2.7.2 (a) WEB SERVER screen

Setting items

Item	Description
PORT NUMBER	Specify a port number to be used with the CNC screen Web server function. If 0 is specified, PORT NUMBER is treated as 80.
TIMEOUT	Specify a timeout of the CNC screen Web server function. TIMEOUT can be set the value of 0, 5 to 99 in seconds. If 0 is specified, TIMEOUT is treated as 10 seconds.
USER NAME	Specify a user name to be used for the CNC screen Web server function. (Up to 31 characters can be specified.)
PASSWORD	Specify a password for the user name specified above. (Up to 31 characters can be specified.) Be sure to set a password.

17.2.7.3 Operation of the CNC screen Web server function

This subsection describes the operation of the CNC screen Web server function.

Start of the CNC screen Web server function

Procedure

1. Turn on the power of the CNC.
2. Wait until the CNC screen is displayed.
3. Start a Web browser on the Tablet-type device and input URI (Uniform Resource Identifier) "http://<IP Address>(:[port number])/cncscrn/". The last "/" is not omissible.

   (Example 1) Case of IP Address (192.168.1.1) and PORT NUMBER (0 or 80)
   Input "http://192.168.1.1/cncscrn/" to the address bar.

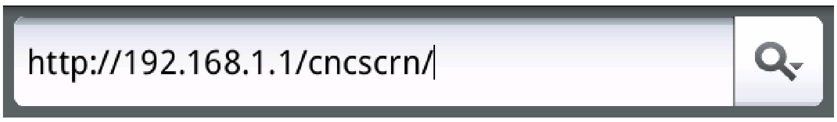

Fig.17.2.7.3 (a) Input case 1

(Example 2) Case of IP Address (192.168.1.1) and PORT NUMBER (8501)
Input "http://192.168.1.1:8501/cncscrn/" to the address bar.

Fig.17.2.7.3 (b) Input case 2

4 When the login screen is displayed, input the username and password, and push the login button.

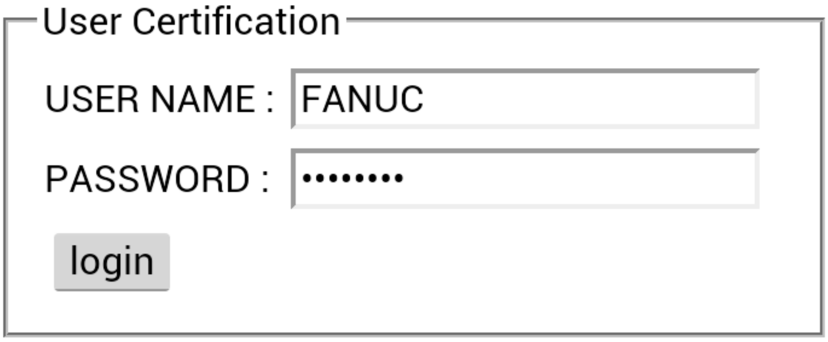

Fig.17.2.7.3 (c) login screen

> **NOTE**
> 1 When the Web browser connection prohibition signal WBEND <G0579.5> is set to "1", the error "Access Denied : Forbidden by signal" is displayed.
> 2 When the Web browser connection status signal WBCNT <F0578.2> is "1", the error "Access Denied : Doubly access" is displayed.
> 3 When bit 6 (WAL) of parameter No.14882 WAL (refer to chapter 4) is set to 0 and failing in login continuously five times, CNC screen Web server function becomes disabled until the CNC is restarted.

5 The CNC screen is displayed on a Web browser, and the Web browser connection status signal WBCNT <F0578.2> becomes “1”.

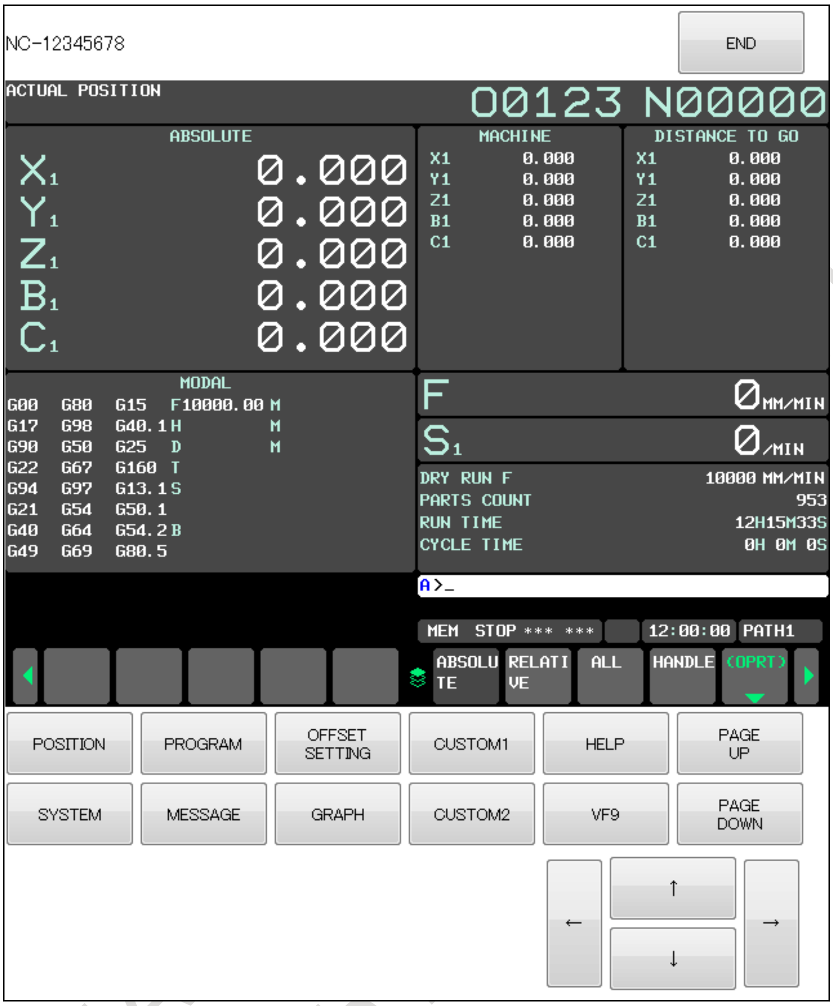

Fig.17.2.7.3 (d) CNC screen on a Web browser

> **NOTE**
> The update cycle of the screen slows more than a standard CNC Display unit.

End of the CNC screen Web server function

The communication with CNC ends in the following cases.

- When Web browser on Tablet-type device is ended.
- When the connection of CNC and Tablet-type device is cut.
- When the Web browser connection prohibition signal WBEND <G0579.5> is set to "1".
- When CNC screen function is started on other personal computer.
- When END button on the Web browser is pushed.

After the time interval that set on WEB SERVER screen is passed, the Web browser connection status signal WBCNT <F0578.2> becomes "0".
To reconnect with the CNC, execute procedure 3 of "Start of CNC screen Web server function" after the Web browser connection status signal WBCNT <F0578.2> becomes “0”.

> **NOTE**
> CNC cannot be operated with MDI key and touch panel of CNC while the Web browser connection status signal WBCNT <F0578.2> is “1”, even if the communication with CNC ends. The maximum time that CNC cannot be operated is the time having set to TIME INTERVAL.

Operation on Web browser

This subsection explains the operation method in a Web browser.

> **NOTE**
> While connecting with Web browser, neither MDI key nor touch panel of CNC can be used for operation.
> The reset key of CNC and External key input, however, are always usable on the CNC.

Operation by button

Function keys, help key, and page keys are displayed as buttons.
CNC screen changes according to each key if these buttons are pushed.
Selected item on the screen is changed if cursor keys are pushed.
If [VF9] button is pushed, short-cut menu by vertical keys is displayed and the operation by touch screen becomes possible.
[End] button is displayed in the upper part of screen.
The communication with CNC ends by pushing the [END] button.

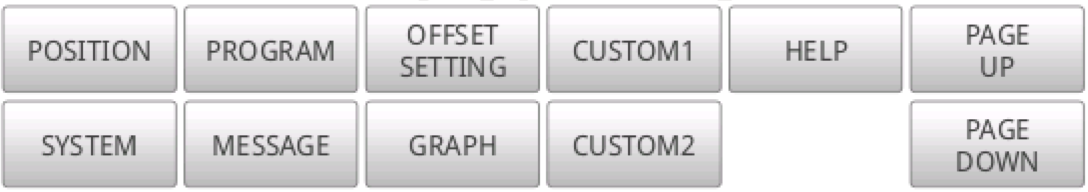

Fig.17.2.7.3 (e) Button on a Web browser

Operation by touch screen

Tap	Soft key on the CNC screen and button can be pushed. CNC can be operated with each key by pushing function key and page key.
Double tap	CNC screen size is set to be suitable for the screen size of Tablet-type device.
Pinch out / Pinch in	CNC screen is expanded and reduced. Pinch out is expansion, and Pinch in is reduction.

Refer to the manual of Tablet-type device for explanation of each operation.

> **NOTE**
> 1 To perform the Tap operation on the screen made by machine tool builder using C language executor, it is necessary to realize the operation with touch panel.
> 2 The communication with CNC might become interrupted during the operation of Pinch out / Pinch in. If the time having set to TIME INTERVAL passed, the communication of CNC and a Tablet-type device is cut.

Operation by direction of Tablet-type device

The direction of screen is changed automatically according to the direction of Tablet-type device.

Operation by key input

When the value of parameter KIE is one, the text input area, SEND button and CLEAR button next to the cursor keys, and the key input becomes possible.

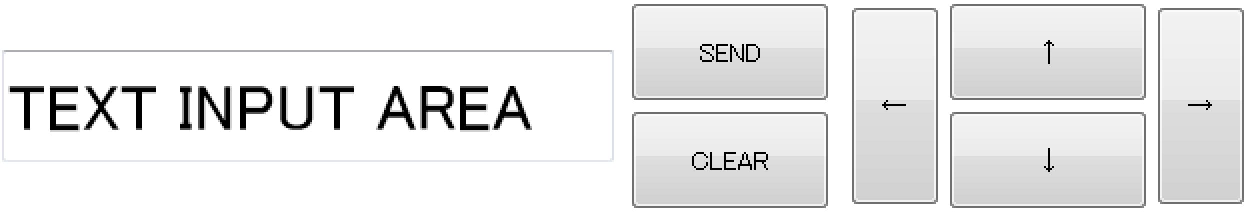

Fig.17.2.7.3 (f) Button on a Web browser

If SEND button is pushed, the character string in the text input area is transmitted to the key-in buffer of CNC. If CLEAR button is pushed, the key-in buffer of CNC is cleared.
The following characters can be input to the text input area.

Enable character	Remarks
a-z, A-Z, 0-9	Alphanumeric characters
!”#&’()*+,-<=>?@[/]^`~.;:~	Special symbols
Space	Blank

NOTE

“{“, ”|”, ”}”, “$”, “¥” and 2-byte code used for Japanese cannot be sent to the key-in buffer of CNC.

Input / Output of CNC data

CNC data is input/output from/to CNC according to the setting of CNC by operation on Web browser screen.
The data cannot be input/output from/to the Web browser side.

Display language

The title and buttons on Web browser are displayed in English.

NOTE

The display language of CNC screen is displayed according to the setting of CNC.

Type of display screen

The screens of CNC displayed in Web browser is the same as the screens displayed in CNC. It is not possible to display different size or kind of screens from CNC.

NOTE

1 Boot screen and IPL screen cannot be displayed.
2 When the system alarm is generated by CNC, the connection of Tablet-type device is cut. The system alarm screen is not displayed in Web browser.

17.2.7.4 Related signals

Signal

Web browser connection prohibition signal WBEND <G579.5>

[Classification] Input signal
[Function] Forbid the connection with Web browser.
[Operation] "0": Permit the connection with Web browser.
"1": Forbid the connection with Web browser.
The connection is shut while connecting with Web browser.

Web browser connection status signal WBCNT<F578.2>

[Classification] Output signal
[Function] Show the status of the connection with Web browser.
[Operation] This signal is set to 1 when connecting with Web browser.
This signal is set to 0 when not connecting with Web browser.

NOTE
Perform the sequences that check this signal and prohibit the operation which relates to the machine operation such as the data input and the operation from the screen, e.g. Virtual MDI key function, the data input by soft keys, or the operation on a machine operator's panel screen made by machine tool builder.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0579			WBEND					

	#7	#6	#5	#4	#3	#2	#1	#0
F0578						WBCNT		

17.2.7.5 Related parameters

	#7	#6	#5	#4	#3	#2	#1	#0
11373	WSE							

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Bit

#7 WSE CNC screen Web server function is:
0: Disabled.
1: Enabled.

	#7	#6	#5	#4	#3	#2	#1	#0
14882		WAL	KIE					

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Bit

#5 KIE In CNC screen Web server function, key input is:
0: Disabled.
1: Enabled.

#6 WAL In CNC screen Web server function, when failing in login continuously five times, this function becomes:
0: Disabled.
1: Enabled.

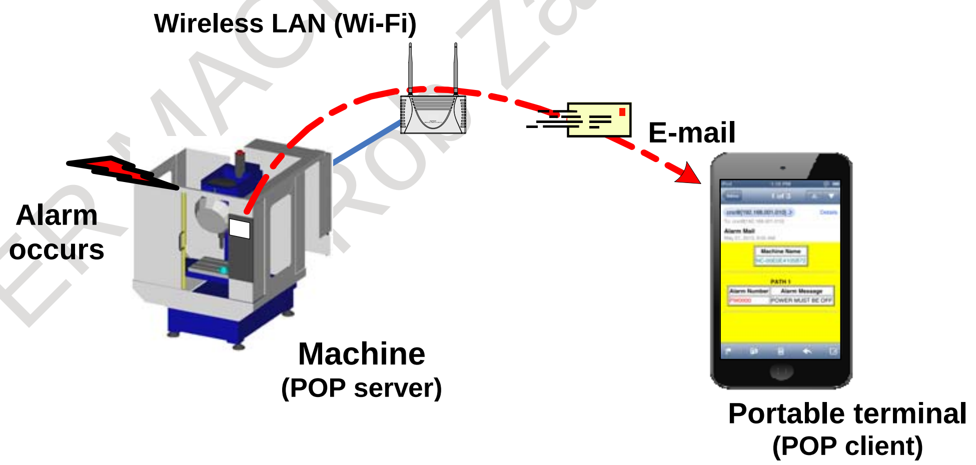
> **NOTE**
> When CNC screen Web server function has become disabled, restart the CNC.

17.2.8 CNC Status Notification Function

This subsection describes the setting required to operate the CNC status notification function with the embedded Ethernet function.

17.2.8.1 Overview

CNC status notification function is provided in the method of Monitoring the alarm even if the operator is not in front of the machine.
This function delivers E-mail of the information about CNC status (for example, alarm number and alarm message) to the e-mail software of a portable terminal or a personal computer via the Embedded Ethernet..



NOTE

1. This function can be used on Embedded Ethernet port and cannot be used on PCMCIA LAN card.
2. This function does not use an e-mail server on the way, to deliver E-mail. Therefore, this function is used only in the Intranet. E-mail cannot be delivered to an external device on Internet.
3. The e-mail software of a portable terminal reads E-mail from CNC with this function. Therefore, E-mail is read according to the timing that the e-mail software of a portable terminal acquires.
4. In the above figure, CNC communicates with a portable terminal by using wireless LAN. However, it is also possible to communicate with a personal computer by using wired LAN.
5. This function is not "short message service(SMS)" using the cellular phone network.
   Therefore, the cellular phone not to be connectable with wireless LAN cannot be used.

17.2.8.2 Contents of E-mail

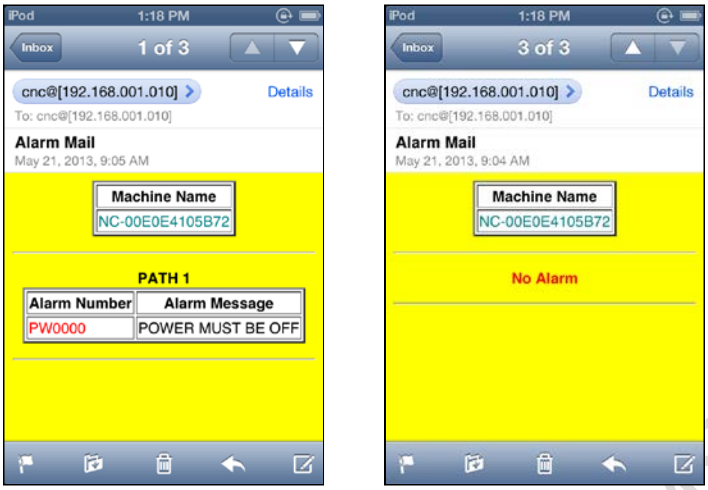
This function creates E-mail and delivers it to the mail software of a portable terminal and a personal computer.
There are two kinds of E-mail, "Alarm mail" and "Status mail".
When the displayed language of the CNC screen is Japanese, English, or Simplified Chinese, the title and each item name of the mail can be displayed in each language. In the case of other languages, the title and each item name of the mail are displayed in English.

Alarm Mail

The alarm mail reports the information of CNC alarm status.

The alarm mail is made at the following cases.
(1) When the alarm is newly generated
(2) When the alarm is canceled
(3) When the number of generated alarms is changed

When two or more alarms have been generated, those alarms are constructed into one alarm mail.
The number of alarms included in one alarm mail is up to 10, and more alarms are not reported.
The order of the notified alarm is the order displayed on the alarm screen of CNC.
In the multi-path system, the alarms are gathered in order of path. Therefore, for example if ten alarms or more are generated in the first path, the alarms which are generated in the second path or later are not reported.
Moreover, the alarm message is reported when the displayed language of the CNC screen is Japanese, English, and Simplified Chinese.
Only the alarm number is written in the case of other languages.



When the alarm is generated **When the alarm is canceled**

Fig.17.2.8.2 (a) Alarm Mail

> **NOTE**
> When the following alarms are generated, the alarm status is reported.
> - PS/BG/SR/SW/SV/OT/IO/PW/SP/OH/DS/IE alarms
> - External alarm message (EX alarm)
> - Macro alarm message of #3000 (MC alarm)

Status Mail

The status mail reports the counter values of the total number of machined parts, number of machined parts and number of parts required when bit 5 (SNP) of parameter No. 14884 is one.

The status mail is made at the following cases:
(1) When the counter values of number of machined parts is changed.

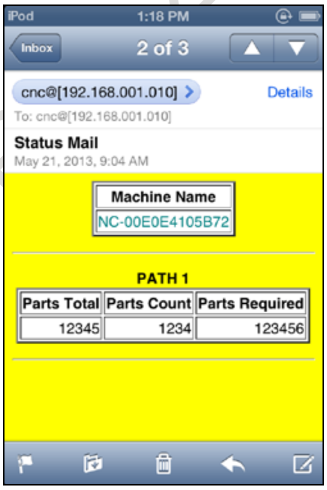


Fig.17.2.8.2 (b) Status mail

> **NOTE**
> The total number of machined parts, number of machined parts and number of parts required of only the first path are reported even in the case of multi-path CNC.
> Even if the number of machined parts of the second CNC path or later is changed, it is not reported.

Message Mail

The message mail reports the message (external operator message or macro message) required when parameter SNO (No.14884#4) is one.

The message mail is made at the following cases:

(1) When the message is newly generated
(2) When the number of generated message is changed
(3) When the message is canceled

When two or more messages have been generated, those messages are constructed into one message mail.
The number of messages included in one message mail is up to 3, and more messages are not reported.
The order of the notified message is the order displayed on the operator message screen of CNC.
The message number, message content, and machine group number of each machine group are notified in external operator message.
The message and path number of each path are notified in macro message.
In the multi-path system, the messages are gathered in order of the path regardless of machine group. And in the path, the messages are gathered in order of external operator message and macro message. Therefore, for example in the machine configuration to which path 1 and 2 belong to machine group 1 and path 3 belong to machine group 2, if three external operator messages or more are generated in the machine group 1, the macro message generated in the machine group 1 and the message generated in the machine group 2 are not reported.
And if one external operator message is generated in the machine group 1, one macro message is generated in the path 1 and one external operator message is generated in the machine group 2, the macro message generated in the path 3 is not reported.
Moreover, the message content is reported when the displayed language of the CNC screen is Japanese, English, and Simplified Chinese.
Only the message number (or the string "MCR" in Macro message) is reported in the case of other languages.

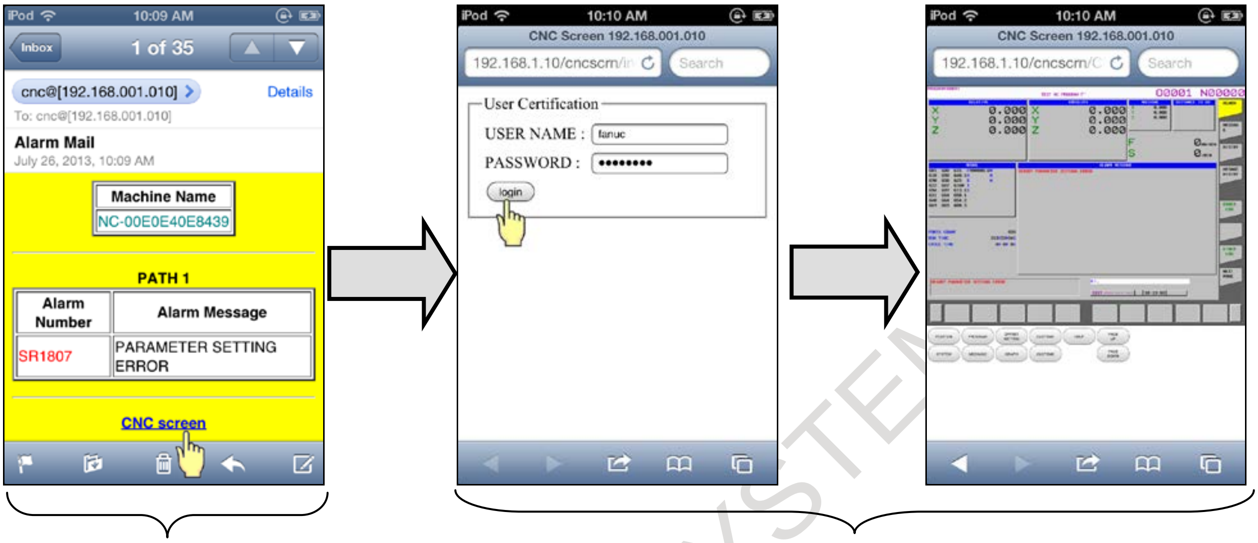
When the message is generated **When the message is canceled**

Fig.17.2.8.2 (c) Message mail

> **NOTE**
> As for the macro message, this function supports English only.

17.2.8.3 Cooperation with CNC screen Web server function

URI(CNC screen) of CNC screen Web server function is added in the mail when CNC screen Web server function is enabled. The CNC screen can be displayed on Web a browser by clicking



Mail client Web browser

Fig.17.2.8.3 Cooperation with CNC screen Web server function

> **NOTE**
> Please refer to Technical Report of CNC Screen Web server function for details of this function.

17.2.8.4 Setting of CNC Status Notification function

This section describes how to set the CNC parameters for CNC Status Notification function.
The setting of the Portable terminal (POP client), please refer to the manual of the Portable terminal or Technical Report (A-94974)

Procedure

(1) Press function key SYSTEM.

(2) Soft key [EMBED PORT] appear.
(When there is no soft keys, press the continue key.)

(3) Press soft key [EMBED PORT] soft key, the Ethernet Setting screen for embedded Ethernet port is displayed.

(4) Press soft key [COMMON] and [MAIL] and then enter parameters for the items that appear.

COMMON screen (BASIC)

Press soft key [COMMON]. The COMMON screen (BASIC) is displayed.

Fig. 17.2.8.4 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify a mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item when the network contains a router. (Example of specification format: "192.168.0.253")
DHCP CLIENT	The value of parameter No.14880#6(DHC) related to the DHCP client function is displayed, and the setting is also possible. For details, see Subsection, "Setting Up the DNS/DHCP Function".

Display items

Item	Description
MAC ADDRESS	Embedded Ethernet MAC address
AVAILABLE DEVICE	Enabled device of the embedded Ethernet. Either the embedded Ethernet port or the PCMCIA Ethernet card is displayed.

COMMON screen (DETAIL)

After pressing soft key [COMMON], press either page key PAGE↑ PAGE↓ to call a desired COMMON screen (DETAIL).

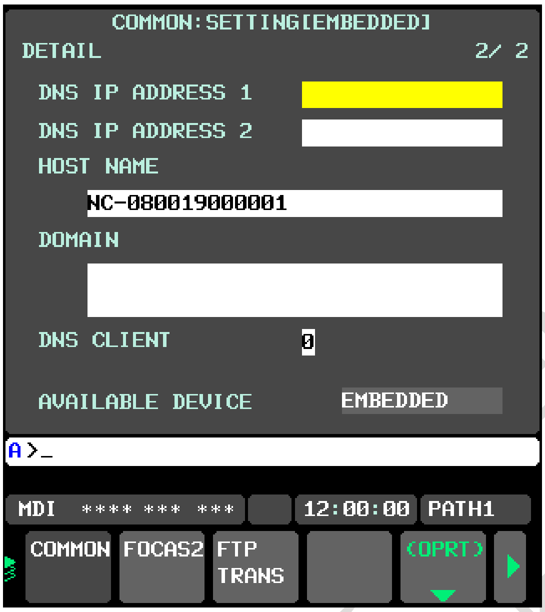


Fig. 17.2.8.4 (b) COMMON screen (DETAIL)

Setting items

Item	Description
HOST NAME	Enter a desired CNC host name. On CNC Status Notification function, this host name is written as “Machine Name” in E-mail. If no host name is set, “NC-<MAC address>” is automatically set. Example of host name automatically set: NC-080019000001

MAIL SETTING screen

Press soft key [MAIL]. The MAIL SETTING screen is displayed.

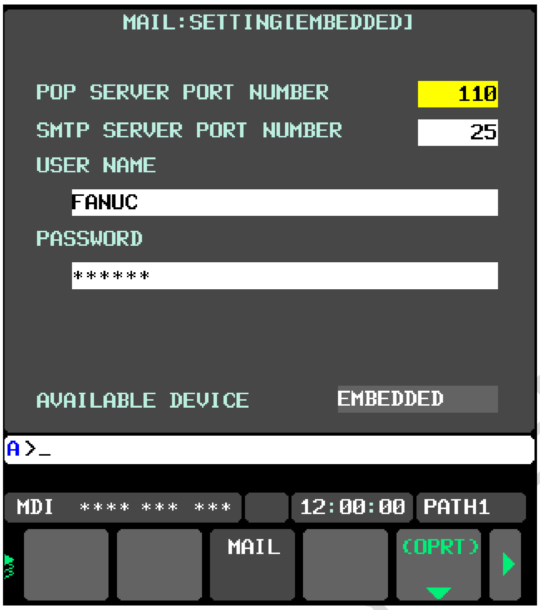

Fig.17.2.8.4 (c) MAIL SETTING screen

Setting items

Item	Description
POP SERVER PORT NUMBER	Specify the port number of POP server. Usually, set 110. If this value is 0, this value is treated as 110.
SMTP SERVER PORT NUMBER (NOTE 1)	Specify the port number of SMTP server. Usually, set 25. If this value is 0, this value is treated as 25.
USER NAME (NOTE 2)	Specify the user name to login to the POP server. A user name of up to 31 characters can be specified.
PASSWORD (NOTE 2)	Specify the password for the above user name. A password of up to 31 characters can be specified.

NOTE

1. SMTP is not actually used in this function.
   However, when creating a mail account, a portable terminal might check the SMTP setting. For this case, the SMTP server port number is necessary.
2. The user name and password of mail account in a portable terminal (POP client) have to match with these settings to login to CNC (POP server).
   However, if neither user name nor password is set in CNC, CNC does not check them when a portable terminal tries to connect to CNC. Thus in this case, the login to CNC always succeeds regardless of any user name and password in a portable terminal.

17.2.8.5 Related NC parameter

	#7	#6	#5	#4	#3	#2	#1	#0
14884	SNE	SNM	SNP	SNO				SNL

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When the following parameters are set, the power must be turned off before operation is continued.

#0 SNL When failing in login continuously five times from a portable terminal, CNC Status Notification function becomes:
0: Disabled.
1: Still enabled.

> **NOTE**
> When CNC Status Notification function has become disabled, please restart the CNC.

#4 SNO In CNC Status Notification function, the message mail is:
0: Not made.
1: Made.

#5 SNP The total number of machined parts, number of machined parts and number of parts required is:
0: Not included in the status mail.
1: Included in the status mail.

#6 SNM When the displayed language of CNC screen is Japanese, English or Simplified Chinese, the alarm message is:
0: Included in the alarm mail.
1: Not included in the alarm mail.

> **NOTE**
> When the displayed language of the CNC screen is not Japanese, English or Simplified Chinese, the alarm message is not included in the alarm mail regardless of this parameter. In this case, only the alarm number is reported.

#7 SNE CNC Status Notification function is:
0: Not used.
1: Used.

> **NOTE**
> If this parameter is not set, the setting screen of CNC Status Notification function is not displayed.

17.2.9 Setting of the Modbus/TCP Server Function

This subsection describes the setting required to operate the Modbus/TCP Server function with the embedded Ethernet function.

> ⚠ **WARNING**
>
> Only when a partner client device sends data and the Modbus/TCP Server function of CNC receives it, the data is checked and processed by CNC. Even if the communication of the client happens to stop unexpectedly, the Modbus/TCP Server function does not detect such situations.
>
> So, do not use the Modbus/TCP Server function for data exchange application concerned with machine safety.
>
> For example, even if the client attempts to send the "STOP" data at some timing, it is not guaranteed that it always reaches CNC. Thus, it is very dangerous to build the system concerned with machine safety by using Modbus/TCP Server function.
>
> If the data exchange concerned with machine safety fails, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

> **NOTE**
>
> 1 The Modbus/TCP Server function can also be used on the Fast Ethernet board. This subsection is written for the embedded Ethernet, but the basic content can be also applied when the Fast Ethernet board is used. For details on using the Fast Ethernet board, see "Industrial Ethernet CONNECTION MANUAL (B-64013EN)".
>
> 2 This function cannot be operated on the PCMCIA LAN card. It cannot be operated on a Fast Ethernet board and on embedded Ethernet at the same time. Switch it between them, using bit 1 (MOD) of parameter No.14882.
>
> 3 The communication speed of the embedded Ethernet is lower than a Fast Ethernet board.
>
> 4 The Modbus/TCP client function and the PROFINET IO controller function are not supported.

17.2.9.1 OVERVIEW

OVERVIEW

This section provides an overview of the Modbus/TCP Server function.

Modbus/TCP data model

The following four kinds of data formats, each called a "Table", are defined for the Modbus/TCP data model.

Table name	Object type (data type)	Type of READ/WRITE
Discrete input	Single bit	READ only
Coils	Single bit	READ-WRITE
Input Registers	16-bit word	READ only
Holding Registers	16-bit word	READ-WRITE

NOTE

1. For the CNC Modbus/TCP Server function, only "Holding Registers" can be used.
   "Discrete input", "Coils", and "Input Registers" cannot be used.
2. "READ" means the input of data as viewed from the Modbus/TCP client, and "WRITE" means the data of output as viewed from the client.

Modbus/TCP function codes

For the Modbus/TCP Server function of the CNC, the following function codes are supported.

Function code name	Code number
Read Holding Registers	03h
Write Multiple Registers	10h
Read/Write Multiple Registers	17h

Modbus area (Holding Registers)

For the Modbus/TCP Server function, the Modbus area (Holding Registers) of 65536 words (131072 bytes) is prepared.
And the Modbus area can be allocated to the PMC area.
Because of this, the data accessed from the Modbus/TCP client device to the Modbus area can be posted to the PMC area, and the user application (Ladder program etc.) can access the Modbus area through the PMC area.
This allocation can be set in up to three areas.
The Modbus/TCP area is a data area in word units, and can take address values of 1 to 65536.

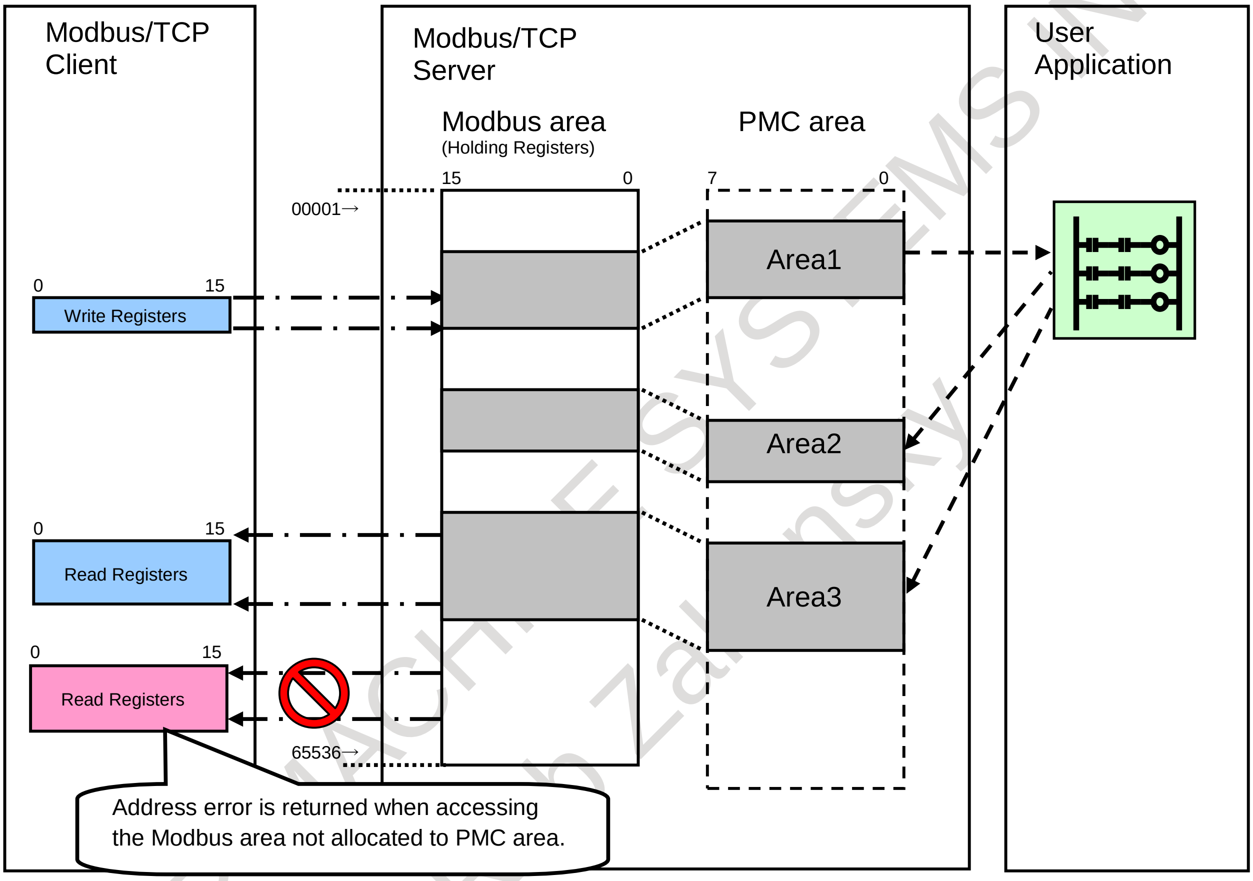

Fig.17.2.9.1 (a) Modbus area

NOTE

A Modbus/TCP client device can access only a Modbus area with a PMC area allocated. If a client device attempts to access a Modbus area with no PMC area allocated, an address error (Exception Code = 0x02, Exception Name = ILLIGAL DATA ADDRESS) is returned to the client device.
Be sure to allocate a PMC area to the Modbus area to be accessed by a client device.

SPECIFICATIONS of the Modbus/TCP Server Function

This section describes the specifications of the Modbus/TCP Server function of the CNC.

The following is a list of specifications of the Modbus/TCP Server function of the CNC.

Item	Description
Combination with other functions	The function can be operated at the same time as the function of embedded Ethernet.
PMC area that can be allocated	- DI : R, E, and D areas - DO : R, E, and D areas - Status : R and E area
Maximum DI/DO data size	Depends on the effective PMC area.
Port number (TCP)	502 (standard value)
Function specification	- "Automatic TCP connection management" is supported. This means that the user application (ladder program) need not take TCP connection into consideration. - "Non-priority connection pool" is supported. This means that if there are requests from more Modbus/TCP clients than a certain number, connections will be terminated in order of the oldest to the newest. (NOTE 1) ("Priority connection pool" is not supported.) - "Access control service" is not supported. This means that no client devices require authentication (user name or password) to access the FANUC Modbus/TCP Server function.
Maximum number of clients that can connect to a single CNC at the same time	3

NOTE

1 Use the function within the maximum number of clients that can be connected to a single CNC at the same time.
If there are connection requests from more clients than the maximum number, the communication with the oldest client will be disconnected. Thus, a client that wants to keep a connection must reconnect if disconnected, assuming that it may be disconnected from the server.

2 Settings of communication parameters are not subject to 8-level data protection function.

Allocating PMC Areas

To allocate a PMC area in the setting screen of each communication function, specify it as follows:

Input format) <Path number>:<PMC address>

For example, for R0500 on the second path of the PMC, input "2:R500".
If <Path number> is omitted (R500), the first path is assumed (1:R0500).
If the <:> key is not available, it can be substituted with the </> key or the <EOB> key. ":" is optional.
To clear "<Path number>:<PMC address>" previously set, input " " (blank). ("---" will be displayed). In this case, it is assumed that no PMC area is used.

> ⚠ **WARNING**
> Be careful not to cause an overlap between the PMC area to allocate and a PMC area used for other purposes. Immediately after setting all necessary communication parameters, check that the DI/DO data and status data are operated properly in a starter where safety is secured.
> If the machine is operated without confirmation of above explanation, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

> ⚠ **CAUTION**
> 1 Immediately after the power is turned on, all R area and E area as volatile memory in the PMC area are 0.
> 2 The D area in the PMC area is allocated to nonvolatile memory. In addition, the E area in the PMC area is normally allocated to volatile memory. However, it can also be used as nonvolatile memory.
> When the area is used as nonvolatile memory, the contents of the area are retained even after the power is turned off. So, special attention should be paid not to cause an unpredictable operation when the power is turned on next time.

Creating a Ladder Program

DI/DO data and status data allocated to a PMC area are processed by a ladder program.
The following provides notes on creating a ladder program required to construct a safety system.

> ⚠ **CAUTION**
> 1 The time after the power is turned on until communication is actually started may vary depending on the system configuration of the CNC and the state of the communication partner device.
> If it is necessary to strictly determine whether communication starts, it is not sufficient to determine it with time and status data only. Determine it with a method such as checking with actual DI data.
> 2 Create a ladder program in such a way that the system will be operated safely even if a communication error occurs.

Input signal (DI) and output signal (DO)

An output signal from the CNC is written by the ladder program into the PMC data area. The reading/writing process of a communication function reads the signal and sends it to the Ethernet network. An input signal also flows a similar route in the opposite direction.

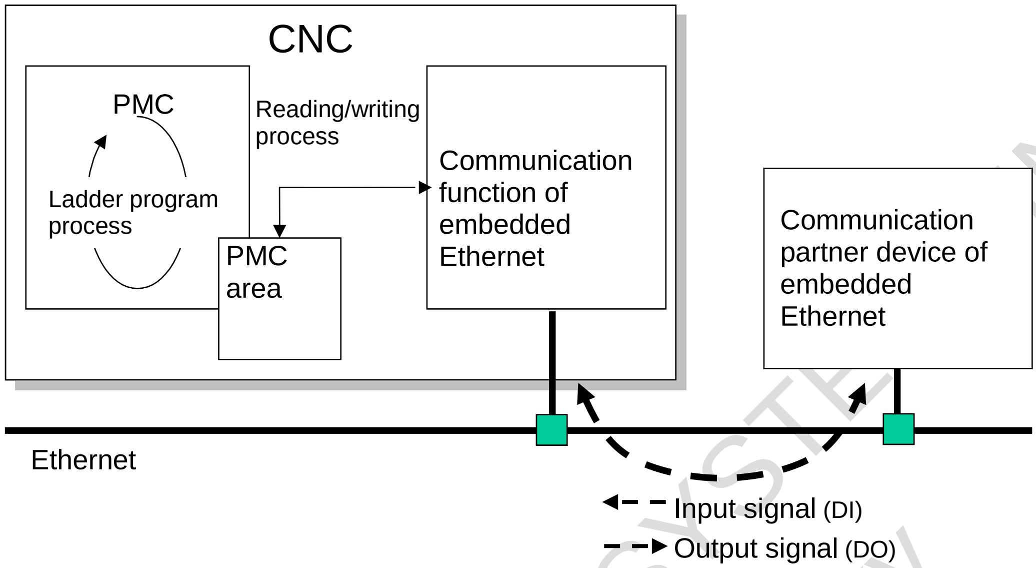

Fig.17.2.9.1 (b) Input signal (DI) and output signal (DO)

Ladder program process and reading/writing process by a communication function

Processing by the ladder program and the reading/writing process by a communication function operate asynchronously with one another.
Processing by the ladder program can operate independently of reading/writing process by a communication function, so the ladder program can be repeatedly executed at high-speed.

The following figure shows a time chart of the internal operation of the CNC with signals output from the ladder program.

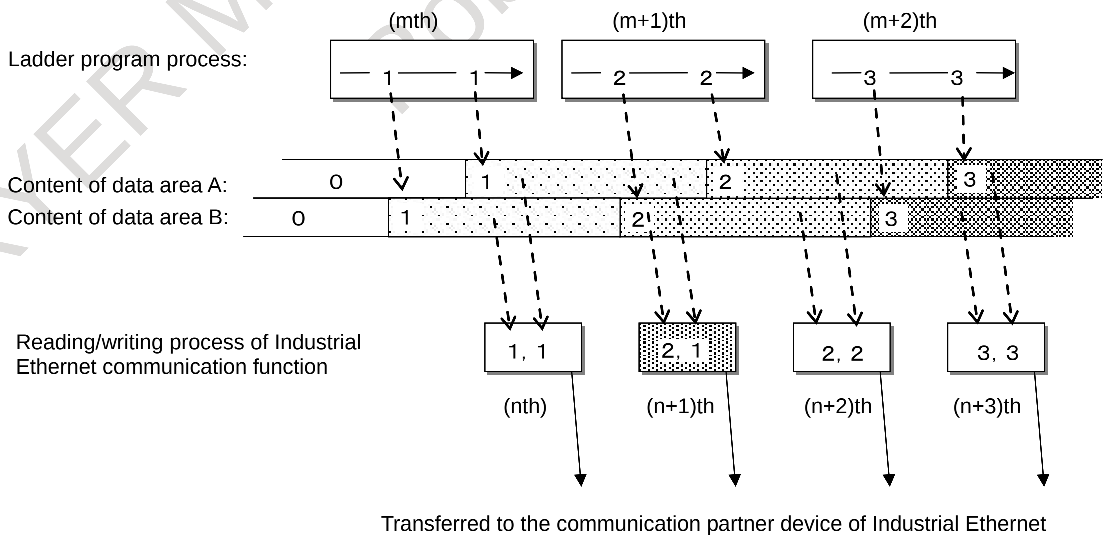

Fig.17.2.9.1 (c) Time chart

The upper part of the figure indicates that processing by the ladder program is performed periodically and writing to data area A or data area B is performed in the ladder program.

The middle part indicates how data area A and data area B in the PMC are updated in this case. There are differences in the timing in which data is written to data area A or data area B even in the same execution cycle of the ladder program, so data area A and data area B are not updated at the same time.

The lower part indicates that the reading/writing process by communication functions is cyclically made to read data in data area A and data area B. Since data area A and data area B are not updated at the same time, for example, in the case of (n+1)th refreshing, the data written by one execution of the ladder program cannot be read as one set.

Conversely, when input signals from communication functions are processed in the ladder program, the data written by one execution of writing may not be read by one execution of the ladder program.

> ⚠ **CAUTION**
>
> Reading/writing process by a communication function is made asynchronously with the execution of the ladder program. Therefore, keep the following in mind when creating a ladder program.
>
> <1> When an input signal from the communication function to be written in the specified PMC address is read from two points in the ladder program, even if the ladder program can be executed in one cycle, there is no guarantee that the same value can be read.
>
> <2> When the ladder program writes an output signal to the communication partner device in the specified PMC address, the signal may be transferred to the communication partner device before the ladder program is completely executed.

Unit of Data and Concurrency

The unit of I/O data can be word (2-bytes) only.
The concurrency of word (2-byte) data is guaranteed, and there will never be data segmentation. The concurrency of long (4-byte) data cannot be guaranteed.

> ⚠ **WARNING**
>
> If the data bigger than word (2-byte) data is used, data segmentation might occur.
> If word (2-byte) data is used, refer to “Creating a Ladder Program” for notes on creating a ladder program.
> If data segmentation occurs, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

To guarantee the concurrency of data, satisfy the following two conditions.

<1> In the ladder program, the following commands are used in units of two bytes.
MOVW, MOVN, XMOVB, SETNW, XCHGW, DSCHB, TBLRW, TBLWW, DSEQW, DSNEW, DSGTW, DSLTW, DSGEW, DSLEW, DMAXW, DMINW, EQW, NEW, GTW, LTW, GEW, LEW, RNGW, COMPB, EOR, AND, OR, NOT, EORW, ANDW, ORW, NOTW, SHLW, SHRW, ROLW, RORW, BSETW, BRSTW, BTSTW, BPOSW, BCNTW, CODB, DCNVB, DECB, TBCDW, FBCDW, ADDB, SUBB, MULB, DIVB, NUMEB, ADDSW, SUBSW, MULSW, DIVSW, MODSW, INCSW, DECSW, ABSSW, NEGSW

<2> When DI data or DO data is assigned to at the setting screen of a communication function, the value of items "ADDRESS" and "SIZE" are aligned with 2-byte boundaries.
Example) ADDRESS/SIZE 1:R0000/2, 2:R0002/4, 3:R0004/6, 1:E0002/8

Conversion of Endian

The byte arrangement in the Modbus area (Holding Registers) is little endian to make it easy for the ladder program to handle it.
With the appropriate setting item on the setting screen of the Modbus/TCP Server function, the byte arrangement can be changed to big endian.

> ⚠ **WARNING**
> Confirm that an appropriate value is set to the setting item of selecting the conversion of endian, and that the byte arrangement of the exchanged data is correct.
> If the machine is operated without confirmation of above explanation, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

Little endian

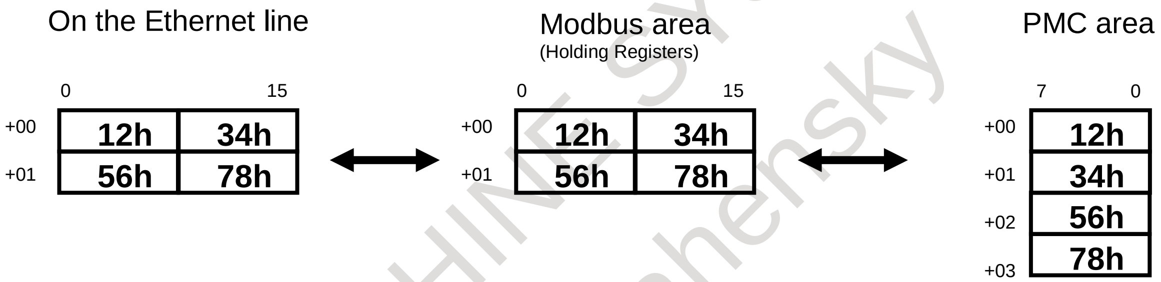

Fig.17.2.9.1 (d) Little endian

When Bit0 of OPTION1 is "1", byte arrangement of data becomes a big endian.

Big endian

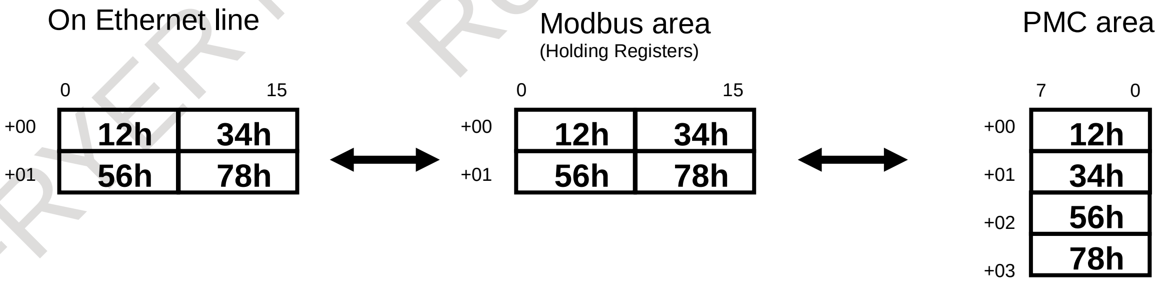

Fig.17.2.9.1 (e) Big endian

17.2.9.2 SETTING

This section describes the setting of the Modbus/TCP Server function.

Procedure

1 Press function key .

2 Soft key [EMBED PORT] appears. When the soft key does not appear, press the continue key.
3 Press soft key [EMBED PORT] to display the setting screen of the embedded Ethernet function.
4 Press soft key [COMMON] or [Modbus SET]. When the soft key does not appear, press the continue key.

COMMON Screen

In the above-mentioned procedure, press soft key [COMMON] to display the COMMON screen (BASIC).

Fig.17.2.9.2 (a) COMMON screen (BASIC)

Setting items

Item	Description
IP ADDRESS	Specify the IP address of the embedded Ethernet. (Example of specification format: "192.168.0.100")
SUBNET MASK	Specify the mask address for the IP addresses of the network. (Example of specification format: "255.255.255.0")
ROUTER IP ADDRESS	Specify the IP address of the router. Specify this item if the network contains a router. (Example of specification format: "192.168.0.253")

Display item

Item	Description
MAC ADDRESS	MAC address of the embedded Ethernet.

Setting Screen of the Modbus/TCP Server Function

In the above-mentioned procedure, press soft key [Modbus SET] to display the setting screen of the Modbus/TCP Server function.

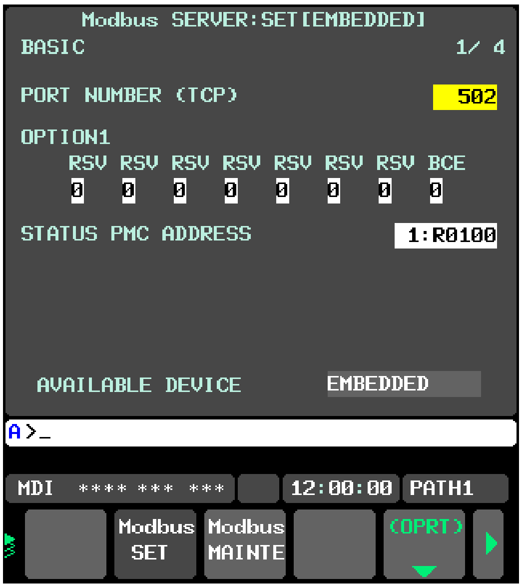

Fig.17.2.9.2 (b) Setting screen 1 (BASIC)

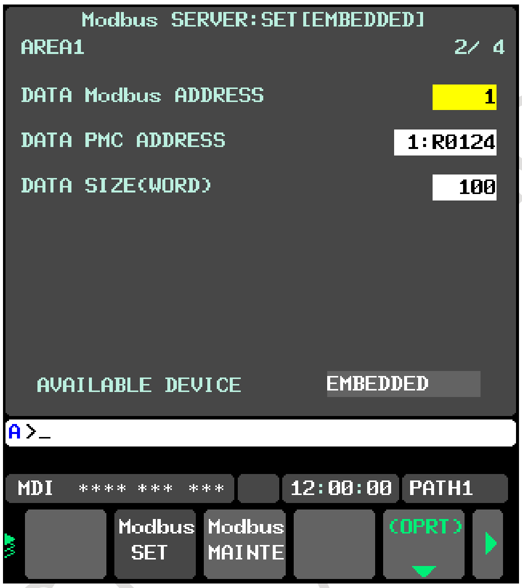

Fig.17.2.9.2 (c) Setting screen 2 (areas 1 to 3)

Setting items

Item	Description
PORT NUMBER (TCP)	Specify the port number for using the Modbus/TCP Server function. The setting range is from 0 to 65535. Usually, set 502. When 0 is set, the Modbus/TCP Server function is not operated.
OPTION1	Bit 0: BCE The byte arrangement in the Modbus area is assumed to be 0: little endian 1: big endian Bits 1 to 7: RSV Be sure to set 0.
STATUS PMC ADDRESS	Specify the top address in the E/R area of the PMC in which to store the status. The setting range depends on the effective PMC area. A 1-byte area is used.
DATA Modbus ADDRESS	Specify the top address in the Modbus area (Holding registers) used to exchange I/O with the Modbus/TCP client. The setting range is 1 to 65536. For details of the endian of the data in the Modbus area (Holding Registers), see Subsection 18.2.6.1, "Conversion of Endian".
DATA PMC ADDRESS	Specify the top address in E/R/D area of the PMC used to exchange I/O with the Modbus/TCP client. The setting range depends on the effective PMC area. Only the even-numbered address can be set.
DATA SIZE	Specify the data size (unit: word size) used to exchange I/O with the Modbus/TCP client. The setting range depends on the effective PMC area. If not exchange I/O with the area, specify 0 for this parameter.

> ⚠ **WARNING**
> When setting PMC address for Modbus/TCP server function, thoroughly confirm the content of "GENERAL WARNINGS FOR CNC APPLICATION DEVELOPMENT" in "SAFETY PRECAUTIONS" at the beginning of this manual.
> Be careful not to cause an overlap between the PMC area to allocate and a PMC area used for other purposes.
> If the machine is operated without confirmation of above explanation, the machine may behave unexpectedly, possibly damaging the tool, the machine itself, the workpiece, or causing injury to the user.

> **NOTE**
> 1 For the changed parameters to take effect, turn the CNC power off and back on or restart embedded Ethernet at the COMMON screen.
> 2 Communication parameters of the Modbus/TCP Server function that is operated on embedded Ethernet are included in the embedded Ethernet parameters.
> 3 Set the Modbus areas for areas 1 to 3 so that they do not overlap. If any overlap, different actions are taken for READ and WRITE, as follows:
> For READ, area n where n is the largest is given priority, and data is read from that area.
> For WRITE, the same value is written to all the overlapping areas.

Status

The status (1 byte) is detected by the Modbus/TCP Server function.

		Status							
		#7	#6	#5	#4	#3	#2	#1	#0
Status PMC address	**+0**	**COM**	**INT**	**-**	**-**	**-**	**-**	**-**	**ERR**

Bit	Name	Description
#0	ERR	Unrecoverable error 0: The Modbus/TCP Server function is operating correctly. 1: An unrecoverable error occurred in the Modbus/TCP Server function.
#1-5	-	Reserved
#6	INT	Initialization completion 0: The initialization of the Modbus/TCP Server function is not completed. 1: The initialization of the Modbus/TCP Server function is completed.
#7	COM	Communicating 0: Not communicating with a Modbus/TCP client. 1: Communicating with one or more Modbus/TCP clients.

17.2.9.3 MAINTENANCE

This section describes the maintenance of the Modbus/TCP Server function.

Maintenance Screen of the Modbus/TCP Server Function

The connection status of the client connected to the Modbus/TCP Server can be checked on this screen.

Procedure

1. Press function key 
.
2. Soft key [EMBED PORT] appears. When the soft key does not appear, press the continue key.
3. Press soft key [EMBED PORT], and then soft key [Modbus MAINTE] appears on the setting screen of the Ethernet function.
4. Press soft key [Modbus MAINTE], and then the maintenance screen (CLIENT LIST) of the Modbus/TCP Server function is displayed.

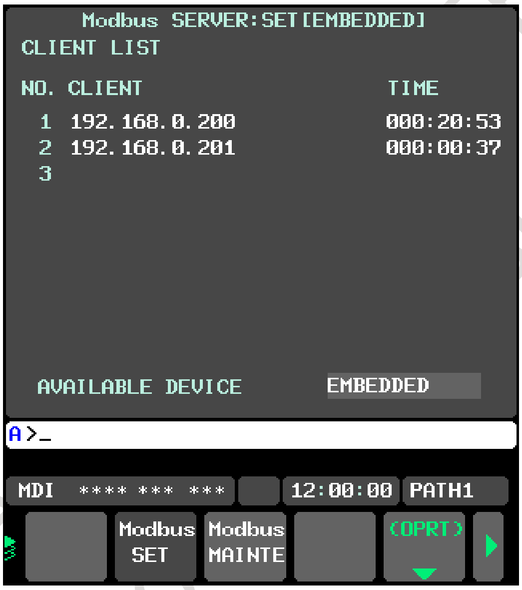

Fig.17.2.9.3 (d) Maintenance screen (CLIENT LIST) of the Modbus/TCP Server function

Display items

Item	Description
CLIENT	The IP addresses of the Modbus/TCP clients connected to this Modbus/TCP Server are displayed. (Example of display format: "192.168.0.200") They are displayed in the order in which the clients are connected.
TIME	The connecting times of the Modbus/TCP clients connected to this Modbus/TCP Server are displayed. The displayed times are updated automatically. The display format for a time of hour (hhh), minute (mm) and second (ss) is "hhh:mm:ss". The maximum value is "999:59:59", and if the maximum value is exceeded, the time will not be updated from "999:59:59".

17.2.9.4 RELATED NC PARAMETER

	#7	#6	#5	#4	#3	#2	#1	#0
14882							MOD	

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#1 MOD The Modbus/TCP Server function is used
- 0: on a Fast Ethernet.
- 1: on embedded Ethernet (embedded Ethernet port).

17.3 SWITCHING BETWEEN THE EMBEDDED ETHERNET DEVICES

There are two types of embedded Ethernet devices: the embedded Ethernet port and PCMCIA Ethernet card.
Screen operation is required to switch between these two types of devices.

Procedure

1. Press the function key SYSTEM.
2. Soft keys [EMBED] and [PCMCIA LAN] appear.
   (When there is no soft keys, press the continue key.)
3. Press soft key [EMBED] or [PCMCIA LAN], press soft key [COMMON], and then press [(OPRT)] to display soft key [EMB/PCMCIA].
4. Pressing soft key [EMB/PCMCIA] switches between enabled devices.

> **NOTE**
> 1 Information on a switched device is stored in nonvolatile memory.
>   On the next power-on, the device last selected can be used as is.
> 2 When using the unsolicited messaging function, note the following:
>   - Processing is forcibly started from the "Not Ready" state, regardless of the unsolicited message transfer state.
>   - When the parameter for control is set to use the response notification method, RES and RES_CODE (0x01) are posted to the ladder program.
>   - When the parameter for control is set to use the simplified method, REQ is cleared.

17.4 RESTART OF THE EMBEDDED ETHERNET

Communication using the embedded Ethernet can be restarted.

Procedure

1. Press the function key  .
2. Soft keys [EMBED] and [PCMCIA] appear.
   (When there is no soft keys, press the continue key.)
3. Press soft key [EMBED] or [PCMCIA LAN], press soft key [COMMON], and then press [(OPRT)] to display soft key [EMB/PCMCIA].
4. Pressing soft key [RSTART] resets embedded Ethernet communication and then restarts it.

> **NOTE**
> 1. Pressing soft key [RSTART] forcibly interrupts communication even when it is in progress.
> 2. This function makes a restart by software. An actual restart may be impossible under some conditions.
> 3. When using the unsolicited messaging function, note the following:
>   - Processing is forcibly started from the "Not Ready" state, regardless of the unsolicited message transfer state.
>   - When the parameter for control is set to use the response notification method, RES and RES_CODE (0x01) are posted to the ladder program.
>   - When the parameter for control is set to use the simplified method, REQ is cleared.

17.5 MAINTENANCE SCREEN FOR EMBEDDED ETHERNET FUNCTION

With the embedded Ethernet function, a dedicated maintenance screen is available.
The maintenance screen enables operations to be checked when the embedded Ethernet function operates abnormally.

Displaying and operating the PING screen

Procedure

1. Press the function key  .
2. Soft keys [EMBED] and [PCMCIA LAN] appear.
   (When there is no soft keys, press the continue key.)
3. By pressing the [EMBED] soft key, the Ethernet Setting screen for the embedded Ethernet is displayed.
   By pressing the [PCMCIA LAN] soft key, the Ethernet Setting screen for the PCMCIA Ethernet card can be set.
4. Press soft key [PING] and then press [(OPRT)].
5. To send the PING command to connection destination 1 for FTP file transfer, press soft key [PING FTP1]. Similarly, to send the PING command to connection destination 2 or 3, press [PING FTP2] or [PING FTP3], respectively.

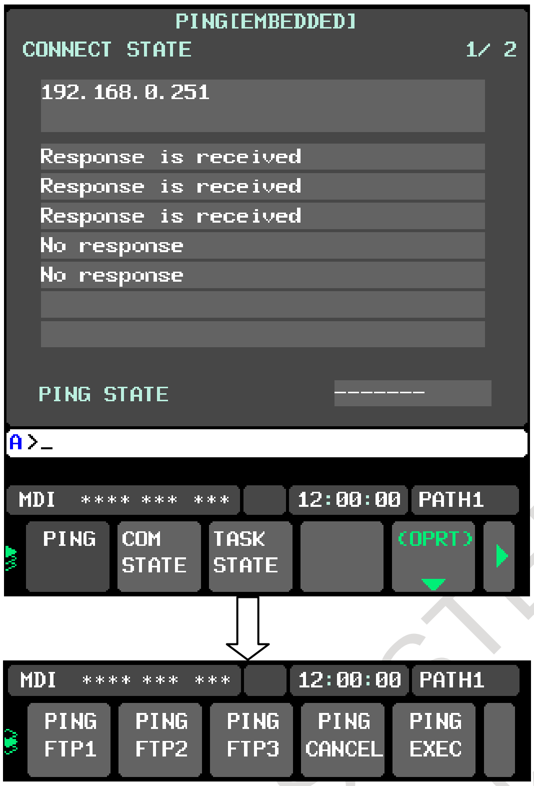

Fig. 17.5 (a) PING connection status screen

6 To send the PING command to the desired destination, enter the address of the destination on the PING setting screen (Fig. 17.5(b)). (Page keys  are used for switching.)

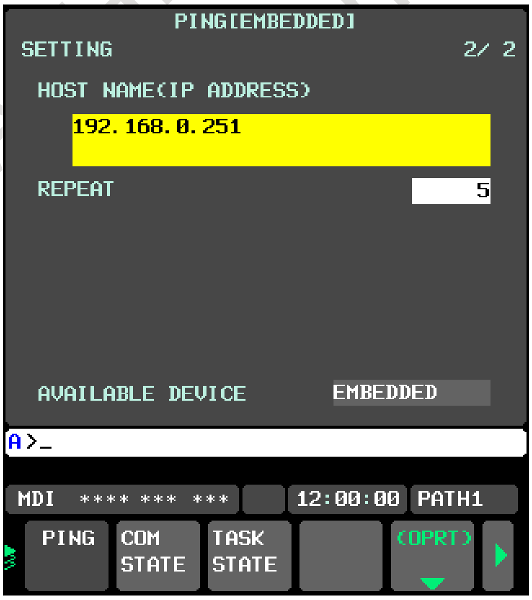

Fig. 17.5 (b) PING connection status screen

7 After entering the address and the repeat count, press the soft key [PING]. The specified number of PING commands are sent to the specified destination.
8 To cancel the PING command currently being sent, press soft key [PING CANCEL].

Displaying Communication status screen

Procedure

1. Press the function key SYSTEM.
2. Soft keys [EMBED] and [PCMCIA LAN] appear.
   (When there is no soft keys, press the continue key.)
3. By pressing the [EMBED] soft key, the Ethernet Setting screen for the embedded Ethernet is displayed.
   By pressing the [PCMCIA LAN] soft key, the Ethernet Setting screen for the PCMCIA Ethernet card can be set.
4. To display the communication status (Fig. 17.5(c)) of the embedded Ethernet, press soft key [COM STATE].
   Page keys PAGE PAGE can be used to switch between the sending state and the receiving state.

Fig. 17.5 (c) Communication status screen

Display items

Item	Description
BAUDRATE	Displays the baud rate and transmission method. Transmission rate: 100Mbps or 10Mbps Transmission method: Full duplex or half duplex -------- : Not connected to HUB
SEND PACKET	Displays the number of transmitted packets.
COLLISION CARRIER SENSE LOST DELAYOVER UNDERRUN SEND PARITY ERROR	Displays the number of errors detected during transmission of packets.
RECEIVE PACKET	Displays the number of packets received.
ALIGNMENT ERROR CRC ERROR OVERRUN ERROR FRAME LENGTH ERROR RECV PARITY ERROR	Displays the number of errors detected during reception of packets.
AVAILABLE DEVICE	Currently available device of embedded Ethernet Displays either the embedded Ethernet port or the PCMCIA Ethernet card.

TASK STATE screen

Procedure

1 Press the function key SYSTEM.

2 Soft keys [EMBED] and [PCMCIA LAN] appear.
(When there is no soft keys, press the continue key.)

3 To display the Ethernet Setting screen for the embedded Ethernet port or the PCMCIA Ethernet card, press soft key [EMBED] or [PCMCIA LAN], respectively.

4 Pressing soft key [TASK STATUS] causes the task status (Fig. 17.5(d)) of the embedded Ethernet function to be displayed.

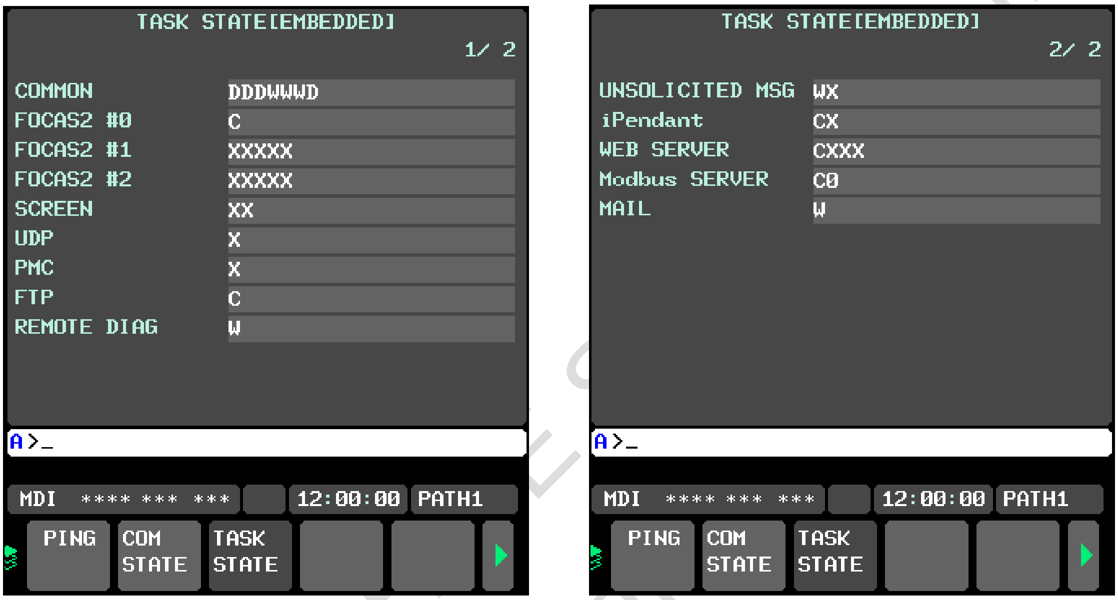

Fig. 17.5 (d) TAST STATE screen

Table 17.5 (a) lists the meaning of each symbol.

Table 17.5 (a)

	Symbol and meaning
FOCAS2 #0	C: Waiting for a connection from the host W: Data processing in progress (1) D: Data processing in progress (2) N: FOCAS2 out of service
FOCAS2 #1,#2	W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
SCREEN	W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
UDP	W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
PMC	W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
FTP	C: Execution wait W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed

	Symbol and meaning
REMOTE DIAG	W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
UNSOLICITED MSG	W: Data processing in progress (1) D: Data processing in progress (2) N: Abnormal state X: Not yet executed Number: Alive signal (UDP) transmission in progress when count-up operation is performed
iPendant	C: Waiting for a connection from iPendant W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
WEB SERVER	C: Waiting for a connection W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed
Modbus SERVER	C: Waiting for a connection W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed Number: Number of sockets currently connected
MAIL	W: Data processing in progress (1) D: Data processing in progress (2) X: Not yet executed

17.6 LOG SCREEN OF THE EMBEDDED ETHERNET FUNCTION

This screen displays the log of the embedded Ethernet function.

NOTE
1 If alarm SR2032, “EMBEDDED ETHERNET/DATA SERVER ERROR” is issued during data transfer using the embedded Ethernet function, check the error details on the log screen of the embedded Ethernet function.
2 The log information for the embedded Ethernet function is stored in volatile memory and it is lost when the power of CNC is turned off. If an error occurs, check the log information before turning the power off.

Displaying the log screen

Procedure

1 Press the function key .

2 To display the log screen (Fig. 17.6(a)) for the embedded Ethernet port or PCMCIA Ethernet card, press soft key [EMBED LOG] or [PCMCIA LOG], respectively. (When there is no soft keys, press the continue key.)

Fig. 17.6 (a) LOG screen

The newest error log appears at the top of the screen. The date and time when an error occurred are displayed at the right end of the line. The format of date and time data is “MMM.DD hh:mm:ss” where MMM represents a month, dd represents a day, hh represents hours, mm represents minutes, and ss represents seconds.
The date and time of the upper item shown Fig. 17.6(a) is October 16, 12:57:06.
To clear the log, press soft keys [(OPRT)] and [CLEAR] in that order. (Fig. 17.6 (b))

Fig. 17.6 (b)

The log for each function can be displayed by using soft keys on the embedded Ethernet log screen.

(1) Soft key [ALL]
Displays all log related to the embedded Ethernet.

(2) Soft key [COMMON]
Displays the log related to the parameter settings of the embedded Ethernet function and the basic communication function.

(3) Soft key [FOCAS2]
Displays the log related to the FOCAS2/Ethernet function.

(4) Soft key [FTP TRANS]
Displays the log related to FTP file transfer.

(5) Soft key [UNSOLT MSG]
Displays the log related to the unsolicited messaging function.

(6) Soft key [WEB]
Displays the log related to the CNC screen Web server function.

(7) Soft key [Modbus]
Displays the log related to the Modbus/TCP Server function.

(8) Soft key [REMOTE DIAG]
Displays the log related to the Machine Remote Diagnosis.

(9) Soft key [MAIL]
Displays the log related to the CNC Status Notification function.

Error and message

Error No.	Log message	Description and necessary action
E-0118 E-0119	Error occurred while wait for FOCAS2 pdu	A communication error has occurred because of any of the following: → The network quality has been lowered to such a level that data cannot be received from a PC at the other end. The communication channel has been logically shut down. → Software running on a PC at the other end has logically shut down the communication channel. → The Ethernet cable has been disconnected.
E-011A	All communication paths are busy	All the FOCAS2/Ethernet communication channels are busy.
E-0126	No response from RMT DIAG server	The IP address of the machine remote diagnosis accepting server may be invalid or the power to the machine remote diagnosis accepting server may be off. Check whether the IP address of the machine remote diagnosis accepting server is valid and whether the power to the machine remote diagnosis accepting server is on. Alternatively, the machine remote diagnosis accepting server may not respond to the PING command to increase the security level (such as a firewall setting). Set bit 1 of parameter No.14880 to 1 and connect the server again.
E-0148	Cannot save parameter for Unsolicited Message	When the FOCAS2 function cnc_wrunsolicprm2 was received, the parameter for the unsolicited messaging function could not be saved for one of the following causes: → The mode of the unsolicited messaging function is not set to "PC mode". → The state of the unsolicited messaging function is not "Not Ready". → The argument "parameter-for-unsolicited-message" of the FOCAS2 function cnc_wrunsolicprm2 includes an invalid value.

Error No.	Log message	Description and necessary action
E-0149	The received parameter for Unsolicited Message is wrong	When the FOCAS2 function cnc_wrunsolicprm2, cnc_rdunsolicprm2, cnc_unsolicstart, or cnc_unsolicstop was received, the argument "parameter-number-for-unsolicited-message" was found to be invalid.
E-0200	(Received message from FTP server)	A message sent by the FTP server is displayed as it is. A message containing characters other than ASCII characters may not be displayed correctly.
E-0202	Connection failed with FTP server	Software of the FTP server may not be running. Run the FTP server software. Alternatively, the FTP server may not respond to the PING command to increase the security level (such as a firewall setting). Set bit 1(PCH) of parameter No. 14880 to "1" and connect the server again.
E-0207	The router is not found	The specified IP address of the router may be wrong. Alternatively, the router may be turned off. Check whether the IP address of the router has been correctly specified and whether the router is turned on.
E-0208	The FTP server is not found	The specified IP address of the FTP server may be wrong. Alternatively, the FTP server may be turned off. Check whether the IP address of the FTP server has been correctly specified and whether the FTP server is turned on. Alternatively, the FTP server may not respond to the PING command to increase the security level (such as a firewall setting). Set bit 1(PCH) of parameter No. 14880 to "1" and connect the server again.
E-020B	Cannot login into FTP server	Check whether a correct user name and password are specified when logging into the FTP server.
E-020C	The parameters of FTP server are wrong	Check whether a correct user name and password are specified when logging into the FTP server.
E-020D	Changing a work folder of host failed	Check the work folder logging into the FTP server.
E-041A	Frame transmission failed (TCP)	A communication error has occurred because of any of the following: → The network quality has been lowered to such a level that data cannot be received from a PC at the other end. The communication channel has been logically shut down. → Software running on a PC at the other end has logically shut down the communication channel. → The Ethernet cable has been disconnected. → Data cannot be posted to the communication destination due to a firewall setting.
E-0901	Cannot read MAC address	The MAC address is not written in the hardware. Alternatively, the hardware has been damaged.
E-0A06	Network is too busy	An excessive amount of data is flowing over the network. One possible solution is to divide the network.
E-0B00	The own IP address is wrong	Specify a correct IP address in the designated format.
E-0B01	The own IP address is not set	Specify an IP address.
E-0B02	Subnet mask is wrong	Specify a correct subnet mask in the designated format.
E-0B03	Subnet mask is not set	Specify a subnet mask.
E-0B04	Router IP address is wrong	There may be class disagreement between the IP address of the local node and the IP address of the router.
E-0B05	IP address of DNS server is wrong	There may be class disagreement between the IP address of the local node and the IP address of the DNS server.
E-0B06	The own host name is wrong	Check whether a correct host name is specified.
E-0B07	The own domain name is wrong	Check whether a correct domain name is specified.

Error No.	Log message	Description and necessary action
E-0B08	TCP port number is wrong	A value beyond the permissible setting range may be specified.
E-0B09	UDP port number is wrong	A value beyond the permissible setting range may be specified.
E-0B0B	IP address of remote FTP server is wrong	Specify a correct IP address in the designated format.
E-0B0C	Port NO of a remote FTP server is wrong	A value beyond the permissible setting range may be specified.
E-0B0D	User name of remote FTP server is wrong	The specified user name may contain a prohibited character.
E-0B0E	Password of remote FTP server is wrong	The specified password may contain a prohibited character.
E-0B0F	Login folder of remote FTP srv is wrong	The specified log-in folder name may contain a prohibited character.
E-0B18	Cannot set because DHCP is available	To allow a set-up, disable the DHCP client function.
E-0B19 E-0B1A	Embedded Ethernet hardware isn't found	The software or hardware of embedded Ethernet function cannot be recognized. Check whether the software has been incorporated. Check whether the hardware is sound.
E-0B27	Unsolicited Message isn't available	The software condition for using the unsolicited messaging function is not satisfied. The cause may be one of the following: → parameters for using the unsolicited messaging function are not set. For the parameters, see Subsection 18.2.4, "Setting of the Unsolicited Messaging Function".
E-0B29	Mode of Unsolicited Message is wrong	In the CNC mode, the FOCAS2 function cnc_wrunsolicprm2 cannot be executed.
E-0B2A	Status of Unsolicited Message is wrong	The state of the unsolicited messaging function was other than "Not Ready", so that the parameters for the unsolicited messaging function could not be updated. The cause may be one of the following: → In a state other than "Not Ready", the FOCAS2 function cnc_wrunsolicprm2 or cnc_unsolicstart was executed. → In a state other than "Not Ready", soft key [APPLY] was pressed.
E-0B2B	Cannot refresh parameter of Unsolicited Message	The parameters for the unsolicited messaging function could not be updated. The cause may be one of the following: → The problem of E-0B29 or E-0B2A occurred. → A parameter for the unsolicited messaging function includes an invalid value.
E-0B44	Invalid value exists in Transmission parameter of Unsolicited Message	The parameter for the unsolicited messaging function, TRANSMISSION NUMBER or TRANSMISSION PARAMETER (NO. 1 to NO. 3), includes an invalid value.
E-0B45	The total of Transmission size of Unsolicited Message exceeds the limitation	The sum of sizes specified by the parameters for the unsolicited messaging function, TRANSMISSION PARAMETER NO. 1 to NO. 3, exceeds the maximum specifiable number of bytes. For the maximum specifiable number of bytes, see the setting item "TRANSMISSION PARAMETER" in Subsection 18.2.4.4, "Setting on the CNC screen".
E-0B47	TCP port number of Modbus/TCP Server is wrong	Zero is specified. To use this function, specify TCP port number.
E-0B48	Status PMC address of Modbus/TCP Server is out of range	A value beyond the permissible setting range is specified. Check the status PMC address settings.
E-0B49	Data PMC address of Modbus/TCP Server is wrong	An odd-numbered address is specified. Check the data PMC address setting.

Error No.	Log message	Description and necessary action
E-0B4A	Data PMC address of Modbus/TCP Server is out of range	A value beyond the permissible setting range is specified. Check the data PMC address setting or data size setting.
E-0B4B	Modbus area of Modbus/TCP Server is out of range	A value beyond the permissible setting range is specified. Check the data Modbus address setting or data size setting.
E-1001	All Modbus communication paths are busy	The number of connected communication parties (Modbus/TCP clients) exceeded the maximum number of connectable clients. Connections to communication parties (Modbus/TCP clients) will be terminated in order of the oldest to the newest.
E-1003	Version number of Modbus packet is wrong	Specify a correct version number according to the protocol of Modbus/TCP.
E-1004	Length of Modbus packet is wrong	Specify a correct size according to the protocol of Modbus/TCP.
E-100B	Function code of Modbus packet is wrong	The specified function code may not be supported. For details of supported function codes, see "Modbus/TCP function codes" in Subsection 18.2.6.1, "OVERVIEW".
E-1015 E-1016	Data address of Modbus packet is wrong	Specify a correct data address according to the protocol of Modbus/TCP.
E-1017 E-1018 E-1019	Data value of Modbus packet is wrong	Specify a correct data address according to the protocol of Modbus/TCP.
E-101A	Data address that client requested is out of range (1-3)	No PMC area is assigned to the Modbus area requested from the connected communication party (Modbus/TCP client). Assign a PMC area.
E-1300	(Sent message to Web browser)	It is a message transmitted to notify the Web browser of the error detected with the Web server.
E-1301	User name is not set	Specify a user name.
E-1302	Password is not set	Specify a password.
E-1303	User name is wrong	Check whether a correct user name.
E-1304	Password is wrong	Check whether a correct password.
E-1305	All communication paths are busy	All the Web communication channels are busy.
E-1306	Session ended	The connection with the Web browser ended.
E-1307	Session canceled	The connection with the Web browser aborted compulsorily by either of the following factor. → The Web browser connection prohibition signal WBEND <G0579.5> became “1”. → CNC screen display function started on other personal computer.
E-1308	Session started	The connection with the Web browser started.
E-1309	Login failed	The CNC screen Web server function became disabled. Turn off / on the power of the CNC.
E-1400	(Sent message to POP client)	It is not generated usually.
E-1401	(Sent message to SMTP client)	It is not generated usually.
E-1402	User name is not set	Enter user name of CNC Status Notification.
E-1403	Password is not set	Enter password of CNC Status Notification
E-1404	User name is wrong	Confirm user name of CNC Status Notification.
E-1405	Password is wrong	Confirm password of CNC Status Notification
E-1406	Login failed	CNC Status Notification function has not been usable. Please restart the CNC.
E-XXXX	(No message)	An internal error has occurred. Make a notification of the error number.

18 DIAGNOSIS FUNCTION

18.1 SERVO WARNING INTERFACE

Overview

The servo system can report the warning status before one of the following target alarms occurs.
When the warning status is entered, a report to the PMC is issued. For example, this signal can be used by the machine for retracting tools from the time a warning occurs by the time a servo alarm occurs.

Signal

Servo warning detail signals SVWRN1 to 4 <Fn093.4 to Fn093.7>

[Classification] Output signal

[Function] Reports the warning signal corresponding to the state of the servo amplifier.

[Output condition] The Table 18.1(a) shows the warning statuses of the servo amplifier and their corresponding warning signals.

Table 18.1 (a)

Corresponding alarm messages	Warning status signals (F93)				Time from when a warning state signal is issued to until an alarm occurs
	SVWRN4 (#7)	SVWRN3 (#6)	SVWRN2 (#5)	SVWRN1 (#4)	
SV0444: SV INTERNAL FAN FAILURE	1	0	0	0	One minute
SV0601: SV EXTERNAL FAN FAILURE	1	0	0	1	Until overheat occurs (inconstant)
SV0040: SV EXTERNAL FAN FAILURE	1	0	1	1	Depending on where the trouble occurs in
SV0443 : SV INTERNAL FAN FAILURE	1	1	0	0	One minute
SV0606: PS EXTERNAL FAN FAILURE	1	1	0	1	Until overheat occurs (inconstant)
SV0431: PS OVERLOAD	1	1	1	0	One minute
SV0607: PS IMPROPER INPUT POWER	1	1	1	1	PSMR: Five seconds, PSM: One minute

A timing chart for handling a warning is shown Fig. 18.1.

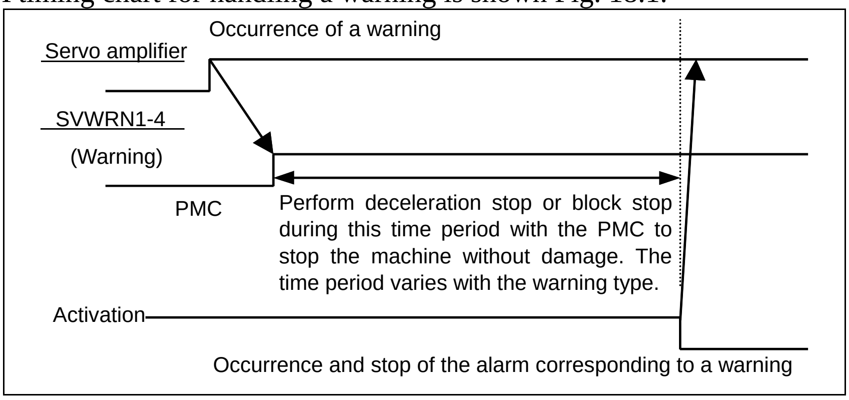

Fig. 18.1 (a)

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn093	SVWRN4	SVWRN3	SVWRN2	SVWRN1				

Warning status alarms for servo amplifiers

When bit 2 (SWP) of parameter No. 1807 is set to 0, if a servo amplifier is placed in the warning status, a DS alarm is output in addition to the servo warning detail signals.

If one of the following alarms is issued, automatic operation enters the feed hold state and movements along all controlled axes including PMC axes are decelerated to a stop. Issuing a warning status alarm does not cause to the servo motor to be deactivated.

Table 18.1 (b)

Alarm No. when the servo amplifier is in the warning status	Alarm No. when the servo amplifier is in the alarm status	Alarm message	Operation performed when the warning status occurs
DS0608	SV0444	n-axis : SV INTERNAL FAN FAILURE	Immediately after the fan stops, alarm DS0608 is displayed and movements along axes enter the feed hold stop state. The servo motor is kept active for 1 minute. After that, the servo motor is deactivated and alarm SV0444 is displayed.
DS0609	SV0601	n-axis : SV EXTERNAL FAN FAILURE	Immediately after the fan stops, alarm DS0609 is displayed and movements along axes enter the feed hold stop state. When bit 2 (SWP) of parameter No. 1807 is set to 1 after that, the alarm display can be canceled by a reset and operation can be restarted.
DS0610	SV0443	n-axis : SV INTERNAL FAN FAILURE	Immediately after the fan stops, DS0610 is displayed and movements along axes enter the feed hold stop state. The servo motor is kept active for 1 minute. After that, the servo motor is deactivated and alarm SV0443 is displayed.
DS0611	SV0606	n-axis : PS EXTERNAL FAN FAILURE	Immediately after the fan stops, DS0611 is displayed and movements along axes enter the feed hold stop state. When bit 2 (SWP) of parameter No. 1807 is set to 1 after that, the alarm display can be canceled by a reset and operation can be restarted.
DS0612	SV0431	n-axis : PS OVERLOAD	
DS0613	SV0607	n-axis : PS IMPROPER INPUT POWER	
DS0614	SV0040	n-axis : PS EXTERNAL INPUT COMPONENT ERROR	Alarm DS0614 is displayed and movements along axes enter the feed hold stop state. The servo motor is kept active for fixed time. The time until deactivation depends on where the trouble occurs in.

After an alarm in the warning status listed in Table 18.1 (b) is issued, when the αi servo amplifier is actually placed in the alarm status, the servo motor is deactivated and the number of an alarm in the alarm status is additionally displayed.

When bit 2 (SWP) of parameter No. 1807 is set to 1, if a servo amplifier is placed in the warning status, only the servo warning detail signals are output and no alarm in the warning status (alarm DS0608 to DS0614) is issued. If a servo amplifier is placed in the warning status during automatic operation, automatic operation is kept. So, decelerate the movements along axes to a stop using the servo warning detail signals before the servo motor is deactivated. Note that if the movements along axes are not decelerated to a stop, the servo motor is suddenly deactivated during movement along axes.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
1807						SWP		

[Input type] Parameter input
[Data type] Bit path

#2 SWP This parameter specifies the operation of the αi series servo amplifier in its warning state (for example, with the fan stopped).

0: An alarm is issued when the amplifier is placed in the warning state. Automatic operation enters the feed hold state and the servo axis is decelerated to a stop.
1: An alarm is not issued even when the amplifier is placed in the warning state. Automatic operation is kept. The servo is deactivated if the amplifier shifts from the warning state to the alarm state.

> ⚠ **CAUTION**
> If operation is continued with the external fan stopped while bit 2 (SWP) of parameter No. 1807 is set to 1, the servo amplifier may be overheated and "overheat alarm", "IPM alarm", or "VRDY off alarm" may be issued depending on the operating conditions. If such an alarm is issued, the amplifier is deactivated and the servo motor is stopped by the dynamic brake, involving a risk of breaking the workpiece or tool as the stop from high-speed rotation requires an extended distance. The user should therefore understand that the operation with bit 2 (SWP) of parameter No. 1807 set to 1 is a temporary step to take before fan replacement. Once the fan has stopped, be sure to replace the fan immediately and set bit 2 (SWP) of parameter No. 1807 back to 0.
>
> If bit 2 (SWP) of parameter No. 1807 is set to 1, the warning text "FAN" blinks on the NC screen to show that the external fan has been stopped. Also on the machine side, monitor the warning signal output to the PMC and remind the operator of the operation with the fan stopped.

18.2 SPINDLE WARNING INTERFACE

Overview

The warning state can be reported before an alarm is issued. When the warning state is entered, a report to the PMC is sent.

For example, this signal can be used for retracting tools or reducing cutting load from the time a warning occurs by the time an overheat alarm occurs. In addition, diagnosis data also contains warning numbers.

Signal

Spindle warning detailed signals SPWRN1 to SPWRN9 <Fn264.0 to 7, Fn265.0>

[Classification] Output

[Function] Reports the warning number corresponding to the state of the αi spindle amplifier.

[Output condition] When the αi spindle is in the warning state, a warning number consisting of SPWRN1 to SPWRN9 is output as nine-bit binary data.

If warnings occurred on multiple αi spindle amplifiers, the warning number of the ai spindle having the smallest axis number is output.

The warning numbers and their descriptions are shown Table 18.2.

Table 18.2

Warning number	Contents	Details
56	Internal fan stopped	If the internal fan stops, the warning signal is output. Since the spindle continues to operate at this time, use the PMC to perform processing as needed. About one minute after the warning signal is output, an alarm occurs.
88	Radiator cooling fan stopped	If the radiator cooling fan stops, the warning signal is output. Since the spindle continues to operate at this time, use the PMC to perform processing as needed. If the main circuit overheats, an alarm occurs.
04	Open-phase detected in the converter main power supply	If an open-phase is detected in the main power supply, the warning signal is output. Since the spindle continues to operate at this time, use the PMC to perform processing as needed. About one minute (for the αiPS) or about five seconds (for the αiPSR) after the warning signal is output, an alarm occurs.
58	Converter main circuit overloaded	If the main circuit of the Power Supply (PS) is overloaded, the warning signal is output. Since the spindle continues to operate at this time, use the PMC to perform processing as needed. About one minute after the warning signal is output, an alarm occurs.
59	Converter cooling fan stopped	If the Power Supply (PS) cooling fan stops, the warning signal is output. Since the spindle continues to operate at this time, use the PMC to perform processing as needed. About one minute after the warning signal is output, an alarm occurs.
113	Converter radiator cooling fan stopped	If the Power Supply (PS) radiator cooling fan stops, the warning signal is output. Since the spindle continues to operate at this time, use the PMC to perform processing as needed. If the Power Supply (PS) main circuit overheats, an alarm occurs.
01	Motor overheat	When the motor temperature increases beyond the overheat warning detection level (set by a parameter), a warning signal is output. At this time, spindle operation is continued. So, perform necessary processing with the PMC. An alarm is issued when the motor temperature has reached the overheat alarm detection level.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn264	SPWRN8	SPWRN7	SPWRN6	SPWRN4	SPWRN4	SPWRN3	SPWRN2	SPWRN1
Fn265								SPWRN9

Diagnosis data

The status of a warning is displayed on the following diagnosis data.

712	Warning status of spindle

[Data type] Word spindle
The number of a warning caused on each spindle is indicated.
If there is no warning, 0 is indicated.

18.3 FAN MOTOR ABNORMALITY MONITORING FUNCTION AND COMMUNICATION RETRY MONITORING FUNCTION

18.3.1 Fan Motor Abnormality Monitoring Function

Overview

This function monitors the number of revolutions of the fan motor in the CNC control part to anticipate a critical fault. If the fan motor is defective, the function detects it as an alarm level or a warning level, and the alarm, the signal, and the warning are output.

> ⚠ **CAUTION**
> Exchange fan motors referring to the maintenance manual if the defect of the fan motor is detected. Even if the warning level is detected, CNC can be continuously operated. However, there is a possibility that fan motor is deteriorated. Exchange fan motors as soon as possible.

Specification

The CNC control unit fan motor operates as shown in Table 18.3.1 if it is defective.

Table 18.3.1 Operation of the PCB cooling fan when it is defective

State	Operation
When the warning level is detected.	Displaying the warning status Outputting the warning level detection signal WFAN
When the alarm level is detected.	Displaying the warning status Outputting the Alarm level detection signal SFAN Servo: Makes a single block stop. Spindle: Continues rotating.
	After 50 seconds Servo: Makes a feed hold stop. Spindle: Stops rotating. After 60 seconds Alarm 701 occurs. Note) System alarm 455 is generated for the CNC control unit where CPU card (high speed version) was installed about 60 seconds after the detection of the alarm level.

> **NOTE**
> When the alarm level is detected, the spindle stops rotating 50 seconds later, but it starts rotating again when the warning or alarm is cleared. To stop the rotation of the spindle completely, create a ladder that stops the spindle using alarm level detection signal SFAN.

Signal

Alarm level detection signal SFAN<Fn093.1>

[Classification] Output signal

[Operation] This signal is output when the alarm level is detected by fan motor in the CNC control unit.

[Function] Reports that the alarm level was detected by fan motor in the CNC control unit.

> **NOTE**
> It takes a maximum of five seconds after the detection of the alarm level until the alarm level detection signal SFAN is output.

Warning level detection signal WFAN<Fn093.3>

[Classification] Output signal

[Operation] This signal is output when the warning level is detected by fan motor in the CNC control unit.

[Function] Reports that the warning level was detected by fan motor in the CNC control unit.

> **NOTE**
> It takes a maximum of five seconds after the detection of the warning level until the warning level detection signal WFAN <Fn093.3> is output.

18.3.2 Communication Retry Monitoring Function

Overview

If the I/O Link retry counter value, Ethernet (embedded + fast), FL-net error detection count, and ECC (SRAM) correction counter exceed the parameter setting, signals are output to report a reduction in system reliability.

Specification

I/O Link retry counter value abnormality monitoring function

This function monitors the retry counter at 10 minute intervals, it outputs warning signals (WIOCH1, WIOCH2, WIOCH3) if the counter value is equal to or more than the setting of parameter No. 11530.

The threshold beyond which a warning occurs changes every eight hours depending on the energization time.

When the energization time is T (hour) and parameter No. 11530 is n:

$0 \le T \le 8$

A warning occurs when the retry counter value is equal to or greater than n.

$8 < T$

A warning occurs when the retry counter value is equal to or greater than $n \times T/8$ (rounded up).

The I/O Link retry counter makes a check at 10 minute intervals, so the warning signal is output at 10 minute intervals.

The counter value is accumulated until the power is turned off.

> **NOTE**
> The maximum value of the retry counter is 255.
> A warning is issued when an overflow occurs.

ECC correction counter value abnormality monitoring function

This function monitors the correction counter at 10 minute intervals, it outputs warning signal (WECCS<F0535.3>) if the counter value is equal to or more than the setting of parameter No. 11531.

The threshold beyond which a warning occurs changes every eight hours depending on the energization time.

When the energization time is T (hour) and parameter No. 11531 is n:

$0 \le T \le 8$

A warning occurs when the retry counter value is equal to or greater than n.

$8 < T$

A warning occurs when the retry counter value is equal to or greater than $n \times T/8$ (rounded up).

The ECC correction counter makes a check at 10 minute intervals, so the warning signal is output at 10 minute intervals.

The counter value is accumulated until the power is turned off.

> **NOTE**
> The maximum value of the correction counter is 4095.
> A warning is issued when an overflow occurs.

Ethernet error detection count abnormality monitoring function

- Error detection of embedded Ethernet
  Checks the error detection count of embedded Ethernet at 10 second intervals and, if the error detection count for the nearest one minute is equal to or greater than the setting of parameter No. 11532, this function outputs warning signal WETE<F0535.4>.

- Error detection of fast Ethernet
  Checks the error detection count of fast Ethernet at 10 second intervals and, if the error detection count for the nearest one minute is equal to or greater than the setting of parameter No. 11533, this function outputs warning signal WETE.

The error detection count is checked at 10 second intervals in both embedded Ethernet and fast Ethernet, so the warning signal is output at 10 second intervals. Turning off and back on the power resets the signal output.

> **NOTE**
> The maximum value for network error counters is 65535.
> If an overflow occurs, no warning is issued and the error count returns to 0.

FL-net error detection count abnormality monitoring function

Checks the error detection count of FL-net at 10 second intervals and, if the error detection count for the nearest one minute is equal to or greater than the setting of parameter No. 11534, this function outputs warning signal. FL-net1 and FL-net2 either use a set value of parameter No.11534. However, as for the warning signal, WFLN1 is output for FL-net1, and WFLN2 is output for FL-net2.

The error detection count is checked at 10 second intervals, so the warning signal is output at 10 second intervals. Turning off and back on the power resets the signal output.

In the FL-net/Ethernet coexisting function, checks total of the error detection count of FL-net and Ethernet at 10 second intervals and, if the error detection count for the nearest one minute is equal to or greater than the setting of parameter No. 11533, this function outputs warning signal WETF<F0535.5>.

> **NOTE**
> The maximum value for network error counters is 65535.
> If an overflow occurs, no warning is issued and the error count returns to 0.

Parameter

11530	Warning value (common to ch1, ch2, and ch3) for I/O link retry counter

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte
[Unit of data] Correction counter value/8 hours
[Valid data range] 0 to 127

Recommended setting = 0
Set a warning value for the I/O link communication retry counter.
When the value in the 8-hour error correction counter becomes higher than or equal to the setting, the warning signal is output.
If the setting is 0, monitoring is performed on a 5 occurrences/8 hours basis.

11531	Warning value for the ECC correction counter (SRAM)

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte
[Unit of data] Correction counter value/8 hours
[Valid data range] 0 to 127

Recommended setting = 0
Set a warning value for the SRAM correction counter.
When the value in the 8-hour error correction counter becomes higher than or equal to the setting, the warning signal is output.
If the setting is 0, monitoring is performed on a 5 occurrences/8 hours basis.

11532	Warning value for the number of embedded-Ethernet error detection occurrences

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte
[Unit of data] Number of detection occurrences/minute
[Valid data range] 0 to 127

Recommended setting = 0
Set a warning value for the number of embedded Ethernet error detection occurrences.
When the number of 1- minute error detection occurrences becomes higher than or equal to the setting, the warning signal is output.
If the setting is 0, monitoring is performed on a 10 occurrences/minute basis.

11533	Warning value for the number of fast Ethernet error detection occurrences

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte
[Unit of data] Number of detection occurrences/minute
[Valid data range] 0 to 128
Recommended setting = 0
Set a warning value for the number of fast Ethernet error detection occurrences.
When the number of 1- minute error detection occurrences becomes higher than or equal to the setting, the warning signal is output.
If the setting is 0, monitoring is performed on a 10 occurrences/minute basis.

11534	Warning value (common to FL-net port 1 and 2) for the number of FL-net error detection occurrences

NOTE
When this parameter is set, the power must be turned off before operation is continued.

[Input type] Parameter input
[Data type] Byte
[Unit of data] Number of detection occurrences/minute
[Valid data range] 0 to 127
Recommended setting = 0
Set a warning value for the number of FL-net error detection occurrences.
When the number of 1- minute error detection occurrences becomes higher than or equal to the setting, the warning signal is output.
If the setting is 0, monitoring is performed on a 3 occurrences/minute basis.

Signal

I/O Link 1 retry abnormality warning signal WIOCH1<F0535.0>

[Classification] Output signal
[Operation] This signal is output when a warning occurs.
[Function] In I/O Link, if an error is detected in received data, the data is transmitted again (retried) to prevent the system from going down due to a temporary communication error caused by noise or the like.
This signal is set to 1 when the data retry count per eight hours is equal to or greater than the value set in parameter No. 11530 (standard setting 0, which means five retries per eight hours) in the I/O link on the first channel side.
An I/O Link retry abnormality is monitored at 10 minute intervals, so this signal is output at 10 minute intervals. Once this signal is set to 1, the value is kept until the CNC power is turned off.

I/O Link 2 retry abnormality warning signal WIOCH2<F0535.1>

[Classification] Output signal
[Operation] This signal is output when a warning occurs.
[Function] This signal is set to 1 when the retry count per eight hours for I/O Link on the second channel side is equal to or greater than the setting of parameter No. 11530.
The other usage is the same as in I/O Link 1 retry failure warning signal WIOCH1.

I/O Link 3 retry abnormality warning signal WIOCH3<F0535.2>

[Classification] Output signal

[Operation] This signal is output when a warning occurs.

[Function] This signal is set to 1 when the retry count per eight hours for I/O Link on the third channel side is equal to or greater than the setting of parameter No. 11530.
The other usage is the same as in I/O Link 1 retry failure warning signal WIOCH1.

SRAM ECC abnormality warning signal WECCS<F0535.3>

[Classification] Output signal

[Operation] This signal is output when a warning occurs.

[Function] SRAM, which stores parameters, machining programs, offset data, etc., uses ECC (error correction code) to correct a single bit error. If the SRAM error correction count is equal to or greater than the setting of parameter No. 11531 (standard setting 0, which means five retries per eight hours), this signal is set to 1.
Once this signal is set to 1, the value is kept until the CNC power is turned off.

Embedded Ethernet communication abnormality warning signal WETE<F0535.4>

[Classification] Output signal

[Operation] This signal is output when a warning occurs.

[Function] If the total number of various errors detected by the communication hardware of the embedded Ethernet function is equal to or greater than the setting of parameter No. 11532 (standard setting 0, which means 10 retries per one minute), this signal is set to 1.
Once this signal is set to 1, the value is kept until the CNC power is turned off.

Fast Ethernet communication abnormality warning signal WETF<F0535.5>

[Classification] Output signal

[Operation] This signal is output when a warning occurs.

[Function] If the total number of various errors detected by the communication hardware of the fast Ethernet function is equal to or greater than the setting of parameter No. 11533 (standard setting 0, which means 10 retries per one minute), this signal is set to 1.
Once this signal is set to 1, the value is kept until the CNC power is turned off.

FL-net1 communication abnormality warning signal WFLN1<F0535.6>

[Classification] Output signal

[Operation] This signal is output when a warning occurs.

[Function] If the total number of various errors detected by the communication hardware of the FL-net1 function is equal to or greater than the setting of parameter No. 11534 (standard setting 0, which means 3 retries per one minute), this signal is set to 1.
Once this signal is set to 1, the value is kept until the CNC power is turned off.

FL-net2 communication abnormality warning signal WFLN2<F0535.7>

[Classification] Output signal

[Operation] This signal is output when a warning occurs.

[Function] If the total number of various errors detected by the communication hardware of the FL-net2 function is equal to or greater than the setting of parameter No. 11534 (standard setting 0, which means 3 retries per one minute), this signal is set to 1.
Once this signal is set to 1, the value is kept until the CNC power is turned off.

18.4 TROUBLE DIAGNOSIS

18.4.1 Outline

Investigating the cause of Servo/Spindle/CNC alarms becomes easier by diagnosis according to the guidance message of this function.
And when the thermal simulation data or disturbance level of servo axis exceeds the trouble forecast level, the machine can be safely stopped by detecting the breakdown beforehand by the use of the trouble forecast signal.
It introduces the example of the method of pursuing the cause of the alarm occurrence that uses the trouble diagnosis function as follows.

When alarm "SV0410 EXCESS ERROR (STOP)" is occurred.

It explains the procedure of the cause investigation when following alarm "SV0410 EXCESS ERROR (STOP)" is occurred.

Fig.18.4.1 (a) Alarm message screen (10.4-inch display unit)

The cause of occurrence is pursued by answering the question displayed on the screen according to the following procedures by soft key [YES] or [NO] though there are some occurrence factors of the alarm "SV0410 EXCESS ERROR (STOP)".

1 After pushing return soft key [<], press the continuous menu key until soft key [GUIDE]/[MONIT]/[W.GRPH] appears.

2 Press soft key [GUIDE].

Fig.18.4.1 (b) Soft key to select trouble diagnosis guidance screen (10.4-inch display unit)

Because the following screens are displayed, press soft key [YES].

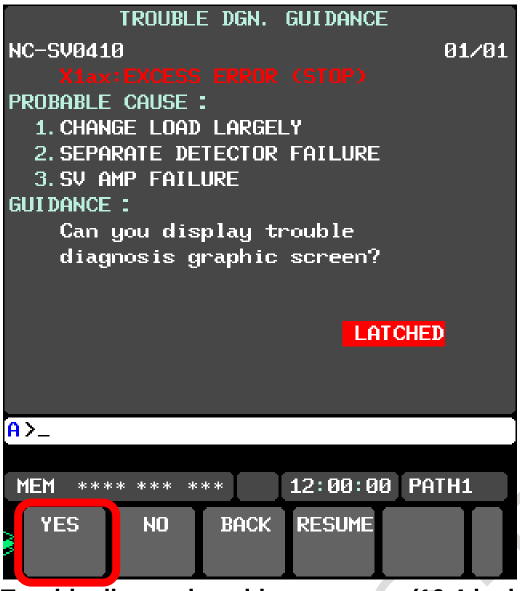

Fig.18.4.1 (c) Trouble diagnosis guidance screen (10.4-inch display unit)

The following guidances are displayed.

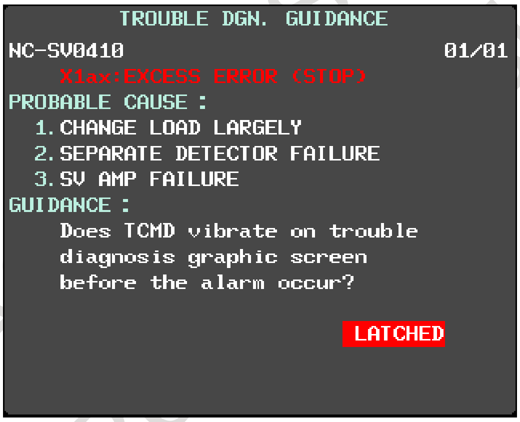

Fig.18.4.1 (d) Trouble diagnosis guidance screen (10.4-inch display unit)

Trouble diagnosis graphic screen is displayed according to the above guidance and the torque command is confirmed.

Trouble diagnosis graphic screen is displayed according to the following procedures.

1 Press return soft key [<].
2 Press soft key [W.GRPH].

Fig.18.4.1 (e) Soft key to select trouble diagnosis graphic screen (10.4-inch display unit)

3 Press soft key [W.PRM].

Fig.18.4.1 (f) Soft key to select trouble diagnosis parameter screen (10.4-inch display unit)

A necessary parameter for the graphic display is set as follows.

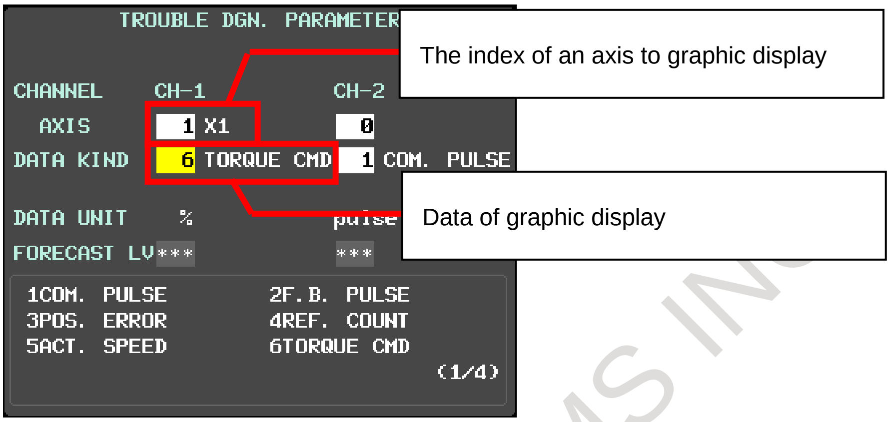

Fig.18.4.1 (g) Trouble diagnosis parameter screen (10.4-inch display unit)

The displayed axis is selected by inputting the index of an axis to the box next to "AXIS".
The displayed data kind is selected by inputting data kind number to the box next to "DATA KIND".

This time, "1" is set in the index of an axis to confirm the waveform of the torque command of the X1 axis and "6" is set to data kind number.

Trouble diagnosis graphic screen is displayed according to the following procedures.

1 Press return soft key [<].
2 Press soft key [G-ADJ.].

Fig.18.4.1 (h) Soft key to select trouble diagnosis graphic screen (10.4-inch display unit)

The graphical chart of the torque command immediately before occurring the alarm as follows is displayed.
The vertical line shown by the arrow on a right edge is time that the alarm is occurred.

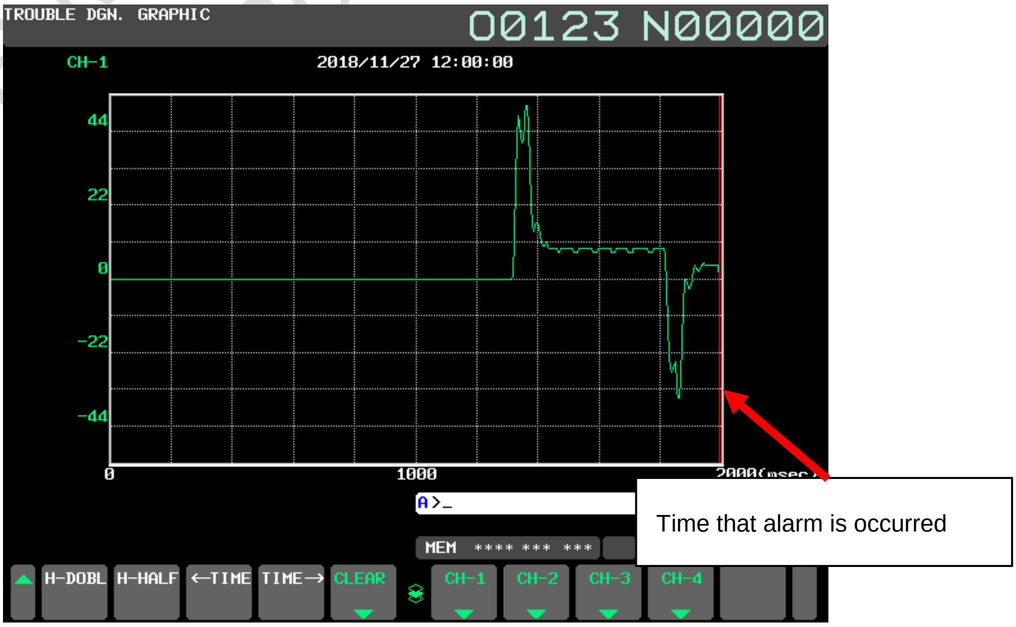

Fig.18.4.1 (i) Trouble diagnosis graphic screen (10.4-inch display unit)

Return to trouble diagnosis guidance screen, and press the soft key [NO], because it can be judged that the torque command doesn't vibrate from this graphical chart.
Trouble diagnosis guidance screen is displayed according to the following procedures.

1. Press return soft key [<].
2. Press soft key [GUIDE].

Fig.18.4.1 (j) Soft key to select trouble diagnosis guidance screen (10.4-inch display unit)

Press soft key [NO] after pressing the soft key [(OPRT)] on the trouble diagnosis guidance screen.

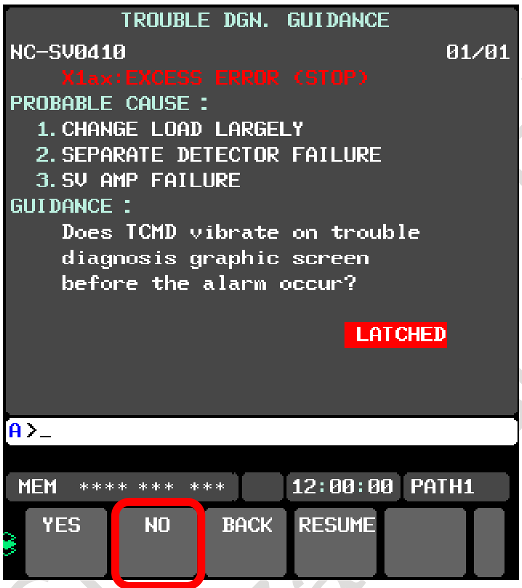

Fig.18.4.1 (k) Trouble diagnosis guidance screen (10.4-inch display unit)

When soft key [NO] is pressed, the following guidances are displayed.

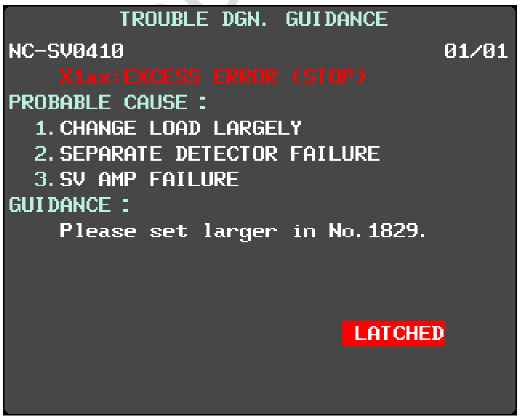

Fig.18.4.1 (l) Trouble diagnosis guidance screen (10.4-inch display unit)

The cause of the alarm is specified like this, and cope according to the content of the guidance.

18.4.2 Investigation procedure of cause of alarm occurrence

The cause of occurrence can be investigated according to the following procedures when Servo/Spindle alarms are occurred.

> **NOTE**
> Status display of the trouble diagnosis screen should be [SAMPLING] to diagnose it when the the servo alarm/spindle alarm is occurred.
> Change in the state of [SAMPLING] surely referring to "Clear of the preserved data" in Chapter 18.4.4 when status display is not [SAMPLING].

Investigation procedure (for 8.4/10.4-inch display unit)

Procedure

1. Press function key , and the message screen is displayed.
2. After pushing return soft key [<], press the continuous menu key  until soft key [GUIDE]/[MONIT]/[W.GRPH] appears.
3. Press soft key [GUIDE].
   The trouble diagnosis guidance screen is displayed.
   The guidance to specify the cause of the occurred alarm is displayed on the trouble diagnosis guidance screen.
   The cause of occurrence and the coping method of the alarm are displayed by answering in soft key [YES]/[NO] referring to servo/spindle monitor information on the trouble diagnosis monitor screen, the waveform data of the trouble diagnosis graphic screen, and the diagnosis screen, etc.

Investigation procedure (for 15/19-inch display unit)

Procedure

1. Press function key , and the message screen is displayed.
2. Press the vertical soft key [NEXT PAGE] until vertical soft key [GUIDE]/[MONIT]/[W.GRPH] appears.
3. Press the vertical soft key [GUIDE].
   The trouble diagnosis guidance screen is displayed.
   The guidance to specify the cause of the occurred alarm is displayed on the trouble diagnosis guidance screen.
   The cause of occurrence and the coping method of the alarm are displayed by answering in horizontal soft key [YES]/[NO] referring to servo/spindle monitor information on the trouble diagnosis monitor screen, the waveform data of the trouble diagnosis graphic screen, and the diagnosis screen, etc.

18.4.3 Trouble diagnosis guidance screen

Outline

The trouble diagnosis guidance screen displays the guidance message to specify the cause of an alarm. The cause of the alarm can be specified by confirmation/coping according to the guidance, and answering by soft key [YES]/[NO] in a short time.

Display procedure of trouble diagnosis guidance screen (for 8.4/10.4-inch display unit)

Procedure

1. Press function key .
2. Press the continuous menu key  until soft key [GUIDE] appears.
3. Press soft key [GUIDE]. The trouble diagnosis guidance screen is displayed as follows.

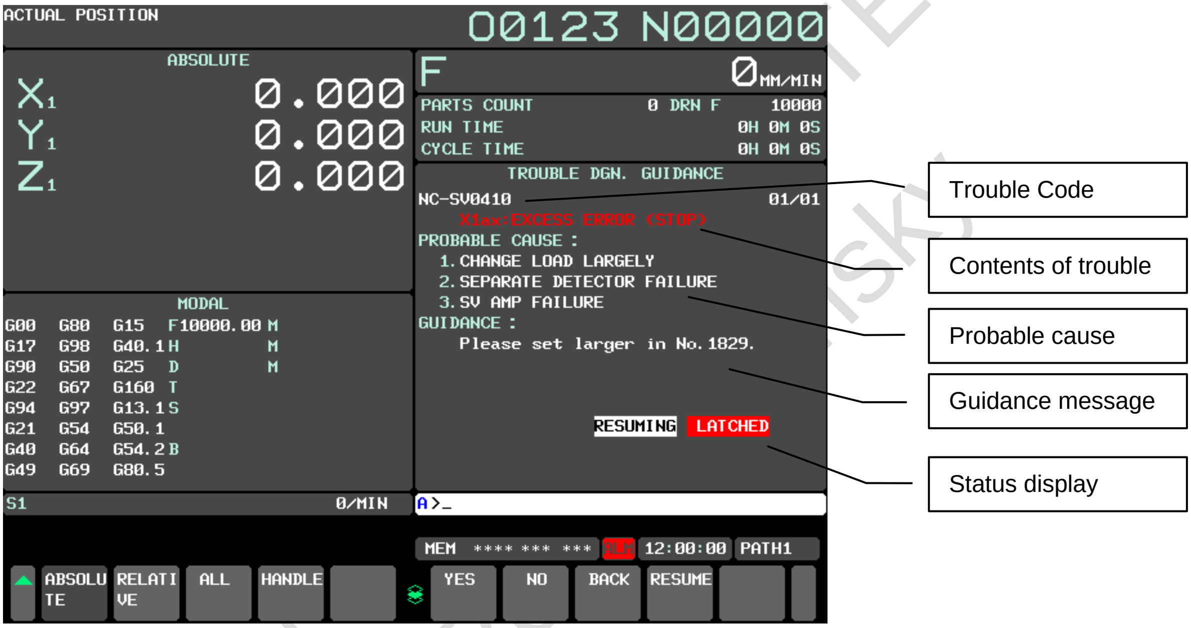

Fig.18.4.3 (a) Trouble diagnosis guidance screen (10.4-inch display unit)

Display procedure of trouble diagnosis guidance screen (for 15/19-inch display unit)

Procedure

1. Press function key .
2. Press the vertical soft key [NEXT PAGE] until vertical soft key [GUIDE] appears.
3. Press the vertical soft key [GUIDE]. The trouble diagnosis guidance screen is displayed.

Explanation

- Contents of Display

Trouble Code : "NC"-"Alarm type + alarm number" is displayed as code for identifying alarm.
Contents of Trouble : Alarm Message.
Probable Cause : Probable Cause of alarm.
Guidance message : Question to find the cause or answer to remove trouble is displayed.
Status display :

[RESUMING] :

When press soft key [RESUME] , the guidance message which was displayed before CNC power turned off is displayed again. Then [RESUMING] appears.

[SAMPLING] / [LATCHED] :

In CNC, there are two states in the state that the state (sampling state) to sample servo/spindle data whenever it usually operates and servo/spindle alarm are occurred and the sampling stops (preserved state). [SAMPLING] or [LATCHED] display show the two states.

The sampling of servo/spindle monitor data is stopped when the servo/spindle alarm is occurred, and the data when the alarm is occurred is kept in CNC.

It is automatically diagnosed that it switches to the trouble diagnosis guidance screen in [LATCHED] state after the alarm is occurred, and the diagnosis to servo/spindle alarm is displayed partially in CNC based on servo/spindle data when the alarm is occurred.

There is a possibility that a correct diagnosis cannot be done when the alarm number diagnosed on the trouble diagnosis guidance screen and the alarm number when monitor data was preserved when the alarm is occurred are different when the alarm is occurred next if the sampling is not begun. In this case, the display of [LATCHED] state blinks.

Clear the kept data on the screen of either the trouble diagnosis guidance screen, the trouble diagnosis monitor screen, or the trouble diagnosis graphic screen to begin the sampling again in preparation for the alarm occurred next after status display changes into [LATCHED] state once. after diagnosing the cause of occurrence and the corrective action of the alarm.

When the kept data is cleared, [LATCHED] state changes into [SAMPLING] state, and restarts the sampling of servo/spindle monitor data.

Operation

Press the soft key [(OPRT)] on the trouble diagnosis guidance screen. (Only for 8.4/10.4-inch display unit)

- Change of Guidance

Soft key [YES]/[NO] :

Check contents of guidance message, and, answer by pressing soft key [YES] or [NO]. Then the next guidance message is displayed.

In some cases CNC automatically checks and judges contents of guidance. In this case the next guidance message is automatically displayed.

Automatic diagnosis is not done in case that CNC power turns off once after servo /spindle monitor data is kept.

Soft key [BACK] :

Guidance message returns back 1 step.

It is possible to trace back the guidance message when soft key [YES]/[NO] is pressed by mistake.

Soft key [RESUME] :

Guidance message which was displayed before CNC power turned off is displayed again.

The diagnosis can be continued from the guidance displayed again.

However, it is not possible to go back to the step before the point where soft key [BACK] is pressed.

Status display “RESUMING” is displayed during the guidance that starts by pressing soft key [RESUME].

- Change of alarm

When several alarms occur in same time, pressing page key 

/ 
can select the guidance message.

18.4.4 Trouble diagnosis monitor screen

Outline

Trouble diagnosis monitor screen displays information when the alarm is occurred necessary to diagnose the servo/spindle alarm.

Servo/spindle monitor data on "1-4 immediately before occurrence of the alarm" for four samplings immediately before and "The latest alarm is occurred" can be displayed as data when the alarm is occurred.
Moreover, "Present" of servo/spindle monitor data when usually operating can be displayed.

Display procedure of trouble diagnosis monitor screen (for 8.4/10.4-inch display unit)

Procedure

1 Press function key [MESSAGE].

2 Press the continuous menu key [▷] until soft key [MONIT] appears.

3 Press soft key [MONIT].

The following screen is sample of displaying data of X axis (servo) when the alarm occurred.

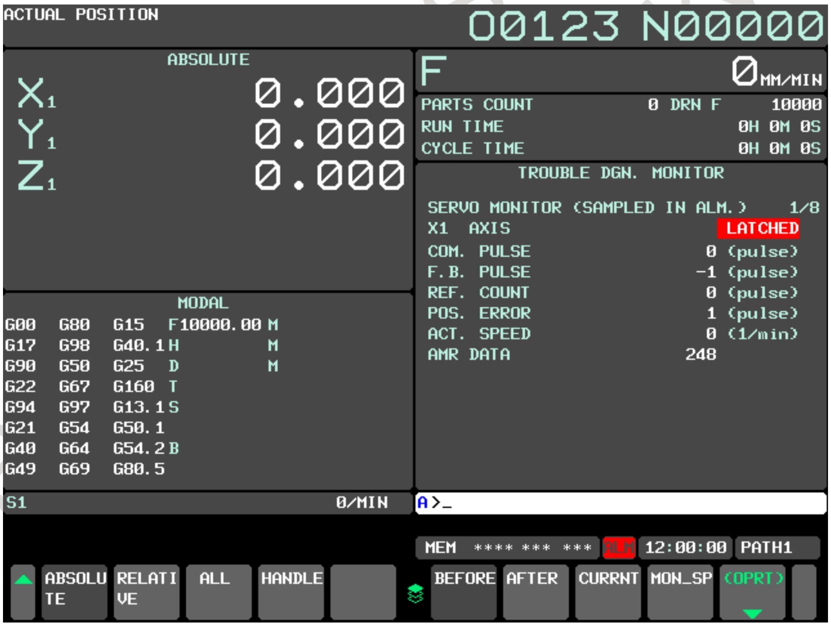

Fig.18.4.4 (a) Trouble diagnosis monitor screen (10.4-inch display unit)

4 The servo monitor data screen and the spindle monitor data screen can be switched by pushing soft key [MON_SP] / [MON_SV].

Display procedure of trouble diagnosis monitor screen (for 15/19-inch display unit)

Procedure

1 Press function key [MESSAGE].

2 Press the vertical soft key [NEXT PAGE] until vertical soft key [MONIT] appears.

3 Press the vertical soft key [MONIT].

4 The servo monitor data screen and the spindle monitor data screen can be switched by pushing the vertical soft key [MON_SP] / [MON_SV].

Explanation

- Data displayed in monitor Screen

Displayed data in monitor screen is showed below.

Table 18.4.4 (a) Data of servo motor

Data (Unit)	Data type	Display range	Data explanation	Page number
COMMAND PULSE (pulse)	2 Word	±99999999		1
F.B. PULSE (pulse)	2 Word	±99999999	(NOTE 3)	1
REF.COUNTER (pulse)	2 Word	±99999999		1
POS. ERROR (pulse)	2 Word	±99999999		1
ACTUAL SPEED (1/min)	Word	-32768 to +32767		1
AMR DATA	Word	0 to +255	Data of pole position of the rotor “256” shows 360 degree as electrical angle	1
TORQUE COMMAND (%)	Word	±400	Torque command. “100” shows maximum torque	2
EFFECTIVE CURRENT (%)	Word	±400	“100” shows maximum current of amplifier	2
MOTOR CURRENT (A)	Word	±4096		2
DISTURBANCE LEVEL (%)	Word	0 to +200	“100” shows the alarm level of Unexpected disturbance torque detection function	2
HEAT SIMULATION (%)	Word	0 to +100	“100” shows the alarm level of OVC alarm.	2

SV DATA 4	Word	-32768 to +32767	(Note2)	7 (NOTE 6)

NOTE

1 The data range shows the range in which a data can be monitored in this function. It doesn't show the system efficiency or rated value.
2 ARBITRARY DATA1,2 and SV DATA1-4 are used for service operation by FANUC.
3 The displayed values as Voltage, Current, Frequency, Resistance, and Temperature are approximate value and they have some error. If you want to know the precise values, measure them by exclusive equipments.
4 PS STATUS FLAG1-4 are used for service operation by FANUC.
5 FSSB ERROR and FSSB JITTER show the status of FSSB communication. They are used for service operation by FANUC.
6 These items are not displayed in the system of G321 and 31 G331.
7 These items are displayed on the 3 page in the system of G321 and G331.

SP DATA 4	Word	-32768 to +32767	(NOTE 4)	8 (NOTE 7)

NOTE

1 The data range shows the range in which a data can be monitored in this function. It doesn't show the system efficiency or rated value.

2 To display COMMAND SPEED and ACTUAL MOTOR SPEED, it's necessary to set following parameters.
- No.4020 : Maximum motor speed of main spindle
- No.4196 : Maximum motor speed of sub spindle (in case of using Spindle switching control)

3 The displayed values as Voltage, Current, Frequency, Resistance, and Temperature are approximate value and they have some error. If you want to know the precise values, measure them by exclusive equipments.

4 SP DATA1-4 are used for service operation by FANUC

5 PS STATUS FLAG1-4 are used for service operation by FANUC.

6 FSSB ERROR and FSSB JITTER show the status of FSSB communication. They are used for service operation by FANUC.

7 These items are not displayed in the system of G321 and G331.

Table 18.4.4 (c) Data of others

Data	Data form	Page number
The latest latch date	Year (Two last digits) / Month (Two digits) / Day (Two digits)	8 (servo), 9 (spindle)
The latest latch time	Hour (Two digits) / Minute (Two digits) / Second (Two digits)	
Executed file name at latched	Character	
Executed N number at latched	N+ number of five digits	

Operation

- Servo monitor data screen

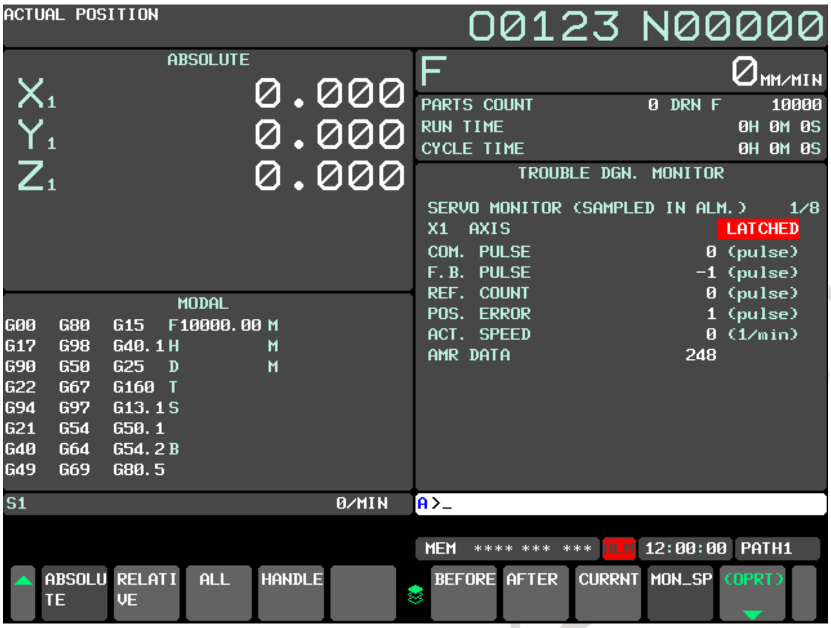

Fig.18.4.4 (b) Trouble diagnosis monitor screen (Servo monitor data) (10.4-inch display unit)

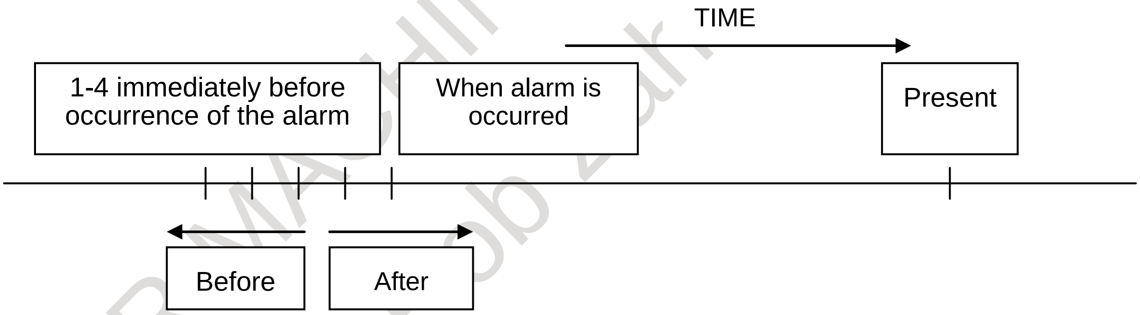
Servo monitor data can be selected by pressing soft key [NEW]/[CURRNT]/[BEFORE]/[AFTER].
Soft key [NEW] and [CURRNT] is displayed alternately.
Moreover, Soft key [BEFORE]/[AFTER] is displayed to press soft key [NEW], and if soft key [CURRNT] is pressed, it is not displayed.



Soft key [NEW]	: Servo monitor data when the alarm is occurred is displayed.
Soft key [CURRNT]	: Present servo monitor data is displayed.
Soft key [BEFORE]	: When the alarm is occurred and status display changes into [LATCHED] state, data before four samplings immediately before occurrence of the alarm is preserved in CNC. Preserved servo monitor data changes and is displayed by pressing this soft key as "SAMPLED IN ALM"→"BEFORE ALM 1"→"BEFORE ALM 2"→"BEFORE ALM 3"→"BEFORE ALM 4".
Soft key [AFTER]	: As well as the above operation, Preserved servo monitor data changes and is displayed by pressing this soft key as "BEFORE ALM 4"→"BEFORE ALM 3"→"BEFORE ALM 2"→"BEFORE ALM 1"→"SAMPLED IN ALM".
Soft key [MON_SP]	: Spindle monitor data screen is displayed.

NOTE

Monitor data of 1 - 4 samplings immediately before occurrence of the alarm is not displayed since 4 pages.

- Spindle monitor data screen

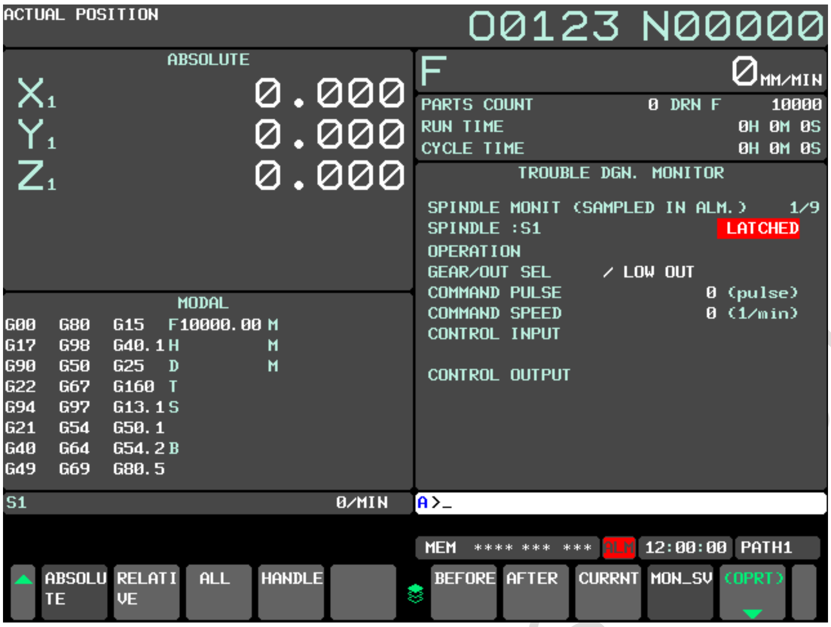


Fig.18.4.4 (c) Trouble diagnosis monitor screen (Spindle monitor data) (10.4-inch display unit)

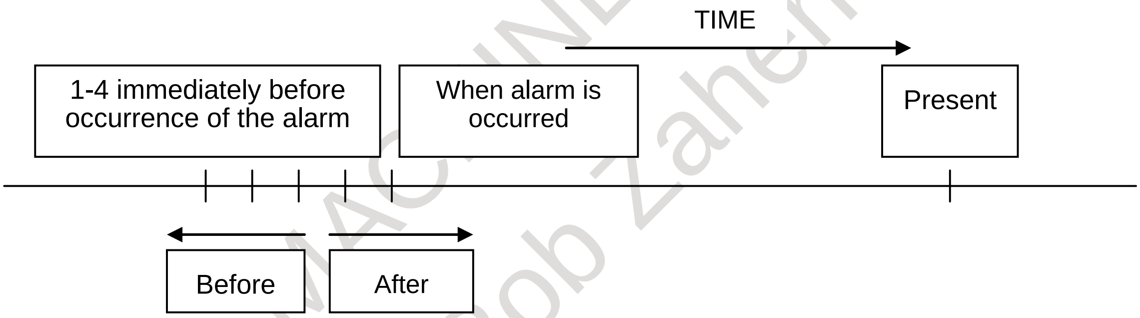
Spindle monitor data can be selected by pressing soft key [NEW]/[CURRNT]/[BEFORE]/[AFTER].
Soft key [NEW] and [CURRNT] is displayed alternately.
Moreover, Soft key [BEFORE]/[AFTER] is displayed to press soft key [NEW], and if soft key [CURRNT] is pressed, it is not displayed.



Soft key [NEW]	: Spindle monitor data when the alarm is occurred is displayed.
Soft key [CURRNT]	: Present Spindle monitor data is displayed.
Soft key [BEFORE]	: When the alarm is occurred and status display changes into [LATCHED] state, data before four samplings immediately before occurrence of the alarm is preserved in CNC. Preserved Spindle monitor data changes and is displayed by pressing this soft key as "SAMPLED IN ALM"→"BEFORE ALM 1"→"BEFORE ALM 2"→"BEFORE ALM 3"→"BEFORE ALM 4".
Soft key [AFTER]	: As well as the above operation, Preserved Spindle monitor data changes and is displayed by pressing this soft key as "BEFORE ALM 4"→"BEFORE ALM 3"→"BEFORE ALM 2"→"BEFORE ALM 1"→"SAMPLED IN ALM".
Soft key [MON_SV]	: Servo monitor data screen is displayed.

NOTE

Spindle monitor data that can the above operation is only an item from page 2 to page 3.
The value is displayed in the item on page 1 and since 4 pages of the spindle monitor data screen the value at present when status display is [SAMPLING], or the value at the alarm is occurred when status display is [LATCHED].

- Change of displayed page

Displayed page is switched by pressing page key  / .

- Change of displayed axis

Displayed axis is switched by pressing cursor key  / .

- Preservation of data when alarm is occurred

When status display is in the state of [SAMPLING], and servo alarm/spindle alarm is occurred newly, "Data at the latest alarm occurrence" and "Data of 1-4 immediately before occurrence of the alarm" of the alarm occurrence axis are preserved.
As a result, [SAMPLING] of status display on the right of the screen changes into [LATCHED].

> **NOTE**
> As for both servos and spindles, when the alarm as two or more axes at the same time is occurred, only the data of the axis of the least index of an axis is preserved.

- Clear of preserved data

After releasing all servo/spindle alarm, clear "Data at the latest alarm occurrence" and "Data of 1-4 immediately before occurrence of the alarm".
As a result, [LATCHED] of status display on the right of the screen changes into [SAMPLING]. Moreover, the waveform data (various data of each axis) displayed on the trouble diagnosis graphic screen is cleared at the same time.

Clear operation procedure of preserved data (for 8.4/10.4-inch display unit)

Procedure

1 The soft key display changes as follows if soft key [(OPER)] is pressed on the trouble diagnosis monitor screen, the trouble diagnosis graphic screen or the trouble diagnosis parameter screen.
(The below figure is a trouble diagnosis monitor screen.)

Fig.18.4.4 (d) Trouble diagnosis monitor screen (10.4-inch display unit)

2 Press the soft key [CLEAR].
The soft key display changes as follows.
Press the soft key [CAN] when you cancel the clear operation.

Fig.18.4.4 (e) Trouble diagnosis monitor screen (10.4-inch display unit)

3 Press the soft key [EXEC].
[LATCHED] of status display on the right of the screen changes into [SAMPLING]

Fig.18.4.4 (f) Trouble diagnosis monitor screen (10.4-inch display unit)

Clear operation procedure of preserved data (for 15/19-inch display unit)

Procedure

1. The horizontal soft key [CLEAR] deletion is displayed on the trouble diagnosis monitor screen, the trouble diagnosis graphic screen or the trouble diagnosis parameter screen.
2. Press the horizontal soft key [CLEAR].
   Press the horizontal soft key [CAN] when you cancel the clear operation.
3. Press the horizontal soft key [EXEC].
   [LATCHED] of status display on the right of the screen changes into [SAMPLING]

18.4.5 Trouble diagnosis graphic screen

Outline

The waveform data immediately before occurrence of the alarm necessary for the diagnosis when the servo alarm / spindle alarm is occurred is displayed.

Trouble diagnosis graphic screen

The servo data / spindle data for a few seconds immediately before occurrence of the alarm is displayed by waveform on the screen. The data of maximum 4 kinds can be displayed at the same time.
The displayed data is set on the trouble diagnosis parameter screen.

Display procedure of trouble diagnosis graphic screen (for 8.4/10.4-inch display unit)

Procedure

1. Press function key ? MESSAGE.
2. Press the continuous menu key until soft key [W.GRPH] appears.
3. Press soft key [W.GRPH].
4. Press soft key [G-ADJ.].

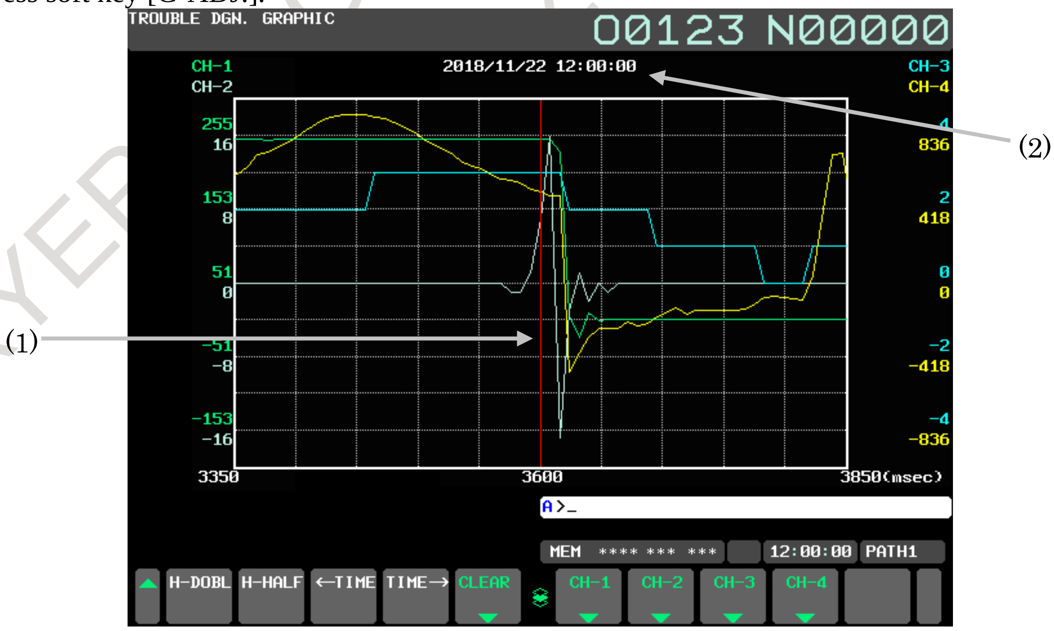


Fig.18.4.5 (a) Trouble diagnosis graphic screen (10.4-inch display unit)

- Contents of display

(1) Red vertical line shows the position (time) in which the alarm is occurred..
(2) The date when the alarm was occurred is displayed.

Display procedure of trouble diagnosis graphic screen (for 15/19-inch display unit)

Procedure

1 Press function key [?MESSAGE].
2 Press the vertical soft key [NEXT PAGE] until vertical soft key [W.GRPH] appears.
3 Press the vertical soft key [W.GRPH].
4 Press the vertical soft key [G-ADJ.].

Operation

- Change of position and magnification

When Soft key [G-ADJ.] is pressed, the following soft keys appear.

```
[<] [W.PRM ] [G-ADJ.] [TRB_LV] [      ] [(OPRT)] [  ]

[<] [H-DOBL] [H-HALF] [←TIME]  [TIME→] [      ] [+]

[<] [ CH-1 ] [ CH-2 ] [ CH-3 ] [ CH-4 ] [      ] [+]

[<] [WAV.EX] [WAV.RE] [WAV.↑]  [WAV.↓] [      ] [  ]
```

Soft key [H-DOBL]	: The length of the time base is expanded.
Soft key [H-HALF]	: The length of the time base is reduced.
Soft key [TIME←]	: The time base is moved to the left side.
Soft key [TIME→]	: The time base is moved to the right side.
Soft key [CH-1]	: The operation to the waveform of channel 1 is selected.
Soft key [CH-2]	: The operation to the waveform of channel 2 is selected.
Soft key [CH-3]	: The operation to the waveform of channel 3 is selected.
Soft key [CH-4]	: The operation to the waveform of channel 4 is selected.
Soft key [WAV.EX]	: The length of the spindle is expanded to the selected waveform.
Soft key [WAV.RE]	: The length of the spindle is reduced to the selected waveform.
Soft key [WAV.↑]	: The selected waveform is moved for above.
Soft key [WAV.↓]	: The selected waveform is moved below.

The time scale is a common scale for the channel 1,2,3 and 4.
The position and magnification of the height scale can be set for each channel.

Parameter setting for waveform display on the trouble diagnosis graphic screen

The data kind and the data unit of the waveform data displayed on the trouble diagnosis graphic screen are displayed and set on the trouble diagnosis parameter screen.

Display procedure of trouble diagnosis parameter screen (for 8.4/10.4-inch display unit)

Procedure

1. Press function key [MESSAGE].
2. Press the continuous menu key [▷] until soft key [W.GRPH] appears.
3. Press soft key [W.GRPH].
4. Press soft key [W.PRM].

Fig. 18.4.5 (b) Trouble diagnosis parameter screen (10.4-inch display unit)

Display procedure of trouble diagnosis parameter screen (for 15/19-inch display unit)

Procedure

1. Press function key [MESSAGE].
2. Press the vertical soft key [NEXT PAGE] until vertical soft key [W.GRPH] appears.
3. Press the vertical soft key [W.GRPH].
4. Press the vertical soft key [W.PRM].

Explanation

- Contents of display

CHANNEL :

Channel for waveform display. Maximum 4 channels can be used. Set data from the first channel sequentially.

AXIS :

Axis for waveform display. Manual setting is available. In some cases Axis data is set automatically for diagnosis in trouble diagnosis guidance screen.

DATA KIND :

Data kind for waveform display. Manual setting is available. In some cases data kind is set automatically for diagnosis in trouble diagnosis guidance screen.

DATA UNIT :

Unit of display data. This data is set automatically according to data kind. Manual setting is invalid.

FORECAST LV :

This data decides boundary value to output trouble forecast signal. Manual setting is available.

Guidance of setting each item :

The guidance to the above setting each item is displayed.

Operation

- Data Setting

1 Move cursor by Cursor key to the setting item.

2 Input number by MDI key and press input key 
to set data.

The content of the following each items can be input by the above operation.

AXIS :

In case of servo axis, input control axis number.
(Example) Set "1" for first servo axis.
In case of spindle axis, input "100 + spindle number".
(Example) Set "101" for first spindle axis.

> **NOTE**
> Set the index of an axis in the path system to the control axis number and the control spindle number for the multi path system.

DATA KIND :

Input data number value according to the following table.

Table 18.4.5 (a) Data of Servo motor

Data number	Data kind
1	Accumulated command pulse (pulse)
2	Accumulated feedback pulse (pulse)
3	Position error (pulse)
4	Reference counter (pulse)
5	Actual speed (1/min)
6	Command current (%)
7	Thermal simulation data (%)
8	Torque (%)

Data number	Data kind
9	Disturbance level (%)
10	Optional data
11	R-phase current (%)
12	Effective current (%)
13	Pulse coder AMR data
14	Optional data 2
20	SV U CURRENT (A)
21	SV V CURRENT (A)
22	PS L1-L2 VOLT. (V) (NOTE 3)
23	PS L2-L3 VOLT. (V) (NOTE 3)
24	PS L3-L1 VOLT. (V) (NOTE 3)
25	PS L1 CURRENT (A) (NOTE 3)
26	PS L2 CURRENT (A) (NOTE 3)
27	PS L3 CURRENT (A) (NOTE 3)
28	PS DC LINK VOLT. (V) (NOTE 3)

Table 18.4.5 (b) Data of Spindle motor

Data number	Data
15	Actual speed (1/min)
16	Load meter (%)
17	Position error (pulse)
18	Actual speed (1/min)/(80msec)
19	Load meter (%)/(80msec)
30	SP U CURRENT (A)
31	SP V CURRENT (A)
32	PS L1-L2 VOLT. (V) (NOTE 3)
33	PS L2-L3 VOLT. (V) (NOTE 3)
34	PS L3-L1 VOLT. (V) (NOTE 3)
35	PS L1 CURRENT (A) (NOTE 3)
36	PS L2 CURRENT (A) (NOTE 3)
37	PS L3 CURRENT (A) (NOTE 3)
38	PS DC LINK VOLT. (V) (NOTE 3)

NOTE

1 Each data kind is classified as follows as the combination to which the waveforms can be displayed at the same time.
- Data number :1 – 17
- Data number :18, 19
- Data number :20, 21, 30, 31
- Data number :22 - 28, 32 – 38

Therefore, if the values other than the same combination as the data kind of another channel are set when the data number is input to the data kind, Warning "DATA SETTING ERROR" is displayed.

2 The emergency must stop when the set point displays the data kind of waveforms of 20 or more number.

3 The displayed values as Voltage and Current are approximate value and they have some error. If you want to know the precise values, measure them by exclusive equipments.

18.4.6 Trouble forecast level setting screen

Trouble forecast level of the servo motor is set in this screen.
The breakdown level at the thermal simulation and disturbance level can be set.

Explanation

Thermal simulation

The calorific value of the motor and the amplifier is simulated based on a real current of the servo motor. The alarm of "SOFTTHERMAL(OVC)" is occurred so that the motor or the amplifier might cause over heat when this thermal simulation data reaches 100%.
Data value increases in the following cases.

1) Operating that frequency of acceleration and deceleration is high.
2) Operating to which state with very large cutting load continues.
3) The machine did not work according to the instruction though the motor output a full torque by the contact etc. of the machine and work.

Disturbance level

The disturbance level shows the torque that the motor receives from the machine excluding the torque to accelerate/decelerate the motor and the machine inertia in the output torque of the motor.

1) The machine came in contact with work.
2) The cutting load has increased.

An increase in these values is observed by this function, and warning can be occurred before the accident to the machine and occurrence of the alarm.

Display procedure of trouble forecast level setting screen (for 8.4/10.4-inch display unit)

Procedure

1 Press function key [MESSAGE].
2 Press the continuous menu key [▷] until soft key [W.GRPH] appears.
3 Press soft key [W.GRPH].
4 Press soft key [TRB LV].

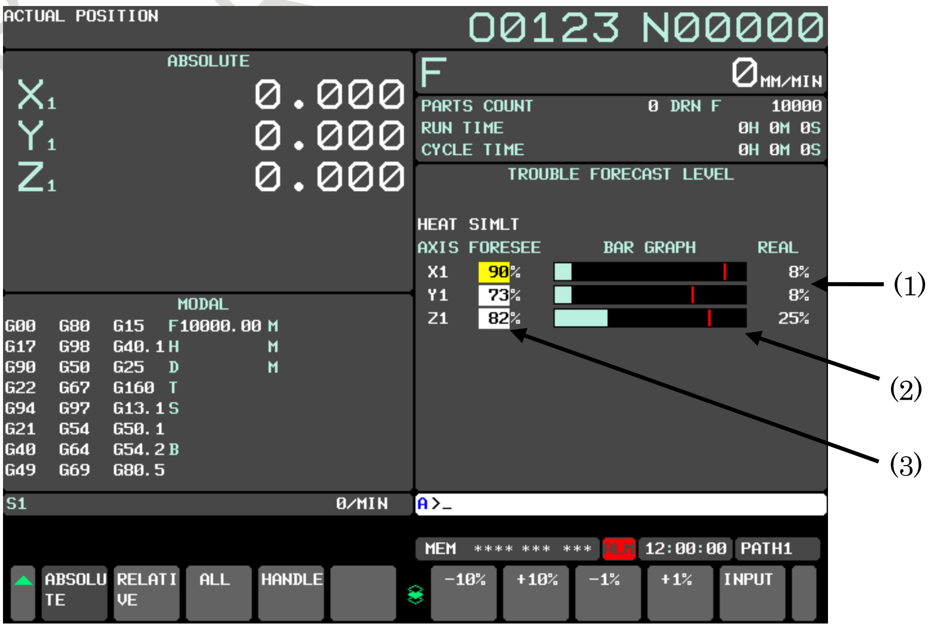

Fig.18.4.6 (a) Trouble forecast level setting screen (10.4-inch display unit)

- Contents of display

(1) Current value of thermal simulation/disturbance level is displayed with sign.

(2) Current value of thermal simulation or disturbance level is displayed by bar graphic.
Light Blue part : Current value of thermal simulation/disturbance level.
Red part : Trouble forecast level.

(3) Trouble forecast level.
The negative value is converted into the absolute value and a positive value is displayed.

Display procedure of trouble forecast level setting screen (for 15/19-inch display unit)

Procedure

1 Press function key .
2 Press the vertical soft key [NEXT PAGE] until vertical soft key [W.GRPH] appears.
3 Press the vertical soft key [W.GRPH].
4 Press the vertical soft key [TRB LV].

Operation

- Setting trouble forecast level

1 Select thermal simulation or disturbance level by page keys / .

2 Select axis by cursor keys / .

3 Input numerical value by MDI key and press input key or soft key [INPUT].

Trouble forecast level is input into parameter No.8860 and 8861.

- Change of trouble forecast level

When Soft key [TRB LV] is pressed, the following soft keys appear.

```
[<] [W.PRM ] [G-ADJ.] [TRB LV] [      ] [(OPRT)] [ ]
[<] [-10% ]  [+10% ]  [ -1% ]  [ +1% ]  [INPUT ] [ ]
```

Soft key [-10%]	: Subtract 10% from trouble forecast level.
Soft key [+10%]	: Add 10% to trouble forecast level.
Soft key [-1%]	: Subtract 1% from trouble forecast level.
Soft key [+1%]	: Add 1% to trouble forecast level.
Soft key [INPUT]	: Input trouble forecast level by MDI key.

- Trouble forecast signal

When thermal simulation or disturbance level of servo axis exceeds trouble forecast level, trouble forecast signal TDSML1 - 8 (Fn298)/ TDFTR1 - 8 (Fn299) is output.
Parameters TRSx (bit 0 of parameter No. 8855) / TRFx (bit 1 of parameter No. 8855) need to be set to 1 to perform the trouble forecast.

- Setting of trouble forecast level on the trouble diagnosis parameter screen

The trouble forecast level can be set even on the trouble diagnosis parameter screen.

1. The trouble diagnosis parameter screen is displayed.
2. The cursor is moved to the item set with the cursor key.
3. The axis is set to the servo axis.
4. The data kind is set at thermal simulation (7) or disturbance level (9).
5. Because the editing box next to "FORECAST LV" can be edited, the trouble forecast level that wants to be set to the axis is input.

Fig.18.4.6 (b) Setting of trouble forecast level on the trouble diagnosis parameter screen

18.4.7 Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
8850								MDG

[Input type] Parameter input
[Data type] Bit

#0 MDG Trouble diagnosis function is:
0: Available.
1: Not available.

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

	#7	#6	#5	#4	#3	#2	#1	#0
8855							TRFx	TRSx

[Input type] Parameter input
[Data type] Bit axis

#0 TRSx In Trouble diagnosis function, trouble forecast of thermal simulation of servo axis is:
0: Not available.
1: Available. (Set the trouble forecast level to parameter No.8860.)

#1 TRFx In Trouble diagnosis function, trouble forecast of disturbance level of servo axis is:
0: Not available.
1: Available. (Set the trouble forecast level to parameter No.8861.)

8860	Trouble forecast level for thermal simulation

[Input type] Parameter input
[Data type] Word axis
[Unit of data] %
[Valid data range] 0 to 100
In Trouble diagnosis function, trouble forecast level for thermal simulation is set.

8861	Trouble forecast level for disturbance level

[Input type] Parameter input
[Data type] Word axis
[Unit of data] %
[Valid data range] 0 to 100
In Trouble diagnosis function, trouble forecast level for disturbance level is set.

18.4.8 Signal

Trouble forecast signals for thermal simulation TDSML1 - TDSML8 <Fn298>

[Classification] Output signal
[Function] The thermal simulation data is notified to exceed the trouble forecast level.
[Output condition] When the thermal simulation data of servo is a value that is bigger than the trouble forecast level, this signal is "1".

Trouble forecast signals for disturbance level TDFTR1 - TDFTR8 <Fn299>

[Classification] Output signal
[Function] The disturbance level is notified to exceed the trouble forecast level.
[Output condition] When the disturbance level of servo is a value that is bigger than the trouble forecast level, this signal is "1".

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn298	TDSML8	TDSML7	TDSML6	TDSML5	TDSML4	TDSML3	TDSML2	TDSML1

	#7	#6	#5	#4	#3	#2	#1	#0
Fn299	TDFTR8	TDFTR7	TDFTR6	TDFTR5	TDFTR4	TDFTR3	TDFTR2	TDFTR1

18.4.9 Restrictions

- The use of the I/O Link β*i* amplifier

The alarm occurred by the motor with the I/O Link β*i* amplifier cannot be diagnosed.

- Using with waveform diagnosis display function together

When data of the machine signal or the servo/spindle are traced by waveform diagnosis display function, the waveform data displayed on the trouble diagnosis graphic screen is not sampled.

- This function on the NC Guide / NC Guide Pro

This function is a not available on the NC Guide / NC Guide Pro.

- The use of the servo guide

When the servo guide is used for the condition of either the following, spindle monitor data on the trouble diagnosis monitor screen and the spindle data of the trouble diagnosis graphic screen are not correctly displayed.

- When CNC systems of G321 or G331 are used.

18.5 MACHINE ALARM DIAGNOSIS

18.5.1 Outline

It is necessary to notify the operator by the alarm display and warning message in the machine tool when a peculiar problem to the machine such as the tool breakage and coolant shortage occurs.
The machine tool builder customizes by using the external alarm, the macro alarm, and the operator message function and a peculiar alarm and message to such a machine can be displayed.
In this function, the diagnostic information to specify the factor in addition can be added to the alarm and the message that the machine tool builder customized.
When a peculiar alarm to the machine etc. are occurred, the added diagnostic information is displayed on the guidance screen of the trouble diagnosis function and can be used to specify the cause.

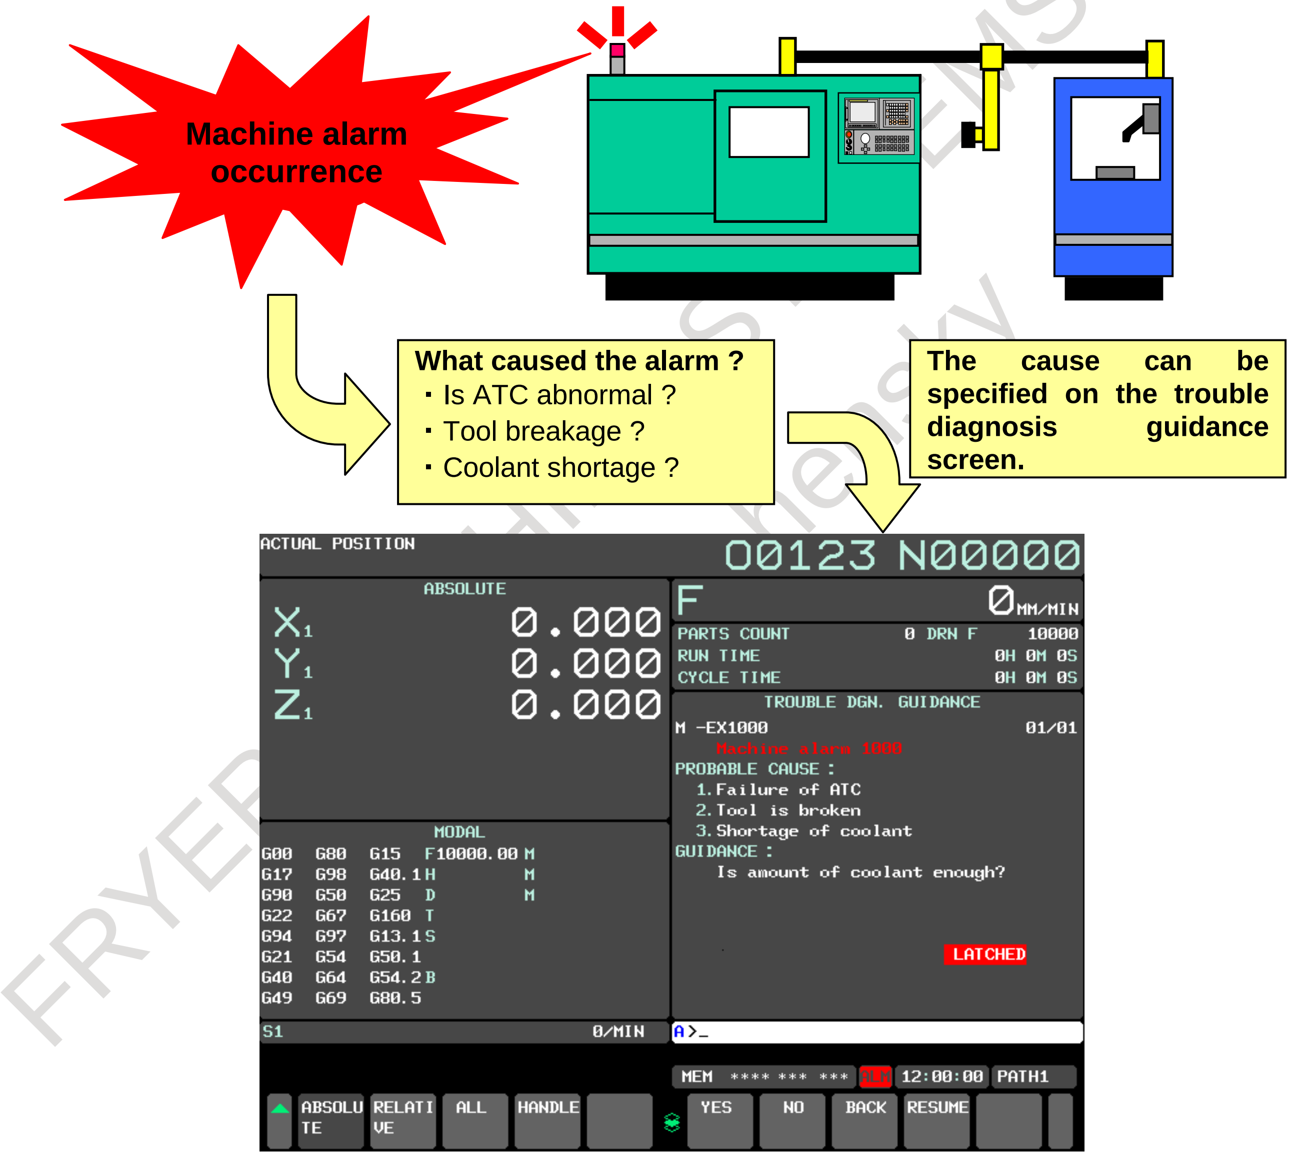

Fig.18.5.1 (a) Trouble diagnosis guidance screen (10.4-inch)

To add the diagnostic information on the screen, make the diagnostic message data to be displayed and convert it the memory card format file that can be read by CNC by using the PC tool "Guidance table for machine alarm diagnosis".
After the file is loaded into CNC, the additional diagnostic information can be displayed on the screen.

18.5.2 Additional alarm and operator message

The alarm and the operator message on the machine side that can be added to the trouble diagnosis message are as follows.

1. External alarm
2. Macro alarm
3. External operator message

18.5.3 Diagnosis Number

In the alarm and the operator message on the machine side, the alarm number and message number that can be diagnosed in the trouble diagnosis guidance screen are as follows.

1. External alarm

Table 18.5.3 (a) Available diagnosis alarm number (External alarm)

	Parameter EXA(No.6301#0)	
	=0	=1
Alarm number	1000 to 1999	0 to 4095

2. Macro alarm

Table 18.5.3 (b) Available diagnosis alarm number (Macro alarm)

	Parameter MCA(No.6008#1)	
	=0	=1
Alarm number	3000 to 3200	0 to 4095

3. External operator message

Table 18.5.3 (c) Available diagnosis message number (External operator message)

	Parameter EXM(No.6301#1)	
	=0	=1
Message number	2000 to 2999	0 to 4095

NOTE

1 Available diagnosis message number in the external operator message is a number according to the setting of parameter No.6310.

2 The above available diagnosis number is a range of the number displayed on the CNC screen, and it is different from the number actually set by the each function. Refer to the following manuals for the number actually set by the each function.
   - External alarm / External operator message
     Series 30*i*/31*i*/32*i*/35*i*-B PMC PROGRAMMING MANUAL (B-64513EN) ”INSTRUCTIONS RELATED TO CNC FUNCTIONS”
   - Macro alarm
     Series 0*i*-MODEL F Plus USER’S MANUAL (Common to Lathe System/Machining Center System) (B-64694EN) “CUSTOM MACRO“

18.5.4 Environment for Making Trouble Diagnosis Message

The following operating environment and the PC tool "Guidance table for machine alarm diagnosis" are necessary to make the trouble diagnosis message displayed on trouble diagnosis guidance screen.
Prepare the personal computer as follows, and install this tool according to the next chapter.

- Operating environment

Operating system	Microsoft® Windows® XP Professional or Microsoft® Windows Vista® Business
Memory	Windows® XP : More than 512M bytes Windows Vista® : More than 1G bytes
Free space in hard disk	More than 128M bytes
Necessary equipment	PC card adapter
Necessary application	Microsoft® Excel® 2007

* Microsoft, Windows, Windows Vista and Excel are the registered trademarks of Microsoft corporation in USA.

> **NOTE**
> "Guidance table for machine alarm diagnosis" is not included in the "machine alarm diagnosis function".
> Purchase "Guidance table for machine alarm diagnosis" CD (A08B-9010-J523#ZZ11) additionally.

18.5.5 Guidance Table for Machine Alarm Diagnosis

This tool is used to make the trouble diagnosis message displayed on the trouble diagnosis guidance screen.
Install this tool in the personal computer according to the following procedures, and make the trouble diagnosis message.

18.5.5.1 Install

The installation procedure of this tool is as follows:

1 Run setup.exe in the install CD (A08B-9010-J523#ZZ11).
2 In the following setup dialog box, set an appropriate installation folder and press the <Next> button.

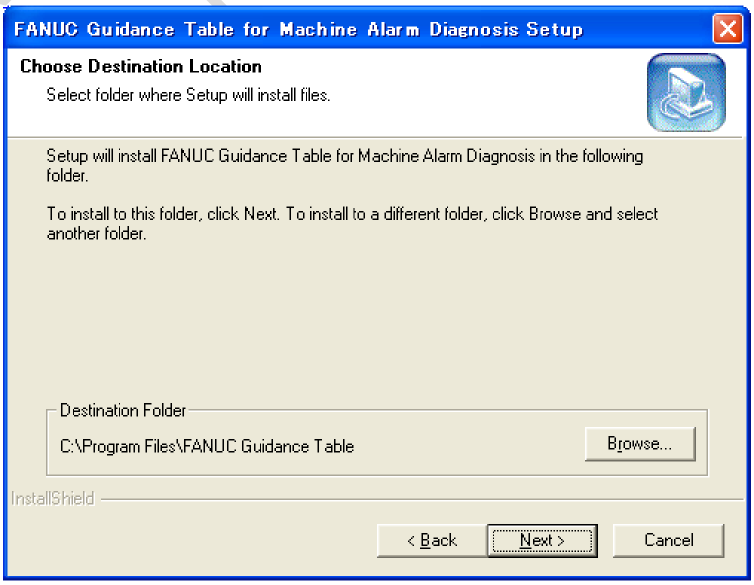

Fig. 18.5.5.1 (a)

NOTE
By pressing the <Browse> button, the installation folder can be changed.

3 By pressing the <Next> button in the dialog box for the confirmation of install, the installation will be started.
4 After the installation is finished normally, a message box to show the finish of the installation appears and "FANUC Guidance Table" is added in the Windows start menu.

18.5.5.2 Uninstall

The uninstall procedure of this tool is as follows:

1 Open the Windows control panel.
2 In the control panel, open the [Add or Remove Programs] and select "FANUC Guidance Table for Machine Alarm Diagnosis" from the currently installed programs.

NOTE
Open the [Programs and Features] in Windows Vista.

3 By pressing the <Remove (or Uninstall)> button, a message box for the confirmation of uninstall appears. By pressing the <Yes> button, this tool will be uninstalled.

18.5.5.3 Making a file to input trouble diagnosis messages

Making a Excel file in which trouble diagnosis messages are input is as follows:

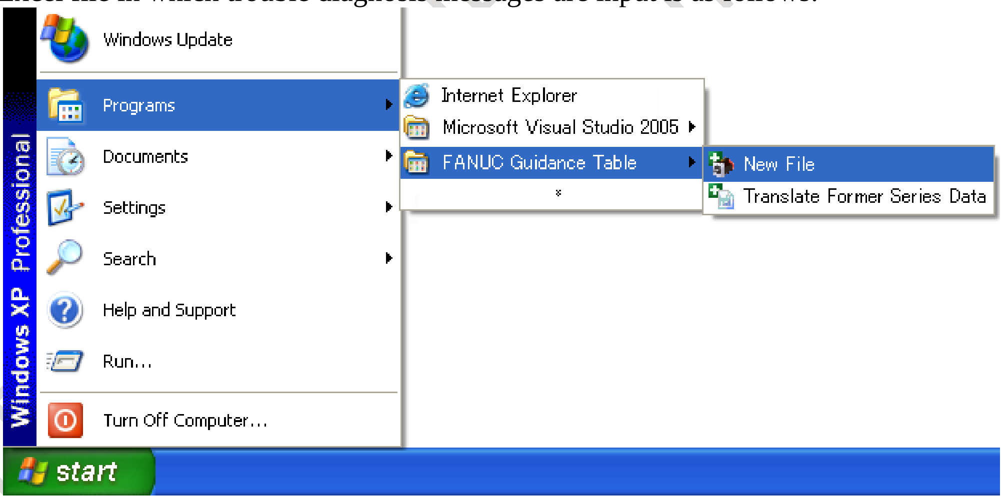

Fig. 18.5.5.3 (a)

1 Select [Program]→[FANUC Guidance Table]→[New File] in the Windows start menu, then the "New File" dialog box will be displayed.

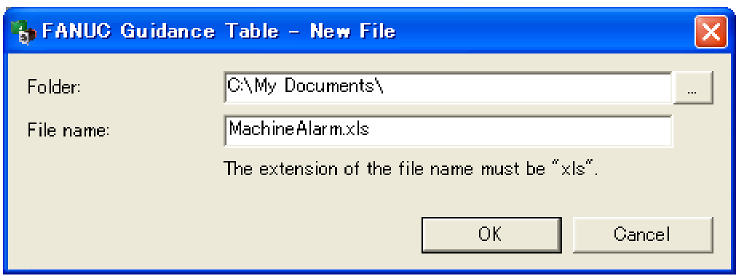

Fig. 18.5.5.3 (b)

2 In the following dialog box, input a destination folder and file name of the Excel file to be made.

NOTE

1 The extension of the file name must be "xls" (Excel book format). Any other extension is ignored and it is changed to "xls".

2 When making a new file is failed, the message box "A trouble diagnosis message file cannot be made." is displayed with one of the following messages about the cause of that failure.

- The specified file name is not correct.
- The specified file has already existed.
- (Destination folder) is not found.
- Files in (destination folder) cannot be written.
- The disk space in (destination folder) is not enough to make a new file.

3 Click the [OK] button, a Excel file will be made as the specified name in the specified folder.

The trouble diagnosis messages can be input by opening the new Excel file.

18.5.5.4 Structure of the file to input trouble diagnosis messages

Three are 2 sheets in the Excel file to input the trouble diagnosis messages.

- [Overall] sheet ・・・The sheet for overall operations and settings
- [Guidance] sheet ・・・The sheet for inputting message strings

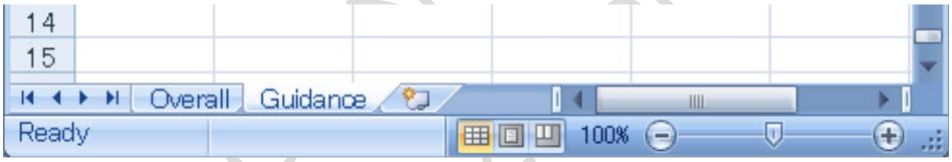

Fig.18.5.5.4 (a)

- Structure of [Overall] sheet

In the [Overall] sheet, you can make the trouble diagnosis messages by using the following operation buttons from (1) to (3).
And, you can switch the display language in sheets and change the settings for multi-languages.

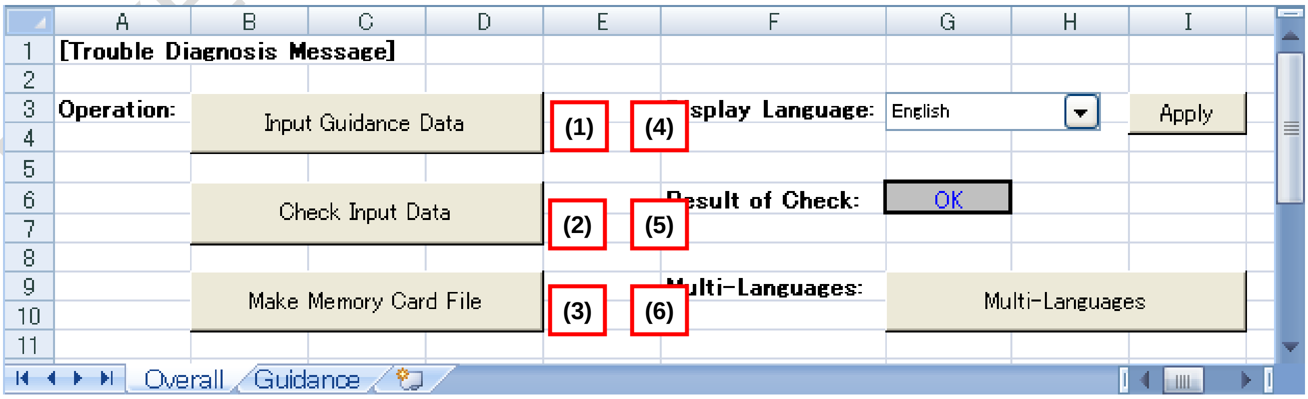

Fig.18.5.5.4 (b)

- Overview for each items

Item	Name	Description	Reference
(1)	Input Guidance Data	Displays the [Guidance] sheet to input the trouble diagnosis messages.	Chapter 18.5.6.1
(2)	Check Input Data	Checks all input data on the [Guidance] sheet as to checking for the range of number, the invalid letter and so on.	Chapter 18.5.6.2
(3)	Make Memory Card File	Makes a CNC readable memory card format file from input data in the [Guidance] sheet.	Chapter 18.5.6.3
(4)	Display Language	Switches the display language for sheets by selecting a language and pressing the [Apply] button. Either Japanese or English can be selected.	—
(5)	Result of Check	Displays the result of check for all input data.	Chapter 18.5.6.2
(6)	Multi-Languages	Changes the settings to input messages for multi-languages.	Chapter 18.5.7

- Structure of [Guidance] sheet

In the guidance sheet, you can input numbers and messages for each alarm or operator message.

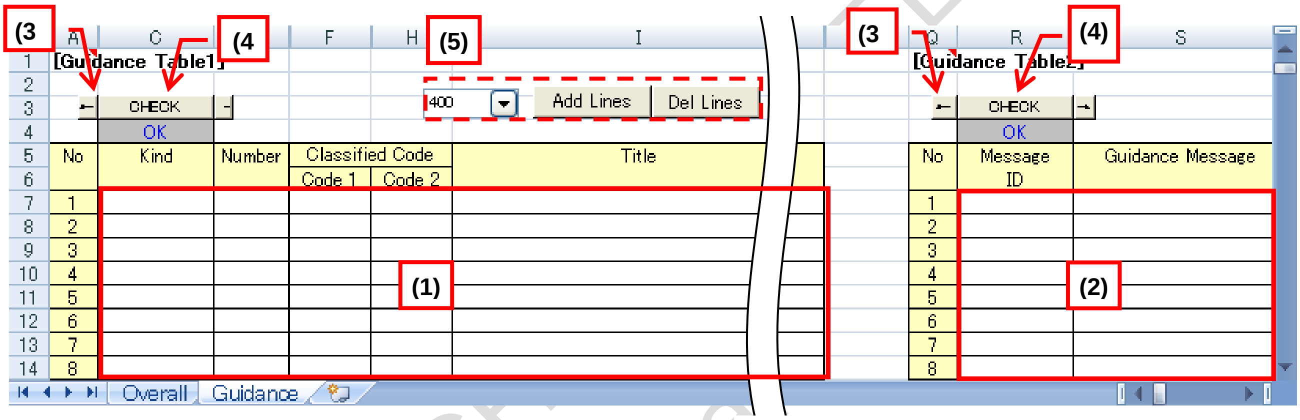

Fig.18.5.5.4 (c)

- Overview for each items

Item	Name	Description	Reference
(1)	Guidance Table 1	The table to input numbers and titles for alarm or operator message.	Chapter 18.5.6.1
(2)	Guidance Table 2	The table to input questions and instructions to an operator for alarm or operator message.	Chapter 18.5.6.1
(3)	Jump to Page	Switches the display between the guidance table 1 and 2.	—
(4)	Check Input Data	Checks input data for each guidance table.	Chapter 18.5.6.2
(5)	Set Line Number	Adds or deletes lines by a number specified in the combo box at the bottom of the guidance table 1 or 2. Note that all line number in the guidance table is from the minimum 30 to the maximum 2000.	—

18.5.6 Making Trouble Diagnosis Messages

Make the trouble diagnosis messages by using the following operation buttons in order from (1) to (3) on the [Overall] sheet.
The brief of making procedure is as follows:

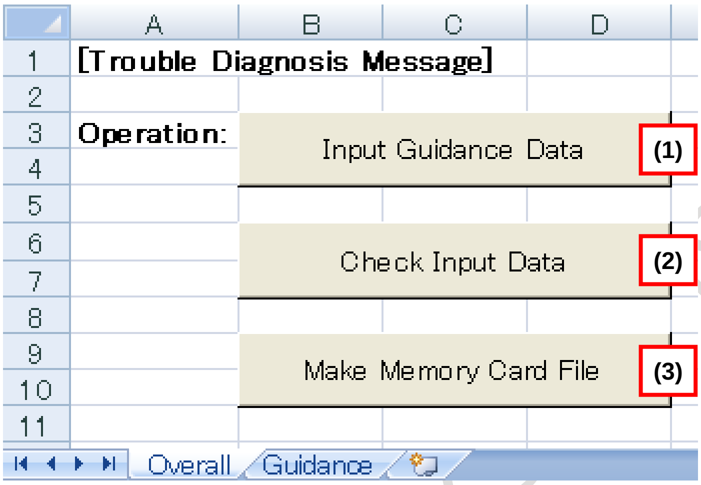

Fig. 18.5.6 (a)

(1) Input Guidance Data
Displays the [Guidance] sheet to input trouble diagnosis messages.
(2) Check Input Data
Checks all input data on the [Guidance] sheet

(3) Make Memory Card File
Makes a memory card format file from input data in the [Guidance] sheet.

The details for each operation are as follows:

18.5.6.1 Input Guidance Data

By clicking the [Input Guidance Data] button on the [Overall] sheet, the [Guidance] sheet will be displayed.
Input data on the guidance table 1 and 2 according to the descriptions of the next section.
The data that is input on each guidance table is displayed on the trouble diagnosis guidance screen as the following figure.

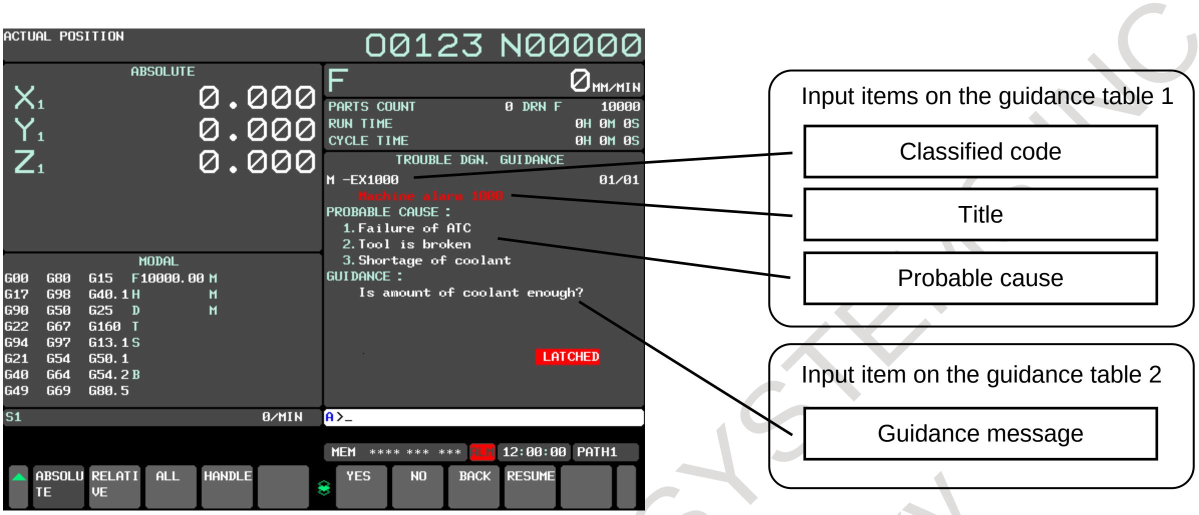

Fig. 18.5.6.1 (a)

Table 18.5.6.1 (a) Display item of trouble diagnosis guidance screen

Display Item	Description
Classified code	Classified code and number for the current alarm or operator message
Title	Title for the current alarm or operator message
Probable cause	Cause of the current alarm or operator message
Guidance message	Confirmation to determine cause of an alarm, or an instruction about an operator message

> **NOTE**
> The character that can be displayed on the CNC screen can be used for each display item. As for details, refer the following manuals.
> Series 0*i*-MODEL F Plus USER’S MANUAL (Common to Lathe System/Machining Center System) (B-64694EN)
> “APPENDIX F. CHARACTER-TO-CODES CORRESPONDENCE TABLE “

- About input data in the guidance table 1

No	Kind	Number	Classified Code		Title	Probable Cause			Message ID	Additional Information (Reserved)
			Code 1	Code 2		First Line	Second Line	Third Line		
1										
2	(1)	(2)	(3)		(4)		(5)		(6)	(7)
3										

Table 18.5.6.1 (b) Description of items in the guidance table 1

Item	Description	Content of item	Num. of letters
(1)	Kind	Input a kind for an external alarm, a macro alarm or an operator message. Specify one of the following strings. EX : External alarm MC : Macro alarm OP : External operator message **NOTE** If a kind other than above is input, checking input data is failed.	2 English capital letters
(2)	Number	Input a number for an external alarm, a macro alarm or an operator message.	Within 4 digits
(3)	Classified Code	Input 2 types of code, "Code 1" and "Code 2". "Code 1 – Code 2" is displayed at the first line on the trouble diagnosis guidance screen.	
		Code 1: Input a classified code for an alarm or an operator message.	Within 2 letters (1 in multi-bytes letters)
		Code 2: Input a number for an alarm or an operator messages.	Within 16 letters (8 in multi-bytes letters)
		NOTE 1 It is not necessary to make each classified code to be the same as (1)kind and (2)number. 2 A character string "NC" is reserved as the code 1 of CNC alarm. Do not use "NC" as the code 1.	
(4)	Title	Input a string displayed at the second line on the trouble diagnosis guidance screen.	Within 32 letters (16 in multi-bytes letters)
(5)	Probable Cause	Input a string displayed at the "Probable cause" part on the trouble diagnosis guidance screen.	Within 32 letters (16 in multi-bytes letters) per line (maximum 3 lines)
(6)	Message ID	Input an ID of a message displayed on the "Guidance Message" part of the trouble diagnosis guidance screen at first when an alarm occurs. Ex. The first guidance message for the external alarm message alarm No.1000 : EX1000A **NOTE** As for the message ID, see the description of the next description " About input data in the guidance table 2".	Within 8 letters (English capital and numerical letters)
(7)	Additional information (Reserved)	Do not input in the item.	

- About input data in the guidance table 2

No	Message ID	Guidance Message	Next Message ID		Notes
			YES	NO	
1					
2	(1)	(2)	(3)		(4)
3					

Table 18.5.6.1 (c) Description of items in the guidance table 2

Item	Description	Content of item	Num. of letters
(1)	Message ID	It is a string to identify to one of the guidance messages in (2). Ex.1. The first message ID for the external alarm No.1000 : EX1000A Ex.2. The second message ID for the external alarm No.1000 : EX1000B **NOTE** The character string that starts by "M"+"Number" is not used as message ID. Because this shows the destination of the jump of the machine side to guidance table 2 from the guidance table for the CNC alarm. Therefore, do not use the character string that starts by "M"+"Number".	Within 8 letters (English capital and numerical letters)
(2)	Guidance Message	It is a message displayed on the "Guidance Message" part of the trouble diagnosis guidance screen. Input a question, an instruction and so on to an operator. **NOTE** When the guidance message is shown on the trouble diagnosis screen, a new line code is inserted to the message per 32 letters (16 in multi-bytes letters) automatically. If you want to insert a new line code at a free position, input "¥n" that is not included as the number of letters. Moreover, the line number of the message is within 4 including the above automatic new line.	Within 128 letters (64 in multi-bytes letters)
(3)	Next Message ID	Input a message ID that is jumped to when pressing the soft key [Yes] or [No] for each question of guidance message. Input "-1" when there is no message ID to be jumped.	Within 8 letters (English capital and numerical letters)
(4)	Notes	Free notes can be written.	

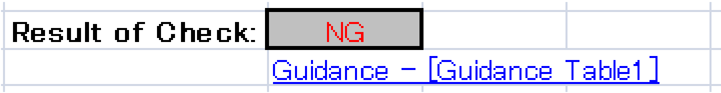
18.5.6.2 Checking input data

By clinking the [Check Input Data] button on the [Overall] sheet, all input data on the guidance sheet will be checked as to the range of number, the number of letters, the invalid letter and the line number of strings.

After the check is completed, the string of the [Result of Check] on the [Overall] sheet is changed from "Unchecked" to "OK".

> **NOTE**
> After "OK" is displayed, it might return to "Unchecked" by editing on the [Guidance] sheet again.

If the check is failed, the string of the [Result of Check] is changed to "NG" and a name of sheet and guidance table where an error occurs is shown in a cell under the [Result of Check].



The guidance table where an error occurs is displayed by clicking the name of the guidance table.

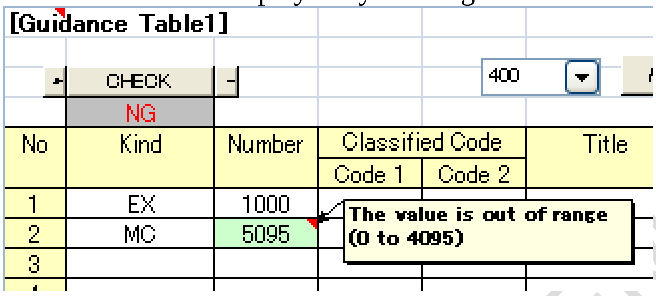


Fig. 18.5.6.2 (a)

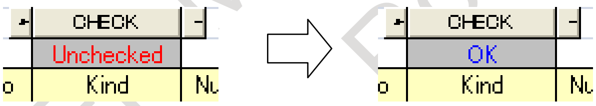
In the guidance table, the color of an error cell is changed to green and an error message is attached to the error cell as a commnet of the cell like the above figure. The list of the error messages is as follows:

- Input a number.
- The value is out of range (n to m).
- Input a string within n characters (m in multi-bytes characters).
- The line number is over limit n.
- The message referenced by the ID is not found.
- The kind(s) cannot be specified.

※m and n are numbers, s is a string

NOTE

1. The input data can be checked for an individual guidance table by clicking the [CHECK] button displayed at the top of the guidance table.
   In this case, the result of the check is displayed under the [CHECK] button like the following figure.



2. In case that errors occurs on two or more guidance tables, the [Result of Check] on the [Overall] sheet shows the name of the guidance table where the first error occurs. As for the result of check for each guidance table, see the display under the [CHECK] button.

Moreover, the color of the cell changes into light blue when the character string that shows the destination of the jump of the machine side to guidance table 2 from the guidance table for the CNC alarm is input to message ID.

Example)

No	Message ID
1	EX1000_A
2	EX1001_A
3	M205
4	

18.5.6.3 Making a memory card format file

By clicking the [Make Memory Card File] button on the [Overall] sheet, the following dialog box will be displayed.

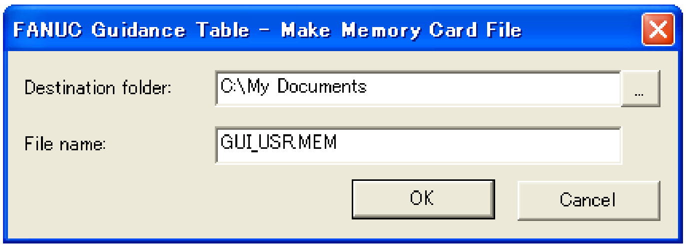


Fig. 18.5.6.3 (a)

Make a CNC readable memory card format file as follows:

1 Input a folder name where you want to make a file in the [Destination folder].

2 Input a file name that you want to make in the [File name].
" GUI_USR.MEM " is input by default.
When you input a file name without its extension, the extension "MEM" is added to the file name automatically.

3 Click the [OK] button.

After making the file is completed, the message box "Making the memory card format file is completed." will be displayed.

> **NOTE**
> 1 The available file name is a short file name with alphabetic and numerical letters (8.3 MS-DOS format).
> Other name format cannot be read by CNC.
> 2 If a file having the same name as the specified one has already existed in the destination folder, the file always will be overwritten.
> 3 When making the memory card format file is failed, the message box "The memory card format file cannot be made." is displayed with one of the following messages about the cause of that failure.
> - The input data have not been checked on (sheet name) – guidance table (1 or 2)
> - There are error(s) of the input data on (sheet name) – guidance table (1 or 2)
> - The specified file name is not correct.
> - (Destination folder) is not found.
> - Files in (destination folder) cannot be written.
> - The disk space in (destination folder) is not enough to make a new file.

By loading the file to CNC with the CNC BOOT function, the trouble diagnosis message can be displayed on the trouble diagnosis guidance screen when the relevant external alarm, macro alarm or operator message happens.

> **NOTE**
> As for the CNC BOOT function, see the following manuals.
> Series 30*i*/31*i*/32*i*-B MAINTENANCE MANUAL (B-64485EN) "APPENDIX C. BOOT SYSTEM"

18.5.6.4 Jump from CNC guidance table to MTB's guidance table

As a result of the diagnosis of the CNC alarm, the diagnosis of the machine side might be needed.
There is special message ID that jumps from the guidance table of the CNC alarm to the guidance table on the machine side for the diagnosis of such a case.
It is possible to jump to the diagnosis of MTB's guidance table after the diagnosis of the CNC alarm if the guidance table is made by using Message ID shown by "M"+"Number" in the following tables.

Table 18.5.6.4 (a) Reserved message ID

No.	Message ID	Title	Probable cause
1	M205	RIGID MODE DI SIGNAL OFF	The rigid mode DI signal (G061.0) is not set to 1 when the rigid tapping is executed.
2	M409	DETECT ABNORMAL TORQUE	A mechanical collision or twist occurred, resulting in a load torque higher than a normal operation value.
3	M410	EXCESS ERROR (STOP)	A mechanical collision or twist occurred, disabling an axis from reaching a target position.
4	M411	EXCESS ERROR (MOVING)	A mechanical collision or twist occurred, disabling an axis from moving.
5	M420	SYNC TORQUE EXCESS	Two axes to be moved synchronously lost mechanical synchronism with each other, resulting in a large torque difference.
6	M421	EXCESS ERROR (SEMI-FULL)	With a closed-loop machine, a shift occurred between the motion of the motor and the motion of the separate detector by a cause such as a mechanical twist.
7	M436	SOFT THERMAL (OVC)	A mechanical collision or twist occurred, resulting in a large load and the flow of an excessive current.

NOTE
Message ID shown by "M"+"Number" other than existing in the above table is not available.

18.5.7 Making Messages for Multi-languages

To change the language of messages displayed in the trouble diagnosis guidance screen complying with the display language of CNC, it is necessary to input messages for each language and make the memory card format file.
The messages for each display language are input on dedicated sheets for multi-languages.

NOTE
The messages in the [Guidance] sheet are assumed as English.
If you need messages other than English, make messages as follows:

18.5.7.1 Making sheets for multi-languages

Making sheets for multi-languages is as follows:

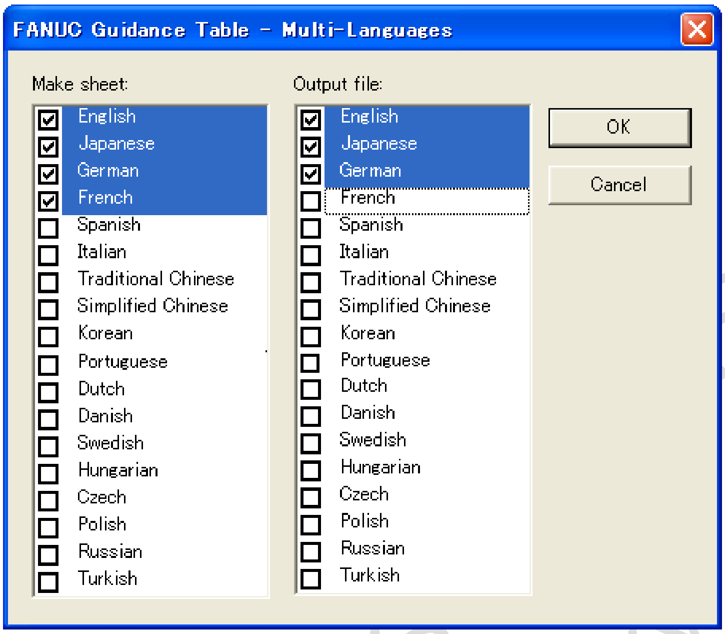

Fig. 18.5.7.1 (a)

1 Click the [Multi-Languages] button on the [Overall] sheet. The following dialog box will be displayed.

2 Turn on a check box for a language that you want to make in the [Make sheet] list. Two or more check boxes can be turned on.
After turning on the check box in the [Make sheet] list, the check box for the corresponding language can be operated in the [Output file] list.

3 In the [Output file] list, turn on a check box for a language that you want to output to your CNC readable memory card format file at the same time. Up to 5 check boxes other than English can be turned on. 6 or more check boxes cannot be turned on.

4 Click the [OK] button.
The sheets that are selected in the item 2 will be made like the following figure.

Sheets for multi-languages

NOTE
1 The supported languages are 18 ones shown in the previous dialog box.
2 The number of languages that can be output to the file of the memory card format at the same time is six languages (English + five national languages).
3 Once a sheet for multi-languages is made, the language of the [Guidance] sheet assumed as English. And, in the previous dialog box, the check box for English in the [Make sheet] and [Output file] list is turned on by default and they cannot be operated.
4 If you input other than English messages in the [Guidance] sheet before making the sheet for multi-languages, move the messages in the [Guidance] sheet to a sheet for an appropriate language by cut and paste operation of Excel.
5 To remove the sheet for multi-languages, turn off the check box for the language that you want to remove in the [Make sheet] list in the previous dialog box.

18.5.7.2 Inputting data in the sheet for multi-languages

The way to input data on the sheet for multi-languages is the same as one on the [Guidance] sheet that has already explained in the section "Making trouble diagnosis messages". However, data can be input for the 3 items only – Title, Probable cause and Guidance message.
As for data other than the 3 times, data in the [Guidance] sheet is copied to here and displayed.

No	Kind	Number	Classified Code		Title	Probable Cause			Message ID
			Code 1	Code 2		First Line	Second Line	Third Line	
1	EX	1000							
2	MC	3000							
3									

Fig. 18.5.7.2 (a) Sheet for multi-languages : Guidance table 1

No	Message ID	Guidance Message	Next Message ID	
			YES	NO
1				
2				
3				

Fig. 18.5.7.2 (b) Sheet for multi-languages : Guidance table 2

After inputting data in the sheet for multi-languages, check the input data and make the memory card format file according to the procedure described in "Making trouble diagnosis messages".

NOTE
The display language of the trouble diagnosis guidance screen is switched automatically according to the CNC display language.
However, when there is no message for the CNC display language in the memory card file, the input messages in the [Guidance] sheet are displayed.

18.5.8 Notice

- Excel's file of trouble diagnosis message

When you use "Guidance table for machine alarm diagnosis", change the setting of the macro function to "Enable" in the Trust Center of Excel 2007. If the setting is "Disable", the trouble diagnosis message cannot be made.
To enable the macro function by setting a path in the "Trusted Locations" of the Trust Center, set the folder where the file to input trouble diagnosis messages should be located and also the install folder of the "Guidance table for machine alarm diagnosis".

18.5.9 Translating Data Used with the Former Series (Series 0*i* /0*i* Mate-B/C, Series 16*i* /18*i* /21*i*-B)

The Excel file and the memory card file used with the former series (Series 0*i* /0*i* Mate-B/C, Series 16*i* /18*i* /21*i*-B) cannot be used with the current target series (Series 30*i* /31*i*/32*i*-B, 31*i*-B5) of this function.
Translate the Excel file used with the former series and make the memory card format file again according to the following description.

NOTE
As for the way to make the trouble diagnosis message for Series 0*i* /0*i* Mate-B/C, Series 16*i* /18*i* /21*i*-B, see the manual "Trouble Diagnosis Specifications" (A-78500) and "Machine Alarm Diagnosis Specifications" (A-78622)

1 Select [Program]→[FANUC Guidance Table]→[Translate Former Series Data] in the Windows start menu.

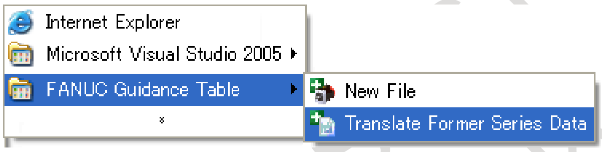

Fig. 18.5.9 (a)

2 In the displayed dialog box, input a Excel file name used with the former series in the [Source file name] and input a translated file name in the [Destination file name].

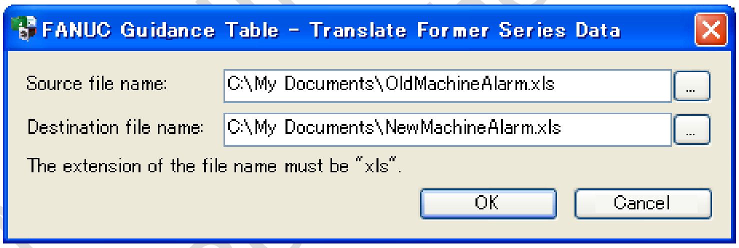

Fig. 18.5.9 (b)

3 Click the [OK] button, then the translated Excel file that is specified in the [Destination file name] will be made.

4 With the translated Excel file, check input data and make the memory card format file according to the section "Making trouble diagnosis messages".

NOTE

1. Input a full path in the [Source file name] and [Destination file name]. The path name cannot be omitted. The extension of the file name must be "xls" (Excel book format). Any other extension is ignored and it is changed to "xls".
2. The "Kind" in the guidance table 1 is input automatically complying with the "Number" during the translation.
   No. 1000 to 1999 → EX (External alarm)
   No. 2000 to 2999 → OP (External operator message)
   No. 3000 to 3200 → MC (Macro alarm)
3. When translating data is failed, the message box "The data cannot be translated." is displayed with one of the following messages about the cause of that failure.
   - (Source file name) is not found.
   - (Destination folder name) is not found.
   - Files in (destination folder) cannot be written.
   - The disk space in (destination folder) is not enough to make a new file
   - (Destination file name) has already existed.
4. If you use separated Excel files for Japanese and English with the former series, translate both files and make a sheet to input Japanese messages in the English file. Then, move the data form the Japanese file to the sheet to input Japanese in the English file by cut and paste operation of Excel so as to combine two files to one.

19 MAINTENANCE FUNCTION

19.1 MACHINE STATE MONITORING FUNCTION

19.1.1 Overview

This function monitors state of machine.
When trouble of the machine occurs, CNC information such as the operation history, the position and the feedrate at that time is saved in the CNC memory.
The saved CNC information can be used to investigate the cause of machine trouble.

Unexpected disturbance torque detection function, servo/spindle alarm, and a ladder program made by machine tool builders monitor the state of machine.
In the ladder program, the shock value is monitored by the Multi-Sensor Unit (MSU). When trouble of the machine such as the spindle collision occurs, the ladder program notifies CNC that the trouble has occurred.
When CNC is notified the trouble occurrence, CNC saves the information on that time in the CNC memory.
Machine tool builders or maintenance members investigate the cause of generation of trouble by using the saved CNC information.
The maximum save number of CNC information is 100. So, the past trouble can be investigated.

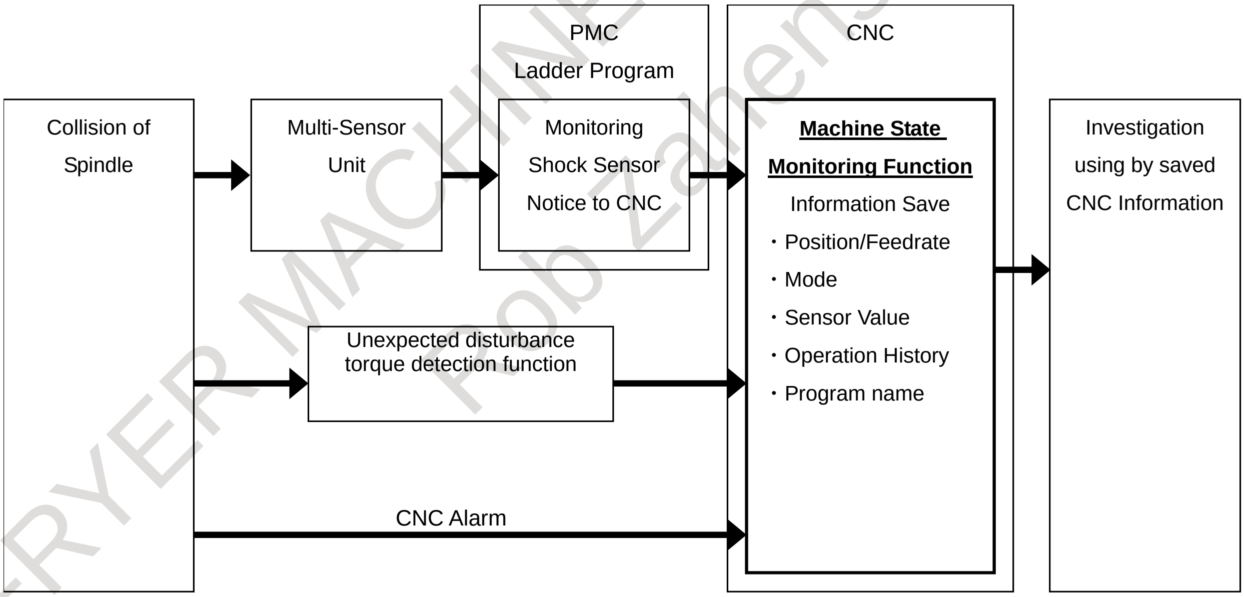

Fig. 19.1.1 (a) Summary of machine state monitoring function (Ex. collision of spindle)

Machine state monitoring function has the following two screens.
(1) Machine state monitoring screen
(2) Machine state history screen

In the machine state monitoring screen, four bytes PMC signals that set by parameter and the signal of the Multi-Sensor Unit can be monitored.

In the machine state history screen, saved CNC state and signal value can be displayed when match status history save condition occurs (machine status history save request signal set to 1, unexpected abnormal torque or servo/spindle alarm are detected). So, the signal of Multi-Sensor Unit and the CNC state such as position and program at the time when a spindle collides can be checked.
In addition, displayed information can be output to external devices.
When CNC saved information exceeded 100, CNC information is overwritten from the old one. CNC Information is remained for eight days or more, so number of saving information each day is restricted.

NOTE

Please refer to the following manuals for Multi-Sensor Unit and unexpected disturbance torque detection function.

- Multi-Sensor Unit:
  FANUC Series 0*i*-MODEL F Plus (HARDWARE) (B-64693EN)
- Unexpected Disturbance Torque Detection Function:
  FANUC Series 0*i*-MODEL F (FUNCTION) (B-64693EN-1)
  “2 PREPARATIONS FOR OPERATION 2.9UNEXPECTED DISTURBANCE TORQUE DETECTION FUNCTION”

19.1.2 Monitoring by CNC Software

CNC software monitors following three statuses and when at least one trouble is detected, CNC saves the information.

1. unexpected disturbance torque
2. servo alarm
3. spindle alarm

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11352	ABT	SVT	SPT					

[Input type] Parameter input
[Data type] Bit path

#5 SPT When spindle alarm occurred, recording CNC information by machine state monitoring is :
0: Disabled.
1: Enabled.

#6 SVT When servo alarm occurred, recording CNC information by machine state monitoring is :
0: Disabled.
1: Enabled.

#7 ABT When unexpected abnormal torque is detected, recording CNC information by machine state monitoring is :
0: Disabled.
1: Enabled.

19.1.3 Monitoring by Ladder Program

A PMC ladder program made by machine tool builders monitors the state of machine.
Machine tool builders deicide abnormal criteria according to the purpose such as spindle collision and machine overheat or the machine characteristic.

Example of abnormal detection)
(1) Detection of spindle collision
- The shock value that read by the Multi-Sensor Unit exceeds the assumption value.
- The load current value that read by the unexpected disturbance torque detection function exceeds the assumption value.

(2) Detection of machine overheat
- The temperature value that read by the Multi-Sensor Unit exceeds the assumption value.

When the trouble is detected, the ladder program sets machine state history save request signal MSUREQ <G0534.6> to “1” to notify CNC the occurrence of trouble.

19.1.4 Saving the Machine State

When the machine trouble is detected by machine state history save request signal MSUREQ <G0534.6>, servo alarm, spindle alarm or unexpected disturbance torque detection function, CNC saves the following information in the CNC memory.

The information can be saved up to 100.
If the new information is saved when history number is max, the oldest data is deleted and latest information is saved.

The saved CNC information cannot be deleted by the screen operation.

Table 19.1.4 (a) Saved CNC Information List

Item	Remarks
Time	Year, Month, Day, Hour, Minute, Second
PMC Signal	4bytes
Machine Position	All Axis, All Path
Absolute Position	All Axis, All Path
Feedrate	All Path
Spindle Speed	All Axis, All Path
Program Name (O Number)	Executing program name, All Path
Block Number	Block number of executing program, All Path
Mode	All Path
Modal	M, S, T, B (Without G code) All Path
Operation History	Data of 1/20 of normal operation history. About 400 MDI keys. The number of MDI keys decreases when a history with large size such as the alarm history is saved.
Non-Save Number	Number of information not saved. (refer to 22.1.4.1)
Multi-Sensor Unit Signals	Maximum 4
Save trigger	SIGNAL : signal MSUREQ ABTRQ : unexpected abnormal torque is detected SV ALM : servo alarm SP ALM : spindle alarm

The machine state at the time when trouble occurs can be checked by the above saved information.

Example)

(1) Spindle collision during automatic operation
If the operation mode is automatic operation such as MEM when the trouble occurs, the operator states can be clarified by checking the saved following data.
- The program name and its block number.
- The machine position and the absolute position.
- The Modal.

(2) Spindle collision during manual operation
If the operation mode is manual operation such as JOG mode when trouble is occurs, the operator states can be clarified by checking the saved following data.
- The machine position and the absolute position.
- The operation history that the CNC parameter is changed.

19.1.4.1 Restriction of saving

To save CNC information for eight or more days, so number of saving information each day is restricted.

Potential Saving Number

Potential Saving Number means the number of limits that can be preserved in a day.
Potential Saving Number is given basically 10 times a day, but remained Potential Saving Number is carried over next day. (Maximum 30)
CNC information is remained eight or more days in CNC memory. (Refer to Example.1 to 3)
Potential Saving Number is displayed on diagnosis data No. 4500.

If number of histories that can be saved per day are exceeded, the history at that time will not be saved even if the machine state history saving condition is satisfied.
The number of history records that were not saved will be recorded in the history that will be saved next time as the number of unsaved histories.

Non-Save Number

Non-Save Number is the number that CNC information was not saved because of restriction of saving even if save request condition is fulfilled(signal MSUREQ<G0534.6> changing into “1”, detecting unexpected abnormal torque, spindle alarm or servo alarm)
Non-Save Number is included in CNC information that will be saved next time.
The maximum value of Non-Save Number is 65535.
Non-Save Number is displayed on Machine state history screen. (Refer to the below figure.)
If “*” displayed at the right of detect time, it means the value of Non-Save Number is 1 or more.
If Non-Save Number is 0, “*” is not displayed.
In details, refer to 22.1.8 Machine state history screen.

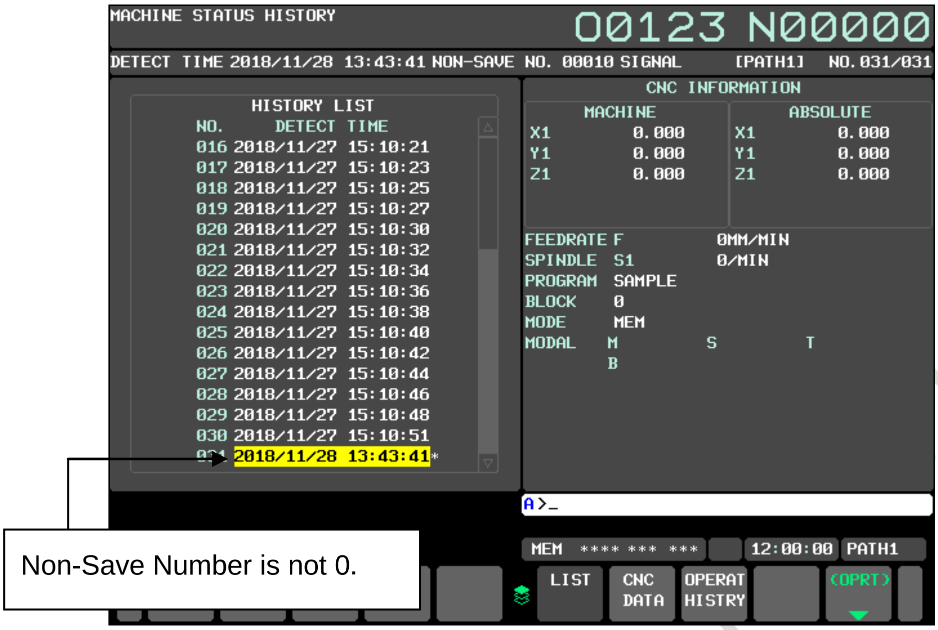

Fig. 19.1.4.1 (a) Non-Save Number

Example.1 (Non-Save Number)

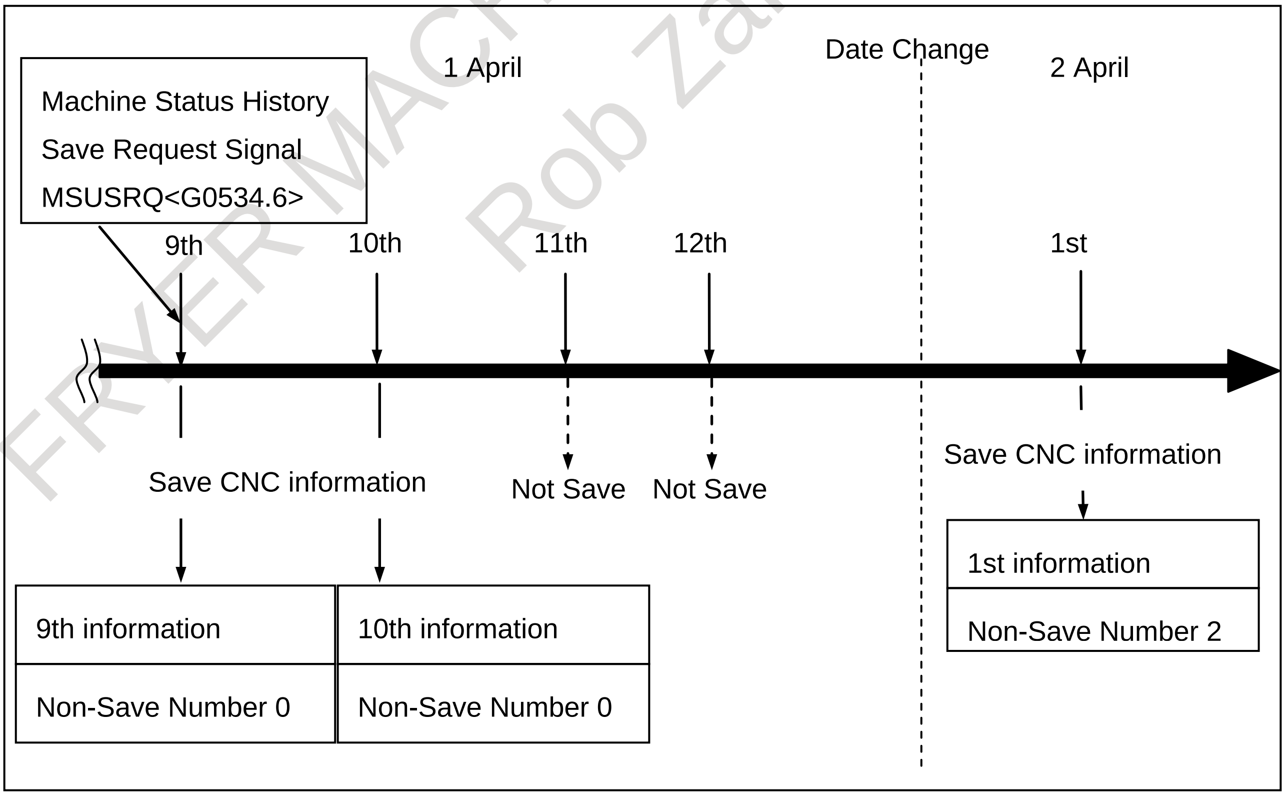
This is the case MSUREQ changes into “1” twelve times on 1 April, and change into “1” only one time 2 April.

On 1 April, Potential Saving Number was 10, and MSUREQ had changed into “1” twelve times.

From 1st to 10th CNC information was saved, but 11th and 12th had not been saved, because of restriction.

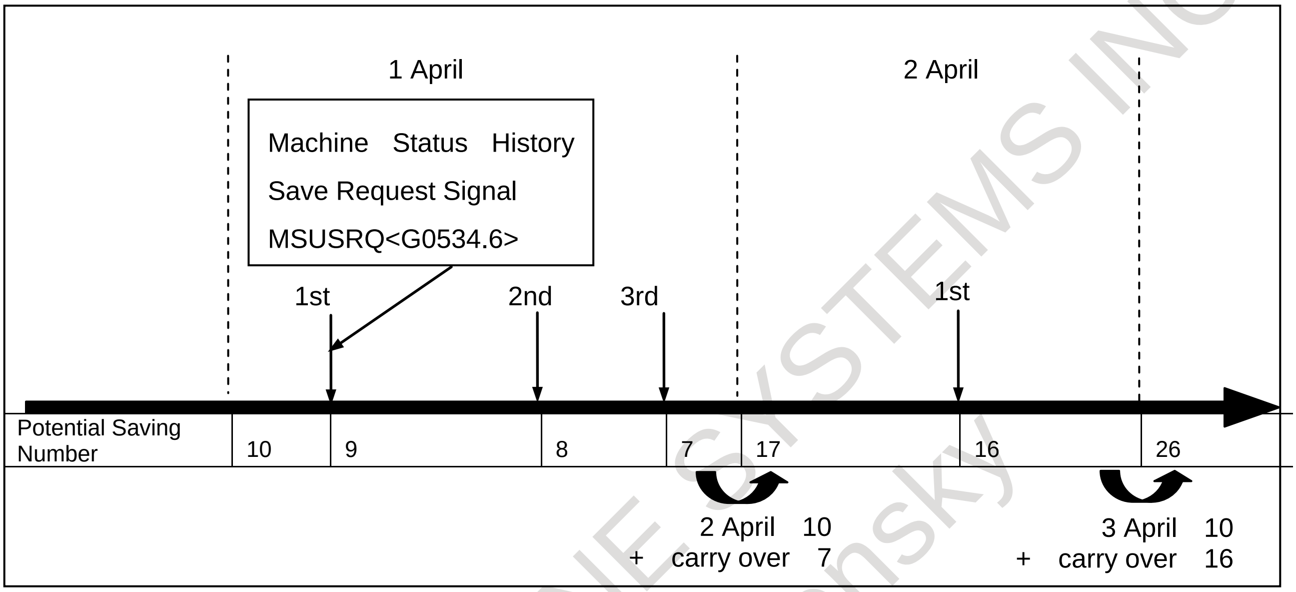
On 2 April, MSUREQ had changed “1” only one time.

In this case, the value of Non-Save Number is saved is 2(11th and 12th on 1 April).



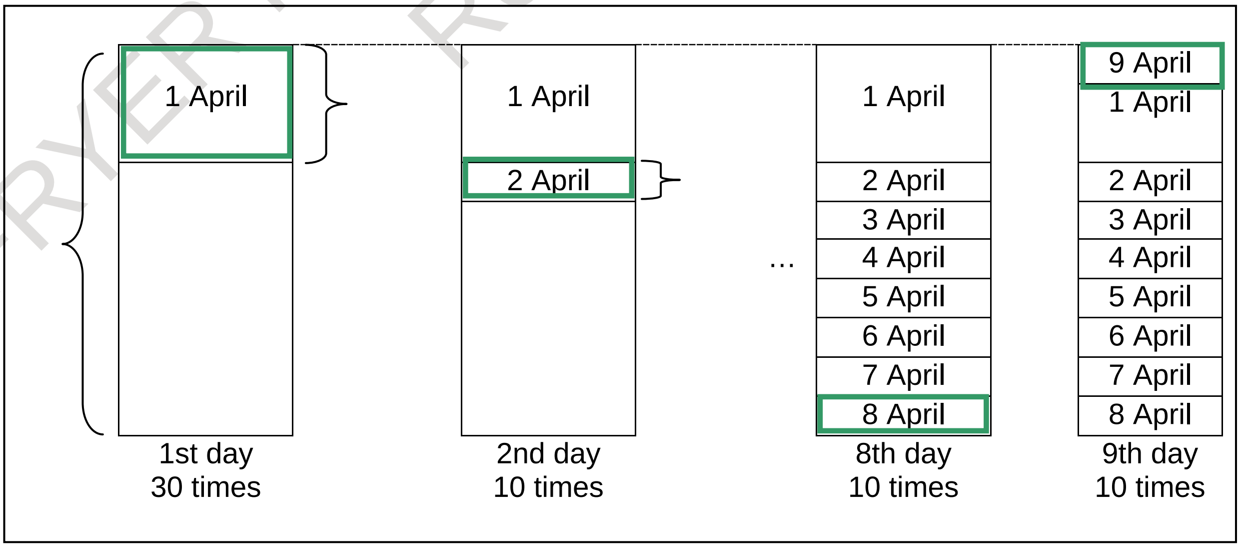
Example.2 (Carry over of Potential Saving Number)

This is the case of carry over of Potential Saving Number.
On 1 April, Potential Saving Number was 10 and CNC information was saved 3 times.
Potential Saving Number was carried over next day.
On 2 April, Potential Saving Number was 17 as a result of carry over from 1 April, and CNC information was saved only 1 time.
On 3 April, Potential Saving Number was 26 as a result of carry over from 2 April.
Max of carry over of Potential Saving Number is 30.



Example.3 (Saving 100 information by the shortest days)

This is the example of saving 100 information in the shortest days.
CNC information was saved 30 times on 1 April.
Next 7 days, information was saved 10 times a day.
On 8 April, there were CNC information from April 1, and information of 1 April still remained.
Like this, information remains for at least 8 days.
9 April the old information on 1 April is overwritten.



19.1.5 Setting

19.1.5.1 PMC signal

Four bytes data can be set as PMC signal.
The address is set by the parameter.

The PMC path number of signal No.1 to 4 is set to parameter No.11378 to No.11381.
The value and the PMC path number that can be set are as follows.

No.11378 to 11381	PMC Path Number
0	Unsetting
1	1st PMC
2	2nd PMC
3	3rd PMC
4	4th PMC
5	5th PMC
9	Dual Check Safety

The address kind of signal No.1 to 4 is set to parameter No.11382 to No.11385.
The value and the address kind that can be set are as follows.

No.11382 to 11385	Address Kind
0	Unsetting
1	X
2	Y
3	G
4	F
5	A
6	R
7	T
8	K
9	C
10	D

The address number of signal No.1 to 4 is set to parameter No.11386 to No.11389.
The range that can be set is decided depending on the address kind.
Refer to PMC Programming Manual (B-64513EN) for detail.

Example:

Signal No	Address	PMC Path Number	Address Kind	Address Number
1	1:X10	No.11378 = 1	No.11382 = 1(X)	No.11386 = 10
2	1:Y20	No.11379 = 1	No.11383 = 2(Y)	No.11387 = 20
3	2:R30	No.11380 = 2	No.11384 = 6(R)	No.11388 = 30
4	3:D40	No.11381 = 3	No.11385 = 10(D)	No.11389 = 40

19.1.5.2 Multi-Sensor Unit

The Multi-Sensor Unit is connected with CNC by I/O Link.
When the Multi-Sensor Unit is detected in the power on, CNC automatically sets the address of the sensor signal.
Therefore, the setting by MTB is unnecessary.

NOTE
The allocation setting of I/O Link is necessary.

19.1.5.3 Delay time for operation history saving

The alarm history can be saved in the operation history.
So, the operation history that contains the generated alarm can be saved by this function.
However, the gap might be caused in timing between the machine status history save request condition is fulfilled and the alarm is saved into operation history.
In this case, even if CNC saves the operation history when the machine status history save request condition is fulfilled, the operation history doesn't contain the alarm generated in the immediately after that.
To prevent this problem, the delay time for operation history save is set.
The delay time for the operation history save is set by parameter No.24302.

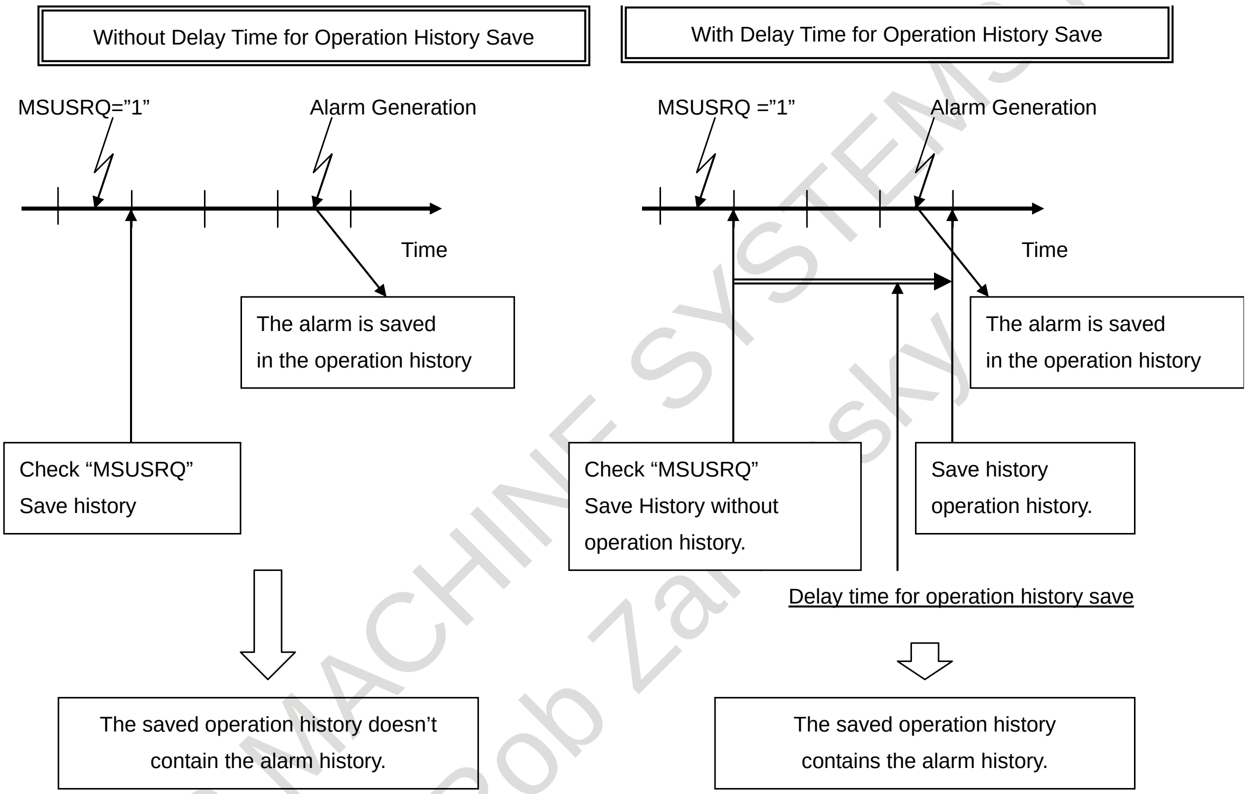


Fig. 19.1.5.3 (a) Delay time for operation history saving

If the parameter No.24302 is –1 or less, the delay time is 0.
If the parameter No.24302 is 0, the delay time is 160ms.
If the parameter No.24302 is 1 or more, the delay time is (No.24302 × 16)ms.
For example, if the parameter No.24302 is 5, the delay time is 80ms.

19.1.5.4 Machine state history saving response signal (MSUSAS)

Machine State History Saving Response Signal MSUSAS <F545.6> is response signal of MSUSRQ<G534.6>.If the machine status history start saving by other reason such as detecting spindle alarm, MSUSAS doesn't become "1".

When CNC detects MSUSRQ<G534.6> changing into "1", CNC changes MSUSAS<F545.6> into "1".
Even if starting saving machine state history when condition MSUSQR<G0534.6> is not set to 1, MSUSAS<F0545.6> is not turned to 1.
Afterwards, behavior of CNC is different depend on the value of Potential Saving Number.

− When Potential Saving Number is one or more
  (1) When CNC detects MSUSRQ changing into “1”, CNC begin to save information and change MSUSAS into “1”.
  (2) Ladder program confirm that MSUSAS changed into “1”, please change MSUSRQ into “0”.
  (3) After information saving is ended, if MSUSRQ is “0”, MSUSAS is changing into “0”.

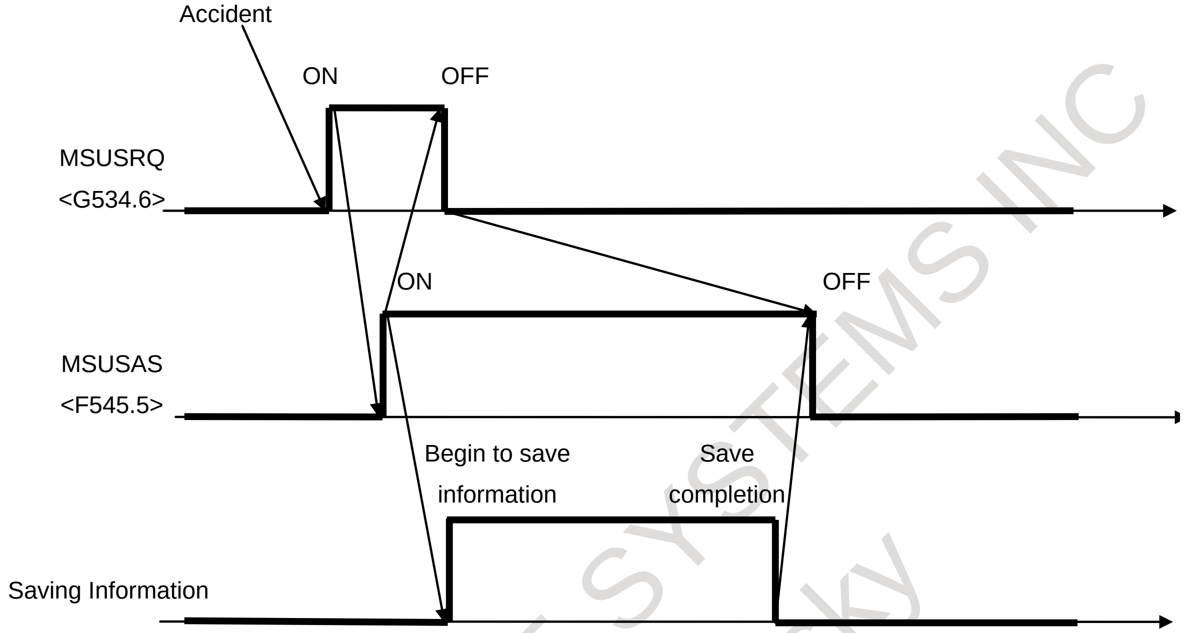

Fig. 19.1.5.4 (a) Machine State History Save Request Signal and Machine State History Saving Response Signal

− When Potential Saving Number is zero
  (1) When CNC detects MSUSRQ changing into “1”, CNC change MSUSAS into “1”, but CNC is not saving information.
  (2) Ladder program confirm that MSUSAS is changed into “1”, please change MSUSRQ into “0”.
  (3) If MSUSRQ is 0, MSUSAS changing into “0”.

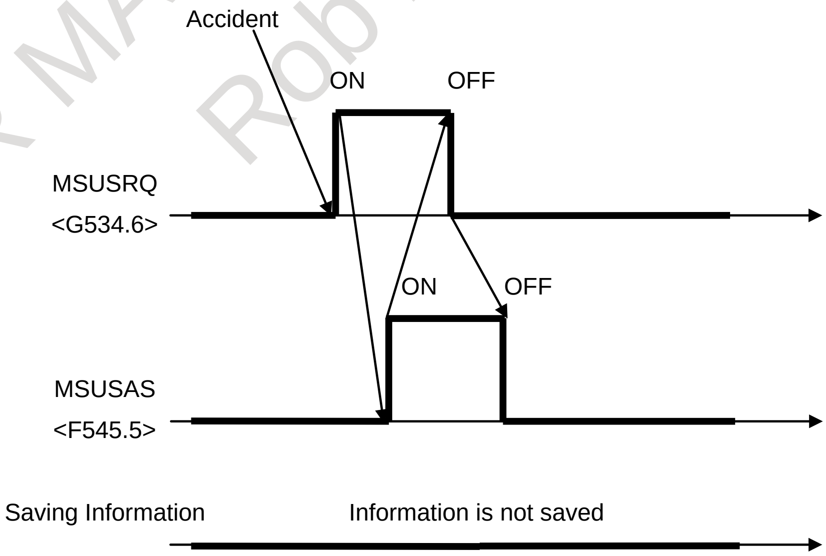

Fig. 19.1.5.4 (b) Machine State History Save Request Signal and Machine State History Saving Response Signal

Signal

Machine State History Save Request Signal MSUSRQ<G0534.6>

[Classification] Input signal
[Function] The save of the machine state history is requested.
[Operation] When this signal becomes 1, the machine state history is saved.

Machine State History Saving Response Signal MSUSAS<F0545.5>

[Classification] Output signal
[Function] Response to the machine status history save request signal (MSUSRQ)
[Output cond.] This signal becomes 1 when:
- Detect MSUSRQ is “1”.

It becomes 0 when:
Behavior is different depend on the information was saved or not.
- The machine state history is saving: Detect MSUSRQ is “0” and saving is ended.
- The machine state history is not saving: Detect MSUSRQ is “0”.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
G0534		MSUSRQ						
F0545			MSUSAS					

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11372	MSH				MSM			

[Input type] Parameter input
[Data type] Bit

#3 MSM The machine state monitoring screen
0: is not displayed.
1: is displayed.

#7 MSH The machine state history screen
0: is not displayed.
1: is displayed.

11378	PMC path number of PMC signal No.1 for the machine state monitoring function
to	
11381	PMC path number of PMC signal No.4 for the machine state monitoring function

[Input type] Parameter input
[Data type] Byte
[Data range] 0 to 5 and 9

The PMC path number of the PMC signal for the machine state monitoring function is set.
The value and the PMC path number that can be set are as follows.

No.11378 to 11381	PMC Path Number
0	Unsetting
1	1st PMC
2	2nd PMC
3	3rd PMC
4	4th PMC

No.11378 to 11381	PMC Path Number
5	5th PMC
9	Dual Check Safety

11382	Address kind of PMC signal No.1 for the machine state monitoring function
to	
11385	Address kind of PMC signal No.4 for the machine state monitoring function

[Input type] Parameter input
[Data type] Byte
[Data range] 0 to 10
Address kind of PMC signal for the machine state monitoring function is set.
The value and the address kind that can be set are as follows.

No.11382 to 11385	Address Kind
0	Unsetting
1	X
2	Y
3	G
4	F
5	A
6	R
7	T
8	K
9	C
10	D

11386	Address number of PMC signal No.1 for the machine state monitoring function
to	
11389	Address number of PMC signal No.4 for the machine state monitoring function

[Input type] Parameter input
[Data type] 2 Word
[Data range] Refer to PMC Programming Manual (B-64513EN) for detail.
Address number of PMC signal for the machine state monitoring function is set.

24302	Delay time from trigger signal to storing operation history for the machine state monitoring function

[Input type] Parameter input
[Data type] Word
[Data range] -1 to 32767
This parameter sets delay time from turning on trigger signal to beginning preservation of the operation history in the machine state monitoring function.

Parameter No.24302	Delay Time
-1	0msec
0	160msec
1 to 32767	Parameter No.24302×16msec

Diagnosis Data

4500	Potential Saving Number

[Valid data range] 0 to 30
Potential Saving Number is displayed.

19.1.6 Display the CNC Information

In the CNC screen, the PMC signal and the signal of the Multi-Sensor Unit can be monitored and the CNC information at the time when the trouble of machine occurs is checked.
The screen for the confirmation has the following two kinds.

- Machine state monitoring screen: Display of current PMC signals and Multi-Sensor Unit information.
- Machine state history screen: Display of CNC information at the time when the trouble of machine occurs.

19.1.7 Machine state monitoring screen

In the machine state monitoring screen, four PMC signals that set by parameter and the signal of the Multi-Sensor Unit can be monitored.

The machine state monitoring screen is displayed by the following procedures.

1. Press function key SYSTEM.
2. Press the continuous menu key several times to display the soft key [MACHIN MONITR]
3. Press the soft key [MACHIN MONITR] to display the machine state monitoring screen.

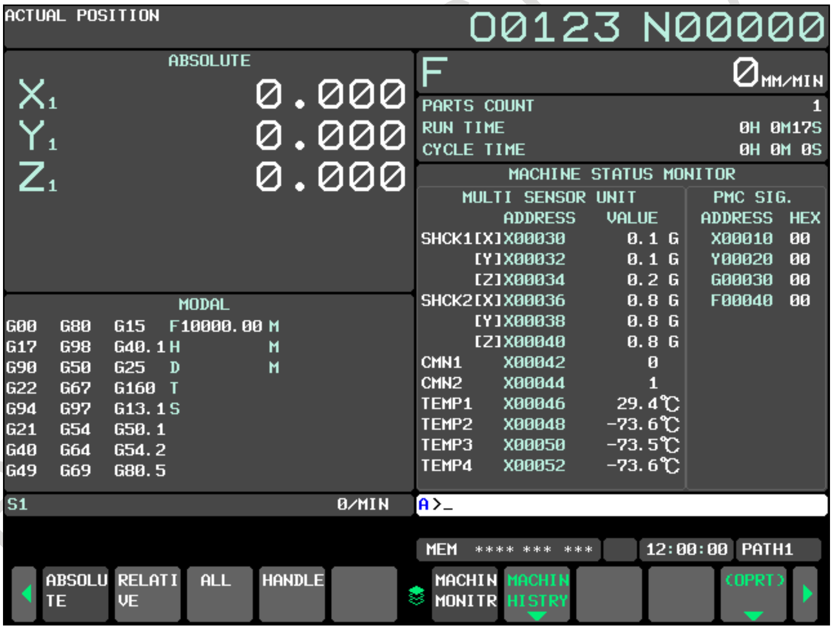

Fig. 19.1.7 (a) Machine state monitoring screen(With Multi-Sensor Unit)

> **NOTE**
> This screen is displayed only when bit 3 (MSM) of parameter No.11372 is 1.

19.1.7.1 Monitoring of PMC signals

In the machine state monitoring screen, four PMC signals that set by parameter can be monitored.

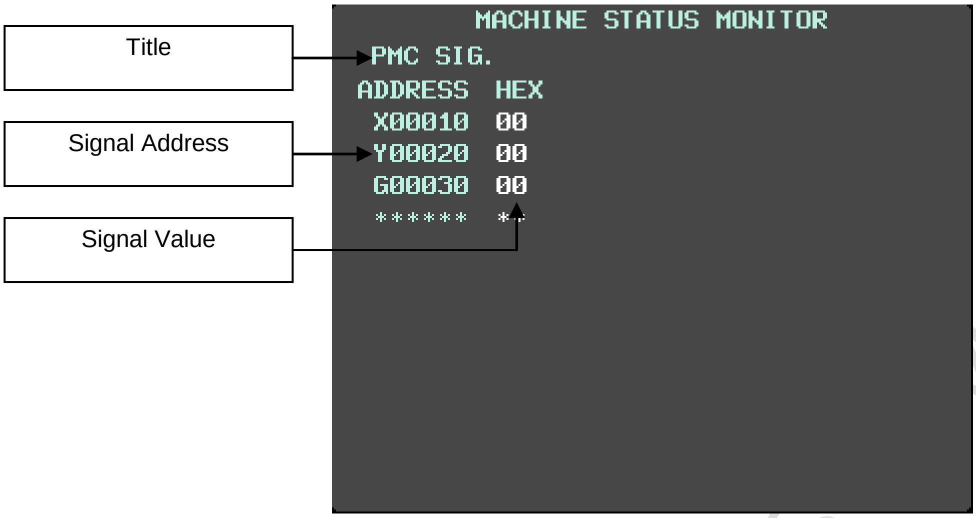

Fig. 19.1.7.1 (a) Monitoring of PMC signals

Details of the content of the display are as follows.

PMC Signal Title

The title of PMC signal that can be set by the parameter is displayed.
The PMC signal can be set only by four bytes or less.

PMC Signal Address

The address of PMC signal set by the parameter is displayed.
If the parameter is not set, “****” is displayed.
In the case of multi PMC system, the PMC path number is displayed ahead of the address. (Refer to Fig. 19.1.7.1 (b))

PMC Signal Value

The real-time value of PMC signal set by the parameter is displayed by Hex.
If the parameter is not set, “****” is displayed.

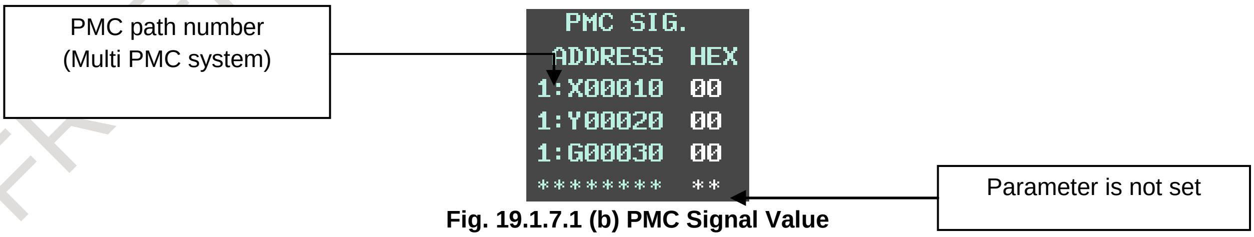

Fig. 19.1.7.1 (b) PMC Signal Value

19.1.7.2 With Multi-Sensor Unit

When Multi-Sensor Unit is connected, machine state monitoring screen is displayed as follows.

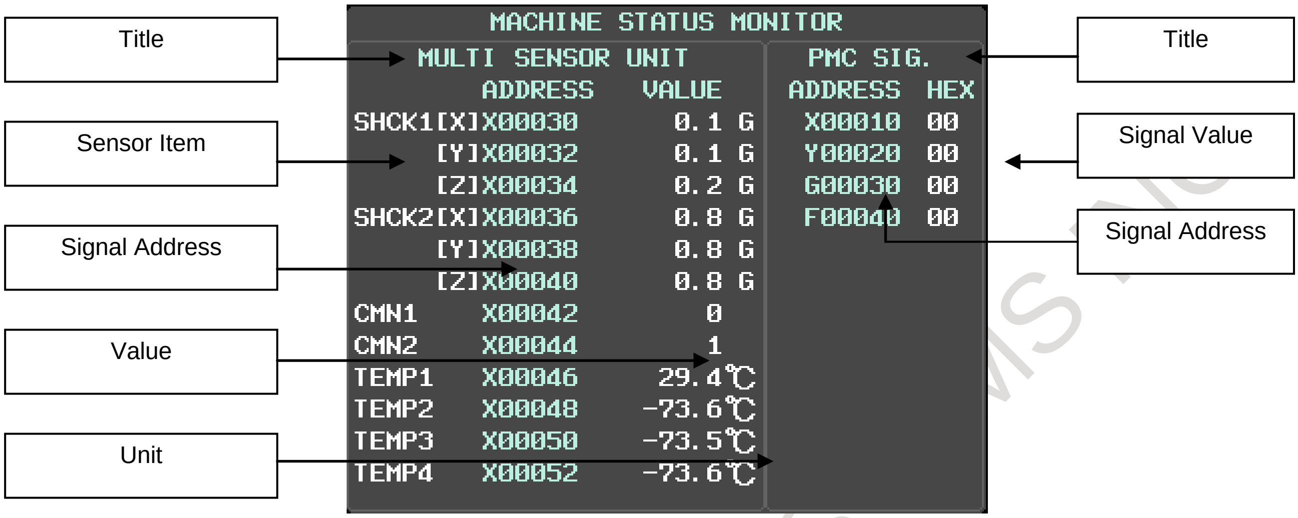

Fig. 19.1.7.2 (a) With Multi-Sensor Unit

Details of the content of the display are as follows.

Multi-Sensor Unit Title

The title of Multi-Sensor Unit title is displayed.

For the multi PMC system

In the case of multi PMC system, the PMC path number of the Multi-Sensor Unit is displayed next to the title.

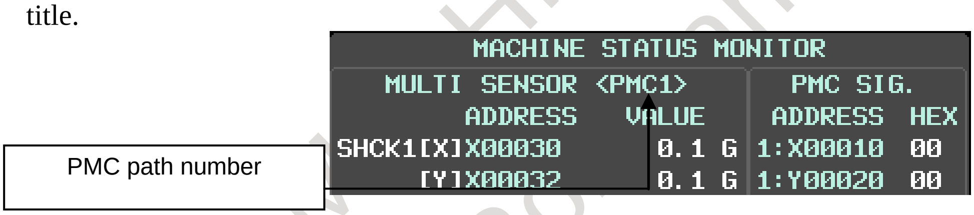

Fig. 19.1.7.2 (b) Multi PMC System

For the plural Multi-Sensor Units

The Multi-Sensor Unit can be connected up to four.
In the case of the plural Multi-Sensor Units, the displayed Multi-Sensor Unit number (MSU No.) and all connected number of MSU are displayed.
The Multi-Sensor Unit number is counted from the one near CNC to four among units connected with I/O Link.

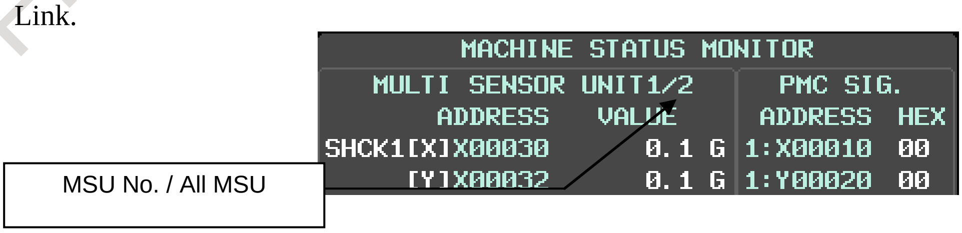

Fig. 19.1.7.2 (c) plural Multi-Sensor Units

For multi PMC system and the plural Multi-Sensor Units

In the case of multi PMC system and the plural Multi-Sensor Units, the displayed MSU No, all connected number of MSU and the PMC path number of the Multi-Sensor Units are displayed next to the title.

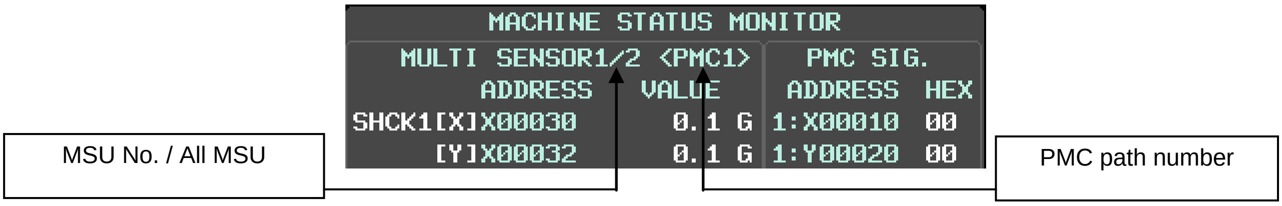

Fig. 19.1.7.2 (d) Multi PMC System and plural Multi-Sensor Units

Sensor Item

The following sensor items are displayed.

(1) Shock Sensor (Direction of X, Y, Z) : 2CH
(2) Analog Input : 2CH
(3) Thermo Sensor : 8CH

When all sensors cannot be displayed in one screen, the page can be switched by pushing page change key .

Address

The address corresponding to each sensor is displayed.

Value

The sensor value that each sensor outputs is displayed.

Unit

The unit corresponding to each sensor is displayed.

PMC Signal Title

Refer to "Monitoring of PMC signals".

PMC Signal Address

Refer to "Monitoring of PMC signals".

PMC Signal Value

Refer to "Monitoring of PMC signals".

Operation

If the soft key [(OPRT)] is pressed, the following soft keys are displayed.

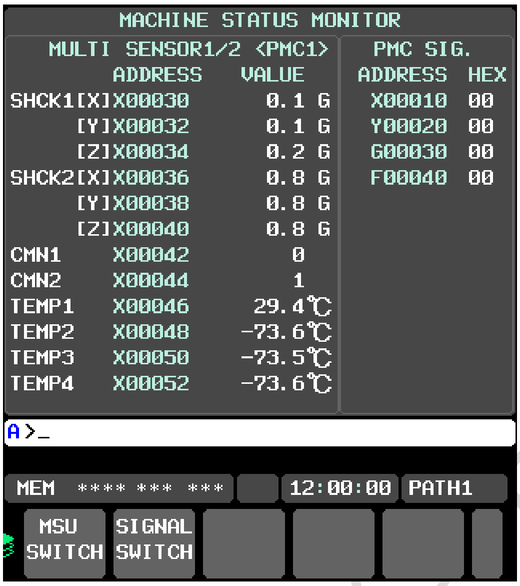

Fig. 19.1.7.2 (e) soft key [(OPRT)]

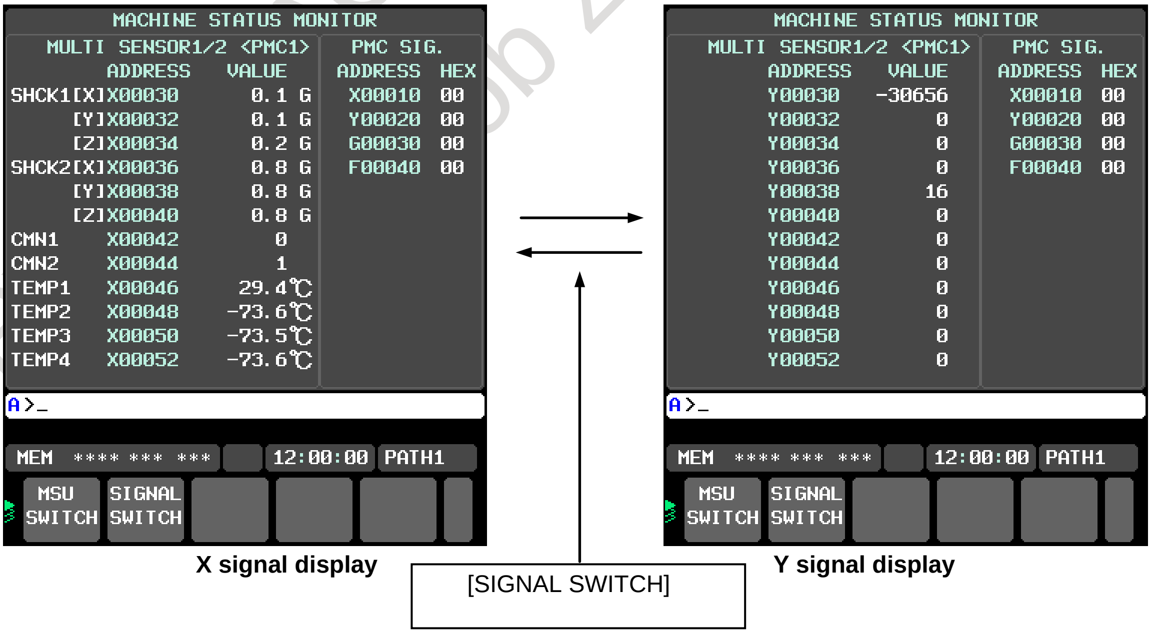
Soft Key [MSU SWITCH]

This soft key is displayed when the plural Multi-Sensor Units are connected.
When this soft key is pressed, the displayed Multi-Sensor Units can be switched.
For example, when four Multi-Sensor Units are connected, whenever this soft key is pushed, the displayed Multi-Sensor Unit changes as MSU No.1 to 2 to 3 to 4 to 1…

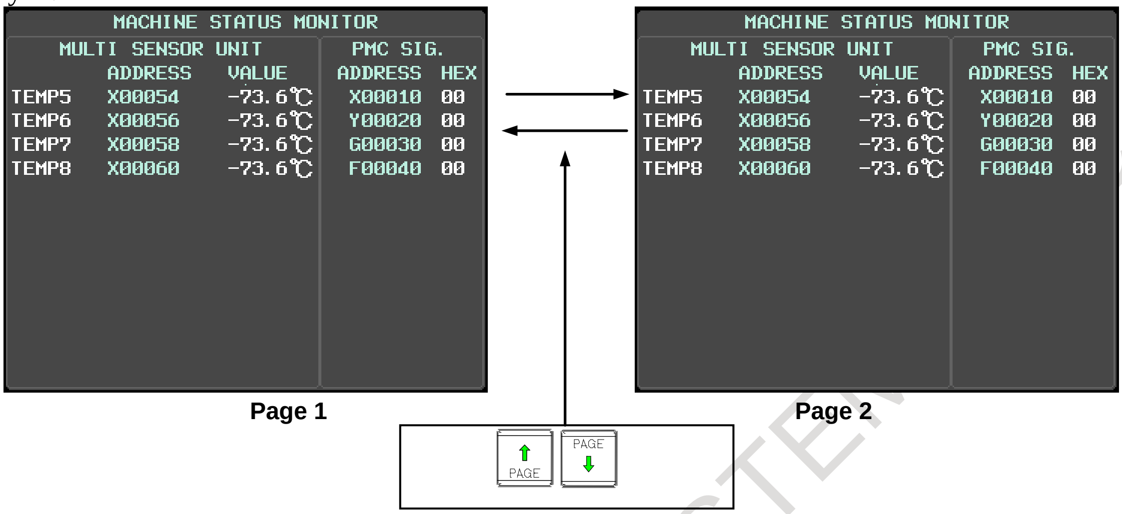
Soft Key [SIGNAL SWITCH]

When this soft key is pressed, either display of X or Y signal can be switched.



Page Change Key

When the page change key is pressed, the sensor signal information of the next page can be displayed.



19.1.8 Machine state history screen

When the machine state history save request condition is fulfilled, CNC saves the PMC signal, the state of CNC and the operation history in CNC as a history.
In the machine state history screen, these saved histories can be displayed.
As a result, for example, the machine state (coordinate, program etc.) and operation history at the time when a spindle collides can be checked and the investigation of cause of trouble and restoration are easy.

The histories can be saved up to 100.

NOTE
1. If the machine state history save request condition is fulfilled when the 100 of history data have been saved, the new history overwrites the oldest one.
2. Don't set the machine state history save request condition fulfilled while the machine state history screen is displayed. In this case, CNC Information is saved when the display of the screen changes other screen.

The state of CNC saved as a history is as follows.

Table 19.1.8 (a) Saved CNC Information List

Item	Remarks
Time	Year, Month, Day, Hour, Minute, Second
PMC Signal	4bytes
Machine Position	All Axis, All Path
Absolute Position	All Axis, All Path
Feedrate	All Path
Spindle Speed	All Axis, All Path
Program Name (O Number)	Executing program name, All Path
Block Number	Block number of executing program, All Path
Mode	All Path
Modal	M, S, T, B (Without G code) All Path
Operation History	Data of 1/20 of normal operation history. About 400 MDI keys. The number of MDI keys decreases when a history with large size such as the alarm history is saved.
Non-Save Number	Number of information not saved.

Item	Remarks
Multi-Sensor Unit Signals	Maximum 4
Save trigger	SIGNAL : signal MSUREQ ABTRQ : unexpected abnormal torque is detected SV ALM : servo alarm SP ALM : spindle alarm

The machine state history screen is composed by the following screens:
(A) Machine state history list screen
(B) Machine state history CNC data screen
(C) Machine state history operation history screen

The machine state history list screen is displayed by the following procedures.

1. Press function key .
2. Press continuous menu key [+] several times to display the soft key [MACHIN HISTORY]
3. Press the soft key [MACHIN HISTORY].
4. Press the soft key [LIST], and machine state history list screen is displayed.
5. Press the soft key [CNC DATA], and CNC data screen is displayed.
6. Press the soft key [OPERAT HISTORY] to display the operation history screen is displayed.

19.1.8.1 Machine State History List Screen

The machine state history list screen is composed by the following area.
(1) Common area
(2) History list area
(3) Detail data area

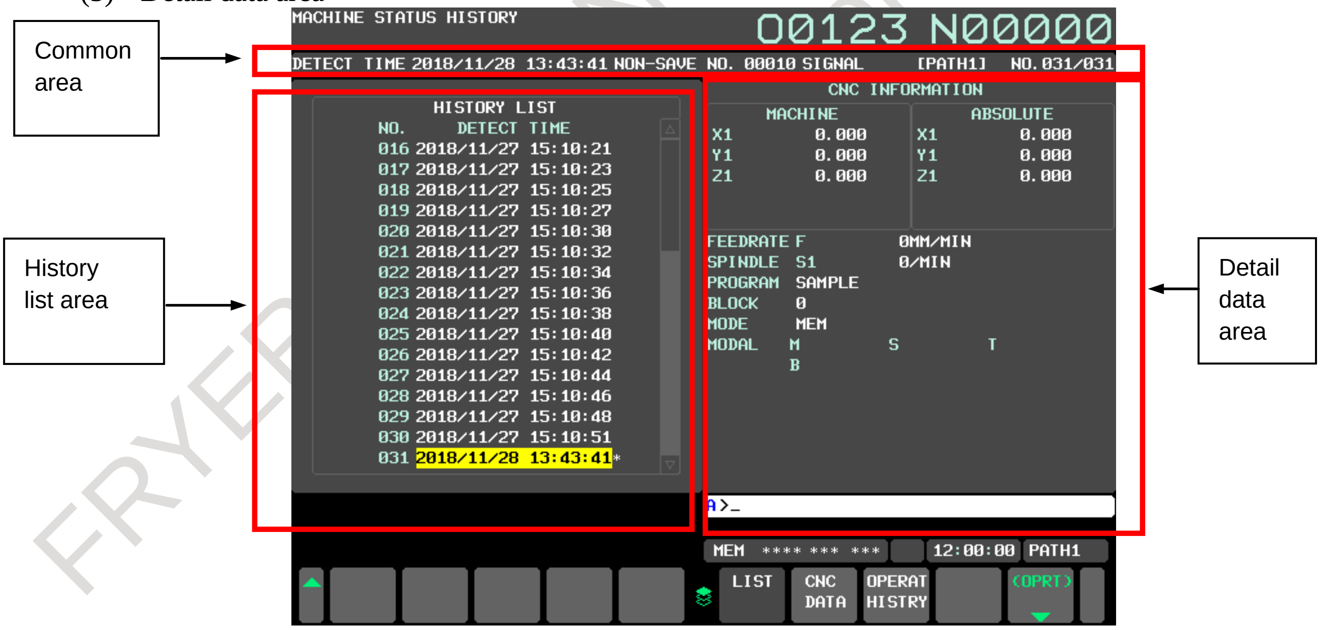


Fig. 19.1.8.1 (a) Machine State History List Screen

In common area, common information such as the detect time and non-save number of the selection history number is displayed.
In history list area, the detect time of all the histories saved in CNC is displayed in the list.
In detail data area, the detail data of the selection history number is displayed.
The following kind of detail data can be displayed.
(a) Signal information
(b) CNC information
(c) Operation history information

These kinds can be selected by cursor key [←] or [→].

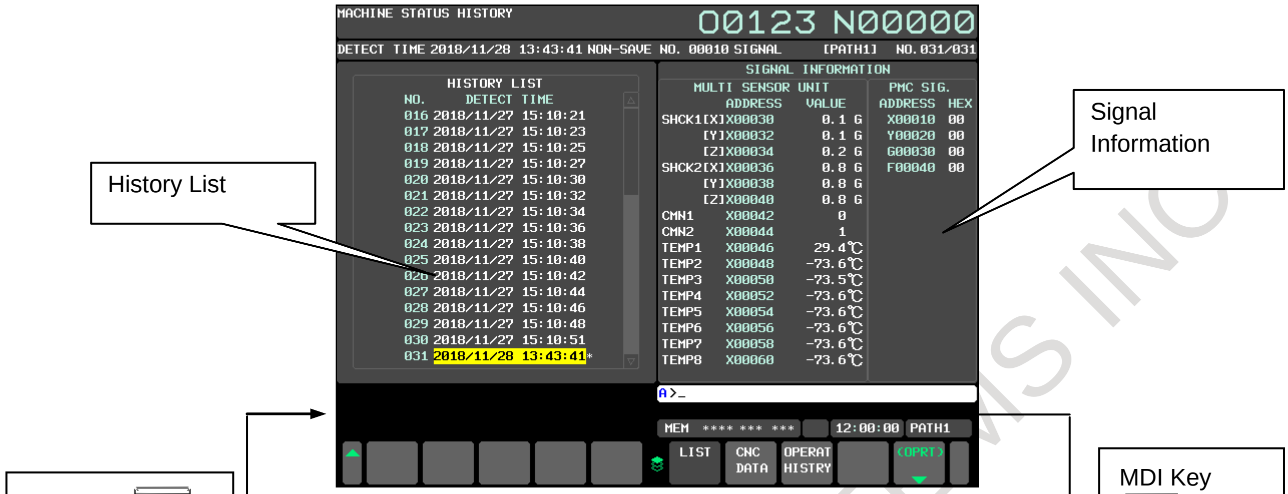

Fig. 19.1.8.1 (b) Machine State History List Screen (List + Signal)

Fig. 19.1.8.1 (c) Machine State History List Screen (List + CNC)

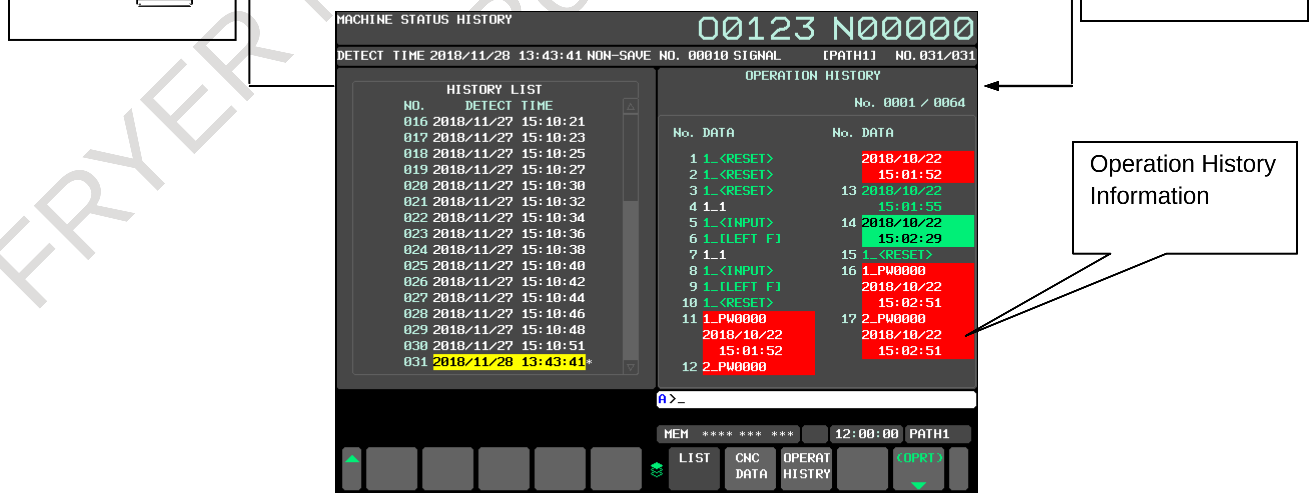

Fig. 19.1.8.1 (d) Machine State History List Screen (List + Operation History)

Common Information

Common information is displayed in the upper part of the screen.

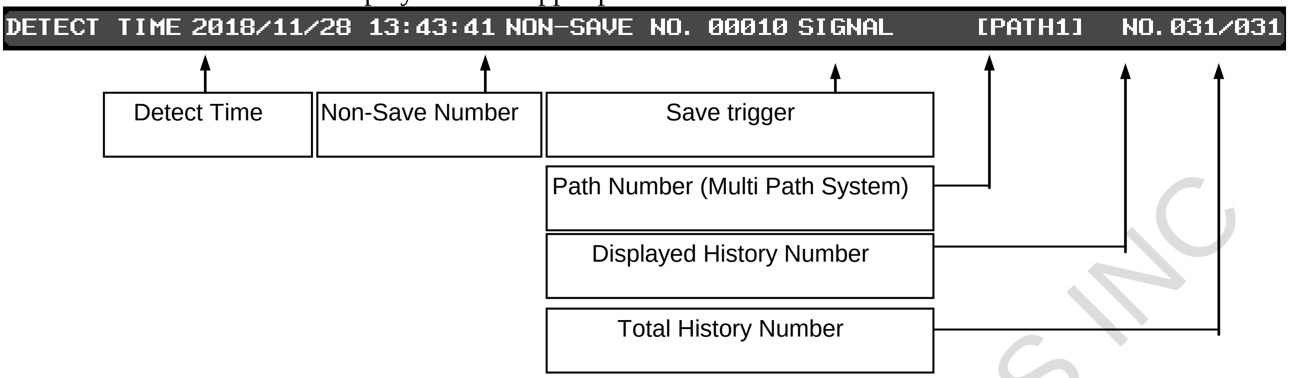

Fig. 19.1.8.1 (e) Common Area

(1) Displayed history number
The selected history number is displayed. A history number is smaller, a data is older.

(2) Total history number
The total number of machine state histories saved in CNC is displayed.

(3) Detect time
The time that the machine state history save request signal MSUSRQ<G0534.6> becomes “1” and the history was saved is displayed.

(4) Path number
In the case of multi path system, the path number of the displayed history is displayed.

(5) Non-Save Number
Non-Save Number is displayed.
The number of history that was not saved due to the number limit is displayed.
When Non-Save Number is 0, it is not displayed on screen.
The maximum value of Non-Save Number is 65535.

(6) Save trigger
Trigger when saving history is displayed.

History List information

The history list information is displayed in the area in the left half of the machine state history list screen.
History number and detect time are displayed.
If Non-Save Number is not 0, “*” is displayed.

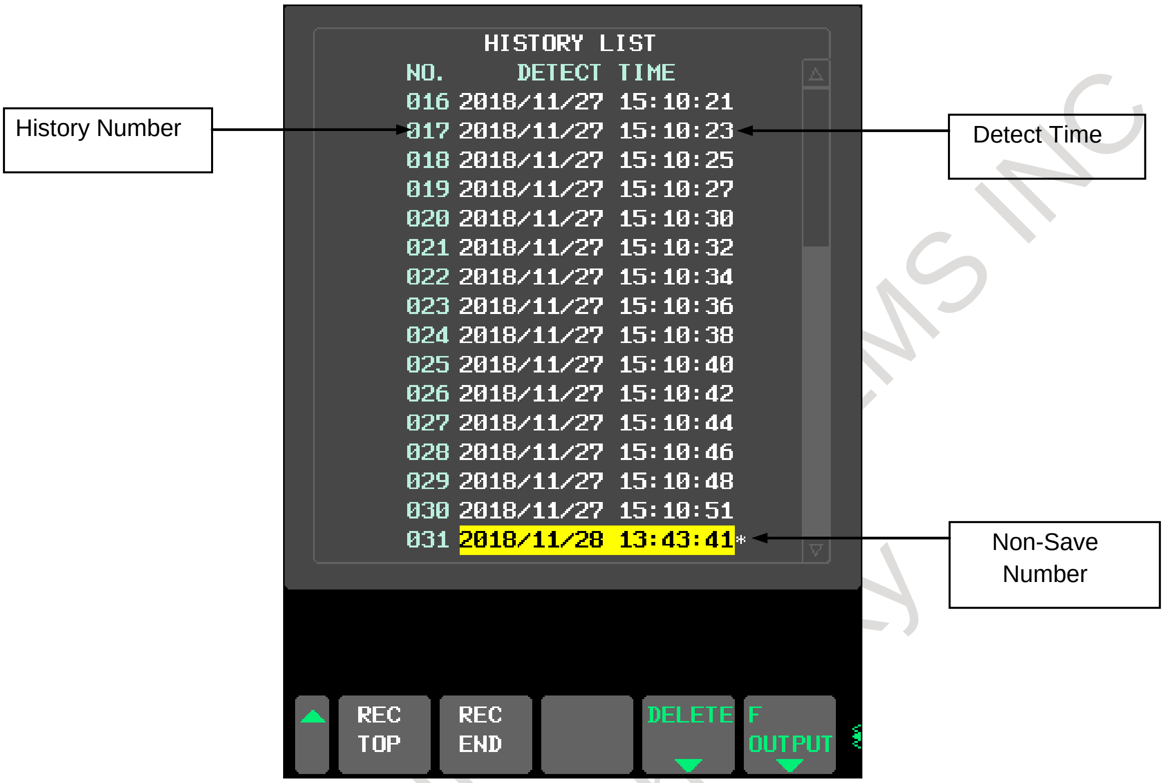

Fig. 19.1.8.1 (f) History List Area

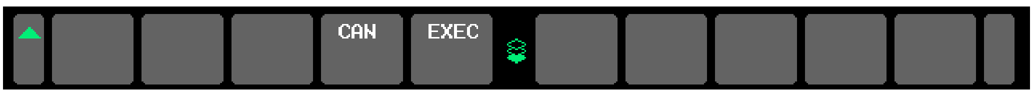
Operation in History List Area

(1) Cursor Key and Page Change Key

The cursor is moved up and down by the cursor key  and page change key , and the displayed history number can be changed.

(2) Soft Key [REC TOP] and [REC END]
If the soft key [REC TOP] is pressed, the oldest history number is displayed.
If the soft key [REC END] is pressed, the latest history number is displayed.

(3) Soft Key [F OUTPUT]
When the emergency stop state or EDIT mode is entered and the soft key [F OUTPUT] is pressed, the following soft keys are displayed.



When any file name is input and the soft key [EXEC] is pressed, all the histories saved in CNC are output.
If no name is input and the soft key [EXEC] is pressed, file name is “MSRHSTRY.TXT”

Signal Information

The signal information is displayed in the area in the right half of the machine state history list screen. The signal information of selected number history is displayed.

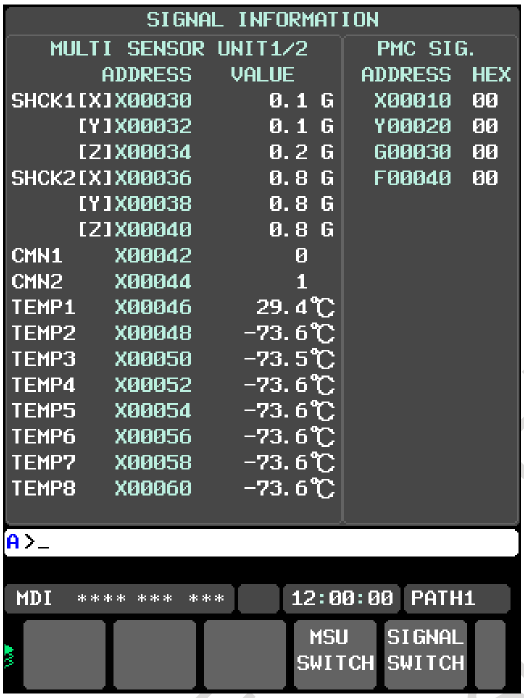


Fig. 19.1.8.1 (g) Signal Information

The content of the display and the operation are similar to the machine state monitoring screen. Refer to “Monitoring of PMC signals” and “With Multi-Sensor Unit”.

CNC Information

The CNC information is displayed in the area in the right half of the machine state history list screen. The CNC information of selected number history is displayed.

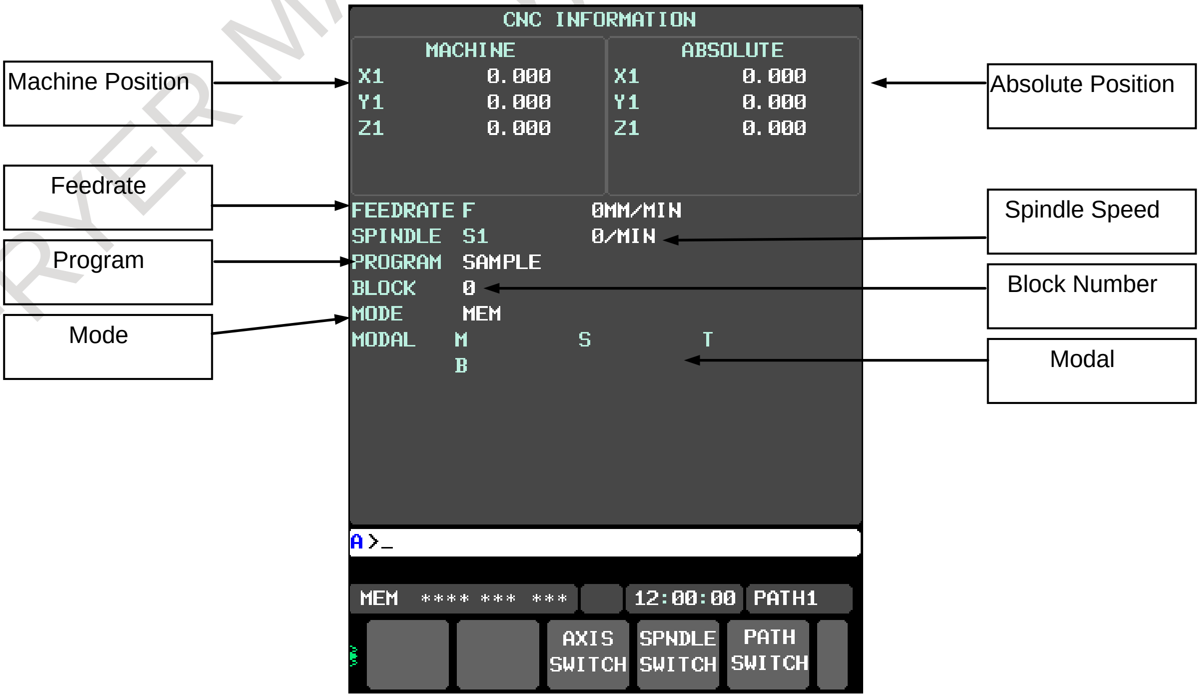

Fig. 19.1.8.1 (h) CNC Information

(1) Machine Position
Machine position is displayed.
When the number of control axis is six or more, if the soft key [AXIS SWITCH] is pressed then the axis since the sixth axis is displayed.

(2) Absolute Position
Absolute position is displayed.
When the number of control axis is six or more, if the soft key [AXIS SWITCH] is pressed then the axis since the sixth axis is displayed.

(3) Feedrate
Feedrate is displayed.

(4) Spindle Speed
Spindle speed is displayed.
When the number of spindle is two or more, if the soft key [SPINDLE SWITCH] is pressed then the spindle since the second spindle is displayed.

(5) Mode
Mode is displayed.

(6) Modal
Modal is displayed.
The modal that can be displayed is M, S, T, and B.

Operation in CNC Information

(1) Soft Key [AXIS SWITCH]
When the number of control axis is six or more, the soft key [AXIS SWITCH] is displayed.
If this soft key is pressed, the positions of the sixth and after axes are displayed in the machine and absolute coordinates.

(2) Soft Key [SPINDLE SWITCH]
When the number of spindle is two or more, the soft key [SPINDLE SWITCH] is displayed.
If this soft key is pressed, the speed of the second and after spindles is displayed.

(3) Soft Key [PATH SWITCH]
When the number of paths are two or more, the soft key [PATH SWITCH] is displayed.
If this soft key is pressed, the displayed path number is changed.

Operation History Information

The operation history information is displayed in the right half of the machine state history list screen.
The operation history until the time that the selected history was saved is displayed.
The operation history is saved about 400 MDI keys.

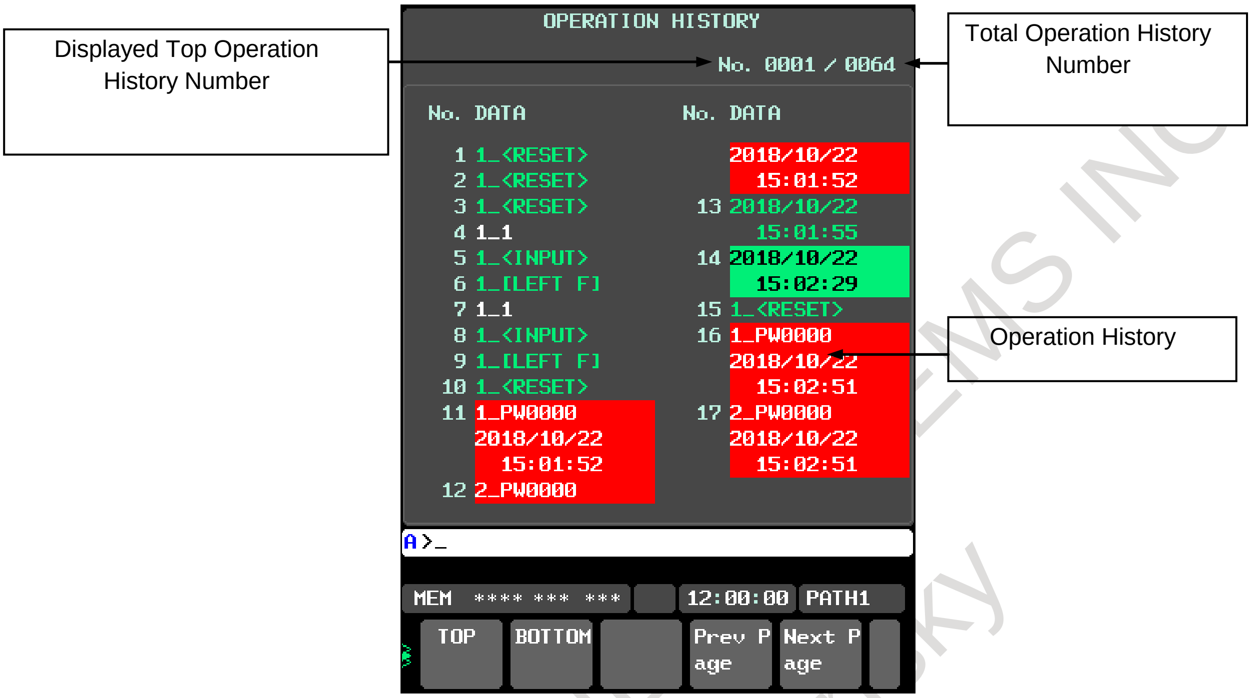

Fig. 19.1.8.1 (i) Operation History Information

Operation in Operation History Information

(1) Soft Key [TOP]
The oldest operation history is displayed.

(2) Soft Key [BOTTOM]
The newest operation history is displayed.

(3) Soft Key [Prev Page]
The previous page is displayed.

(4) Soft Key [Next Page]
The next page is displayed.

19.1.8.2 Machine State History CNC Data Screen

In the machine state history CNC data screen, the common information, the signal information and CNC information are displayed together.
In each machine state history screen, If the soft key [CNC DATA] is pressed, the machine state history CNC data screen is displayed.

Fig. 19.1.8.2 (a) CNC Data Screen

Refer to "Machine State History List Screen" for each information.

19.1.8.3 Machine State History Operation History Screen

In the machine state history operation history screen, the common information and operation history information are displayed together.
If the soft key [OPERAT HISTRY] is pressed, the machine state history operation history screen is displayed.
The operation history information is displayed in the full screen.

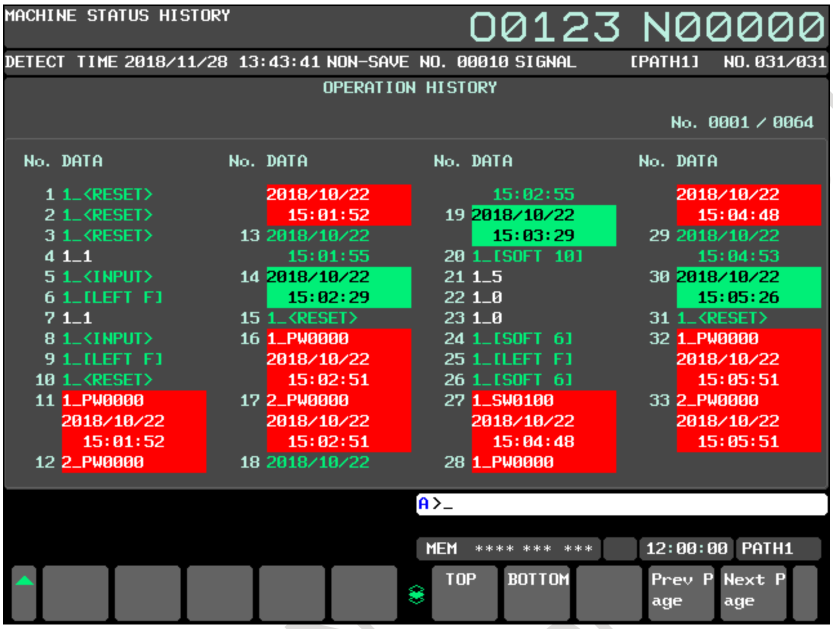

Fig. 19.1.8.3 (a) Operation History Screen

Refer to “Machine State History List Screen” for the displayed contents and the operation.

19.1.8.4 Output CNC Information

When the soft key [F OUTPUT] is pressed in the machine state history list screen, all history saved in CNC is output.
The composition of the output file is as follows.

HEADER
HISTORY DATA 1
HISTORY DATA 2
:
HISTORY DATA N

Fig. 19.1.8.4 (a) The composition of the output file

Header

In the header, total history number and file information is output. The file information is for maintenance.

NUMBER OF HISTORY : 010 ← Total history number
FILE INFORMATION : 1-100-10-9 ← File Information (For maintenance)

History Data

In the history data, history number, detect time, Non-Save Number, save trigger, Multi-Sensor Unit data(All MSU), PMC signal, CNC data(All Path), operation history and auxiliary information are output.

(1) History number, detect time and Non-Save Number.
The history number and the detect time are output as follows.
[HISTORY NO.001]-------------------------------- ← History Number
DETECT TIME : 2010/03/10 21:15:07 ← Detect Time
NON-SAVE NO. : 00025 ← Non-Save Number
SAVE TRIGGER: ABTRQ ← Save Trigger

(2) Multi-Sensor Unit Data

The Multi-Sensor Unit data is output as follows. In the case of the plural Multi-Sensor Units, all Multi-Sensor Unit data are output.

```
MULTI SENSOR UNIT DATA :
    <MULTI SENSOR UNIT NO.1>
        SHOCK1 X(X00000) :      0.0 [G]
        SHOCK1 Y(X00002) :      0.0 [G]
        SHOCK1 Z(X00004) :     29.9 [G]
        SHOCK2 X(X00006) :      1.9 [G]
        SHOCK2 Y(X00008) :      0.0 [G]
        SHOCK2 Z(X00010) :      0.0 [G]
        COMMON1 (X00012) :        0 [-]
        COMMON2 (X00014) :        0 [-]
        TEMP1    (X00016) :     0.0 [C]
        TEMP2    (X00018) :     0.0 [C]
        TEMP3    (X00020) :     0.0 [C]
        TEMP4    (X00022) :     0.0 [C]
        TEMP5    (X00024) :     0.0 [C]
        TEMP6    (X00026) :     0.0 [C]
        TEMP7    (X00028) :     0.0 [C]
        TEMP8    (X00030) :     0.0 [C]
                (Y00000) : -30656
                (Y00002) :      0
                (Y00004) :      0
                (Y00006) :      0
                (Y00008) :     16
                (Y00010) :      0
                (Y00012) :      0
                (Y00014) :      0
                (Y00016) :      0
                (Y00018) :      0
                (Y00020) :      0
                (Y00022) :      0
                (Y00024) :      0
                (Y00026) :      0
                (Y00028) :      0
                (Y00030) :      0
```

(3) PMC Signal

The PMC signal is output as follows.

```
Single PMC System
PMC SIGNAL DATA :
    X00000 0x3F
    X00001 0x04
    Y00000 0x00
    Y00008 0xF0
Multi PMC System:
PMC SIGNAL DATA :
    1:X00000 0x3F
    1:X00001 0x04
    1:Y00000 0x00
    1:Y00008 0xF0
```

(4) CNC Data

The CNC data is output as follows. In the case of multi path system all path data are output.

```
CNC DATA :
    <<MACHINE>>
        X           0.000
        Y           0.000
        Z           0.000
    <<ABSOLUTE>>
        X           0.000
        Y           0.000

Reading of CNC information by FOCAS2/C language executor

Information saved in CNC can be read by the following functions of the FOCAS2 library and the C language library of C language executor.

Table 19.1.8.4 (a)

Function Name	Function
cnc_upstart4	Beginning of NC data read (4)
cnc_upload4	NC data read (4)
cnc_upend4	End of NC data read (4)

When cnc_upstart4 is called specifying 78 for argument type, CNC information can be read.
A basic procedure of reading CNC information by cnc_upstart4, cnc_upload4, and cnc_upend4 function is as shown in fig.19.1.8.4 (b).

Please refer to “10.The function specification” of FANUC FOCAS1/2 library specifications (FWLIB32.HTM) included in “FOCAS1/2 library disk” for details of cnc_upstart4, cnc_upload4, and cnc_upend4 function of the FOCAS2 library.

Please refer to “the CNC/PMC window library” of C language Executor programming manual (B-63943EN-3) for details of cnc_upstart4, the cnc_upload4, and cnc_upend4 function of the C language library of C language executor.

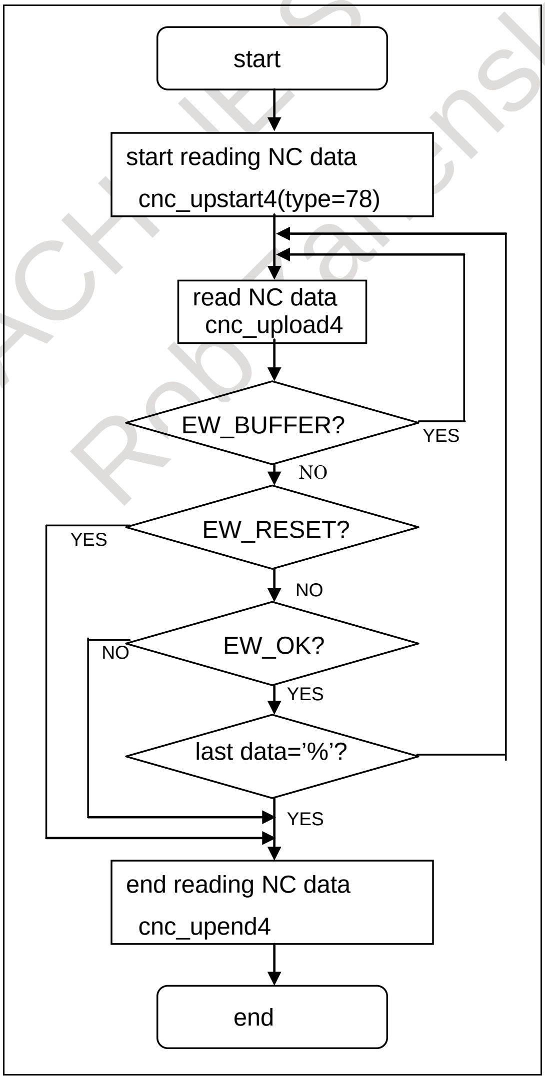

Fig. 19.1.8.4 (b) Reading data

19.1.9 Caution

To save CNC information for eight or more days, so number of saving information each day is restricted. The history can be saved only up to the potential saving number. (Refer to “Restriction of saving”)
So, in the ladder program, please judge trouble as accurately as possible.

Do not save CNC information at the time when trouble does not occur in order to decrease the load of CNC.

At shipment of CNC, Potential Saving Number is 30.

CNC information might not be able to be saved correctly immediately before the power failure. So in the system that can detect power failure, don’t save the CNC information when the power failure occurs.

19.2 SERVO/SPINDLE WAVEFORM DATA OUTPUT FUNCTION

19.2.1 Outline

When something trouble occurs with machine, servos and spindles waveform data before and after the trouble is automatically output to Data Server, which is sampled by Trouble diagnosis function.
Since long-termed data is automatically saved, it is easier to detect the cause of the trouble.

CNC always samples waveform data.
If something trouble occurs with machine, CNC detects the trouble through alarms or signals and output waveform data before and after the trouble to Data Server automatically (Fig.19.2.1(a)).

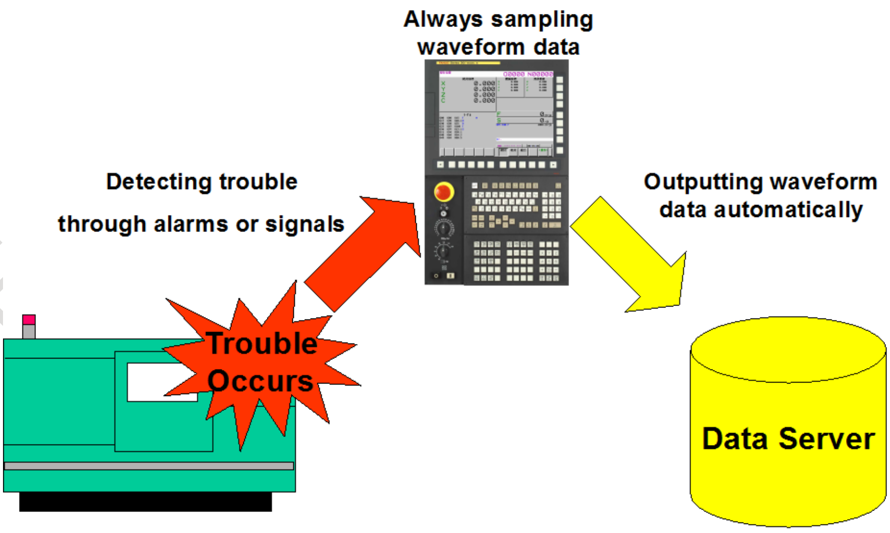

Fig. 19.2.1 (a) Outline of Servo / spindle waveform data output function

> **NOTE**
> This function requires Data Server function.

19.2.2 Waveform Data

This function can output several kinds of data listed in tables below.
Each data can be sampled for up to 40 seconds summing up before and after trouble.

Table 19.2.2 (a) Data list for servo motors

Data (Unit)	
Accumulated command pulse	(pulse)
Accumulated feedback pulse	(pulse)
Position error	(pulse)
Reference counter	(pulse)
Actual speed	(1/min)
Torque command	(%)
Head simulation	(%)
Motor current	(A)
Disturbance level	(%)
Arbitrary data	
Effective current	(%)
AMR data	
Arbitrary data 2	

Table 19.2.2 (b) Data list for spindle motors

Data (Unit)	
Actual motor speed	(1/min)
Load meter	(%)
Position error	(pulse)
Torque command	(%)
Motor current	(A)

Whole data of all axes can be output, though output data can be selected by parameters.

> **NOTE**
> The upper limit of sampling time cannot be extended even if output data is reduced.

19.2.3 Sampling

It is necessary to always sample waveform data in order to use this function.
Trouble diagnosis data monitoring signal TDDM<G0589.0> starts the sampling.
Trouble diagnosis data monitoring signal clears latched data of Trouble diagnosis function and changes the state of the function from “LATCHED” to “SAMPLING”.

Output of waveform data to Data Server starts when sampling after trouble finishes, which is specified by parameter No.24320.
It is necessary to start sampling again by trouble diagnosis data monitoring signal after outputting of waveform data.
Weather the output finishes or not is indicated by Waveform data transfer signal WVTRNS<F0578.0>.

Restriction

When this function is effective, the state of Trouble diagnosis function, “SAMPLING” or “LATCHED”, is common for all paths, though the state can be different for each path in ordinary Trouble diagnosis function. Therefore, Trouble diagnosis data monitoring signal starts sampling of all paths simultaneously and trouble in some path stops sampling of all paths.

NOTE
1. Latched data of Trouble diagnosis function and waveform data sampled by this function is cleared when sampling restarts after trouble.
2. Though Trouble diagnosis data monitoring signal is for each path, this function uses only the signal of 1st path.
3. Trouble diagnosis data monitoring signal is ignored when SV or SP alarm occurs in some path. Start sampling by Trouble diagnosis data monitoring signal after confirming that no SV or SP alarm occurs in all paths.
4. The state of sampling (the state of Trouble diagnosis function) does not change even if power is turned off and on. Therefore, it is necessary to start sampling after power is turned on if sampling was stopped (the state of Trouble diagnosis function was "LATCHED") before power was turned off. Oppositely, sampling is started automatically after power is turned on if sampling was active (the state of Trouble diagnosis function was "SAMPLING") before power was turned off.

19.2.4 Detect Trouble

SV or SP alarm changes the state of Trouble diagnosis function into "LATCHED" when the state is "SAMPLING". At the same time, CNC regards that something trouble occurs with machine and the sequence of outputting waveform data of servos and spindles to Data Server is started.

This function makes it possible to detect trouble by changing Trouble diagnosis data latching signal TDDL<G0589.1> from "0" to "1" as well as SV and SP alarms. Weather trouble is detected by Trouble diagnosis data latching signal or not is specified by bit 1 (SPT) of parameter No.24318.

NOTE
1. Though Trouble diagnosis data latching signal is for each path, this function uses the signal of 1st path.
2. Data of Trouble diagnosis function is latched and the state changes from "SAMPLING" to "LATCHED" when trouble is detected by Trouble diagnosis data latching signal.
3. Sampling continues for a while after trouble is detected, which can be specified by parameter No.24320.
4. Trouble is not detected and this function is not active when the state of Trouble diagnosis function is "LATCHED".

19.2.5 Sequence when Trouble Occurs

Servos and spindles waveform data is sampled with constant period and, if trouble occurs, data before and after the trouble specified by parameter Nos.24319 and 24320 is output to Data Server. The output is started automatically if sampling after the trouble finishes, which is specified by parameter No.24320.
Waveform data transfer signal WVTRNS<F0578.0> is "1" between the occurrence of the trouble and the end of the output.
Sequence when trouble occurs is shown in Fig. 19.2.5 (a) and Fig. 19.2.5 (b) below.

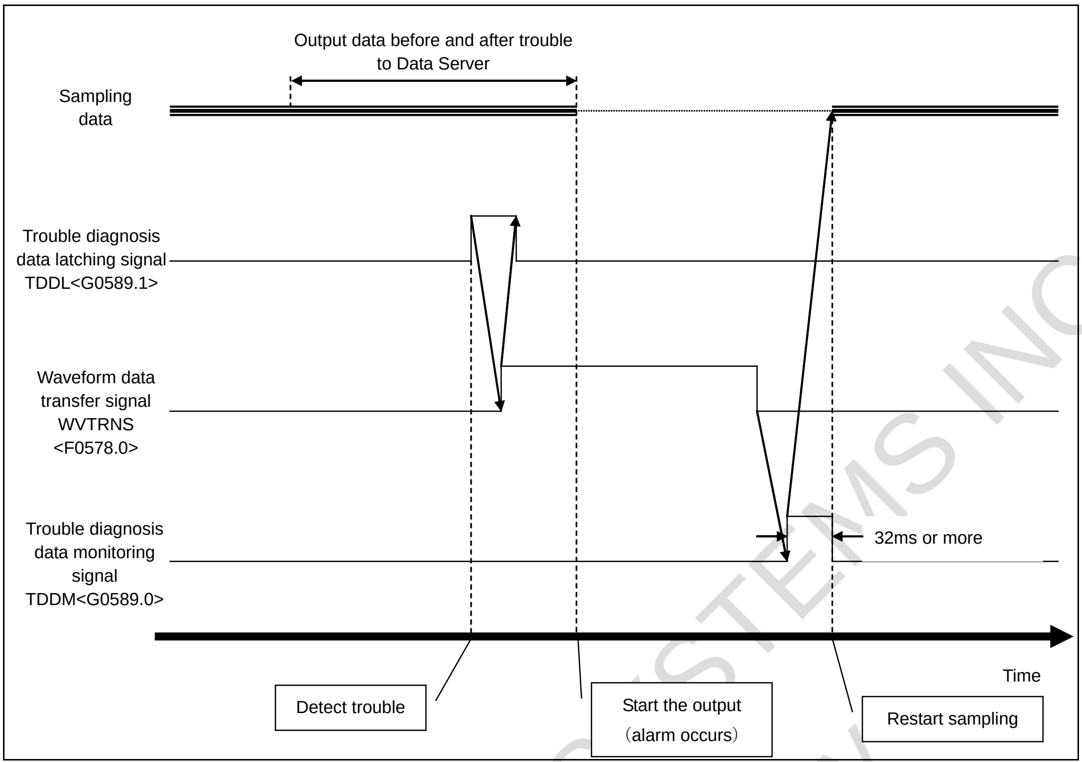

Fig. 19.2.5 (a) Sequence when trouble occurs (when the trouble is detected by the signal)

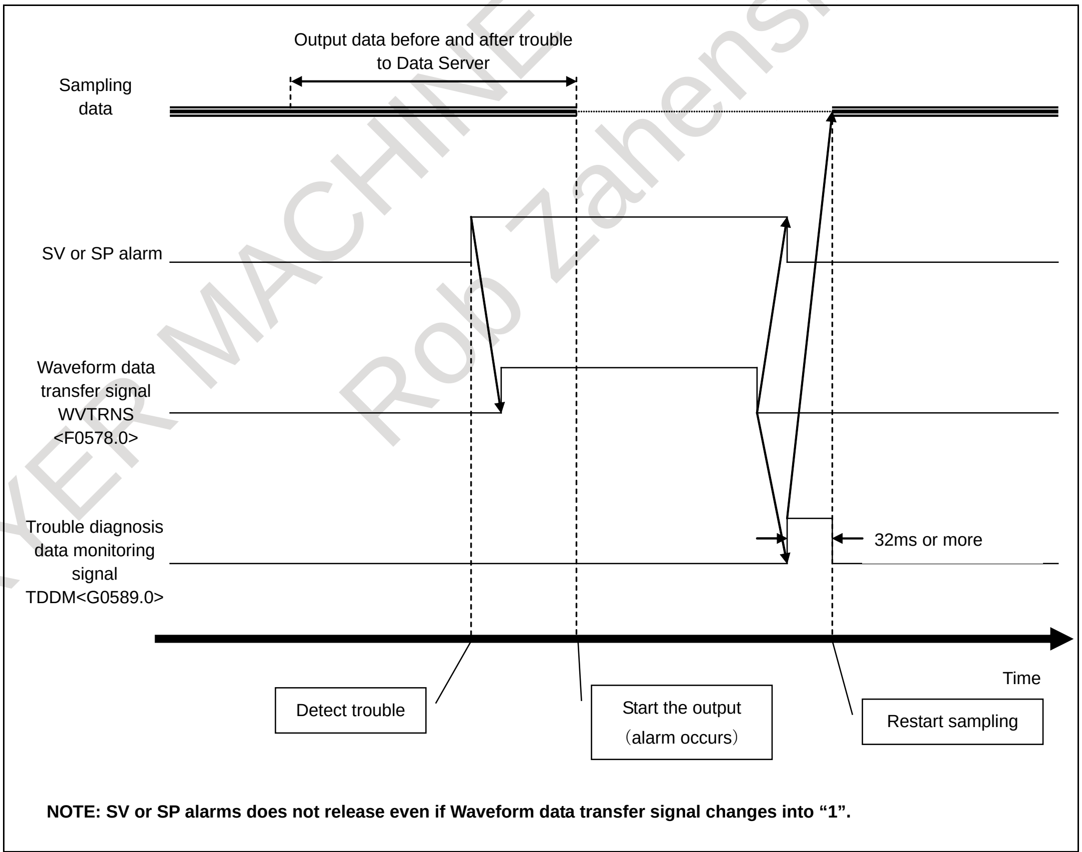

Fig. 19.2.5 (b) Sequence when trouble occurs (when the trouble is detected by SV or SP alarm)

> **NOTE**
> 1 Make it impossible to turn off power during Waveform data transfer signal is "1" in order to output data normally.
> 2 Sampling cannot be started when Waveform data transfer signal is "1" or SV/SP alarm occurs. In addition, Trouble diagnosis function and this function are not effective in such cases.

19.2.6 Data Output

Output of waveform data to Data Server is started automatically if trouble is detected and sampling after the trouble finishes, which is specified by parameter No.24320.
"OUTPUT" is blinking at Status bar during the output.
The data is output to "SVSPWAVE" folder below Data Folder on Data Server regardless of I/O devices specified in parameter Nos.20-23.
Make all paths in alarm states before the output, which is required to start the output to Data Server (See 0 in NOTE below).

Waveform data transfer failure signal WVTF<F0578.1> is "1" if the output fails because of, for examples, no data Folder existing on Data Server, memory shortage, not in alarm states, and so on. After the cause of failure is resolved while WVTF<F0578.1> is "1", setting Waveform data re-output signal WVROP<G0589.2> from "0" to "1" restarts the output in such cases.
Waveform data transfer failure signal is "0" in the following cases:
1) When the re-output finishes normally.
2) When the next sampling is started.
3) When power is turned off.
Sequence of normal output is shown in Fig. 19.2.6 (a) and Fig. 19.2.6 (b), and that of output failure is shown in Fig. 19.2.6 (c) and Fig. 19.2.6 (d).

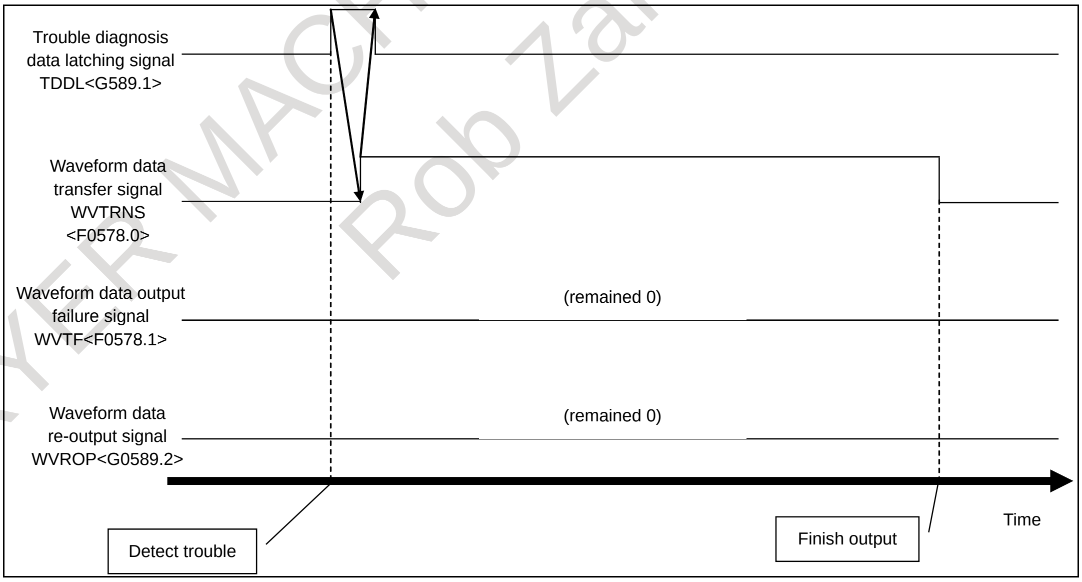

Fig. 19.2.6 (a) Sequence of normal output (when the trouble is detected by the signal)

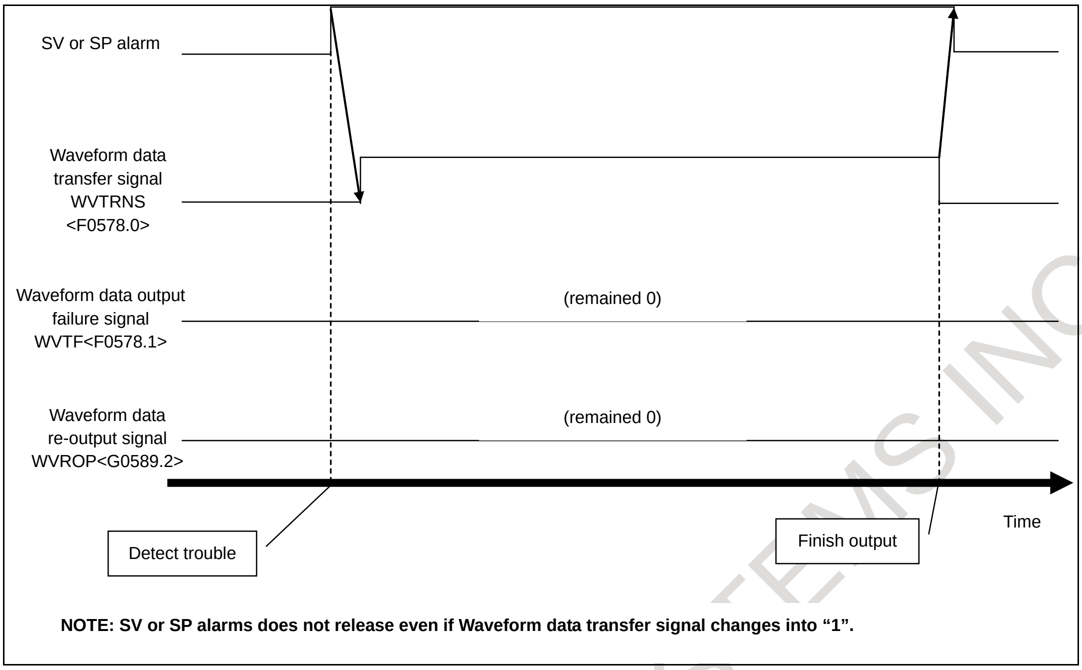

Fig. 19.2.6 (b) Sequence of normal output (when the trouble is detected by SV or SP alarm)

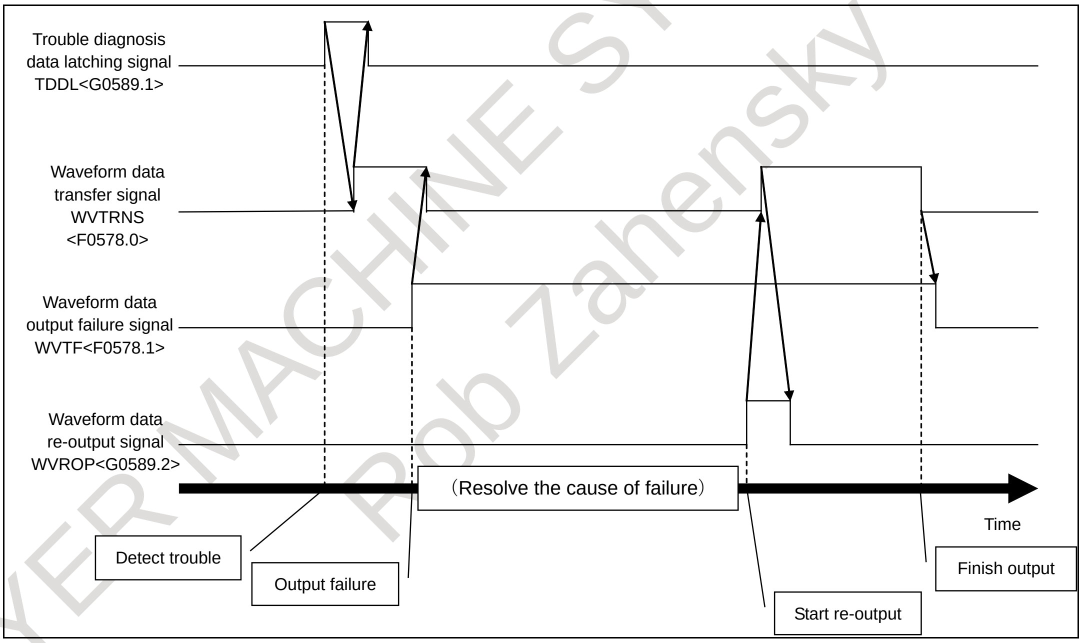

Fig. 19.2.6 (c) Sequence when output fails (when the trouble is detected by the signal)

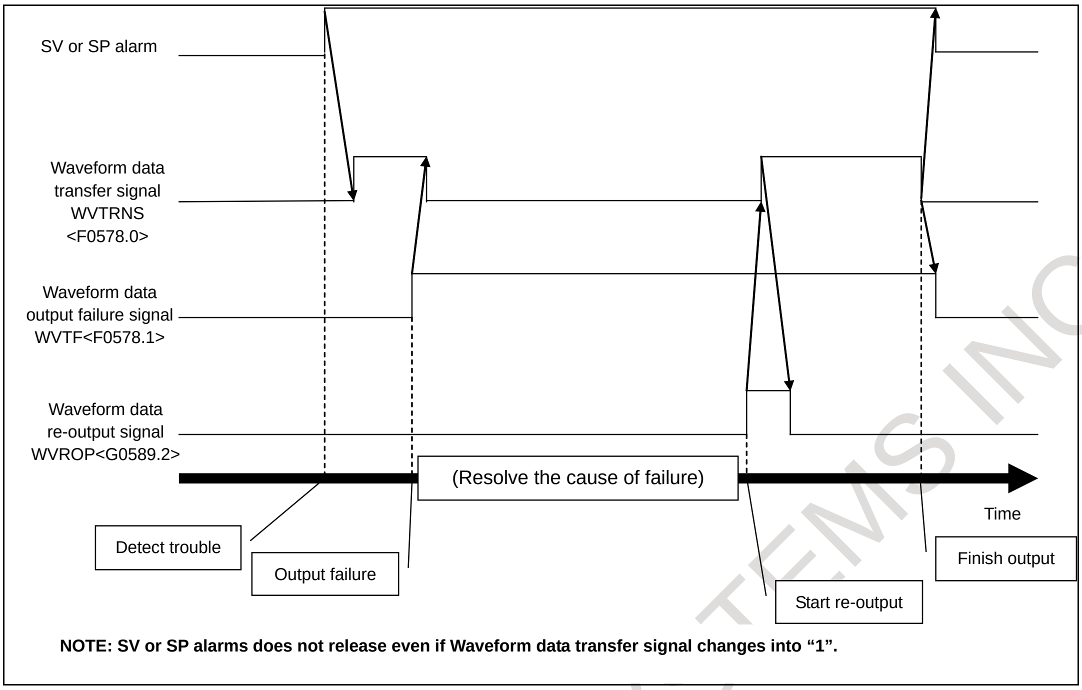

Fig. 19.2.6 (d) Sequence when output fails (when the trouble is detected by SV or SP alarm)

NOTE

1. Make all paths in alarm states by external alarms before the output starts if trouble is detected by Trouble diagnosis data latching signal (TDDL).
2. Remain alarm states during the output.
3. Output of waveform data cannot be stopped by reset operations.
4. It is impossible to output other data by screen operations during the data output. Warning message "THE MACHINE IS UNDER USE" is displayed if an output operation is made during the data output.
5. Screen hard copy cannot be used during the output. BG alarm "HARD COPY REJECTED DURING OUTPUT" occurs if screen hard copy is requested by a MDI operation or a signal. In the same way, EW_REJECT is returned if screen hard copy is requested from a FOCAS2 function.
6. Operations listed below are accepted after the output finishes if they are operated during the data output:
   - Changing the active path (only for display)
   - Saving alarm history (Time when the save is done is saved as the occurrence time of the alarm.)
   - Writing PMC data on FROM
   - Setting Memory protection signal KEYP<G0046.0>
   - Changing displayed language
7. It takes several 10 seconds or a few minutes to output whole data.
8. Re-output makes a new file involving whole data. The old defective file is overwritten by the new file.
9. Reserve enough area on Data Server to output waveform data by transferring files in "SVSPWAVE" folder to host computers etc. regularly because waveform data is always output automatically if trouble is detected.
   Diagnosis No.4600 will help the data transfer.
10. Specify ratio of capacity available for data folder and number of registered files among total capacity and the maximum number of registered files of CF card mounted on data server in parameter No.24315.

19.2.7 Output File Format

Waveform data is output in CSV format.

Filename

Output filenames are in the format “SVSPW_yyyymmddHHMMSS.CSV”.
The part of “yyyymmddHHMMSS” means date when trouble occurs.

- yyyy: year (2000-2999)
- mm: month (01-12)
- dd: day (01-31)
- HH: hour (00-23)
- MM: minute (00-59)
- SS: second (00-59)

File format

File format is as shown below.

%							

Wave Data of Trouble Diagnosis							←Title

%							

19.2.8 Restriction

Sampling of this function stops when sampling of Waveform diagnosis function is active.
Note that Servos and spindles waveform data is not output if something trouble occurs during sampling of Waveform diagnosis function is active.

Signal

Trouble diagnosis data monitoring signal TDDM<Gn589.0>

[Classification] Input signal

[Function] Clears latched data of Trouble diagnosis function and changes the state from "LATCHED" to "SAMPLING". In addition, sampling of all paths starts in Servo / spindle waveform data output function.

[Operation] When this signal is set from "0" to "1", latched data of Trouble diagnosis function is cleared and the state changes from "LATCHED" to "SAMPLING". In addition, sampling of waveform data starts. Note that this signal is ignored when Wave data transfer signal WVTRNS is "1". Since this signal is also ignored when SV or SP alarm occurs, set this signal after resolving the causes of alarms.

> **NOTE**
> Only the signal of 1st path is effective when Servo / spindle waveform data output function is effective.

Trouble diagnosis data latching signal TDDL<Gn589.1>

[Classification] Input signal

[Function] Latches data of Trouble diagnosis function and changes the state from "SAMPLING" to "LATCHED". In addition, sequence of outputting waveform data starts in Servo / spindle waveform data output function.

[Operation] When this signal is set from "0" to "1", data of Trouble diagnosis function is latched and the state changes from "SAMPLING" to "LATCHED". In addition, sequence of outputting waveform data starts. Note that this signal is ignored when the state of Trouble diagnosis function is "LATCHED".

> **NOTE**
> Only the signal of 1st path is effective when Servo / spindle waveform data output function is effective.

Waveform data re-output signal WVROP<G0589.2>

[Classification] Input signal

[Function] Starts re-output of waveform data if output of servos and spindles waveform data fails because of shortage of memory and so on.

[Operation] When this signal is set from "0" to "1", re-output of waveform data is started. Start re-output by this signal after resolving causes of output failure. Note that this signal is ignored when Waveform data transfer failure signal WVTF is "0".

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn589						WVROP	TDDL	TDDM

Waveform data transfer signal WVTRNS<F0578.0>

[Classification] Output signal

[Function] Notifies that trouble was detected and that output of waveform data does not finish in Servo / spindle waveform data output function. Note that this signal is “1” even if output of waveform data does not run during sampling after the trouble.

[Operation] This signal is “1” when output of waveform data does not finish.
This signal is “0” when output of waveform data finishes.

Waveform data transfer failure signal WVTF<F0578.1>

[Classification] Output signal

[Function] Notifies that output of waveform data failed in Servo / spindle waveform data output function. Re-output of the data can be started by Waveform data re-output signal when this signal is “1”.

[Operation] This signal is “1” when output of waveform data failed.
This signal is “0” in the following cases:

1. Output of waveform data was normal.
2. Sampling of waveform data was restarted.
3. Power was turned off and on.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Fn578							WVTF	WVTRNS

Parameter

24315	Ratio of use of data folder of data server

[Input type] Parameter input

[Data type] Byte system

[Valid data range] 0 to 9(common to the system)

Specify ratio of capacity available for data folder and number of registered files among total capacity and the maximum number of registered files of CF card mounted on data server.

For example, when formatting is executed by setting parameter DFR to 3, while using a CF card with 2 GB capacity, in data folder it is possible to use up to about 0.6 GB, which is 30% of the total capacity, and available capacity of NC program storage area is approximately 1.4 GB.

Also, if 2047 files can be registered, the maximum number of registered files is 614 in the data folder and 1433 in NC program. If 0 is specified, the data folder cannot be available and the data folder is not created even when formatting.

When 10 or more or -1 or less is specified, it assumed to be 5.

	#7	#6	#5	#4	#3	#2	#1	#0
24318							SPT	WDT

[Input type] Parameter input

[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 WDT Servo / spindle waveform data output function is

0: Effective.

1: Not effective.

#1 SPT In Trouble diagnosis function and Servo / spindle waveform data output function, Trouble diagnosis data monitoring signal and Trouble diagnosis data latching signal are
0: Ignored.
1: Not ignored.

24319	Sampling time of waveform data before trouble

[Input type] Parameter input
[Data type] Byte
[Unit of data] sec
[Valid data range] 0 to 40

24320	Sampling time of waveform data after trouble

[Input type] Parameter input
[Data type] Byte
[Unit of data] sec
[Valid data range] 0 to 40

Set sampling times before and after trouble in Servo / spindle waveform data output function.
Specify the sampling times so that the sum of them is within 40 seconds because room for the buffer is limited. Note that data is not sampled as specified by these parameters if the sum exceeds 40 seconds.
The following is an example when the sum exceeds 40 seconds:
When 30 seconds is specified for the sampling time before trouble and 20 seconds is specified for the sampling time after trouble, waveform data of 30 seconds before trouble and of 10 seconds after trouble is obtained.
When 50 seconds is specified for the sampling time before trouble and 10 seconds is specified for the sampling time after trouble, waveform data of only 40 seconds before trouble is obtained.

	#7	#6	#5	#4	#3	#2	#1	#0
24321	MCR	HTS	TCM	ASD	REF	PER	FBP	CMP

[Input type] Parameter input
[Data type] Bit axis

#0 CMP In Servo / spindle waveform data output function, accumulated command pulse of a servo axis is
0: Output.
1: Not output.

#1 FBP In Servo / spindle waveform data output function, accumulated feedback pulse of a servo axis is
0: Output.
1: Not output.

#2 PER In Servo / spindle waveform data output function, position error of a servo axis is
0: Output.
1: Not output.

#3 REF In Servo / spindle waveform data output function, reference counter of a servo axis is
0: Output.
1: Not output.

#4 ASD In Servo / spindle waveform data output function, actual speed of a servo axis is

0: Output.
1: Not output.

#5 TCM In Servo / spindle waveform data output function, torque command of a servo axis is
0: Output.
1: Not output.

#6 HTS In Servo / spindle waveform data output function, heat simulation of a servo axis is
0: Output.
1: Not output.

#7 MCR In Servo / spindle waveform data output function, motor current of a servo axis is
0: Output.
1: Not output.

	#7	#6	#5	#4	#3	#2	#1	#0
24322				AR2	AMR	EFC	AR1	DLV

[Input type] Parameter input
[Data type] Bit axis

#0 DLV In Servo / spindle waveform data output function, disturbance level of a servo axis is
0: Output.
1: Not output.

#1 AR1 In Servo / spindle waveform data output function, arbitrary data 1 of a servo axis is
0: Output.
1: Not output.

#2 EFC In Servo / spindle waveform data output function, effective current of a servo axis is
0: Output.
1: Not output.

#3 AMR In Servo / spindle waveform data output function, AMR data of a servo axis is
0: Output.
1: Not output.

#4 AR2 In Servo / spindle waveform data output function, arbitrary data 2 of a servo axis is
0: Output.
1: Not output.

	#7	#6	#5	#4	#3	#2	#1	#0
24323				MCR	TCM	PER	LDM	SPD

[Input type] Parameter input
[Data type] Bit spindle

#0 SPD In Servo / spindle waveform data output function, actual motor speed of a spindle axis is
0: Output.
1: Not output.

#1 LDM In Servo / spindle waveform data output function, load meter of a spindle axis is
0: Output.
1: Not output.

#2 PER In Servo / spindle waveform data output function, position error of a spindle axis is

0: Output.
1: Not output.

#3 TCM In Servo / spindle waveform data output function, torque command of a spindle axis is
0: Output.
1: Not output.

#4 MCR In Servo / spindle waveform data output function, motor current of a spindle axis is
0: Output.
1: Not output.

Diagnosis

Diagnosis	4600	Counter of output of waveform data

[Data type] Byte
[Unit of data] 1 time
[Valid data range] 0-255

The state of output of servos and spindles waveform data can be displayed.

Power-on clears this value to 0 and then 1 is added when output starts. In addition, 1 is added again when output finishes normally. Therefore, odd number means that output is active and even number means that output is not active.

Note that this value changes as follows if output fails:
1 1 is added when output starts.
2 1 is subtracted when output fails.
3 1 is added when output starts again.
4 1 is added when output finishes normally.

NOTE
1 This value is not cleared even if power is turned off.
2 This value is counted up from 0 again if this value exceeds 255.

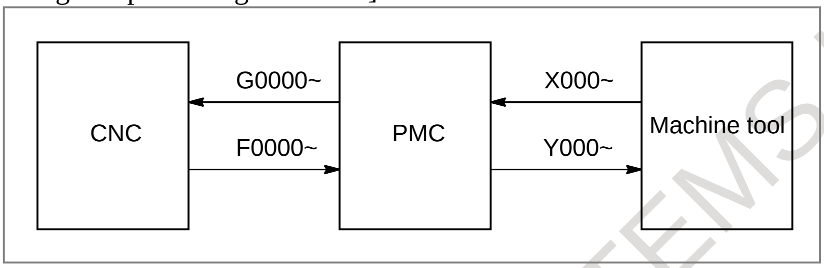
APPENDIX

A INTERFACE BETWEEN CNC AND PMC

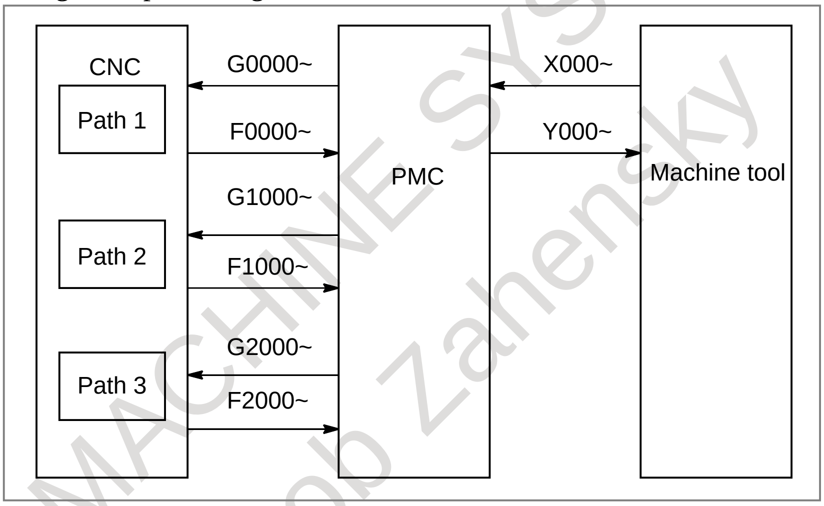
A.1 LIST OF ADDRESSES

Interface addresses among CNC and PMC are as follows:

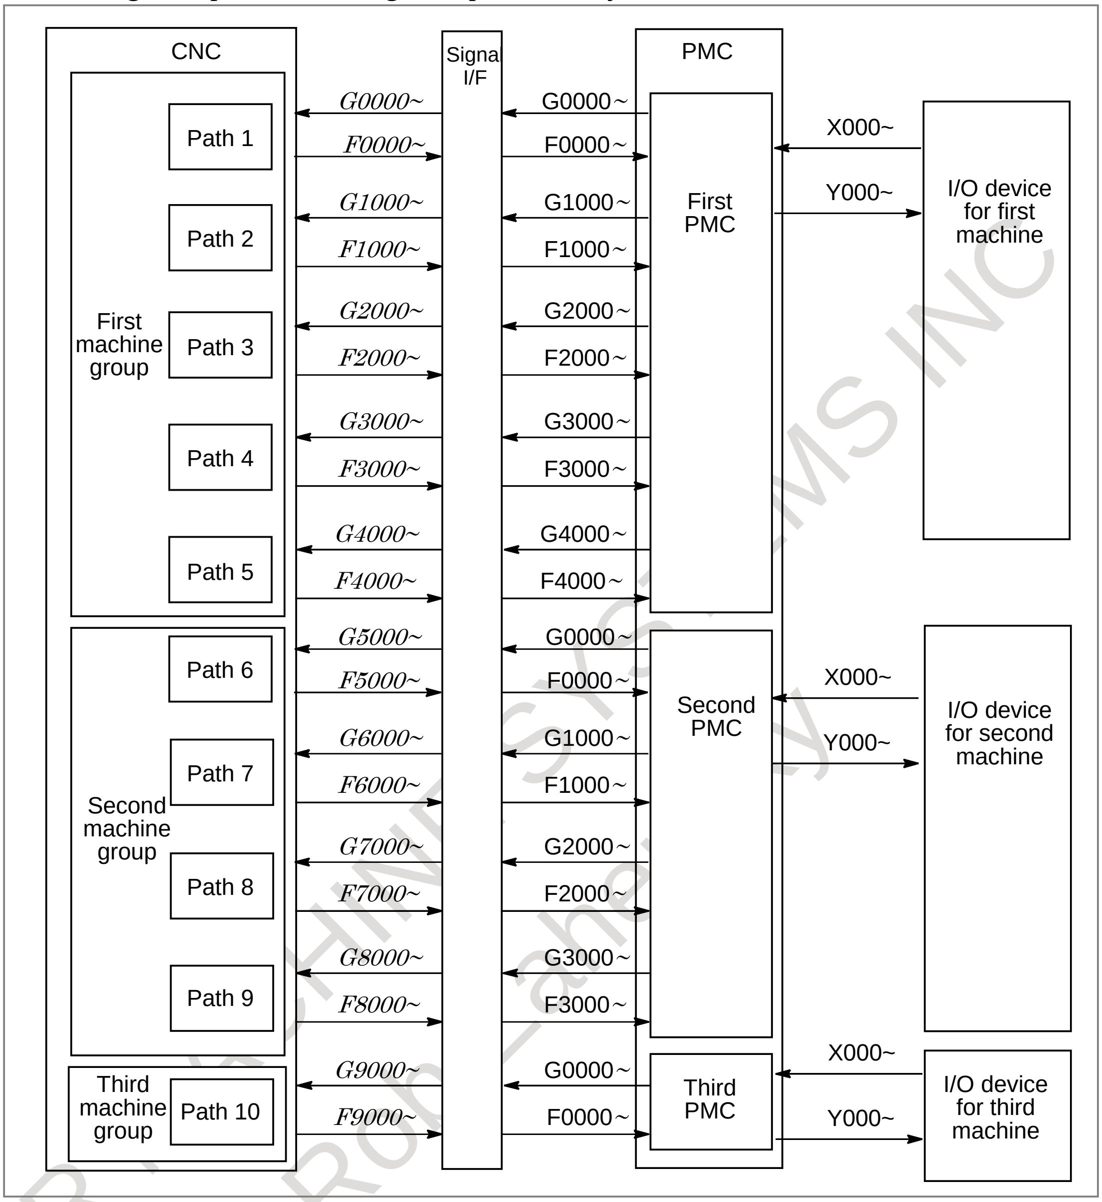
[Example of controlling one path using one PMC]



[Example of controlling three path using one PMC]



[Example of controlling multipath CNC using multipath PMC system]



> **NOTE**
> Each PMC of a multipath PMC system has an independent signal area. The F, G, X, and Y signal addresses of each PMC begin with 0. On the other hand, the F and G signal addresses from the viewpoint of the CNC are fixed for each path number. Note that the F and G signal addresses used in programming of each ladder are different from those from the viewpoint of the CNC.

- Expression of signals

Address	Symbol (#0 to #7 indicates bit position)							
	#7	#6	#5	#4	#3	#2	#1	#0
Fn000	OP	SA	STL	SPL				RWD

In an item where both lathe system and machining center system are described, some signals are covered with shade ( ) in the signal address figure as shown below. This means either lathe system or machining center system does not have this signal. Upper part is for lathe system and lower part is for machining center system.

	#7	#6	#5	#4	#3	#2	#1	#0	
Gn053	*CDZ		ROVLP		UINT			TMRON	T series M series

[Example 1]

The figure above indicates ROVLP is provided only for the lathe system while the other signals for both the lathe system and machining system.

	#7	#6	#5	#4	#3	#2	#1	#0	
Gn040					OFN9	OFN8	OFN7	OFN6	T series M series

[Example 2]

Signals OFN6 to OFN9 are for machining center system only.

NOTE

1 In X addresses in the table, the emergency stop signal for each signal is *ESP<X0008.4>, *ESP<X0008.0>, and *ESP<X008.1>, respectively.

2 For multipath control, one of the following superscripts is attached to the top right of a symbol depending on the signal type.
- Path type (for path 1 on PMC side) : #1
- Path type (for path 2 on PMC side) : #2
- Path type (for path 3 on PMC side) : #3

In addition, #1, #2 or #3 attached to a signal indicates the signal is provided only for path 1, 2, or 3 on PMC side, respectively.
- Path type : #P
- Controlled axis type : #SV
- Spindle type : #SP

In G and F addresses in the table, #P, #SV, or #SP attached to a signal indicates the signal is provided for each path on CNC side, each control axis on CNC side, or each spindle on CNC side, respectively.
- PMC axis control group type: #PX

#PX attached to a signal indicates the signal is provided for each PMC axis control group.

3 For the signals, a single data number is assigned to 8 bits. Each bit has a different meaning.

4 The letter "n" in each address representation indicates the address position used in each path on the CNC side, as shown below.

1st path : n=0 (No. 0 to 999)
2nd path : n=1 (No. 1000 to 1999)
: :
10th path : n=9 (No. 9000 to 9999)

5 For a signal of controlled axis type, when the number of axes eceeds eight for each path, set parameter No. 3021 to address this situation.

6 For a signal of spindle type, when the number of axes eceeds four for each path, set parameter No. 3022 to address this situation.

A.2 LIST OF SIGNALS

A.2.1 List of Signals (In Order of Functions)

○ : Available
● : Available only with multi path control
- : Unavailable

Function	Signal name	Symbol	Address	T series	M series
2nd feedrate override	2nd feedrate override signals	*AFV0 to *AFV7	G013	○	○
2nd geometry tool offset	Tool offset direction signal	G2RVX	G090.0	○	-
		G2RVZ	G090.1	○	-
		G2RVY	G090.2	○	-
	2nd geometry tool offset axis select signal	G2X	G090.4	○	-
		G2Z	G090.5	○	-
		G2Y	G090.6	○	-
	2nd geometry tool offset signal	G2SLC	G090.7	○	-
2nd reference position return/3rd, 4th reference position return	2nd reference position return completion signals	ZP21 to ZP28	F096	○	○
	3rd reference position return completion signals	ZP31 to ZP38	F098	○	○
	4th reference position return completion signals	ZP41 to ZP48	F100	○	○
Absolute position detection	Absolute position detector battery voltage zero alarm signal	PBATZ	F172.6	○	○
	Absolute position detector battery voltage low alarm signal	PBATL	F172.7	○	○
Actual speed display	Actual speed display axis selection signals	*ACTF1 to *ACTF8	G580	○	○
Actual spindle speed output	Actual spindle speed signals	AR00 to AR15	F040,F041	○	○
		AR002 to AR152	F202,F203	○	○
		AR003 to AR153	F206,F207	○	○
		AR004 to AR154	F272,F273	○	○
AI contour control I/II	AI contour control mode signal	AICC	F062.0	○	○
Alarm signal	Alarm signal	AL	F001.0	○	○
	Battery alarm signal	BAL	F001.2	○	○
Angular axis control	Signal for disabling angular axis control for the perpendicular axis	NOZAGC	G063.5	○	○
Arbitrary speed threading	Chamfering for arbitrary speed threading signal	ASTC	G549.6	○	○
	Groove of thread measurement signal	GTMSR	G549.4	○	○
	Re-machining thread signal	RMTC	G549.5	○	○
	Groove of thread measurement completion signal	GTMC	F546.4	○	○
	Groove of thread measurement error signal	GTME	F546.5	○	○

Function	Signal name	Symbol	Address	T series	M series
Arbitrary spindle position phase synchronization function	Spindle position save start signal	SPMST1 to SPMST4	G587.0 to G587.3	○	○
	Spindle position save selection signal	SMSL11 to SMSL14	G588.0 to G588.3	○	○
		SMSL21 to SMSL24	G588.4 to G588.7	○	○
	Arbitrary spindle position phase synchronization signal	SPAPH1 to SPAPH4	G587.4 to G587.7	○	○
	Spindle position save completion signal	SPMFN1 to SPMFN4	F577.0 to F577.3	○	○
	Spindle position save error signal	SPMER1 to SPMER4	F577.4 to F577.7	○	○
Automatic data backup	Automatic data backup executing signal	ATBK	F520.0	○	○
Automatic phase synchronization for flexible synchronization control	Flexible synchronization control automatic phase synchronization signals	AUTPHA, AUTPHB, AUTPHC, AUTPHD	G381.0 to G381.3	○	○
	Flexible synchronization control phase synchronization end signals	PHFINA, PHFINB, PHFINC, PHFIND	F381.0 to F381.3	○	○
	Automatic phase synchronization error detection signals	PHERA, PHERB, PHERC, PHERD	F553.0 to F553.3	○	○
	Flexible synchronization control mode selecting signals	FSYSA, FSYSB, FSYSC, FSYSD	F553.4 to F553.7	○	○
Automatic tool length measurement (M series)/ Automatic tool offset (T series)	Measuring position reached signals	GAE1	G517.0	○	○
		GAE2	G517.1	○	○
		GAE3	G517.2	-	○
Auxiliary function/2nd auxiliary function	Auxiliary function code signals	M00 to M31	F010 to F013	○	○
	Auxiliary function strobe signals	MF	F007.0	○	○
	Decode M signals	DM00	F009.7	○	○
		DM01	F009.6	○	○
		DM02	F009.5	○	○
		DM30	F009.4	○	○
	Spindle function code signals	S00 to S31	F022 to F025	○	○
Auxiliary function/2nd auxiliary function	Spindle function strobe signal	SF	F007.2	○	○
	Tool function code signals	T00 to T31	F026 to F029	○	○
	Tool function strobe signal	TF	F007.3	○	○
	2nd auxiliary function code signals	B00 to B31	F030 to F033	○	○
	2nd auxiliary function strobe signal	BF	F007.7	○	○
	End signal	FIN	G004.3	○	○
	Distribution completion signals	DEN	F001.3	○	○

Function	Signal name	Symbol	Address	T series	M series
Auxiliary function lock	Auxiliary function lock signal	AFL	G005.6	○	○
	Auxiliary function lock check signal	MAFL	F004.4	○	○
Auxiliary function output block reverse movement for manual handle retrace	Auxiliary function output block reverse movement enable output signal	ADCO	F091.5	○	○
Axis immediate stop	Axis immediate stop start signal	ESTPR	G203.3	○	○
Axis non-display	Axis non-displayed signals	NPOS1 to NPOS8	G198	○	○
Axis switching	Axis switching signals	AXC1	G534.0	○	○
		AXC2	G534.1	○	○
		AXC4	G534.2	○	○
Axis synchronous control	Signals for selecting the manual feed axis for axis synchronous control	SYNCJ1 to SYNCJ8	G140	○	○
	Machine coordinate match state output signals	SYNMT1 to SYNMT8	F210	○	○
	Axis synchronous control status signals	SYNO1 to SYNO8	F532	○	○
	Synchronization compensation enable state output signals	SYNOF1 to SYNOF8	F211	○	○
	Signal for indicating a positional deviation error alarm for axis synchronous control	SYNER	F403.0	○	○
	Synchronous control axis selection signals	SYNC1 to SYNC8	G138	○	○
	Signal for disabling torque difference alarm detection for axis synchronous control	NSYNCA	G059.7	○	○
Axis total travel distance display	Total travel distance clear signal	TDC1 to TDC8	G726	○	○
	Target distance attainment status signal	TDA1 to TDA8	F730	○	○
Canned cycle / multiple repetitive canned cycle	Chamfering signal	*CDZ	G053.7	○	-
Canned cycle for drilling	Small-hole peck drilling cycle in progress signal	PECK2	F066.5	-	○
	Tapping signal	TAP	F001.5	○	○
Changing the display language by pmc signals	Display language switch start signal	SLANG	G581.7	○	○
	Display language setting signals	LANG1 to LANG7	G581.0 to G581.6	○	○
	Display language switch completion signal	FLANG	F545.0	○	○
Chuck / tail stock barrier	Tail stock barrier selection signal	*TSB	G060.7	○	-
CNC ready signal	CNC ready signal	MA	F001.7	○	○
	Servo ready signal	SA	F000.6	○	○
CNC screen dual display	Key control selection signal	CNCKY	G295.7	○	○

Function	Signal name	Symbol	Address	T series	M series
CNC screen dual display	Key control selection status signal	CNCKYO	F295.7	○	○
	Dual display forcible end request signal	C2SEND	G295.6	○	○
	Dual display forcible end status signal	C2SENO	F295.6	○	○
CNC screen Web server function	Web browser connection status signal	WBCNT	F0578.2	○	○
	Web browser connection prohibition signal	WBEND	G0579.5	○	○
Communication Retry Monitoring Function	I/O Link 1 retry abnormality warning signal	WIOCH1	F0535.0	○	○
	I/O Link 2 retry abnormality warning signal	WIOCH2	F0535.1	○	○
	I/O Link 3 retry abnormality warning signal	WIOCH3	F0535.2	○	○
	SRAM ECC abnormality warning signal	WECCS	F0535.3	○	○
	Embedded Ethernet communication abnormality warning signal	WETE	F0535.4	○	○
	Fast Ethernet communication abnormality warning signal	WETF	F0535.5	○	○
	FL-net1 communication abnormality warning signal	WFLN1	F0535.6	○	○
	FL-net2 communication abnormality warning signal	WFLN2	F0535.7	○	○
Constant surface speed control	Constant surface speed signal	CSS	F002.2	○	○
Controlled axis detach	Controlled axis detach signals	DTCH1 to DTCH8	G124	○	○
	Controlled axis detach status signals	MDTCH1 to MDTCH8	F110	○	○
Cs contour control	Cs contour control change signal	CON	G027.7	○	○
	Cs contour control change signal (for each spindle)	CONS1	G274.0	○	○
		CONS2	G274.1	○	○
		CONS3	G274.2	○	○
		CONS4	G274.3	○	○
	Cs contour control change completion signal	FSCSL	F044.1	○	○
	Cs contour control change completion signal (for each spindle)	FCSS1	F274.0	○	○
		FCSS2	F274.1	○	○
		FCSS3	F274.2	○	○
		FCSS4	F274.3	○	○
Cs contour control axis coordinate establishment	Cs axis coordinate establishment request signals	CSFI1	G274.4	○	○
		CSFI2	G274.5	○	○
		CSFI3	G274.6	○	○
		CSFI4	G274.7	○	○
	Cs axis coordinate establishment alarm signals	CSFO1	F274.4	○	○
		CSFO2	F274.5	○	○
		CSFO3	F274.6	○	○
		CSFO4	F274.7	○	○

Function	Signal name	Symbol	Address	T series	M series
Cs contour control axis coordinate establishment	Cs axis origin established state signals	CSPENA	F048.4	O	O
		CSPENB	F052.4	O	O
		CSPENC	F171.4	O	O
		CSPEND	F269.4	O	O
Custom macro	Custom macro input signals	UI000 to UI031	G054 to G057	O	O
		UI100 to UI131	G276 to G279	O	O
		UI200 to UI231	G280 to G283	O	O
		UI300 to UI331	G284 to G287	O	O
	Custom macro output signals	UO000 to UO031	F054,F055, F276,F277	O	O
		UO100 to UO131	F056 to F059	O	O
		UO200 to UO231	F280 to F283	O	O
		UO300 to UO331	F284 to F287	O	O
Cycle start / feed hold	Cycle start signal	ST	G007.2	O	O
	Feed hold signal	*SP	G008.5	O	O
	Automatic operation signal	OP	F000.7	O	O
	Cycle start lamp signal	STL	F000.5	O	O
	Feed hold lamp signal	SPL	F000.4	O	O
Data transfer between PMC and DCSPMC	DI signal for Data transfer between PMC and DCSPMC	TPMG00 to TPMG07	G765	O	O
	DO signal for Data transfer between PMC and DCSPMC	TDCF00 to TDCF07	F747	O	O
DeviceNet Master function	DeviceNet communication normal signal	DNTCM	F290.2	O	O
	DeviceNet communication abnormal signal	DNTER	F545.4	O	O
	DeviceNet communication error clear signal	DNTCLR	G518.4	O	O
Diameter/radius specification switch	Diameter/radius specification switch signals	DI1 to DI8	G296	O	O
	Diameter/radius specification switching in-progress signals	DM1 to DM8	F296	O	O
Direct input of tool offset value measured	Position record signal	PRC	G040.6	O	-
Direct input of tool offset value measured B	Tool offset number selection signals	OFN0 to OFN5, OFN6 to OFN9	G039.0 to G039.5, G040.0 to G040.3	O	-
	Tool offset write mode select signal	GOQSM	G039.7	O	-
	Workpiece coordinate system shift value write mode select signal	WOQSM	G039.6	O	-
	Tool offset write signals	+MIT1,-MIT1 +MIT2,-MIT2	X004.2,X004.3 X004.4,X004.5	O	-
		+MIT1 to +MIT2 -MIT1 to -MIT2	G132.0 to G132.1 G134.0 to G134.1		
	Spindle measurement select signal	S2TLS	G040.5	O	-

Function	Signal name	Symbol	Address	T series	M series
Direct input of tool offset value measured B	Workpiece coordinate system shift value write signal	WOSET	G040.7	○	-
	Tool compensation number specification signal	ONSC	G547.6	○	-
	Spindle 1 under measurement signal	S1MES	F062.3	○	-
	Spindle 2 under measurement signal	S2MES	F062.4	○	-
	Tool offset number selection signals (for milling and turning function)	OFNC0 to OFNC5, OFNC6 to OFNC9	G546.0 to G546.5, G547.0 to G547.3	-	○
	Tool offset write mode select signal (for milling and turning function)	GQSMC	G546.7	-	○
	Tool offset write signals	+MIT1	G132.0	-	○
Direct operation by personal computer function	Direct operation select signal	DMMC	G042.7	○	○
DNC operation	DNC operation select signal	DNCI	G043.5	○	○
	DNC operation selection confirm signal	MRMT	F003.4	○	○
	External device program execution signal	DVCPR	F531.6	○	○
Dry run	Dry run signal	DRN	G046.7	○	○
	Dry run check signal	MDRN	F002.7	○	○
Dual position feedback	Turning mode selection signal	HBTRN	G531.3	○	○
	Compensation clamp signals	*CL1 to *CL8	G548	○	○
Dual control axes switching	Dual control axes switching signal	SVMWC1 to SVMWC8	G687	○	○
	Dual control axes status signal	SVMWS1 to SVMWS8	F687	○	○
Each axis workpiece coordinate system preset signals	Each axis workpiece coordinate system preset signals	WPRST1 to WPRST8	G358	○	○
	Each axis workpiece coordinate system preset completion signals	WPSF1 to WPSF8	F358	○	○
Electronic gear box	Retract signal	RTRCT	G066.4	○	○
	Retract completion signal	RTRCTF	F065.4	○	○
	EGB mode signal	SYNMOD	F065.6	○	○
Electronic gear box 2 pair	EGB synchronization start signals	EGBS1 to EGBS8	G530	○	○
	EGB mode confirmation signals	EGBM1 to EGBM8	F208	○	○
Emergency stop	Emergency stop signals	*ESP	G008.4	○	○
			X008.4, .0, .1	○	○
Extended external machine zero point shift	Extended external machine zero point shift signal	EMZ0 to EMZ15	Specifying by parameter No.1280.	○	○

Function	Signal name	Symbol	Address	T series	M series
External data input	Address signals for external data input	EA6 to EA0	G002.6 to G002.0	○	○
	Data signals for external data input	ED31 to ED0	G211,G210, G001,G000	○	○
	Read signal for external data input	ESTB	G002.7	○	○
	Read completion signal for external data input	EREND	F060.0	○	○
	Search completion signal for external data input	ESEND	F060.1	○	○
	Search cancel signal for external data input	ESCAN	F060.2	○	○
External deceleration	External deceleration signals 1	*+ED1 to *+ED8	G118	○	○
		*-ED1 to *-ED8	G120	○	○
	External deceleration signals 2	*+ED21 to *+ED28	G101	○	○
		*-ED21 to *-ED28	G103	○	○
	External deceleration signals 3	*+ED31 to *+ED38	G107	○	○
		*-ED31 to *-ED38	G109	○	○
	External deceleration signals 4	*+ED41 to *+ED48	G341	○	○
		*-ED41 to *-ED48	G342	○	○
	External deceleration signals 5	*+ED51 to *+ED58	G343	○	○
		*-ED51 to *-ED58	G344	○	○
External I/O device control	External input start signal	EXINP	G058.1	○	○
	External input/output stop signal	EXSTP	G058.2	○	○
	External output start signal	EXOUT	G058.3	○	○
	Input/output busy signal	IOBSY	F053.2	○	○
	Input/output alarm signal	IOALM	F053.3	○	○
	Background editing signal	BGEACT	F053.4	○	○
External key input	External key input mode selection signal	ENBKY	G066.1	○	○
	Key code signals	EKC0 to EKC7	G098	○	○
	Key code read signal	EKSET	G066.7	○	○
	Key code read completion signal	EKENB	F053.7	○	○
	Key input disable signal	INHKY	F053.0	○	○
	Program screen display mode signal	PRGDPL	F053.1	○	○
External workpiece number search	External workpiece number search signals	PN1,PN2,PN4, PN8,PN16	G009.0 to G009.4	○	○
	Extended external workpiece number search signals	EPN0 to EPN13	G024.0 to G025.5	○	○
	External workpiece number search start signal	EPNS	G025.7	○	○
Fan Motor Abnormality Monitoring Function	Alarm level detection signal	SFAN	F093.1	○	○
	Warning level detection signal	WFAN	F093.3	○	○
Feedrate override	Feedrate override signals	*FV0 to *FV7	G012	○	○
Flexible path axis assignment	Removal start signal	RMVST	G536.2	○	○
	Assignment start signal	ASNST	G536.3	○	○
	Exchange start signal	EXCST	G536.4	○	○

Function	Signal name	Symbol	Address	T series	M series
Flexible path axis assignment	Direct assignment mode signal	DASN	G536.5	○	○
	Removal completion signal	RMVED	F536.2	○	○
	Assignment completion signal	ASNED	F536.3	○	○
	Exchange completion signal	EXCED	F536.4	○	○
	Initial axis assignment signal	INIST	F536.7	○	○
Flexible synchronization control	Flexible synchronization control mode selection signals	MTA,MTB,MTC, MTD	G197.0 to G197.3	○	○
	Flexible synchronization control mode status signals	MFSYNA, MFSYNB, MFSYNC, MFSYND	F197.0 to F197.3	○	○
Follow-up	Follow-up signal	*FLWU	G007.5	○	○
Function of deceleration stop in case of power failure	Power failure deceleration signal	PWFL	G203.7	○	○
G code preventing buffering	Speed-up of non-buffering command by G code invalid signal	NHSW	G579.6	○	○
Handle-synchronous feed	Handle-synchronous feed signal	HREV	G023.4	○	○
	Selecting direction of manual handle rotation signal	HDSR	G193.3	○	○
	Feed zero signal	FEED0	F066.2	○	○
High precision oscillation function	Oscillation feedrate override signals	*CHP1 to *CHP8	G051.0 to G051.3	○	○
	Oscillation start signal	CHPST	G051.6	○	○
	Oscillation hold signal	*CHLD	G051.7	○	○
	Oscillation -in-progress signal	CHPMD	F039.2	○	○
	Oscillation cycle signal	CHPCYL	F039.3	○	○
High-speed M/S/T/B interface	Auxiliary function completion signal	MFIN	G005.0	○	○
	Spindle function completion signal	SFIN	G005.2	○	○
	Tool function completion signal	TFIN	G005.3	○	○
	2nd auxiliary function completion signal	BFIN	G005.7	○	○
	2nd M function completion signal	MFIN2	G004.4	○	○
	3rd M function completion signal	MFIN3	G004.5	○	○
	4th M function completion signal	MFIN4	G004.6	○	○
	5th M function completion signal	MFIN5	G004.7	○	○
High-speed position switch	High-speed position switch signals	HPS01 to HPS16	F293,F294	○	○
			Yxxx,Yxxx+1	○	○

Function	Signal name	Symbol	Address	T series	M series
High speed program check	High-speed program check signal	PGCK	G290.5	○	○
	High speed program check mode signal	PRGMD	F290.5	○	○
High speed program check	High speed program check saving data signal	PCKSV	F290.4	○	○
High-speed program management	All programs save request signal	HPMRSV	G514.4	○	○
	Programs not saved status signal	HPMNTS	F547.5	○	○
	Programs saving in progress signal	HPMSVM	F547.6	○	○
	Programs save error signal	HPMERR	F547.7	○	○
High-speed skip	High-speed skip status signals	HDO0 to HDO7	F122	○	○
In-acceleration/ deceleration signal	In-acceleration/ deceleration signal	ACDEC	F520.3	-	○
Inch/metric conversion	Inch input signal	INCH	F002.0	○	○
Index table indexing function	B axis clamp signal	BCLP	F061.1	-	○
	B axis clamp completion signal	*BECLP	G038.7	-	○
	B axis unclamp signal	BUCLP	F061.0	-	○
	B axis unclamp completion signal	*BEUCP	G038.6	-	○
In-feed control (for grinding machine)	In-feed control cut start signal	INFD	G063.6	-	○
In-position check	In-position signals	INP1 to INP8	F104	○	○
	In-position check signal	SMZ	G053.6	○	○
	In-position check disable signal	NOINPS	G023.5	○	○
Interference check	Path interference check association signal	ITF01 to ITF10	G406.0 to G407.1	●	-
	Path interference check in progress signal	TICHK	F064.6	●	-
	Path interference alarm signal	TIALM	F064.7	●	-
Interlock	Start lock signal	STLK	G007.1	○	○
	Interlock signal for all axes	*IT	G008.0	○	○
	Interlock signal for each axis	*IT1 to *IT8	G130	○	○
	Interlock signal for each axis direction	+MIT1 to +MIT8 -MIT1 to -MIT8	G132 G134	-	○
	Cutting block start interlock signal	*CSL	G008.1	○	○
	Block start interlock signal	*BSL	G008.3	○	○
Interrupt type custom macro	Interrupt signal for custom macro	UINT	G053.3	○	○
Inter-path flexible synchronization control	Inter-path flexible synchronization mode select signal	OVLN	G531.4	○	○
	Inter-path flexible synchronization mode signal	OVLNS	F545.1	○	○

Function	Signal name	Symbol	Address	T series	M series
I/O Link βi Manual handle interface (Peripheral equipment control interface)	Manual handle generators selection signal	IOLBH1, IOLBH2	G199.0, G199.1	○	○
	β ready signal	IOLBR	F531.7	○	○
Jog feed/incremental feed	Feed axis and direction selection signals	+J1 to +J8	G100	○	○
		-J1 to -J8	G102	○	○
	Manual feedrate override signals	*JV0 to *JV15	G010,G011	○	○
	Manual rapid traverse selection signal	RT	G019.7	○	○
Machine lock	All-axis machine lock signal	MLK	G044.1	○	○
	Each-axis machine lock signal	MLK1 to MLK8	G108	○	○
	All-axis machine lock check signal	MMLK	F004.1	○	○
Macro executor	Input signals for P-code macro	EUI00 to EUI15	G082,G083	○	○
	Output signals for P-code macro	EUO00 to EUO15	F084,F085	○	○
Manual 2nd/3rd/4th reference position return function	Manual 2nd/3rd/4th reference position return select 1 signal	SLREF	G340.5	○	○
	Manual 2nd/3rd/4th reference position return select 2 signal	SLRER	G340.6	○	○
Manual absolute on/off	Manual absolute signal	*ABSM	G006.2	○	○
	Manual absolute check signal	MABSM	F004.2	○	○
Manual handle feed	Manual handle feed axis selection signals	HS1A to HS1D, HS1E	G018.0 to G018.3, G411.0	○	○
		HS2A to HS2D, HS2E	G018.4 to G018.7, G411.1	○	○
		HS3A to HS3D, HS3E	G019.0 to G019.3, G411.2	○	○
		HS4A to HS4D, HS4E	G020.0 to G020.3, G411.3	○	○
		HS5A to HS5D, HS5E	G379.0 to G379.3, G412.0	○	○
	Manual handle feed amount selection signals (incremental feed signals)	MP1,MP2,MP4	G019.4,G019.5 G019.6	○	○
	Manual handle feed amount selection signals	MP21, MP22 MP31, MP32 MP41, MP42 MP51, MP52	G087.0,G087.1 G087.3,G087.4 G087.6,G087.7 G380.0,G380.1	○	○
	Manual handle feed maximum feedrate change signal	HNDLF	G023.3	○	○
	Manual handle feed direction inversion signal	HDN	G347.1	○	○

Function	Signal name	Symbol	Address	T series	M series
Manual handle interrupt	Manual handle interrupt axis selection signals	HS1IA to HS1ID, HS1IE	G041.0 to G041.3, G411.4	○	○
		HS2IA to HS2ID, HS2IE	G041.4 to G041.7, G411.5	○	○

Retrace	Reverse execution signal	RVS	G007.0	-	○
	Reverse movement signal	RVSL	F082.2	-	○
Retraction for Rigid tapping	Rigid tapping retraction start signal	RTNT	G062.6	○	○
	Rigid tapping retraction completion signal	RTPT	F066.1	○	○
Rigid tapping	Rigid tapping signal	RGTAP	G061.0	○	○
	Spindle rotation direction signals	RGSPP	F065.0	○	○
		RGSPM	F065.1	○	○
	Rigid tapping-in-progress signal	RTAP	F076.3	○	○
	Rigid tapping spindle selection signals	RGTSP1 to RGTSP4	G061.4 to G061.7	○	-
Run hour and part count display	Target part count reached signal	PRTSF	F062.7	○	○
	General-purpose integrating meter start signal	TMRON	G053.0	○	○
Screen erasure	Screen erasure disable signal	*CRTOF	G062.1	○	○
	Automatic screen erasure status in-progress signal	ERTVA	F006.2	○	○
Screen hard copy function	Hard copy cancellation request signal	HCABT	G067.6	○	○
	Hard copy execution request signal	HCREQ	G067.7	○	○
	Hard copy cancellation request reception signal	HCAB2	F061.2	○	○
	Hard copy execution status signal	HCEXE	F061.3	○	○
Servo loop gain / in-position width switching function by signal	Servo loop gain / in-position width switching signal	GIS	G599.3	○	○
	Servo loop gain / in-position width switching confirmation signal	GISO	F599.3	○	○
Servo warning interface	Servo warning detail signals	SVWRN1	F093.4	○	○
		SVWRN2	F093.5	○	○
		SVWRN3	F093.6	○	○
		SVWRN4	F093.7	○	○
Servo off / mechanical handle feed	Servo off signals	SVF1 to SVF8	G126	○	○
Servo/Spindle synchronous control	Servo motor rotation speed specification signals	SVR01I to SVR12I	G021.0 to G022.3	○	○
	Differential speed synchronization command signal	DFSYC	G022.4	○	○
	Servo motor rotation polarity specification signal	SVGN	G022.5	○	○
	Servo motor spindle control switching signal	SVSP	G022.7	○	○
	Servo motor spindle synchronization start signal	SYSS	G061.2	○	○

Function	Signal name	Symbol	Address	T series	M series
Servo/Spindle synchronous control	Servo motor spindle synchronization mode acceleration/deceleration completion signal	SYAR	F090.4	○	○
	Servo motor spindle synchronization mode signal	SYSSM	F090.5	○	○
	Servo motor spindle control mode acceleration/deceleration completion signal	SVAR	F090.6	○	○
	Servo motor spindle control mode signal	SVSPM	F090.7	○	○
Simple spindle electronic gear box	Simple spindle EGB signals	SSEGB1 to SSEGB4	G351.0 to G351.3	○	○
	Simple spindle EGB mode signals	SSEGBM1 to SSEGBM4	F351.0 to F351.3	○	○
Single block	Single block signal	SBK	G046.1	○	○
	Single block check signal	MSBK	F004.3	○	○
Skip function	Skip signal	SKIPP	G006.6	○	○
		SKIP	X004.7	○	○
Software operator's panel	Software operator's panel signal (MD1)	MD1O	F073.0	○	○
	Software operator's panel signal (MD2)	MD2O	F073.1	○	○
	Software operator's panel signal (MD4)	MD4O	F073.2	○	○
	Software operator's panel signal (ZRN)	ZRNO	F073.4	○	○
	Software operator's panel signal (+J1 to +J4)	+J1O to +J4O	F081.0,F081.2, F081.4,F081.6	○	○
	Software operator's panel signal (-J1 to -J4)	-J1O to -J4O	F081.1,F081.3, F081.5,F081.7	○	○
	Software operator's panel signal (RT)	RTO	F077.6	○	○
	Software operator's panel signal (HS1A)	HS1AO	F077.0	○	○
	Software operator's panel signal (HS1B)	HS1BO	F077.1	○	○
	Software operator's panel signal (HS1C)	HS1CO	F077.2	○	○
	Software operator's panel signal (HS1D)	HS1DO	F077.3	○	○
	Software operator's panel signal (MP1)	MP1O	F076.0	○	○
	Software operator's panel signal (MP2)	MP2O	F076.1	○	○
	Software operator's panel signal (*JV0 to *JV15)	*JV0O to *JV15O	F079,F080	○	○
	Software operator's panel signal (*FV0 to *FV7)	*FV0O to *FV7O	F078	○	○
	Software operator's panel signal (ROV1)	ROV1O	F076.4	○	○
	Software operator's panel signal (ROV2)	ROV2O	F076.5	○	○

Function	Signal name	Symbol	Address	T series	M series
Software operator's panel	Software operator's panel signal (BDT)	BDTO	F075.2	○	○
	Software operator's panel signal (SBK)	SBKO	F075.3	○	○
	Software operator's panel signal (MLK)	MLKO	F075.4	○	○
	Software operator's panel signal (DRN)	DRNO	F075.5	○	○
	Software operator's panel signal (KEY1 to KEY4)	KEYO	F075.6	○	○
	Software operator's panel signal (*SP)	SPO	F075.7	○	○
	Software operator's panel general-purpose switch signals	OUT0 to OUT15	F072,F074	○	○
Speed display function of a milling tool with servo motor	Speed display change signal	SDPC	G038.5	○	○
Spindle control mode changing by program command	Spindle control mode off signals	MDOFF1 to MDOFF4	G586.4 to G586.7	○	○
Spindle command synchronous control	Spindle command synchronous control signal	ESRSYC	G064.6	○	○
	Spindle command synchronous control signal (for each spindle)	ESSYC1	G264.0	○	○
		ESSYC2	G264.1	○	○
		ESSYC3	G264.2	○	○
		ESSYC4	G264.3	○	○
	1st spindle parking signal	PKESS1	G122.6 (G031.6)	○	○
	2nd spindle parking signal	PKESS2	G122.7 (G031.7)	○	○
	Spindle command synchronous parking signal (for each spindle)	PKESE1	G265.0	○	○
		PKESE2	G265.1	○	○
		PKESE3	G265.2	○	○
		PKESE4	G265.3	○	○
	Phase error monitor signal	SYCAL	F044.4	○	○
	Phase error monitor signal (for each spindle)	SYCAL1	F043.0	○	○
		SYCAL2	F043.1	○	○
		SYCAL3	F043.2	○	○
		SYCAL4	F043.3	○	○
Spindle control with servo motor	SV speed control mode signals	SRVON1 to SRVON8	G521	○	○
	SV reverse signals	SVRVS1 to SVRVS8	G523	○	○
	SV speed control mode in-progress signals	SVREV1 to SVREV8	F521	○	○
	Spindle indexing signals for each axis	SPP1 to SPP8	F522	○	○
	Speed zero signals	SVSST1 to SVSST8	F376	○	○
	Speed arrival signals	SVSAR1 to SVSAR8	F377	○	○

Function	Signal name	Symbol	Address	T series	M series
Spindle orientation	Spindle orientation signals with the stop position externally set	SH00A to SH14A	G078.0 to G079.6	○	○
		SH00B to SH14B	G080.0 to G081.6	○	○
		SH00C to SH14C	G208.0 to G209.6	○	○
		SH00D to SH14D	G270.0 to G271.6	○	○
Spindle output control by the PMC	Spindle motor speed command selection signals	SIND	G033.7	○	○
		SIND2	G035.7	○	○
		SIND3	G037.7	○	○
		SIND4	G273.7	○	○
	Spindle motor speed command signals	R01I to R12I	G032.0 to G033.3	○	○

	All-spindle operation ready signal	SRSRDY	F034.7	○	○
	1st serial spindle ready signals	SRSP1R	F034.6	○	○
	2nd serial spindle ready signals	SRSP2R	F034.5	○	○
	3rd serial spindle ready signals	SRSP3R	F034.4	○	○
	4th serial spindle ready signals	SRSP4R	F034.3	○	○
Spindle speed control	Spindle warning detail signals 1 to 9	SPWRN1 to SPWRN9	F264.0 to F265.0	○	○
	Spindle stop signal	*SSTP	G029.6	○	○
	Spindle orientation signal	SOR	G029.5	○	○
	Spindle speed override signals	SOV0 to SOV7	G030	○	○
	Spindle speed arrival signal	SAR	G029.4	○	○
	Spindle enable signal	ENB	F001.4	○	○
	Gear selection signals (output)	GR1O,GR2O, GR3O	F034.0 to F034.2	-	○
	Gear selection signals (input)	GR1	G028.1	○	○
		GR2	G028.2	○	○
	S 12-bit code signals	R01O to R12O	F036.0 to F037.3	○	○
Spindle speed fluctuation detection	Spindle speed fluctuation detection alarm signal	SPAL	F035.0	○	○

Function	Signal name	Symbol	Address	T series	M series
Spindle synchronous control	Spindle synchronous control signal	SPSYC	G038.2	○	○
	Spindle synchronous control signal (for each spindle)	SPSYC1	G288.0	○	○
		SPSYC2	G288.1	○	○
		SPSYC3	G288.2	○	○
		SPSYC4	G288.3	○	○
	Spindle phase synchronous control signal	SPPHS	G038.3	○	○
	Spindle phase synchronous control signal (for each spindle)	SPPHS1	G289.0	○	○
		SPPHS2	G289.1	○	○
		SPPHS3	G289.2	○	○
		SPPHS4	G289.3	○	○

Status output signal	Rapid traversing signal	RPDO	F002.1	○	○
	Cutting feed signal	CUT	F002.6	○	○
	Dwell status signal	DWL	F526.5	○	○
Stored stroke check	Stored stroke check 1 switching signals in axis direction	+EXL1 to +EXL8	G104	○	○
		-EXL1 to -EXL8	G105	○	○
	Stored stroke check 1 select signals	EXLM, EXLM2, EXLM3	G007.6, G531.6, G531.7	○	○

Function	Signal name	Symbol	Address	T series	M series
Stored stroke check	Stroke check 1 release signal	RLSOT	G007.7	○	○
	Overtravel alarm signals	+OT1 to +OT8	F124	○	○
		-OT1 to -OT8	F126	○	○
Stored stroke check 2, 3	Stroke check 3 release signal	RLSOT3	G007.4	○	○
Stored stroke limit range switching function by signal	Stored stroke limit range switching data selection signals	OTD0 to OTD15	G594,G595	○	○
	Stored stroke limit range switching axis selection signals	OTA1 to OTA8	G596	○	○
	Stored stroke limit range switching selection signals	+OT11, -OT11, +OT12, -OT12, +OT2, -OT2, +OT3, -OT3	G597	○	○
	Sotred stroke limit range switching cancellation signals	+OT11C, -OT11C, +OT12C, -OT12C, +OT2C, -OT2C, +OT3C, -OT3C	G598	○	○
	Stored stroke limit range switching start signal	OTSW	G599.0	○	○
	Stored stroke limit range switching confirmation signals	+OT11O, -OT11O, +OT12O, -OT12O, +OT2O, -OT2O, +OT3O, -OT3O	F598	○	○
	Stored stroke limit range switching finish signal	OTSWFN	F599.0	○	○
Stroke limit external setting	Stroke limit external setting signals	+LM1 to +LM8	G110	○	○
		-LM1 to -LM8	G112	○	○
Superimposed control	Superimposed control axis selection signals	OVLS1 to OVLS8	G190	○	○
	Superimposed control master axis confirmation signals	OVMO1 to OVMO8	F344	○	○
	Superimposed control slave axis confirmation signals	OVSO1 to OVSO8	F345	○	○
	Synchronous/composite/superimposed control under way signals	SYN1O to SYN8O	F118	○	○
Superimposed control available in the AI contour control mode	Superimposed control axis selection signals	OVLS1 to OVLS8	G190	○	○
	Synchronous/composite/superimposed control under way signals	SYN1O to SYN8O	F118	○	○
	AI contour control permission signal	OVLN	G531.4	○	○
	Advanced superimposition mode signal	OVLNS	F545.1	○	○
Synchronous and composite control	Composite control axis change selection signals	MIX1 to MIX8	G128	○	○
	Composite axis confirmation signals	MIXO1 to MIXO8	F343	○	○

Function	Signal name	Symbol	Address	T series	M series
Synchronous and composite control	Synchronous control axis selection signals	SYNC1 to SYNC8	G138	○	○
	Synchronous master axis confirmation signals	SYCM1 to SYCM8	F341	○	○
	Synchronous slave axis confirmation signals	SYCS1 to SYCS8	F342	○	○
	Synchronous/composite/superimposed control under way signals	SYN1O to SYN8O	F118	○	○
	Parking signals	PK1 to PK8	G122	○	○
	Parking axis confirmation signals	SMPK1 to SMPK8	F346	○	○
	Excess synchronization error signals	SEO1 to SEO8	F559	○	○
Threading	Threading signal	THRD	F002.3	○	○
Three-dimensional coordinate conversion	Three-dimensional coordinate system conversion manual interruption switch signal	M3R	G031.3	○	○
	Three-dimensional coordinate conversion mode signal	D3ROT	F062.6	○	○
Time constant of acceleration / deceleration after interpolation switching function by signal	Time constant of acceleration / deceleration after interpolation for cutting feed switching signals	CTC2 CTC3	G599.4 G599.5	○	○
	Time constant of acceleration / deceleration after interpolation for rapid traverse switching signals	RTC2 RTC3	G599.6 G599.7	○	○
	Time constant of acceleration / deceleration after interpolation for cutting feed switching confirmation signals	CTC2O CTC3O	F599.4 F599.5	○	○
	Time constant of acceleration / deceleration after interpolation for rapid traverse switching confirmation signals	RTC2O RTC3O	F599.6 F599.7	○	○
Tool life management	Tool change signal	TLCH	F064.0	○	○
	Tool change reset signal	TLRST	G048.7	○	○
	Individual tool change signal	TLCHI	F064.2	○	○
	Individual tool change reset signal	TLRSTI	G048.6	○	○
	Tool skip signal	TLSKP	G048.5	○	○
	New tool select signal	TLNW	F064.1	○	○
	Tool group number selection signals	TL01 to TL512	G047.0 to G048.1	○	○
	Tool life count override signals	*TLV0 to *TLV9	G049.0 to G050.1	○	○
	Tool life arrival notice signal	TLCHB	F064.3	○	○

Function	Signal name	Symbol	Address	T series	M series
Tool life management	Tool life counting disable signal	LFCIV	G048.2	○	○
	Tool life counting disabled signal	LFCIF	F093.2	○	○
	Number of remaining tools notification signal	TLAL	F154.0	-	○
Tool management extension function	Tool management data protection signal	TKEY0 to TKEY5	G330.0 to G330.5	○	○
Tool management function	Tool management data modification in-progress signal	TLMG10	F315.2	○	○
	Tool management data output in-progress signal	TLMOT	F315.4	○	○
	Tool management data edit in-progress signal	TLMEM	F315.7	○	○
	Tool search in-progress signal	TLMSRH	F315.1	○	○
	Tool change signal	TLCH	F064.0	○	○
	Tool change signal 1	TLCH1	F328.0	○	○
	Tool change signal 2	TLCH2	F328.1	○	○
	Tool change signal 3	TLCH3	F328.2	○	○
	Tool change signal 4	TLCH4	F328.3	○	○
	Tool change reset signal	TLRST	G048.7	○	○
	Tool change reset signal 1	TLRST1	G328.0	○	○
	Tool change reset signal 2	TLRST2	G328.1	○	○
	Tool change reset signal 3	TLRST3	G328.2	○	○
	Tool change reset signal 4	TLRST4	G328.3	○	○
	Individual tool change signal	TLCHI	F064.2	○	○
	Individual tool change signal 1	TLCHI1	F328.4	○	○
	Individual tool change signal 2	TLCHI2	F328.5	○	○
	Individual tool change signal 3	TLCHI3	F328.6	○	○
	Individual tool change signal 4	TLCHI4	F328.7	○	○
	Individual tool change reset signal	TLRSTI	G048.6	○	○
	Individual tool change reset signal 1	TLRSTI1	G328.4	○	○
	Individual tool change reset signal 2	TLRSTI2	G328.5	○	○
	Individual tool change reset signal 3	TLRSTI3	G328.6	○	○
	Individual tool change reset signal 4	TLRSTI4	G328.7	○	○
	Tool life expiration notice signal	TLCHB	F064.3	○	○
	Tool life expiration notice signal 1	TLCHB1	F329.4	○	○

Function	Signal name	Symbol	Address	T series	M series
Tool management function	Tool life expiration notice signal 2	TLCHB2	F329.5	○	○
	Tool life expiration notice signal 3	TLCHB3	F329.6	○	○
	Tool life expiration notice signal 4	TLCHB4	F329.7	○	○
	Tool skip signal	TLSKP	G048.5	○	○
	Tool skip signal 1	TLSKP1	G329.0	○	○
	Tool skip signal 2	TLSKP2	G329.1	○	○
	Tool skip signal 3	TLSKP3	G329.2	○	○
	Tool skip signal 4	TLSKP4	G329.3	○	○
	Tool skip completion signal	TLSKF	F315.0	○	○
	Tool skip completion signal 1	TLSKF1	F329.0	○	○
	Tool skip completion signal 2	TLSKF2	F329.1	○	○
	Tool skip completion signal 3	TLSKF3	F329.2	○	○
	Tool skip completion signal 4	TLSKF4	F329.3	○	○
	Tool life count override signals	*TLV0 to *TLV9	G049.0 to G050.1	○	○
	Tool life counting disable signal 1	TLNCT1	G329.4	○	○
	Tool life counting disable signal 2	TLNCT2	G329.5	○	○
	Tool life counting disable signal 3	TLNCT3	G329.6	○	○
	Tool life counting disable signal 4	TLNCT4	G329.7	○	○
	Life expiration signal	TMFNFD	F315.6	○	○
Tool retract & recover	Tool retraction axis movement signal	TRMTN	F092.4	○	○
	Tool retraction signal	TRESC	G059.0	○	○
	Tool retraction mode signal	TRACT	F092.3	○	○
	Tool return signal	TRRTN	G059.1	○	○
	Tool return completion signal	TRSPS	F092.5	○	○
Torque limit skip	Torque limit reached signals	TRQL1 to TRQL8	F114	○	○
Touch panel check signal	Touch panel check signal	TPPRS	F006.0	○	○
Trouble diagnosis	Trouble forecast signals for thermal simulation	TDSML1 to TDSML8	F298	○	○
	Trouble forecast signals for disturbance level	TDFTR1 to TDFTR8	F299	○	○
U-axis Control	EGB synchronization mode selection signal	EGBS	G067.4	○	○
	EGB synchronization mode confirmation signal	EGBSM	F082.6	○	○
Unexpected disturbance torque detection	Unexpected disturbance torque detection ignore signals	IUDD1 to IUDD8	G125	○	○

Function	Signal name	Symbol	Address	T series	M series
Unexpected disturbance torque detection	Unexpected disturbance torque detection signals	ABDT1 to ABDT8	F184	○	○
	Servo axis unexpected disturbance torque detection signal	ABTQSV	F090.0	○	○
	1st spindle unexpected disturbance torque detection signal	ABTSP1	F090.1	○	○
	2nd spindle unexpected disturbance torque detection signal	ABTSP2	F090.2	○	○
	3rd spindle unexpected disturbance torque detection signal	ABTSP3	F090.3	○	○
	4th spindle unexpected disturbance torque detection signal	ABTSP4	F091.4	○	○
VRDY off alarm ignore signal	All-axis VRDY off alarm ignore signal	IGNVRY	G066.0	○	○
	Each-axis VRDY off alarm ignore signals	IGVRY1 to IGVRY8	G192	○	○
Waiting M code	No-wait signal	NOWT	G063.1	●	●
	No-wait signal	NMWT	G063.7	●	●
	Waiting signal	WATO	F063.6	●	●
Waiting M codes of high-speed type	Waiting M codes of high-speed type invalid signal	NHSW	G579.6	●	●
Warning function against modification of setting	Notification signal for modification of C Language Executor program	CDCEX	F558.0	○	○
	Notification signal for modification of 1st path PMC Ladder program	CDLAD1	F558.1	○	○
	Notification signal for modification of 2nd path PMC Ladder program	CDLAD2	F558.2	○	○
	Notification signal for modification of 3rd path PMC Ladder program	CDLAD3	F558.3	○	○
	Notification signal for modification of Dual Check Safety PMC Ladder program	CDDCL	F558.4	○	○
	Notification signal for modification of CNC parameter	CDPRM	F558.5	○	○
	Notification signal for modification of 4th path PMC Ladder program	CDLAD4	F558.6	○	○
	Notification signal for modification of 5th path PMC Ladder program	CDLAD5	F558.7	○	○

A.2.2 List of Signals (In Order of Symbols)

○ : Available
● : Available only with multi path control
- : Unavailable

Group	Symbol	Signal name	Address	T series	M series
*	*+ED1 to *+ED8	External deceleration signals 1	G118	○	○
	*+ED21 to *+ED28	External deceleration signals 2	G101	○	○
	*+ED31 to *+ED38	External deceleration signals 3	G107	○	○
	*+ED41 to *+ED48	External deceleration signals 4	G341	○	○
	*+ED51 to *+ED58	External deceleration signals 5	G343	○	○
	*+L1 to *+L8	Overtravel signals	G114	○	○
	*-ED1 to *-ED8	External deceleration signals 1	G120	○	○
	*-ED21 to *-ED28	External deceleration signals 2	G103	○	○
	*-ED31 to *-ED38	External deceleration signals 3	G109	○	○
	*-ED41 to *-ED48	External deceleration signals 4	G342	○	○
	*-ED51 to *-ED58	External deceleration signals 5	G344	○	○
	*-L1 to *-L8	Overtravel signals	G116	○	○
	*ABSM	Manual absolute signal	G006.2	○	○
	*ACTF1 to *ACTF8	Actual speed display axis selection signals	G580	○	○
	*AFV0 to *AFV7	2nd feedrate override signals	G013	○	○
	*BSL	Block start interlock signal	G008.3	○	○
	*BECLP	B axis clamp completion signal	G038.7	-	○
	*BEUCP	B axis unclamp completion signal	G038.6	-	○
	*CDZ	Chamfering signal	G053.7	○	-
	*CHLD	Chopping/oscillation hold signal	G051.7	○	○
	*CHP1 to *CHP8	Chopping/oscillation feedrate override signals	G051.0 to G051.3	○	○
	*CL1 to *CL8	Dual position feedback compensation clamp signals	G548	○	○
	*CRTOF	Screen erasure disable signal	G062.1	○	○
	*CSL	Cutting block start interlock signal	G008.1	○	○
	*DEC1 to *DEC8	Reference position return deceleration signals	X009	○	○
			G196	○	○
	*EAXSL	Controlled axis selection status signals (PMC axis control)	F129.7	○	○
	*ESP	Emergency stop signals	X008.4, .0, .1	○	○
			G008.4	○	○
	*ESPA	Emergency stop signals (serial spindle)	G071.1	○	○
	*ESPB		G075.1	○	○
	*ESPC		G205.1	○	○
	*ESPD		G267.1	○	○
	*EFOV0 to *EFOV7	Feedrate override signals (for group 1 to 4) (PMC axis control)	G151	○	○
	*EFOV0B to *EFOV7B		G163	○	○
	*EFOV0C to *EFOV7C		G175	○	○
	*EFOV0D to *EFOV7D		G187	○	○
	*EROV0 to *EROV7	1% step rapid traverse override signals (for group 1 to 4) (PMC axis control)	G151	○	○
	*EROV0B to *EROV7B		G163	○	○
	*EROV0C to *EROV7C		G175	○	○
	*EROV0D to *EROV7D		G187	○	○

Group	Symbol	Signal name	Address	T series	M series
*	*FHRO0 to *FHRO9	0.1% rapid traverse override signals	G352.0 to G352.7 G353.0 to G353.1	○	○
	*FLWU	Follow-up signal	G007.5	○	○
	*FV0 to *FV7	Feedrate override signals	G012	○	○
	*FV0O to *FV7O	Software operator’s panel signal (*FV0 to *FV7)	F078	○	○
	*HROV0 to *HROV6	1% rapid traverse override signals	G096.0 to G096.6	○	○
	*IT	Interlock signal for all axes	G008.0	○	○
	*IT1 to *IT8	Interlock signal for each axis	G130	○	○
	*JV0 to *JV15	Manual feedrate override signals	G010,G011	○	○
	*JV0O to *JV15O	Software operator’s panel signal (*JV0 to *JV15)	F079,F080	○	○
	*PLSST	Polygon spindle stop signal	G038.0	○	○
	*SCPFA	Spindle clamp completion signal	G028.5	○	○
	*SCPFB		G401.1	○	○
	*SCPFC		G401.2	○	○
	*SCPFD		G401.3	○	○
	*SP	Feed hold signal	G008.5	○	○
	*SSTP	Spindle stop signal	G029.6	○	○
	*SSTP1	Individual spindle stop signals	G027.3	○	○
	*SSTP2		G027.4	○	○
	*SSTP3		G027.5	○	○
	*SSTP4		G026.6	○	○
	*SUCPFA	Spindle unclamp completion signal	G028.4	○	○
	*SUCPFB		G400.1	○	○
	*SUCPFC		G400.2	○	○
	*SUCPFD		G400.3	○	○
	*TLV0 to *TLV9	Tool life count override signals	G049.0 to G050.1	○	○
	*TSB	Tail stock barrier selection signal	G060.7	○	-
+	+EXL1 to +EXL8	Stored stroke check 1 switching signals in axis direction	G104	○	○
	+J1 to +J8	Feed axis and direction selection signals	G100	○	○
	+J1O to +J4O	Software operator’s panel signal (+J1 to +J4)	F081.0,F081.2, F081.4,F081.6	○	○
	+Jg,+Ja	Feed axis and direction selection signals	G086.0,G086.2	○	○
	+LM1 to +LM8	Stroke limit external setting signals	G110	○	○
	+MIT1,+MIT2	Tool offset write signals	X004.2,X004.4 G132.0,G132.1	○	-
	+MIT1	Tool offset write signals	G132.0	-	○
	+MIT1 to +MIT8	Interlock signal for each axis direction	G132	-	○
	+OT1 to +OT8	Overtravel alarm signals	F124	○	○
	+OT11	Stored stroke limit range switching selection signals	G597.0	○	○
	+OT12		G597.2	○	○
	+OT2		G597.4	○	○
	+OT3		G597.6	○	○

Group	Symbol	Signal name	Address	T series	M series
+	+OT11C	Stored stroke limit range switching cancellation signals	G598.0	○	○
	+OT12C		G598.2	○	○
	+OT2C		G598.4	○	○
	+OT3C		G598.6	○	○
	+OT11O	Stored stroke limit range switching confirmation signals	F598.0	○	○
	+OT12O		F598.2	○	○
	+OT2O		F598.4	○	○
	+OT3O		F598.6	○	○
-	-EXL1 to -EXL8	Stored stroke check 1 switching signals in axis direction	G105	○	○
	-J1 to -J8	Feed axis and direction selection signals	G102	○	○
	-J1O to -J4O	Software operator's panel signal (-J1 to -J4)	F081.1,F081.3, F081.5,F081.7	○	○
	-Jg,-Ja	Feed axis and direction selection signals	G086.1,G086.3	○	○
	-LM1 to -LM8	Stroke limit external setting signals	G112	○	○
	-MIT1,-MIT2	Tool offset write signals	X004.3,X004.5 G134.0,G134.1	○	-
	-MIT1 to -MIT8	Interlock signal for each axis direction	G134	-	○
	-OT1 to -OT8	Overtravel alarm signals	F126	○	○
	-OT11	Stored stroke limit range switching selection signals	G597.1	○	○
	-OT12		G597.3	○	○
	-OT2		G597.5	○	○
	-OT3		G597.7	○	○
	-OT11C	Stored stroke limit range switching cancellation signals	G598.1	○	○
	-OT12C		G598.3	○	○
	-OT2C		G598.5	○	○
	-OT3C		G598.7	○	○
	-OT11O	Stored stroke limit range switching confirmation signals	F598.1	○	○
	-OT12O		F598.3	○	○
	-OT2O		F598.5	○	○
	-OT3O		F598.7	○	○
A	ABDT1 to ABDT8	Unexpected disturbance torque detection signal	F184	○	○
	ABTQSV	Servo axis unexpected disturbance torque detection signal	F090.0	○	○
	ABTSP1	1st spindle unexpected disturbance torque detection signal	F090.1	○	○
	ABTSP2	2nd spindle unexpected disturbance torque detection signal	F090.2	○	○
	ABTSP3	3rd spindle unexpected disturbance torque detection signal	F090.3	○	○
	ABTSP4	4th spindle unexpected disturbance torque detection signal	F091.4	○	○

Group	Symbol	Signal name	Address	T series	M series
A	ACDEC	In-acceleration/deceleration signal	F520.3	-	○

	WOQSM	Workpiece origin offset measurement mode selection signal	G039.6	–	○
	WOQSM	Workpiece coordinate system shift value write mode select signal	G039.6	○	–
	WOSET	Workpiece coordinate system shift value write signal	G040.7	○	-

Group	Symbol	Signal name	Address	T series	M series
W	WPRST1 to WPRST8	Each axis workpiece coordinate system preset signals	G358	○	○
	WPSF1 to WPSF8	Each axis workpiece coordinate system preset completion signals	F358	○	○
X	XPFLA	Power failure detection signal (serial spindle)	F307.1	○	○
	XPFLB		F309.1	○	○
	XPFLC		F311.1	○	○
	XPFLD		F313.1	○	○
Z	ZP1 to ZP8	Reference position return end signals	F094	○	○
	ZP21 to ZP28	2nd reference position return completion signals	F096	○	○
	ZP31 to ZP38	3rd reference position return completion signals	F098	○	○
	ZP41 to ZP48	4th reference position return completion signals	F100	○	○
	ZRF1 to ZRF8	Reference position establishment signals	F120	○	○
	ZRN	Manual reference position return selection signal	G043.7	○	○
	ZRNO	Software operator's panel signal (ZRN)	F073.4	○	○
	ZRNR	Mode notification signal	F513.7	○	○

A.2.3 List of Signals (In Order of Addresses)

○ : Available
● : Available only with multi path control
- : Unavailable

Address	Signal name	Symbol	T series	M series
X004.2 to X004.6, X004.0,X004.1	Skip signal	SKIP2 to SKIP6, SKIP7,SKIP8	○	○
X004.2 to X004.5	Tool offset write signals	+MIT1,-MIT1 +MIT2,-MIT2	○	-
X004.6	Skip signal (PMC axis control)	ESKIP	○	○
X004.7	Skip signal	SKIP	○	○
X008.0	Emergency stop signals	*ESP	○	○
X008.1			○	○
X008.4			○	○
X009	Reference position return deceleration signals	*DEC1 to *DEC8	○	○
Y***	High-speed position switch signals	HPS01 to HPS16	○	○
Y***+1				
G000 to G001	Data signals for external data input	ED15 to ED0	○	○
G002.6 to G002.0	Address signals for external data input	EA6 to EA0	○	○
G002.7	Read signal for external data input	ESTB	○	○
G004.3	End signal	FIN	○	○
G004.4	2nd M function completion signal	MFIN2	○	○
G004.5	3rd M function completion signal	MFIN3	○	○
G004.6	4th M function completion signal	MFIN4	○	○
G004.7	5th M function completion signal	MFIN5	○	○
G005.0	Auxiliary function completion signal	MFIN	○	○
G005.2	Spindle function completion signal	SFIN	○	○
G005.3	Tool function completion signal	TFIN	○	○
G005.6	Auxiliary function lock signal	AFL	○	○
G005.7	2nd auxiliary function completion signal	BFIN	○	○
G006.0	Program restart signal	SRN	○	○
G006.2	Manual absolute signal	*ABSM	○	○
G006.4	Override cancel signal	OVC	○	○
G006.6	Skip signal	SKIPP	○	○
G007.0	Reverse execution signal	RVS	-	○
G007.1	Start lock signal	STLK	○	○
G007.2	Cycle start signal	ST	○	○
G007.4	Stroke check 3 release signal	RLSOT3	○	○
G007.5	Follow-up signal	*FLWU	○	○
G007.6	Stored stroke check 1 select signals	EXLM	○	○
G007.7	Stroke check 1 release signal	RLSOT	○	○
G008.0	Interlock signal for all axes	*IT	○	○
G008.1	Cutting block start interlock signal	*CSL	○	○
G008.3	Block start interlock signal	*BSL	○	○
G008.4	Emergency stop signals	*ESP	○	○
G008.5	Feed hold signal	*SP	○	○
G008.6	Reset & rewind signal	RRW	○	○
G008.7	External reset signal	ERS	○	○
G009.0 to G009.4	External workpiece number search signals	PN1,PN2,PN4,PN8, PN16	○	○
G010,G011	Manual feedrate override signals	*JV0 to *JV15	○	○

Address	Signal name	Symbol	T series	M series
G012	Feedrate override signals	*FV0 to *FV7	○	○
G013	2nd feedrate override signals	*AFV0 to *AFV7	○	○
G014.0,G014.1	Rapid traverse override signals	ROV1,ROV2	○	○
G016.7	One-digit F code feed signal	F1D	-	○
G018.0 to G018.3	Manual handle feed axis selection signals	HS1A to HS1D	○	○
G018.4 to G018.7		HS2A to HS2D	○	○
G019.0 to G019.3		HS3A to HS3D	○	○
G019.4,G019.5, G019.6	Manual handle feed amount selection signals (incremental feed signals)	MP1,MP2,MP4	○	○
G019.7	Manual rapid traverse selection signal	RT	○	○
G020.0 to G020.3	Manual handle feed axis selection signals	HS4A to HS4D	○	○
G021.0 to G022.3	Servo motor rotation speed specification signals	SVR01I to SVR12I	○	○
G022.4	Differential speed synchronization command signal	DFSYC	○	○
G022.5	Servo motor rotation polarity specification signal	SVGN	○	○
G022.7	Servo motor spindle control switching signal	SVSP	○	○
G023.3	Manual handle feed maximum feedrate change signal	HNDLF	○	○
G023.4	Handle-synchronous feed signal	HREV	○	○
G023.5	In-position check disable signal	NOINPS	○	○
G024.0 to G025.5	Extended external workpiece number search signals	EPN0 to EPN13	○	○
G025.7	External workpiece number search start signal	EPNS	○	○
G026.0	Position coder selection signal	PC3SLC	○	○
G026.1		PC4SLC	○	○
G026.3	Spindle selection signals	SWS4	○	○
G026.6	Individual spindle stop signals	*SSTP4	○	○
G027.0	Spindle selection signals	SWS1	○	○
G027.1		SWS2	○	○
G027.2		SWS3	○	○
G027.3	Individual spindle stop signals	*SSTP1	○	○
G027.4		*SSTP2	○	○
G027.5		*SSTP3	○	○
G027.7	Cs contour control change signal	CON	○	○
G028.1,G028.2	Gear selection signals (input)	GR1,GR2	○	○
G028.4	Spindle unclamp completion signal	*SUCPFA	○	○
G028.5	Spindle clamp completion signal	*SCPFA	○	○
G028.6	Spindle stop complete signal	SPSTPA	○	○
G028.7	2nd position coder selection signal	PC2SLC	○	○
G029.0	Gear selection signals (input)	GR21	○	○
G029.1		GR22	○	○
G029.2		GR31	○	○
G029.3		GR32	○	○
G029.4	Spindle speed arrival signal	SAR	○	○
G029.5	Spindle orientation signal	SOR	○	○
G029.6	Spindle stop signal	*SSTP	○	○
G030	Spindle speed override signals	SOV0 to SOV7	○	○
G031.3	Three-dimensional coordinate system conversion manual interruption switch signal	M3R	○	○
G031.4	Gear selection signals (input)	GR41	○	○

Address	Signal name	Symbol	T series	M series
G031.5		GR42	O	O
G031.6	1st spindle parking signal	PKESS1	O	O
G031.7	2nd spindle parking signal	PKESS2	O	O
G032.0 to G033.3	Spindle motor speed command signals	R01I to R12I	O	O
G033.5	Spindle motor command polarity command signals	SGN	O	O
G033.6	Spindle motor command polarity selection signals	SSIN	O	O
G033.7	Spindle motor speed command selection signals	SIND	O	O
G034.0 to G035.3	Spindle motor speed command signals	R01I2 to R12I2	O	O
G035.5	Spindle motor command polarity command signals	SGN2	O	O
G035.6	Spindle motor command polarity selection signals	SSIN2	O	O
G035.7	Spindle motor speed command selection signals	SIND2	O	O
G036.0 to G037.3	Spindle motor speed command signals	R01I3 to R12I3	O	O
G037.5	Spindle motor command polarity command signals	SGN3	O	O
G037.6	Spindle motor command polarity selection signals	SSIN3	O	O
G037.7	Spindle motor speed command selection signals	SIND3	O	O
G038.0	Polygon spindle stop signal	*PLSST	O	O
G038.1	Spindle synchronous speed ratio control signal	SBRT	O	O
G038.2	Spindle synchronous control signal	SPSYC	O	O
G038.3	Spindle phase synchronous control signal	SPPHS	O	O
G038.5	Speed display change signal	SDPC	O	O
G038.6	B axis unclamp completion signal	*BEUCP	-	O
G038.7	B axis clamp completion signal	*BECLP	-	O
G039.0 to G039.5	Tool offset number selection signals	OFN0 to OFN5	O	O
G040.0 to G040.3		OFN6 to OFN9	O	O
G039.6	Workpiece origin offset measurement mode selection signal	WOQSM	-	O
G039.6	Workpiece coordinate system shift value write mode select signal	WOQSM	O	-
G039.7	Tool offset measurement mode selection signal	GOQSM	-	O
G039.7	Tool offset write mode select signal	GOQSM	O	-
G040.5	Spindle measurement select signal	S2TLS	O	-
G040.6	Position record signal	PRC	O	-
G040.7	Workpiece coordinate system shift value write signal	WOSET	O	-
G041.0 to G041.3	Manual handle interrupt axis selection signals	HS1IA to HS1ID	O	O
G041.4 to G041.7		HS2IA to HS2ID	O	O
G042.0 to G042.3		HS3IA to HS3ID	O	O
G042.7	Direct operation select signal	DMMC	O	O
G043.0 to G043.2	Mode selection signals	MD1,MD2,MD4	O	O
G043.5	DNC operation select signal	DNCI	O	O
G043.7	Manual reference position return selection signal	ZRN	O	O
G044.0	Optional block skip signals	BDT1	O	O
G044.1	All-axis machine lock signal	MLK	O	O
G045	Optional block skip signals	BDT2 to BDT9	O	O
G046.0	Memory protection signal	KEYP	O	O

Address	Signal name	Symbol	T series	M series
G046.1	Single block signal	SBK	○	○
G046.3 to G046.6	Memory protection signals	KEY1 to KEY4	○	○
G046.7	Dry run signal	DRN	○	○
G047.0 to G048.1	Tool group number selection signals	TL01 to TL512	○	○
G048.2	Tool life counting disable signal	LFCIV	○	○
G048.5	Tool skip signal	TLSKP	○	○
G048.6	Individual tool change reset signal	TLRSTI	○	○
G048.7	Tool change reset signal	TLRST	○	○
G049.0 to G050.1	Tool life count override signals	*TLV0 to *TLV9	○	○
G051.0 to G051.3	Oscillation feedrate override signals	*CHP1 to *CHP8	○	○
G051.6	Oscillation start signal	CHPST	○	○
G051.7	Oscillation hold signal	*CHLD	○	○
G053.0	General-purpose integrating meter start signal	TMRON	○	○
G053.3	Interrupt signal for custom macro	UINT	○	○
G053.5	Rapid traverse block overlap disable signal	ROVLP	○	○
G053.6	In-position check signal	SMZ	○	○
G053.7	Chamfering signal	*CDZ	○	-
G054 to G057	Custom macro input signals	UI000 to UI031	○	○
G058.1	External input start signal	EXINP	○	○
G058.2	External input/output stop signal	EXSTP	○	○
G058.3	External output start signal	EXOUT	○	○
G059.0	Tool retraction signal	TRESC	○	○
G059.1	Tool return signal	TRRTN	○	○
G059.7	Signal for disabling torque difference alarm detection for axis synchronous control	NSYNCA	○	○
G060.7	Tail stock barrier selection signal	*TSB	○	-
G061.0	Rigid tapping signal	RGTAP	○	○
G061.2	Servo motor spindle synchronization start signal	SYSS	○	○
G061.4 to G061.7	Rigid tapping spindle selection signals	RGTSP1 to RGTSP4	○	-
G062.1	Screen erasure disable signal	*CRTOF	○	○
G062.6	Rigid tapping retraction start signal	RTNT	○	○
G062.7	Path select signal（Tool post select signal） 2	HEAD2	●	●
G063.0	Path select signal (Tool post select signal)	HEAD	●	●
G063.1	No-wait signal	NOWT	●	●
G063.2,G063.3	Path spindle command selection signals	SLSPA,SLSPB	●	●
G063.5	Signal for disabling angular axis control for the perpendicular axis	NOZAGC	○	○
G063.6	In-feed control cut start signal	INFD	-	○
G063.7	No-wait signal	NMWT	●	●
G064.2,G064.3	Path spindle feedback selection signals	SLPCA,SLPCB	●	●
G064.6	Spindle command synchronous control signal	ESRSYC	○	○
G066.0	All-axis VRDY off alarm ignore signal	IGNVRY	○	○
G066.1	External key input mode selection signal	ENBKY	○	○
G066.4	Retract signal	RTRCT	○	○
G066.7	Key code read signal	EKSET	○	○
G067.0	Manual tool compensation command number	MTLC	○	-
G067.2	Checking mode signal	MMOD	○	○
G067.3	Handle available signal in checking mode	MCHK	○	○
G067.4	EGB synchronization mode selection signal	EGBS	○	○

Address	Signal name	Symbol	T series	M series
G067.6	Hard copy cancellation request signal	HCABT	○	○
G067.7	Hard copy execution request signal	HCREQ	○	○
G68,G69	Manual tool compensation tool number signal (4 digits)	MTLN00 to MTLN15	○	-
G070.0	Torque limit command LOW signals (serial spindle)	TLMLA	○	○
G070.1	Torque limit command HIGH signals (serial spindle)	TLMHA	○	○
G070.3,G070.2	Clutch/gear signals(serial spindle)	CTH1A,CTH2A	○	○
G070.4	CCW command signals(serial spindle)	SRVA	○	○
G070.5	CW command signals(serial spindle)	SFRA	○	○
G070.6	Orientation command signals (serial spindle)	ORCMA	○	○
G070.7	Machine ready signals(serial spindle)	MRDYA	○	○
G071.0	Alarm reset signals (serial spindle)	ARSTA	○	○
G071.1	Emergency stop signals(serial spindle)	*ESPA	○	○
G071.2	Spindle selection signals (serial spindle)	SPSLA	○	○
G071.3	Power line switch completion signals (serial spindle)	MCFNA	○	○
G071.4	Soft start/stop signals(serial spindle)	SOCNA	○	○
G071.5	Speed integral signals (serial spindle)	INTGA	○	○
G071.6	Output switch request signals (serial spindle)	RSLA	○	○
G071.7	Power line status check signals (serial spindle)	RCHA	○	○
G072.0	Orientation stop position change command signals (serial spindle)	INDXA	○	○
G072.1	Rotational direction command signals for orientation stop position change (serial spindle)	ROTAA	○	○
G072.2	Shortcut command signals for orientation stop position change (serial spindle)	NRROA	○	○
G072.3	Differential speed mode command signals (serial spindle)	DEFMDA	○	○
G072.4	Analog override signals (serial spindle)	OVRA	○	○
G072.5	Incremental command externally set orientation signals(serial spindle)	INCMDA	○	○
G072.6	Spindle switch MAIN MCC contact status signals(serial spindle)	MFNHGA	○	○
G072.7	Spindle switch HIGH MCC contact status signals (serial spindle)	RCHHGA	○	○
G073.0	Magnetic sensor orientation command signal(serial spindle)	MORCMA	○	○
G073.1	Subordinate operation mode command signals (serial spindle)	SLVA	○	○
G073.2	Motor power cutoff command signals (serial spindle)	MPOFA	○	○
G073.3	Synchronous orientation request command	SORSLA	○	○
G073.4	Disconnection detection disable signal (serial spindle)	DSCNA	○	○
G074.0	Torque limit command LOW signals (serial spindle)	TLMLB	○	○
G074.1	Torque limit command HIGH signals (serial spindle)	TLMHB	○	○
G074.3,G074.2	Clutch/gear signals(serial spindle)	CTH1B,CTH2B	○	○
G074.4	CCW command signals(serial spindle)	SRVB	○	○
G074.5	CW command signals(serial spindle)	SFRB	○	○
G074.6	Orientation command signals (serial spindle)	ORCMB	○	○
G074.7	Machine ready signals(serial spindle)	MRDYB	○	○
G075.0	Alarm reset signals (serial spindle)	ARSTB	○	○
G075.1	Emergency stop signals(serial spindle)	*ESPB	○	○
G075.2	Spindle selection signals (serial spindle)	SPSLB	○	○
G075.3	Power line switch completion signals (serial spindle)	MCFNB	○	○
G075.4	Soft start/stop signals(serial spindle)	SOCNB	○	○

Address	Signal name	Symbol	T series	M series
G075.5	Speed integral signals (serial spindle)	INTGB	○	○
G075.6	Output switch request signals (serial spindle)	RSLB	○	○
G075.7	Power line status check signals (serial spindle)	RCHB	○	○
G076.0	Orientation stop position change command signals (serial spindle)	INDXB	○	○
G076.1	Rotational direction command signals for orientation stop position change (serial spindle)	ROTAB	○	○
G076.2	Shortcut command signals for orientation stop position change (serial spindle)	NRROB	○	○
G076.3	Differential speed mode command signals (serial spindle)	DEFMDB	○	○
G076.4	Analog override signals (serial spindle)	OVRB	○	○
G076.5	Incremental command externally set orientation signals(serial spindle)	INCMDB	○	○
G076.6	Spindle switch MAIN MCC contact status signals (serial spindle)	MFNHGB	○	○
G076.7	Spindle switch HIGH MCC contact status signals (serial spindle)	RCHHGB	○	○
G077.0	Magnetic sensor orientation command signal(serial spindle)	MORCMB	○	○
G077.1	Subordinate operation mode command signals (serial spindle)	SLVB	○	○
G077.2	Motor power cutoff command signals (serial spindle)	MPOFB	○	○
G077.3	Synchronous orientation request command	SORSLB	○	○

B LIST OF FUNCTIONS USING PMC SIGNALS OTHER THAN G/F ADDRESS

B.1 LIST OF FUNCTIONS USING PMC SIGNALS OTHER THAN G/F ADDRESS

Functions using PMC signals other than G/F address in addition to the function to create applications and the communication function that are listed in “SAFETY PRECAUTIONS” are as follows.

Function name	Signal types	Access types to signal	Related parameter numbers	Reference item
High-Speed Position Switch	Y	Write	HPF(No.8501#0) No.8565	1.2.11 High-Speed Position Switch
Flexible Path Axis Assignment	R	Write	No.11554	1.18.1 Outputting States of Individual Axes
Stored Stroke Limit Range Switching Function by Signal	D	Read	No.1313	2.3.10 Stored Stroke Limit Range Switching Function by Signal
Manual Linear/Circular Interpolation	R	Read Write	MRI(No.7106#3) MRO(No.7106#4) No.13541 No.13542	3.4 Manual Linear/Circular Interpolation
Manual Reference Position Return	X	Read	GDC(No.3006#0) XSG(No.3008#2) No.3013 No.3014	4.1 Manual Reference Position Return
Spindle Speed Command Clamp	R	Read	No.3773	11.26 Spindle Speed Command Clamp
Custom Macro	R	Write	IFR(No.6020#2) No.6094	13.6 Custom Macro
Energy Saving Level Selecting Function	X,Y,A,R, T,K,C,D	Read	Set signals on the display	14.1.25 Energy Saving Level Selecting Function
Automatic Tool Length Measurement (M Series) /Automatic Tool Offset (T Series)	X	Read	XSG(No.3008#2) No.3019	16.2 Automatic Tool Length Measurement (M Series) /Automatic Tool Offset (T Series)
Skip Function	X	Read	XSG(No.3008#2) No.3012	16.3.1 Skip Function
Multi-Step Skip	X	Read	XSG(No.3008#2) No.3012	16.3.5 Multi-Step Skip
Direct Input of Offset Value Measured B (for Lathe System)	X	Read	XSG(No.3008#2) No.3019	16.4.2 Direct Input of Offset Value Measured B (for Lathe System)
PMC Axis Control	X	Read	XSG(No.3008#2) No.3019 SKE(No.8001#7)	17.1.1 PMC Axis Control
Extended External Machine Zero Point Shift	R	Read	EMS(No.1203#0) No.1280	17.3 Extended External Machine Zero Point Shift

Function name	Signal types	Access types to signal	Related parameter numbers	Reference item
Communication Retry Monitoring Function	R9051 (Z51) R9057 (Z57) R9165 (Z165)	Read	Fixed signals	19.3.2 Communication Retry Monitoring Function

C LIST OF FUNCTIONS INCLUDE ADDRESS P IN THE PROGRAM COMMAND

C.1 LIST OF FUNCTIONS INCLUDE ADDRESS P IN THE ARGUMENT OF G CODE

Functions including address P in the argument of G code are shown below.

Function name	Machining center system	Lathe system			Reference item
		G code system			
		A	B	C	
Dwell	G04	G04	G04	G04	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
G code preventing buffering	G04.1	G04.1	G04.1	G04.1	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
AI contour control II(high-precision contour control/AI high-precision contour control compatible command)	G05	G05	G05	G05	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
AI contour control (advanced preview control compatible command)	G08	G08	G08	G08	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Programmable data input	G10	G10	G10	G10	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Programmable parameter input	G10	G10	G10	G10	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Programmable internal data change	G10.8	G10.8	G10.8	G10.8	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES)
Machine configuration selecting function	G10.8	G10.8	G10.8	G10.8	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Spindle speed fluctuation detection	G26	G26	G26	G26	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Reference position return	G30	G30	G30	G30	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Multi-step skip	G31	G31	G31	G31	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Torque limit skip	G31	G31	G31	G31	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Continuous high-speed skip	G31	G31	G31	G31	OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Skip function for EGB axis	G31.8	G31.8	G31.8	G31.8	CONNECTION MANUAL(FUNCTION)
Wheel wear compensation	G41	G41	G41	G41	OPERATOR'S MANUAL(For Machining Center System) II. PROGRAMMING

Function name	Machining center system	Lathe system G code system			Reference item
		A	B	C	
Scaling	G51	-	G51	G51	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Polygon turning	G51.2	G51.2 (G251)	G51.2 (G251)	G51.2 (G251)	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING
Synchronous, Composite and Superimposed control by program command	G51.4, G51.5, G51.6, G50.5	G51.4, G51.5, G51.6, G50.5	G51.4, G51.5, G51.6, G50.5	G51.4, G51.5, G51.6, G50.5	CONNECTION MANUAL(FUNCTION) OPERATOR'S MANUAL(COMMON TO T/M SERIES) II. PROGRAMMING

D PARAMETER TUNING FOR ENHANCEMENT OF MACHINING QUALITY

This chapter is composed of the following item.
CNC and Servo control parameters setting/tuning are executed as the following sequence.

CNC and Servo control parameters tuning

1 Initialization of parameters

- Setting of recommended values

2 Tuning if there is problem

- 2-1 Tuning of AI contour control — Tuning highly effective parameters for problem
- 2-2 Countermeasure of vibration for lower frequency — Reducing the vibration less than 50Hz

Supplement

Supplement A Details of AI contour control

Supplement B Servo tuning for higher response

D.1 CNC AND SERVO CONTROL PARAMETERS TUNING

1 Initialization of parameters

Set recommended value in CNC and Servo control parameters.

Setting item	Parameter number	Recommended value for BT30			Recommended value for BT40			Recommended value for BT50		
		Fast	Normal	Fine	Fast	Normal	Fine	Fast	Normal	Fine
AI contour control during automatic operation	No.1604#0	1	1	1	1	1	1	1	1	1
Acceleration rate for Acc./Dec. before interpolation [mm/sec^2]	No.1660	4000	2000	1600	2800	800	400	1580	620	300
Time constant for bell-type Acc./Dec. before interpolation [msec]	No.1772	20	32	40	20	32	40	48	60	64
Type for Acc./Dec. after interpolation (Bell-type)	No.1602#6,#3	1	1	1	1	1	1	1	1	1
Time constant for Acc./Dec. after interpolation [msec]	No.1769	24	16	16	24	16	16	24	24	24
Corner feed rate difference [mm/min]	No.1783	500	500	400	500	300	150	632	248	120
Allowable acceleration rate for circular interpolation Allowable acceleration rate for small line blocks [mm/sec^2]	No.1735 No.1737	3000	1500	1200	2100	600	300	1185	465	225
Minimum feed rate for deceleration based on allowable acceleration rate for circular interpolation Minimum feed rate for deceleration based on allowable acceleration rate for small line blocks [mm/min]	No.1732 No.1738	100	100	100	100	100	100	100	100	100

Time constant for 2nd Acc./Dec. after interpolation in cutting feed [msec]	No.11238	0	0	0	0	0	0	0	0	0
Enable Smart overlap function	No.11236#1	1	1	1	1	1	1	1	1	1
Time constant for Acc./Dec. after interpolation of Smart overlap [msec]	No.11248	16	16	16	16	16	16	16	16	16

Setting item	Parameter number	Recommended value for BT30			Recommended value for BT40			Recommended value for BT50		
		Fast	Normal	Fine	Fast	Normal	Fine	Fast	Normal	Fine
Maximum overlap value of Smart overlap (Rapid traverse - Rapid traverse) [Detection unit 1μm/0.1μm]	No.10740	1000/ 10000	1000/ 10000	1000/ 10000	1000/ 10000	1000/ 10000	1000/ 10000	1000/ 10000	1000/ 10000	1000/ 10000
Maximum overlap value of Smart overlap (Rapid traverse – Cutting feed) [Detection unit 1μm/0.1μm]	No.10741	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000
Maximum overlap value of Smart overlap (Cutting feed - Rapid traverse) [Detection unit 1μm/0.1μm]	No.10742	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000	100/ 1000

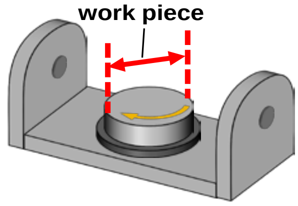
- For large machines such as double colum machines with BT50, use fine setting value as normal setting value.

Setting of rotary axis

Setting value of rotary axis basically should be the same as linear axis. In the case of machining work piece that diameter is mainly 120mm or less on rotary table, decide parameters on the following table with K obtained by the following formula. It reduces machining time.

$$K = \frac{120}{\text{Diameter of work piece[mm]}}$$

$$\textit{Setting value of rotary axis} = (\textit{Recommneded value of linear axis}) \times K$$



- Set K to 3, if K is more than 3.

Recommended setting value of linear axis

Setting item	Parameter number	Recommended value for BT30			Recommended value for BT40			Recommended value for BT50		
		Fast	Normal	Fine	Fast	Normal	Fine	Fast	Normal	Fine
Acceleration rate for Acc./Dec. before interpolation [mm/sec^2]	No.1660	4000	2000	1600	2800	800	400	1580	620	300
Corner feed rate difference [mm/min]	No.1783	500	500	400	500	300	150	632	248	120
Allowable acceleration rate for circular interpolation Allowable acceleration rate for small line blocks [mm/sec^2]	No.1735 No.1737	3000	1500	1200	2100	600	300	1185	465	225

Jerk control (M series)

Setting item	Parameter number	Recommended value
Allowable acceleration change amount [mm/sec^2]	No.1788	0
Allowable acceleration change amount (linear interpolation) [mm/sec^2]	No.1789	0
Ratio of change time of the rate of change of acceleration [%]	No.1790	0

- If machine vibration and machining error cannot be reduced enough by only setting allowable acceleration rate, use Jerk control.

Servo control

Setting item	Parameter number	Recommended value

Backlash acceleration amount override	No.2296#7	1
Backlash acceleration stop	No.2296#6	1

2 Tuning if there is problem

2-1 Tuning of AI contour control

Tune the parameter according to priority for each purpose (Reducing vibration, Reducing machining error, Enhancing machining quality, Reducing cycle time).

Tuning priority Priority High : ◊◊ / Middle : ◊ / Low : None

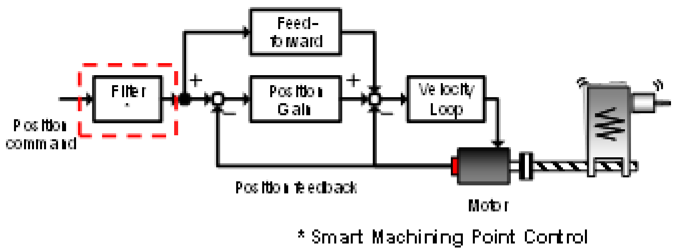
Purpose	Machining	Tuning item (Upper : Parameter number / Lower : Tuning rage)					
		Acc. rate for Acc./Dec. before interpolation (No.1660)	Time const. for bell-type Acc./Dec. before interpolation (No.1772)	Time const. for Acc./Dec. after interpolation (No.1769)	Corner feed rate difference (No.1783)	Allowable acc. rate for circular interpolation (No.1735)	Allowable acc. rate for small line blocks (No.1737)
	Parts	250 to 5000	16 to 64	8 to 48	150 to 1000	200 to 3750	200 to 3750
	Die-mold			8 to24			
Reducing vibration	Parts	Decrease ◊	Increase ◊	Increase ◊◊	Decrease ◊	Decrease	Decrease
	Die-mold			Increase			
Reducing machining error	Parts	Decrease	Increase	Decrease ◊◊	Decrease ◊	Decrease ◊	Decrease
	Die-mold				Decrease	Decrease	Decrease ◊
Enhancing machining quality	Parts	Decrease	Increase	Increase ◊◊	Decrease	Decrease	Decrease
	Die-mold		Increase ◊	Decrease ◊◊			Decrease ◊
Reducing cycle time	Parts	Increase ◊	Decrease ◊◊	Decrease	Increase ◊	Increase	Increase
	Die-mold						

- In case that the priority of parameter is same, tune the parameter with high effect after confirming the effect of each parameter.

2-2 Countermeasure of vibration for lower frequency

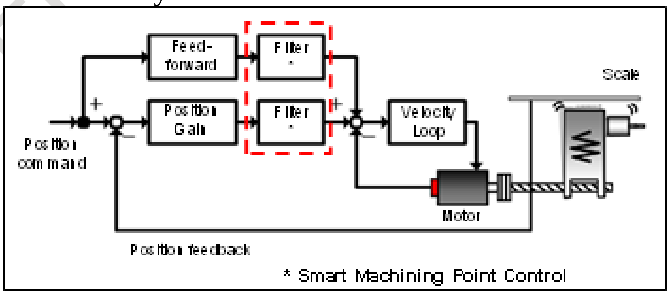
Avoidance of machining point vibration (below 50Hz) after Acc./Dec. by Smart machining point control.

Semi-closed system



Parameter number	Recommended value
No.2564#1	1
No.2638[0.1Hz]	Vibration freq.[Hz]×10
No.2639	10

Full-closed system

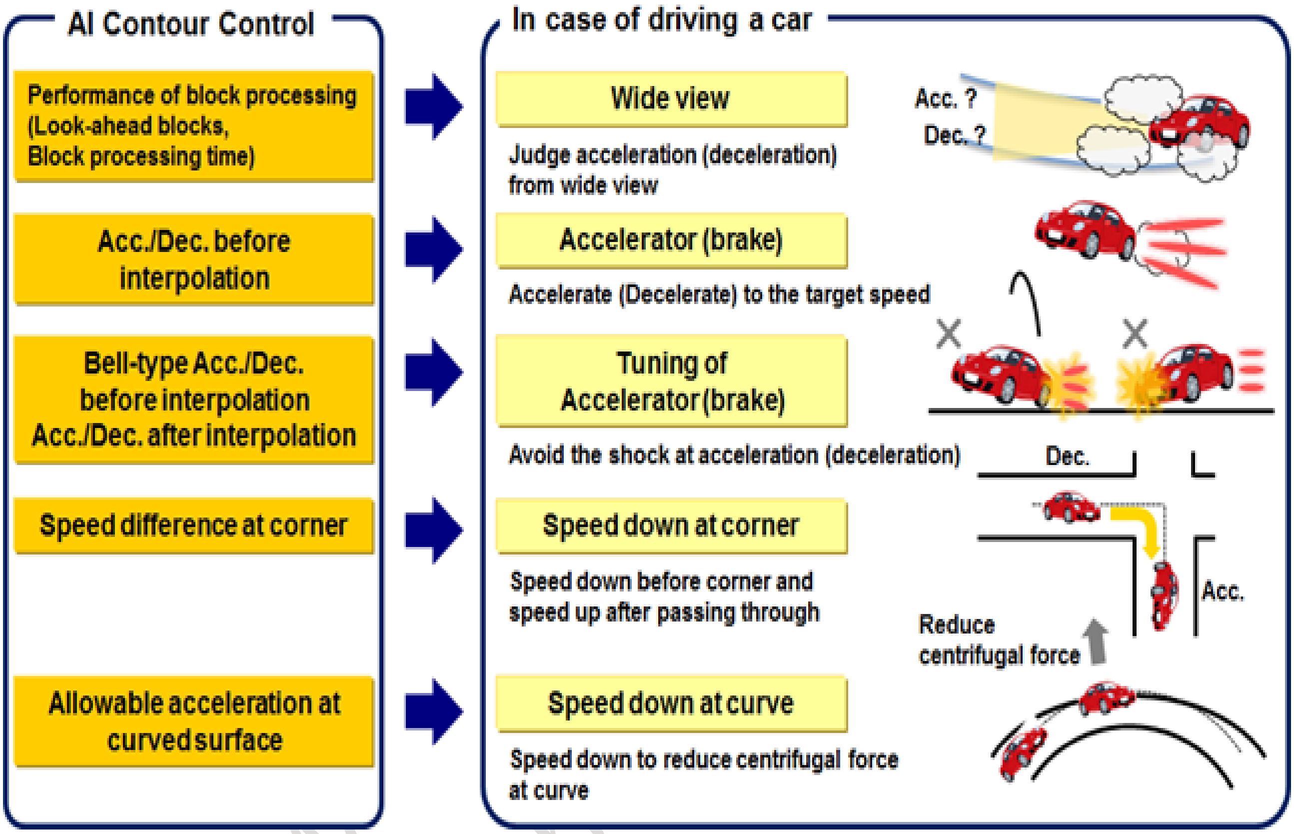


Parameter number	Recommended value
No.2570#4	1
No.2571#3	1
No.2647[0.1Hz]	Vibration freq.[Hz]×10
No.2648	30
No.2649	2510

D.2 SUPPLEMENT

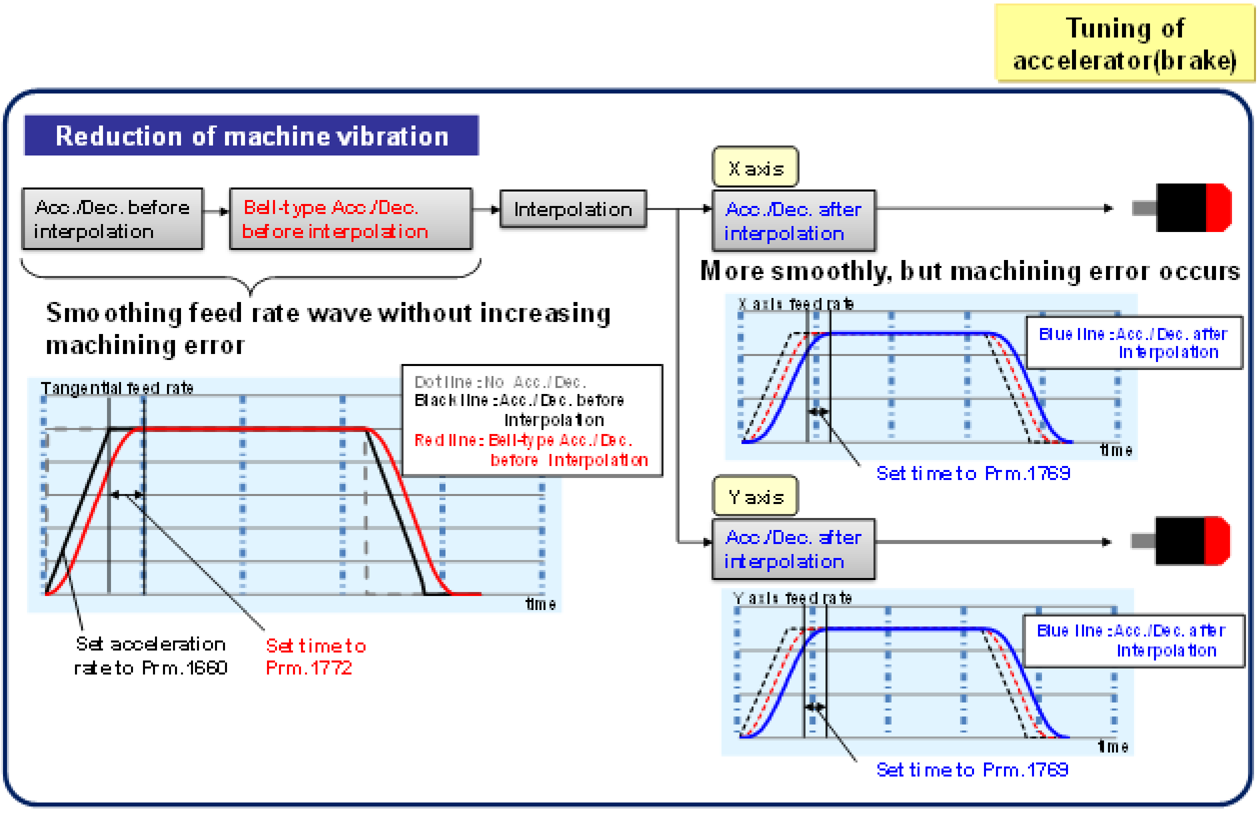
Supplement A. Details of AI contour control

AI contour control is the function to possible high speed and high precision machining with low machine vibration and low machining error by following four functions.
The following four functions can be easily understood as the comparison to driving a car.



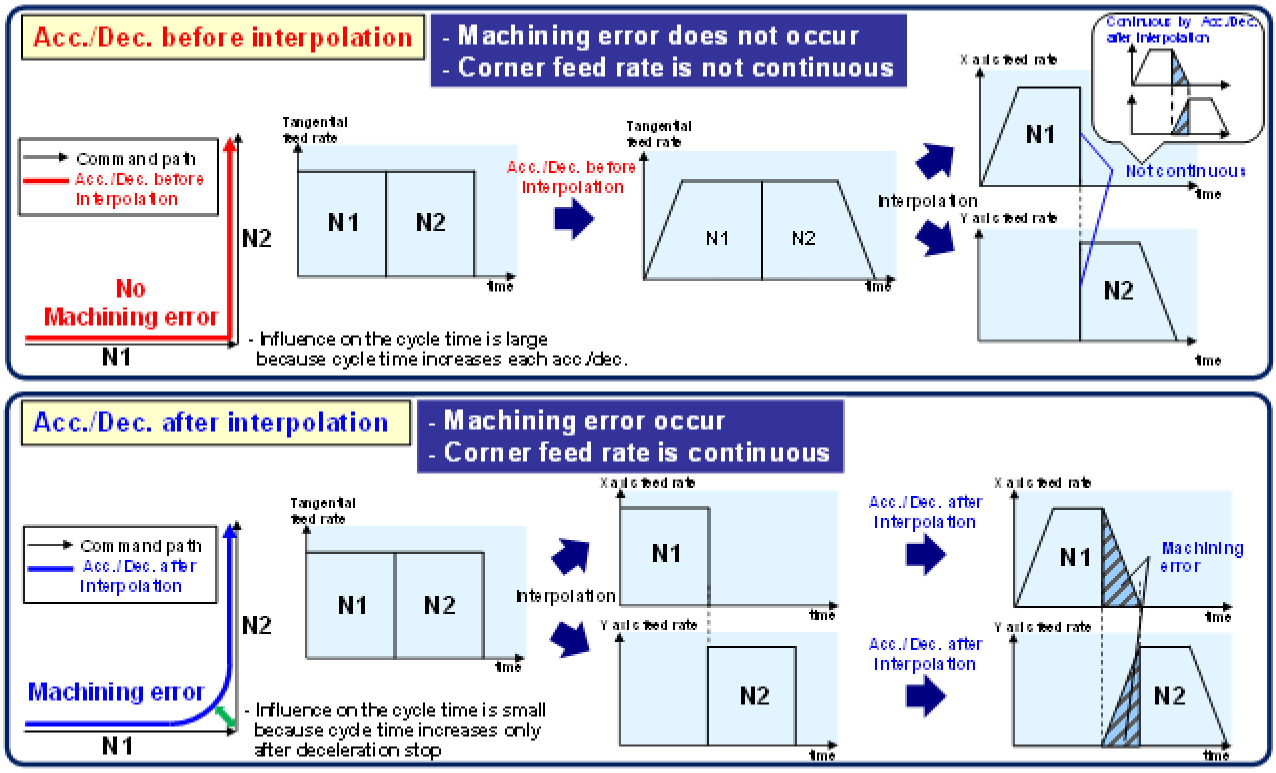
Acc./Dec. before interpolation, Bell-type Acc./Dec. before interpolation, Acc./Dec. after interpolation

Acc./Dec. before interpolation is function to accelerate or decelerate for command feed-rate before CNC interpolates machining program command. Acc./Dec. after interpolation is function to accelerate or decelerate for each axis feed-rate after CNC interpolates.
In Acc./Dec. before interpolation, set acceleration rate (No.1660), and it is possible to produce smooth feed-rate curve by bell-type Acc./Dec. before interpolation (No.1772).
Acc./Dec. before interpolation achieve Acc./Dec. without machining error because CNC interpolates smoothed feed-rate curve with Acc./Dec. before interpolation.
It is possible to more smooth feed-rate curve by using Acc./Dec. after interpolation (No.1769), but Acc./Dec. after interpolation makes machining error because it makes after CNC interpolation.



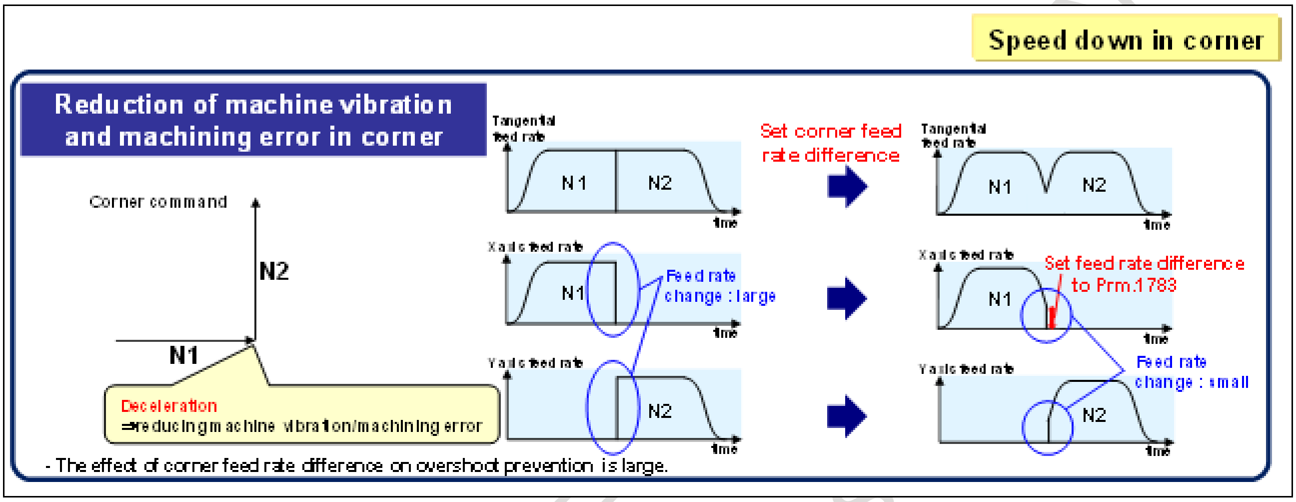
Difference between Acc./Dec. before interpolation and Acc./Dec. after interpolation

Acc./Dec. before interpolation achieve Acc./Dec. without machining error, but feed-rate of each axis is not continuous in the corner and it might cause machine vibration or shock.
It is possible to smooth the discontinuous feed-rate point by using Acc./Dec. after interpolation that accelerate or decelerate for each axis feed-rate after CNC interpolates, but the smoothing of feed-rate by Acc./Dec. after interpolation occurs machining error as described above.
So, both Acc./Dec. before interpolation and Acc./Dec. after interpolation are necessary functions and it is important to use well-balance.

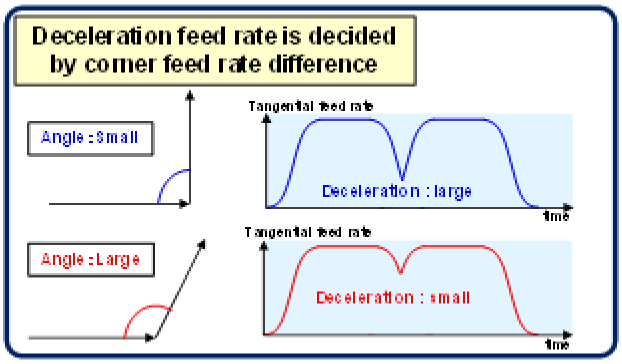


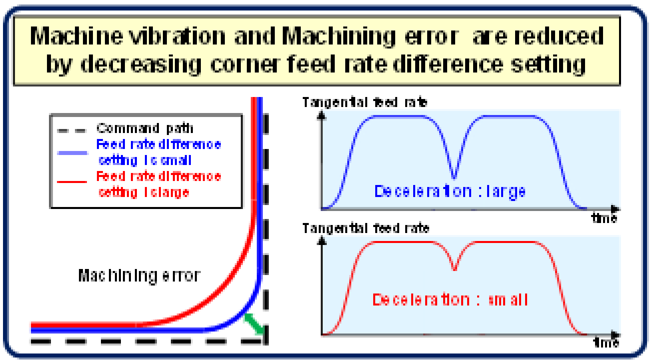
Corner feed rate difference

In the corner, tangential feed-rate curve is smooth, but feed-rate change of each axis is large, so it might cause machine vibration. In this case, machine vibration can be reduced by deceleration with corner feed-rate difference (No.1783) in the corner.
Deceleration feed-rate is decided so that there is no difference of setting value of corner feed-rate difference for each axis or more.
Feed-rate difference under the value of setting corner feed-rate difference in the corner can be smooth by Acc./Dec. after interpolation. And machining error is reduced by reducing feed-rate difference in the corner.



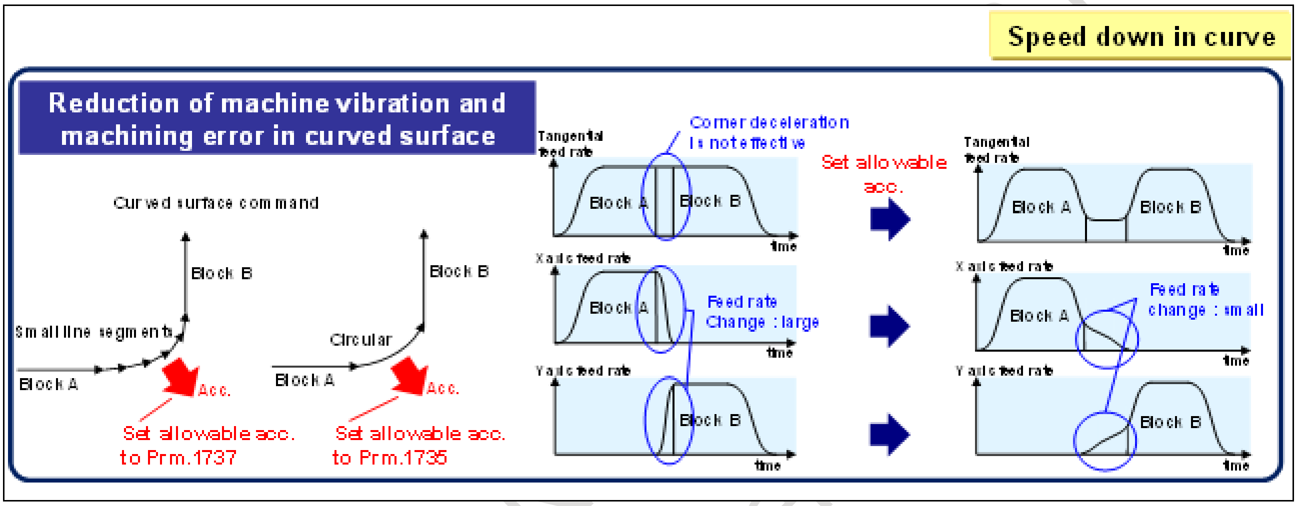
Feed-rate in the corner is decided by parameter setting value of corner feed-rate difference and corner angle.
In case of the same parameter setting value of corner feed-rate difference, if corner angle is smaller, feed-rate difference of each axis is made below parameter setting value by more deceleration in the corner.
In case of the same corner angle, if parameter setting value of corner feed-rate difference is smaller, machine vibration and machining error are reduced by more deceleration in the corner.



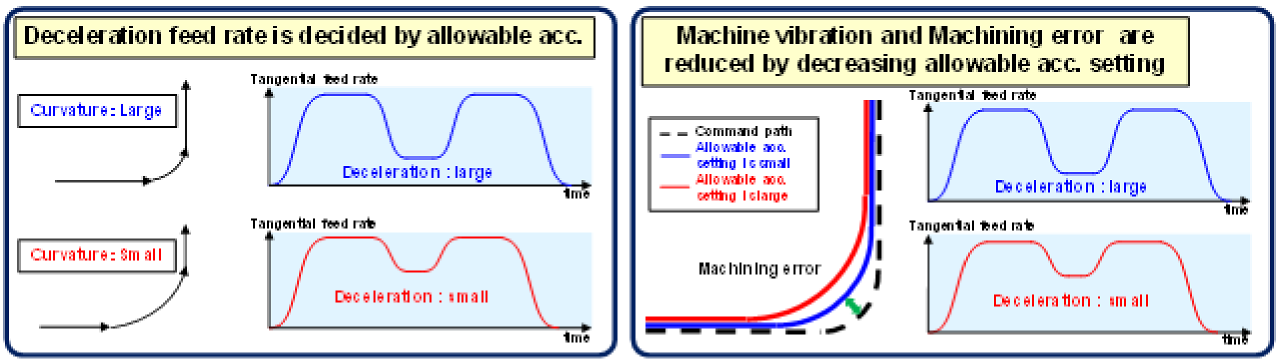


Allowable acceleration rate for curved surface

In the curved surface, tangential feed-rate curve is smooth, but feed-rate change (=acceleration rate) of each axis is large, so it might cause machine vibration. Corner deceleration is not effective in the curved surface. Even if the curved surface is composed of small line segment blocks, corner deceleration is not effective because feed-rate difference between blocks is small.
In this case, machine vibration can be reduced by limiting acceleration rate with allowable acceleration rate (No.1735, No.1737) in the curved surface.
Moreover, as corner deceleration, machining error caused by Acc./Dec. after interpolation is reduced by deceleration in the curved surface.
Different allowable acceleration rate value can be set for small line segment blocks (No.1737) and circular interpolation (No.1735).



Feed-rate in the curved surface is decided by parameter setting value of allowable acceleration and curved rate.
In case of the same parameter setting value of allowable acceleration, if curved rate is larger, acceleration rate of each axis is made below parameter setting value by more deceleration in the curved surface.
In case of the same curved rate, if parameter setting value of allowable acceleration is smaller, machine vibration and machining error are reduced by more deceleration in the curved surface.



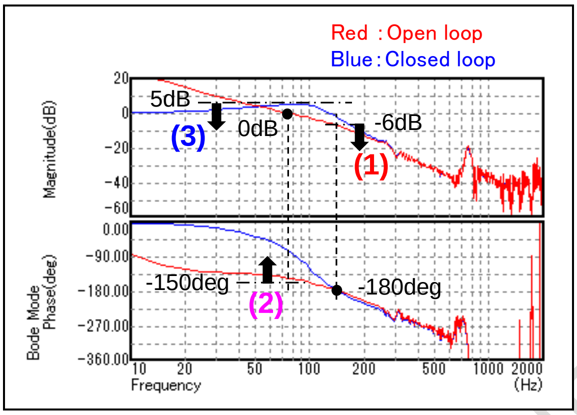
Supplement B. Servo tuning for higher response

Tuning for higher servo stiffness and for improvement of machining accuracy.

Tuning of velocity Loop gain and filter

Measure frequency response by SERVO GUIDE and increase velocity loop gain with keeping the following three conditions.

(1) Open loop gain below -6dB
where phase = -180 deg
(2) Open loop phase above -150 deg
where gain = 0dB
(3) Closed loop gain below +5dB



When vibration occurs, refer to the following table.

Vibration frequency	Method of tuning	Standard parameter range of filter
Lower 200Hz	Decrease velocity loop gain	—
200 to 400Hz	Apply resonance elimination filter	Attenuation bandwidth : 60 to 100Hz Damping : 0 to 50%
400 to 1000Hz	Apply resonance elimination filter	Attenuation bandwidth : 100 to 200Hz Damping : 0 to 10%
Upper 1000Hz	Apply resonance elimination filter	Attenuation bandwidth : 300 to 600Hz Damping : 0 to 10%

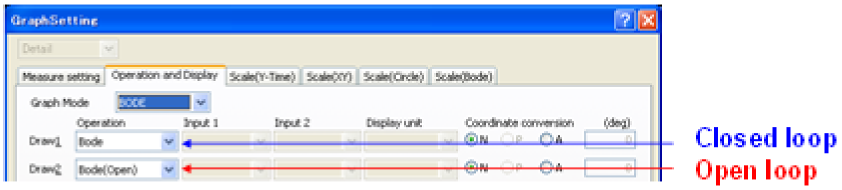
Tuning of velocity feed-forward

Setting of feed-forward coefficient calculated by following formula

Parameter number	Inertia information	No inertia information
No.2069 No.2145	$100 \times \dfrac{\text{Rotor inertia of motor} + \text{Load inertia}}{\text{Rotor inertia of motor}}$	100

[Supplement 1] Display of open loop characteristic

Push "F5", display "Operation and display" and select Bode(Open) in Draw2's operation.



[Supplement 2] Measurement of vibration over 1kHz

Measure TCMD with 125μs sampling cycle.

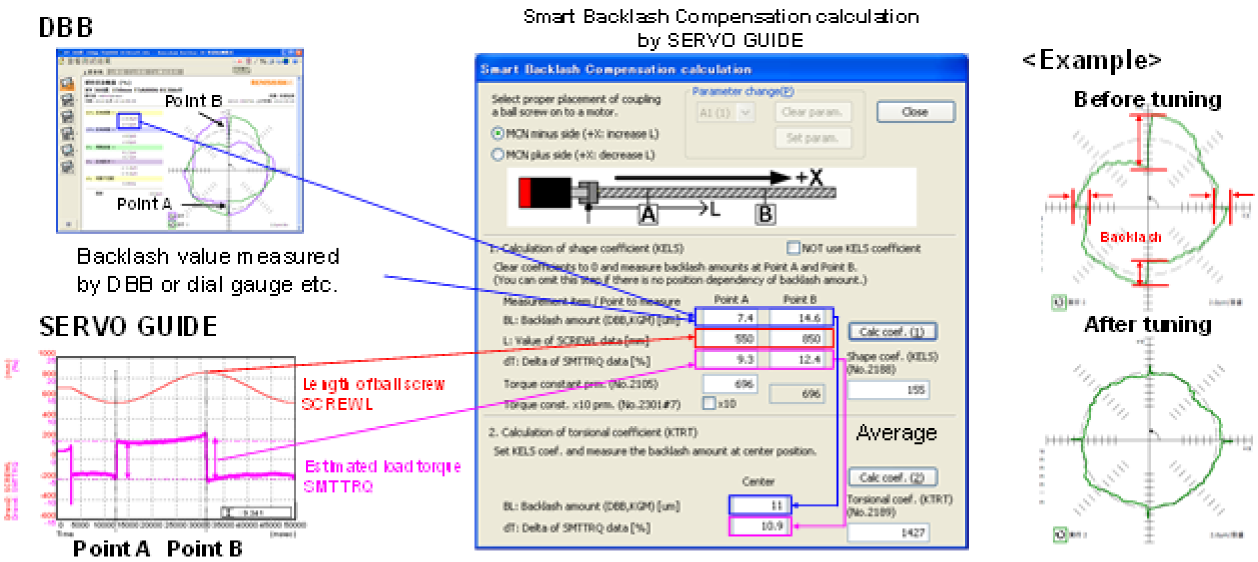
Tune range on YT mode.
(Zoom up or down on time range by cursor key up or down
and decrease wave number below 10 waves per 1 division.)

Do Fourier analysis by "Ctrl + F" , set wave information check box(w-info),
and measure peak frequency.

Tuning of Smart Backlash Comp.

Tuning of Smart Backlash Compensation with DBB and SERVO GUIDE

1. Measure backlash by DBB and measure length of ball screw and estimated load torque by SERVO GUIDE
2. Set measured backlash (Backlash is able to be measured by dial gauge etc. instead of DBB.)
3. Set length of ball screw and change value of estimated load torque when axis reversing



E AUTOMATIC SETTING / INITIAL SETTING PARAMETER

E.1 AUTOMATIC SETTING OF AUTOMATIC SETTING / INITIAL SETTING PARAMETER

Some parameters are automatically set to recommended values in Series 0*i*-F Plus, so that you can use the CNC by recommended setting.
These parameters set up automatically are classified into following (1) or (2).

(1) Automatic setting parameter
(2) Initial setting parameter

The specifications of (1) and (2) are as follows.

(1) Automatic setting parameter

The parameter value is compared with the initial value at power-on. If the value is other than the initial value, the parameter is reset to the initial value.

The parameter value cannot be changed by the parameter screen, PMC window function (WINDW: SUB52), FOCAS2, C Language Executor, Macro Executor, and programmable parameter input (G10), because it is basically unnecessary for the machine tool builder to change the parameter value.

(2) Initial setting parameter

The parameter is set to the recommendation setting value at power-on only when memory all clear has been executed.
Although use with recommended value is recommended, the machine tool builder can change the parameter value.

The parameter of (1) and (2) is set to recommended value at the time of shipment of CNC.

Prohibition of setting to automatic setting parameter

If automatic setting parameter is tried to set to other than recommended value, the following operations are performed.

- Setting parameter from parameter screen
  The warning message "WRITE PROTECTED" is displayed, and the parameter value is not changed.

- PMC window function (WINDW: SUB52)
  Completion code 7 (write-protected) is returned, and the parameter value is not changed.

- FOCAS2, C Language Executor (cnc_wrparam, cnc_wrparas)
  In the case of setting by cnc_wrparam, return value is set to EW_PROT (Writing protection) and the parameter value is not changed.
  In the case of setting by cnc_wrparas, return value is set to EW_PROT (Writing protection), but the values of the parameters before prohibited one is changed.

- Macro Executor (G314)
  Completion code 7 (The data of the parameter corresponding to the specified parameter number is protected.) is returned, and the parameter value is not changed.

- Programmable parameter input (G10)
  The alarm PS1302, "ILLEGAL DATA NUMBER" occurs, and the parameter value is not changed.

Operation when the parameter file is inputted

When the parameter file is inputted, automatic setting parameter is also rewritten according to the contents of the parameter file.
Whether automatic setting parameters are automatically set up again at the time of next power-on.

Automatic servo parameter initialization

There are standard parameters for the servo motor in automatic setting parameters. (feed- forward setting, HRV3 control setting)
When automatic servo parameter initialization (after bit 1 of parameter No.2000 is 0, power is turned off and turned on.) is executed, feed-forward settings(No.2005#1, No.2069, No.2092) are set automatically.

Automatic spindle parameter initialization

There are spindle parameters in automatic setting parameters. Some parameters are that the initial setting value of automatic spindle parameter initialization is different from the recommended value of this function.
Priority is given to the recommended value of this function in Series 0*i*-F Plus.

When automatic spindle parameter initialization (MAIN) (bit 7 of parameter No.4019 is 1) is executed, the following parameters are set to the recommended values of this function.
No.4542#4, No.4627

When automatic spindle parameter initialization (SUB) (bit 7 of parameter No.4195 is 1) is executed, the following parameters are set to the recommended values of this function.
No.4344

E.2 AUTOMATIC SETTING PARAMETER

The list of automatic setting parameter is shown below.

Parameter No.	Meaning of parameters	Automatic setting value
No.301#1	When the input from the connected device to NC is aborted via Ethernet with CNC screen display, 0: Alarm has been occurred. 1: Alarm is not occurred.	1
No.909#0	On the Data server host file list screen, high speed file search is: 0: Invalid. 1: Valid.	1
No.1611#1	When a threading command is specified in AI contour control mode: 0: An alarm is issued. 1: AI contour control mode is temporarily canceled and the command is executed.	1
No.2013#0	HRV3 current control is: 0: Not used. 1: Used.	1 *Only for the M Series
No.2283#0	The high-speed HRV current control mode (servo HRV3 control) is: 0: Set only when both G5.4Q1 and G01 are specified. 1: Set when G01 is specified (G5.4Q1 is not monitored).	1 *Only for the M Series
No.3002#2	When the high-speed M/S/T/B interface is used, if a block specifying an M, S, T, or B code does not contain a move command or dwell command, the distribution end signal and the strobe signal for the function are: 0: Output conventionally (the output of the distribution end signal is delayed). 1: Output at the same time.	1
No.3458#1	In retrace function, when reverse execution is done during auxiliary function execution and then forward reexecution is done, the output of auxiliary function is: 0: Once. 1: Twice.	1 *Only for the M Series
No.3470#0	In helical interpolation, when the circular interpolation axes don't move and other specified axes don't move: 0: Alarm PS0021,"ILLEGAL PLANE SELECT" is issued. 1: Alarm is not issued.	1
No.3729#2	When the Cs contour control mode is turned off, an in-position check is: 0: Performed. 1: Not performed.	1
No.3785#2	At the start of cutting feed, : 0: Always wait until the time elapsed prior to checking the spindle speed arrival signal of parameter No. 3740. 1: If the time longer than the parameter No. 3740 has elapsed since the spindle speed was changed, it does not wait for the passage of the parameter No.3740.	1
No.3785#7	The speed-up of changing Cs contour control mode is 0: Disabled. 1: Enabled.	1
No.5107#0	For G71/G72 (G-code system A), movement to the last turning start position is performed by: 0: Cutting feed. 1: Rapid traverse.	1 *Only for the T Series

Parameter No.	Meaning of parameters	Automatic setting value
No.5107#1	The G71/G72 (G-code system A) TYPE1 commands execute the movement toward the current turning start position in: 0: Two cycles. 1: One cycle.	1 *Only for the T Series
No.5107#2	In G70-G73 (G-code system A), the cycle operation is executed by: 0: Conventional method. 1: Improved method.	1 *Only for the T Series
No.5107#5	If Multiple repetitive canned cycle (G70 to G76) is specified in Coordinate system rotation, Programmable mirror image or Scaling mode: 0: Alarm is not issued. 1: Alarm (PS0327) "MODAL THAT MULTIPLE REPETIVE CYCLES CANNOT BE DONE" is issued.	1 *Only for the T Series
No.5108#3	In the multiple repetitive cycle G71/G72 (G-code system A) of type II, the cutting is executed: 0: By conventional path. (The same cutting path might be executed.) 1: Not to repeat the same cutting path.	1 *Only for the T Series
No.5108#5	In Multiple repetitive cycle G71/G72 (G-code system A), in-position check between cutting blocks is: 0: Executed. 1: Not executed.	1 *Only for the T Series
No.5109#0	When an axis, which is not included in the specified plane, is commanded in the multiple repetitive cycle (G70 to G76): 0: An alarm does not occur. 1: An alarm PS0021,"ILLEGAL PLANE SELECT" occurs.	1 *Only for the T Series
No.5124#0	In a TYPE-1 of multiple repetitive canned cycle (G71, G72), escape after rough cutting is performed by: 0: Cutting feed. 1: Rapid traverse.(The tool path follows the setting in bit 1 (LRP) of parameter No. 1401.)	1 *Only for the T Series
No.5125#6	In type I of G71, G72 of multiple repetitive canned cycle, the axes : 0: Don't move directly from retraction end point to the last turning start point. 1: Move directly from retraction end point to the last turning start point.	1 *Only for the T Series
No.5203#2	In rigid tapping, feed forward is: 0: Disabled. 1: Enabled.	1
No.5208#0	High-speed rigid tapping is: 0: Invalid. 1: Valid.	1
No.5208#1	Speed-up of the motion at the hole bottom in rigid tapping is: 0: Disabled. 1: Enabled.	1
No.5208#5	Speed-up of cycle operation in rigid tapping is: 0: Disabled. 1: Enabled.	1
No.5209#6	If Constant surface speed control is commanded in Rigid tapping mode: 0: Alarm is not issued. 1: Alarm (PS0200) "ILLEGAL S CODE COMMAND" is issued.	1
No.5209#7	On the peck rigid tapping, if the depth of cut (Q) is smaller than the cutting start distance (d): 0: Alarm is not issued. 1: Alarm (PS5560) "ILLEGAL DEPTH OF CUT" is issued.	1

Parameter No.	Meaning of parameters	Automatic setting value
No.5402#6	In case that Positioning has not been done after Coordinate system rotation, if Circular interpolation with R is specified: 0: a center angle might change by over 180 degrees. 1: a center angle does not change by over 180 degrees.	1
No.6000#2	A custom macro is executed: 0: At a normal speed. 1: At a high-speed.	1
No.6021#1	For rotation axes for which rollover function is enabled, the reading of block end point position by system variables #5001 to #5020 or #100001 to #100050 is: 0: Not available. 1: Available.	1
No.8019#1	After the move command of PMC axis control is interrupted by reset signal ECLRg, If different acceleration/deceleration type command without waiting for a deceleration stop generates: 0: Not alarm. 1: Alarm DS1451,"IMPROPER PMC AXIS COMMAND".	1
No.8019#2	If the controlled axis selection signals EAX1 to EAX8 are "0" or PMC controlled-axis selection variable (#8700) is 0, the PMC axis control command generates: 0: Not alarm. 1: Alarm DS1451 "IMPROPER PMC AXIS COMMAND".	1
No.8106#2	By reset in the path other than the path 1, the custom macro variables common to tool path set to common variables #100-#499 cleared by power-off are: 0: Not cleared to <null>. 1: Cleared to <null>. (The setting bit 6 (CCV) of parameter No. 6001 is depended on.)	1
No.8209#4	When the reference position return of angular axis is performed in the slanted coordinate system the reference position return of perpendicular axis is: 0: Not performed in the slanted coordinate system. 1: Performed in the slanted coordinate system.	1
No.8655#3	When the crt_cncscrn function is executed from the main task of C Language Executor, the main task is: 0: Not stopped at the end of the function (is stopped after processing is performed for a very short time). 1: Stopped at the end of the function.	1
No.9032#6	Speed-up read/write function of P-CODE variables(#10000～#19999) and extended P-CODE variables(#20000～#89999) is: 0: Enabled. 1: Disabled.	0
No.10345#1	When the forbidden area of the stored stroke check 2, 3 (Parameter No.1322, 1323) is set or it is changed by G22 command, the setting value for axes with diameter specification is: 0: Half of command value 1: Command value	1
No.10350#1	The servo loop gain for each axis (parameter No. 1825) and the In-position width for each axis (parameter No. 1826) are: 0: Write-disabled during axis moving. 1: Write-enabled if the corresponding axis is stopped.	1

Parameter No.	Meaning of parameters	Automatic setting value
No.10597#0	On the Dual Check Safety Diagnosis screen, the following information is: 0: Not displayed. 1: Displayed. - Safety speed limit (unit: mm/min, inch/min, deg/min) - Safety speed zero monitoring request signal. - Safe feed limit/safe machine position selection signal - Safe feed limit/safe machine position selection signal in case of an alarm - Programmable Safety I/O signal	1
No.11002#1	Speed-up of Spindle indexing is: 0: Disabled. 1: Enabled.	1
No.11303#4	During MDI program execution, blocks that call an execution macro are: 0: Not displayed. 1: Displayed.	1
No.11353#5	While user program which is called by Execution macro function is executing, the data returned by FOCAS2 function as the data under execution is: 0: Data of user program. 1: Data of caller program.	1
No.11354#1	While data transmission is awaited using the DPRNT/BPRNT of the custom macro or macro executor, screen switching is: 0: Not possible. 1: Possible.	1
No.11354#2	When the storage capacity for history data is exceeded due to non-alarm history, alarm history will be: 0: Erased. 1: Erased, except the most recent 50 items of history data.	1
No.11354#3	When the storage capacity for history data is exceeded due to data other than external operator message history, external operator message history will be: 0: Erased. 1: Retained.	1
No.11374#0	If EOB code is included in comment block when program is read: 0: Alarms are not generated. 1: The alarm PS0518,"CODE OF CONTROL-IN DOES NOT EXIST" is generated.	1
No.11400#3	Select the behavior of following system variable related to tool length offset by reset operation. #5081-#5100 in case of the parameters LVC(No.5006#3)=1, LWT(No.5002#2)=0. #5121-#5140 in case of the parameters LVC(No.5006#3)=1, LGT(No.5002#4)=1. 0: Not clear the system variable. 1: Clear the system variable.	1 *Only for the T Series
No.11500#1	Cutting feed-forward flag is 0: output immediately when it comes in-position state. 1: output after waiting for 1 interpolation period after becoming in-position state.	0
No.11501#5	The timing of starting detection of a one-rotation signal in threading is: 0: conventional. 1: high-speed execution.	1

Parameter No.	Meaning of parameters	Automatic setting value
No.11501#6	Speed-up of G28, G30 and G53 is: 0: Disabled. 1: Enabled.	1
No.11502#3	If the cycle start of MEM/RMT mode is commanded without reset while executing subprogram/macro call of the MDI mode: 0: The alarm is not generated. 1: The alarm PS0525,"subprogram/macro calling." is generated.	1
No.11503#2	The precision improvement of the actual machine position by speed up of the timing that the servo position deviation is reflected is: 0: Invalid. 1: Valid.	1
No.11503#4	When the axis controlled with a servo motor enters in-position check: 0: The next block is begun at the next interpolation cycle that entered in-position. 1: The next block is begun at the interpolation cycle when entering in-position.	1
No.11504#5	Operating time reduction of command of preventing buffering is: 0: Disabled. 1: Enabled.	1
No.11507#3	Speed-up of processing related to RS-232C is: 0: Disabled. 1: Enabled.	1
No.11538#6	In automatic operation, the speed-up between blocks is: 0: Invalid. 1: Valid.	1
No.11565#1	In Flexible path axis assignment, tool geometry offset value and tool wear offset value and tool offset value are: 0: not canceled and alarm PS0514 occurs when flexible path axis assignment command is issued. 1: canceled only for the commanded axis when flexible path axis command is issued. In this case, the axis does not move regardless of the tool offset methods.	1 *Only for the T Series
No.11602#2	In the continuous block of the high-speed G53, in the case of interpolation type rapid traverse or time fixed type, the rapid overlap is: 0: Invalid. 1: Valid.	1
No.11602#3	When the rapid traverse is linear interpolation type and time constant acceleration/decerelation type, the rapid overlap is: 0: Invalid. 1: Valid.	1
No.11620#0	In the program in which the cutting feed (G01) in AI contour control mode is continuous, when there is a block with the same position command in between,: 0: It decelerates and stops. 1: Ignore the block of the same position command and do not decelerate and stop, overlapping with the next block.	1
No.11651#1	When GOTO statement using stored sequence numbers/LGOTO statement using stored label is enabled and memory operation of a program on Data Server/Memory card is executed, sequence numbers/LBL[label] in the program are: 0: Stored. 1: Not stored.	1

Parameter No.	Meaning of parameters	Automatic setting value
No.11850#0	If in PMC axis control, a rapid traverse rate is specified with the axis control block data signal, with bit 0 (RPD) of parameter No. 8002 being set to 1, the rapid traverse rate is: 0: Always treated as being in millimeters. 1: Dependent on the setting of bit 0 (INM) of parameter No.1001.	1
No.13205#5	In Tool management function, when following G codes and M6 are commanded in the same block, axes move to the end position of the block: - G53 Machine coordinate system setting (except for high speed G53) - G28 Automatic return to reference position - G29 Movement from reference position - G30 2nd, 3rd and 4th reference position return 0: After FIN signal returned. 1: Before FIN signal returned.	1
No.13208#6	In case of tool management function, if T code is commanded when either of following PMC window is executing, edge number change and tool search by T code command are: - PMC window for tool exchange (Function code 329) - PMC window for tool moving (Function code 329) - PMC window for shifting tool management data (Function code 367) 0: Not kept waiting. 1: Kept waiting until PMC window is finished.	1
No.13421#2	If G27/G28/G29/G30/G53 is specified during flexible synchronization control, alarm PS0010,"IMPROPER G-CODE" is: 0: Issued. 1: Is not issued. Commands to the master axis are possible.	1
No.13421#4	For a synchronization group for which a PMC axis is a master axis, when the controlled axis selection signal EAXn<G0136> for PMC axis control is set to "1" after starting flexible synchronization control mode, and the master axis is specified by PMC axis control, or for a synchronization group for which spindle control with servo motor is a master axis, when SV speed control mode of the master axis is turned on after starting flexible synchronization control mode: 0: Alarm is not generated. 1: Alarm PS5381 "INVALID COMMAND IN FSC MODE" is generated.	1
No.13450#4	When the cutting is executed without specifying a feedrate (F) after the modal G code of group 05 was changed by G93(inverse time feed) / G94(feed per minute) / G95(feed per revolution) command: 0: The feedrate (F) is inherited as a modal. 1: Alarm PS0011,"FEED ZERO (COMMAND)" is issued.	1
No.13805#1	When the setting of that follow-up is executed by follow-up signal (*FLWU) in servo-off state is effective (the value of the parameter FUPx(No.1819#0) is 0), the following limit is applied to the safety position error monitoring function during servo off state and follow-up state including emergency stop and servo alarm etc, or pole position detection . 0: The position deviation limit in moving state (The parameter No.1838, 1841) 1: The position deviation limit in servo-off state (The parameter No.1840)	1
No.13806#0	The brake signal(*BRKx) of Dual Check Safety in servo off state 0: is not to 0. 1: is to 0.	1

Parameter No.	Meaning of parameters	Automatic setting value
No.18050#7	If an axis move command is executed with PMC axis control during automatic operation, and the NC block under execution is stopped by a feed hold when the axis moving due to PMC axis control is completed, the amount of movement due to PMC axis control in that block is: 0: Not reflected in the NC coordinate system. 1: Reflected in the NC coordinate system.	1
No.24308#4	While the execution macro is being executed, making the data for displaying program being executed is: 0: processing 1: not processing	1

E.3 INITIAL SETTING PARAMETER

The list of initial setting parameter is shown below.

Parameter No.	Meaning of parameters	Initial setting value
No.101#0	The number of stop bits 0: 1 1: 2	1
No.101#7	Feed before and after the data output 0: Output 1: Not output	1
No.103	Baud rate (when I/O CHANNEL is set to 0)	10
No.1602#3	Acceleration/deceleration after interpolation for cutting feed in a mode of look-ahead acceleration/deceleration before interpolation such as the AI contour control mode: 0: Exponential acceleration/deceleration or linear acceleration/ deceleration is used. (The setting of bit 6 (LS2) of parameter No. 1602 is followed.) 1: Bell-shaped acceleration/deceleration is used. (The bell-shaped acceleration/deceleration after cutting feed interpolation option is required.)	1
No.1602#6	Acceleration/deceleration after interpolation for cutting feed in a mode of acceleration/deceleration before interpolation such as the AI contour control mode: 0: Exponential acceleration/deceleration is used. 1: Linear acceleration/deceleration is used.	1
No.1604#0	When automatic operation is started, the state equivalent to the specification of G5.1Q1 for AI contour control is: 0: Not set 1: Set	1 *Only for the M Series
No.1610#0	Acceleration/deceleration in cutting feed or dry run during cutting feed 0: Exponential acceleration/deceleration is applied. 1: Linear acceleration/deceleration after interpolation is applied.	1
No.1610#1	Acceleration/deceleration in cutting feed or dry run during cutting feed 0: Exponential acceleration/deceleration or linear acceleration/ deceleration is applied. (depending on the setting in bit 0 (CTLx) of parameter No. 1610) 1: Bell-shaped acceleration/deceleration is applied.	1

Parameter No.	Meaning of parameters	Initial setting value
No.1610#4	Acceleration/deceleration in jog feed 0: Exponential acceleration/deceleration is applied. 1: The same acceleration/deceleration as for cutting feedrate is applied. (Depending on the settings of bits 1 (CTBx) and 0 (CTLx) of parameter No. 1610)	1
No.1660	Maximum allowable acceleration rate in acceleration/deceleration before interpolation for each axis	2000.0 *Only for the M Series
No.1800#3	Feed-forward control in rapid traverse is: 0: Disabled. 1: Enabled.	1
No.1825	Position loop gain	3000
No.2005#1	Feed-forward function is: 0: Disabled. 1: Enabled.	1
No.2013#0	HRV3 current control is: 0: Not used. 1: Used.	1 *Only for the T Series
No.2017#7	Velocity loop high cycle management function is: 0: Disabled. 1: Enabled.	1
No.2069	Velocity feed-forward coefficient for rapid traverse	100
No.2092	Advanced preview feed-forward coefficient for rapid traverse	9800
No.2144	Position advanced preview feed-forward coefficient for cutting	10000
No.2145	Velocity feed-forward coefficient for cutting	100
No.2202#1	The cutting/rapid velocity loop gain switching function is: 0: Disabled. 1: Enabled.	1
No.2214#4	The cutting/rapid feed-forward switching function is: 0: Disabled. 1: Enabled.	1
No.2283#0	The high-speed HRV current control mode (servo HRV3 control) is: 0: Set only when both G5.4Q1 and G01 are specified. 1: Set when G01 is specified (G5.4Q1 is not monitored).	1 *Only for the T Series
No.2334	Current loop gain magnification in high-speed HRV current control mode	150
No.2335	Velocity loop gain magnification in high-speed HRV current control mode	200
No.2415#1	The default value of the feed-forward timing adjustment parameter is: 0: 0. 1: Compatible with that of 16 *i* Series.	1
No.3205#5	When the background editing is started without inputting the program name in the key: 0: Program to be edited are initialized (to the state where no selection is made). 1: the editing of the previously edited programs are continued. (Continued editing is possible only when last edited time is not changed (to allow continued editing).)	1
No.3403#6	When the same address two or more times are specified in one block: 0: The address specified last is valid. 1: It is treated as a program error and the alarm PS5074, "ADDRESS DUPLICATION ERROR" is issued.	1
No.4344	Advanced feed-forward coefficient	9800

Parameter No.	Meaning of parameters	Initial setting value
No.4542#4	The cutting feed/rapid traverse feed-forward function is: 0: Disabled. 1: Enabled.	1
No.4627	Advanced preview feed-forward coefficient for cutting feed	10000
No.5203#5	As acceleration/deceleration for rigid tapping cutting feed: 0: Linear acceleration/deceleration is used. 1: Bell-shaped acceleration/deceleration is used.	1
No.5503#0	In the index table indexing function, when the parameter ABS(No.5500#2) is set to 1, internal coordinate system is: 0: Not rounded by one rotation. 1: Rounded by one rotation.	1 *Only for the M Series
No.7003#0	When the manual absolute is on and manual operation is executed in reset state or automatic operation stop state, the movement amount of the manual operation is: 0: Reflected to the movement amount of the first absolute command. 1: Reflected to the coordinate system at the cycle start.	1
No.8306#0	In synchronization establishment: 0: A machine coordinate difference between the master axis and slave axis is output at a time as command pulses (axis movements are performed without acceleration/deceleration). 1: Axis movements are executed with the feedrate of manual rapid traverse and the acceleration/deceleration after interpolation in rapid traverse.	1
No.11304#0	When the path select signal is changed, the screen of the multi path simultaneous display group: 0: Is not switched. 1: Is switched to the display group including the selected path.	1
No.11308#1	When the file of specified name already exists on memory card: 0: It is not overwritten. Alarm SR1973, “FILE ALREADY EXIST” is generated. 1: It is overwritten.	1
No.11364#3	If a program or a folder exists in the target folder when the deletion operation is done specifying the folder: 0: The folder is not deleted. 1: The folder and programs/folders in the target folder are deleted.	1
No.11391#7	In direct input of offset value measured B for 2 spindle lathe, when the setting that a workpiece coordinate system shift amount is set in the workpiece coordinate system memory is an automatic selection is made (parameter 2AT(No.5051#1), and workpiece coordinate system shift value write mode select signal WOQSM <Gn039.6> is 1, the cursor movement by the MDI operation is: 0: Not prohibited. 1: Prohibited.	1 *Only for the T Series
No.11501#3	At a start of the automatic operation, the time from a falling edge of the cycle start signal ST to a start of the automatic operation is: 0: conventional. 1: reduced.	1
No.11933#0	Set a communication method for the I/O Link channel 1: 0: The I/O Link is used. 1: The I/O Link i is used.	1
No.11933#1	Set a communication method for the I/O Link channel 2: 0: The I/O Link is used. 1: The I/O Link i is used.	1

Parameter No.	Meaning of parameters	Initial setting value
No.14000#1	If an inch-metric switch command is executed at a position other than 0 of the machine coordinate, 0: Alarm is not issued. 1: Alarm PS5362,"CONVERT INCH/MM AT REF-POS" is issued.	1
No.19503#0	When a feedrate is determined based on acceleration in AI contour control, smooth feedrate control is: 0: Not used. 1: Used.	1 *Only for the M Series
No.19517#0	When smooth speed control is effective, by block length of the linear interpolation, smooth speed control and speed control with change of acceleration on each axis; 0: Are not invalidated. 1: Are invalidated.	1 *Only for the M Series
No.19517#1	By block length of the linear interpolation, speed control with acceleration on each axis and speed control with change of acceleration on each axis: 0: Are not invalidated. 1: Are invalidated.	1 *Only for the M Series
No.19800#0	Command path correction function is: 0: Disabled. 1: Enabled.	1 *Only for the M Series
No.24306#2	On the servo tuning screen, path is changed to other path and returned previous path, axis page and cursor position is: 0: Not restored. 1: Restored.	1
No.24311#7	When virtual MDI key function is used, the current position on program screen of TEACH IN mode is: 0: Not displayed. 1: Displayed.	1

F 0*i*-F PLUS START-UP PROCEDURE

In 0*i*-F Plus, Fast cycle-time setting and Fine surface setting are standard. In Fast cycle-time setting, recommended values can be set for parameters related to reducing the cycle time all at once. In Fine surface setting, recommended values can be set for parameters related to high-quality processing all at once. In order to improve the performance of CNC, set the recommended values all at once by these functions.

> **NOTE**
> This function is for the machine tool builder. It is used only when parameter setting at machine start-up.

Blinking of "ADJUST"

In 0*i*-F Plus, in order to urge adjustment by Fast cycle-time setting and Fine surface setting, "ADJUST" blinks in the status section when any function is incompletely adjusted. Be sure to set adjustment completion before machine shipment and hide "ADJUST". (For the adjustment completion setting, refer to "Adjustment completion setting" below.)

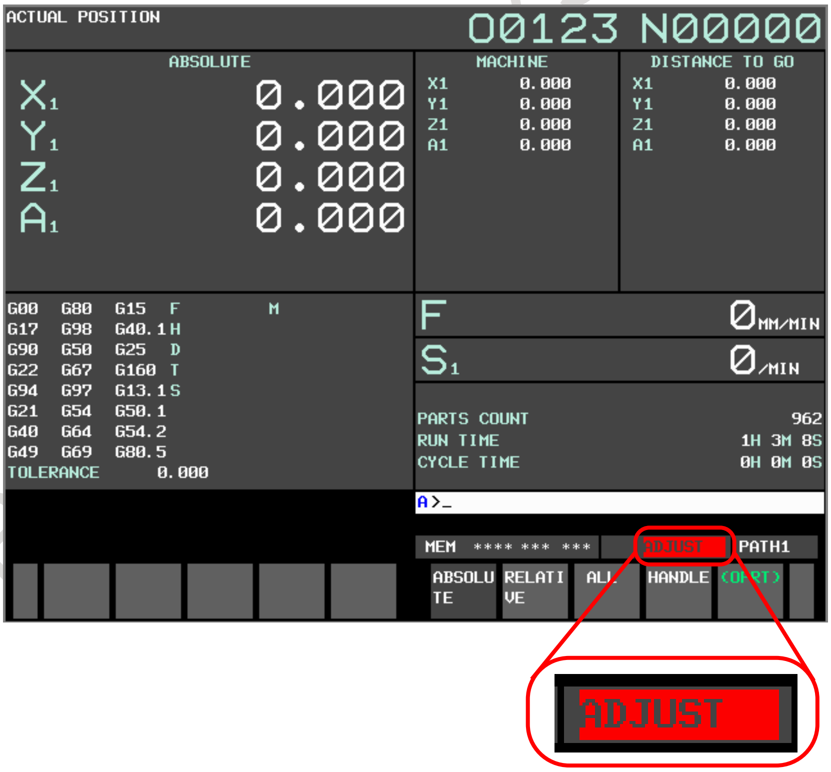


Fig. F (a) Blinking of "ADJUST"

Setting procedure (overview)

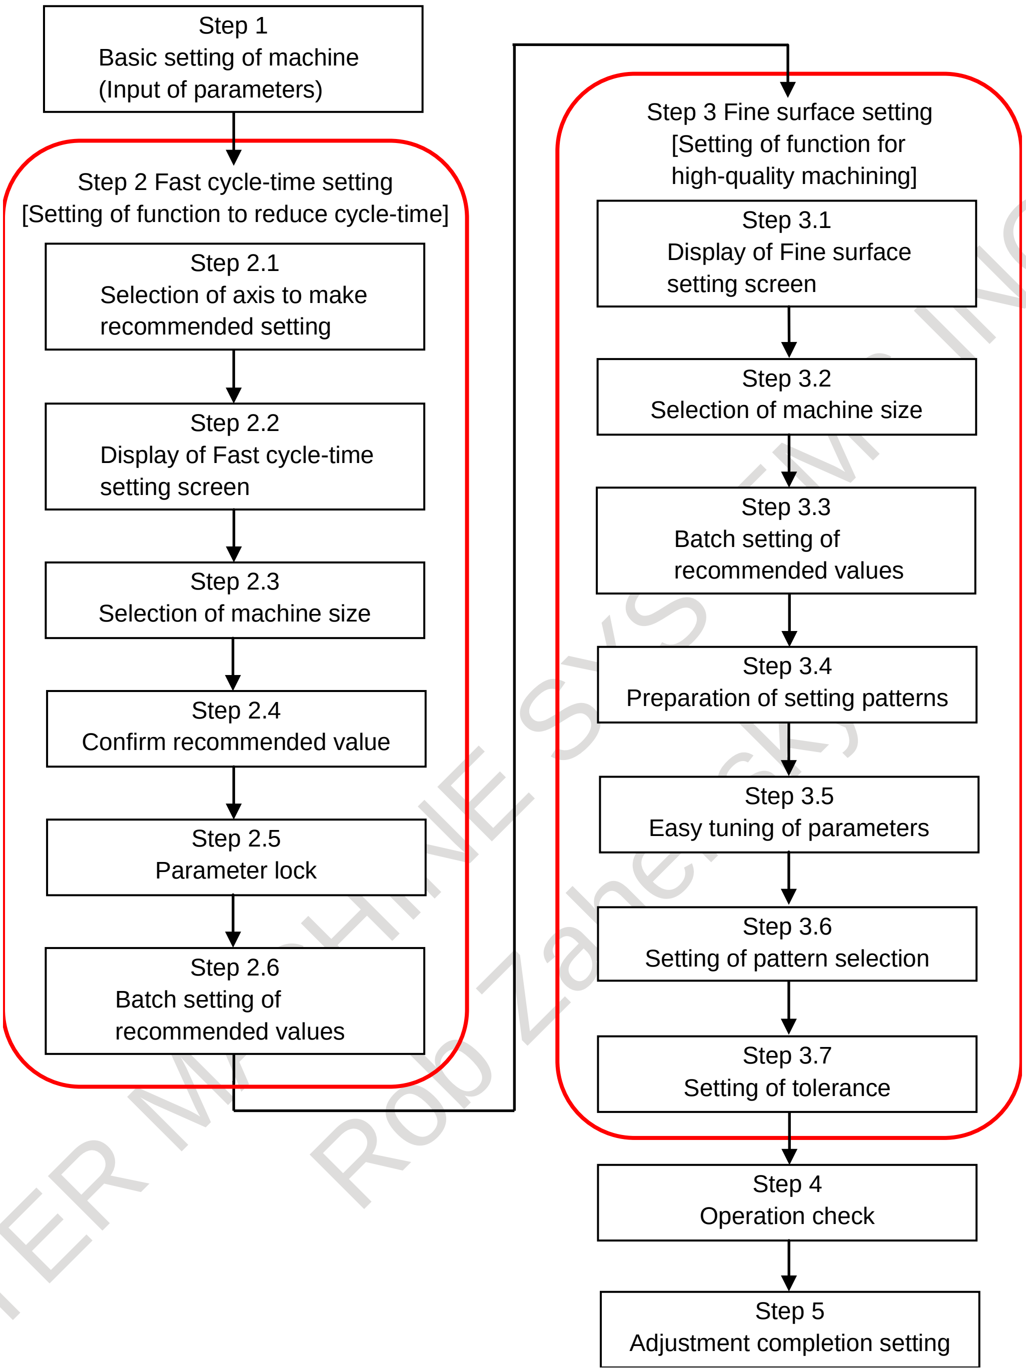

Fig. F (b) Setting procedure (overview)

Below, Step 1 to 5 is explained.

F.1 BASIC SETTING OF MACHINE

Before setting the recommended value by Fast cycle-time setting and Fine surface setting, input the parameters of machine to 0*i*-F Plus and perform basic setting such as number of axes. After inputting the parameters, turn the power OFF/ON.

F.2 FAST CYCLE-TIME SETTING

Overview

Recommended values can be set for parameters related to reducing the cycle time all at once. This makes it easy to set parameters related to reducing the cycle time when the machine is started up.

Explanation

In Fast cycle-time setting, recommended values can be set for parameters related to reducing the cycle time all at once in the following procedure. Setting by Fast cycle-time setting is done on the dedicated Fast cycle-time setting screen (FCS screen).

Step 1
Selection of axis to make recommended setting

↓

Step 2
Display of Fast cycle-time setting screen

↓

Step 3
Selection of machine size

↓

Step 4
Confirm recommended value

↓

Step 5
Parameter lock

↓

Step 6
Batch setting of recommended values

Fig. F.2 (a) Fast cycle-time setting procedure

Below, Step 1 to 6 is explained.

Step 1 : Selection of axis to make recommended setting

The servo axis/spindle that setting recommended values by Fast cycle-time setting is specified. The servo axis is specified by the bit 7 (FAXx) of parameter No.11525. The spindle is specified by the bit 7 (FSPs) of parameter No. 11527. Only the servo axis/spindle with parameter FAXx = 1/FSPs = 1 on the parameter screen becomes the target axis for batch setting. For axes you want to exclude from the batch setting such as the PMC axis, set the parameter FAXx = 0/FSPs = 0.

Step 2 : Display of Fast cycle-time setting screen

The FCS screen can be displayed by pressing the function key SYSTEM when the bit 0 (FCS) of parameter No. 24745 is 0 (adjustment by Fast cycle-time setting is incomplete). On the FCS screen, the selected machine size, item (parameter) name, parameter value, Fanuc standard value, and item (parameter) explanation are displayed. The parameter value is the value on the parameter screen. Fanuc standard value is the standard value set by FANUC (For Fanuc standard value, refer to "Parameter set by Fast cycle-time setting" below). Also, when the parameter FCS is 0, "ADJUST" blinks in the status section.

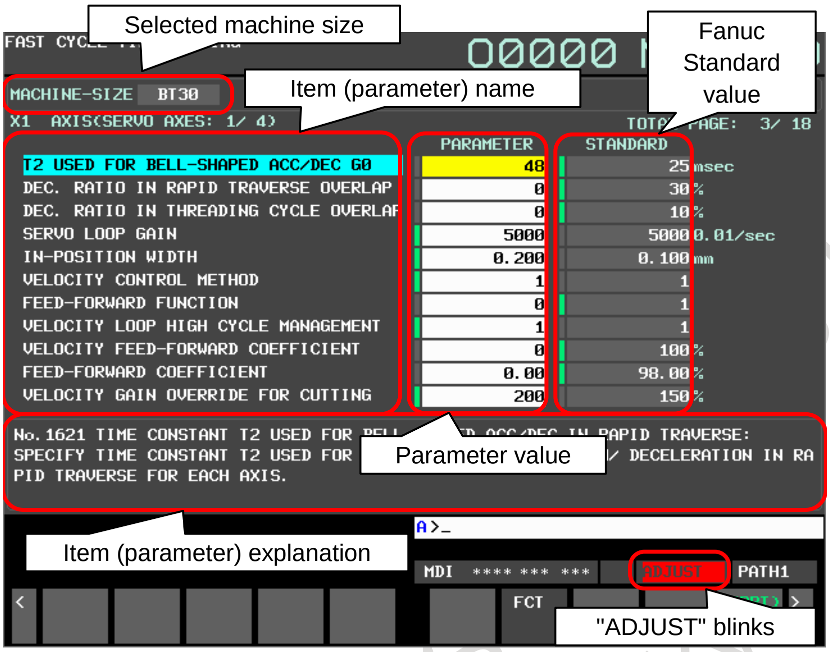

Fig. F.2 (b) Fast cycle-time setting screen (10.4-inch display unit)

There are three major setting items for Fast cycle-time setting.

- “Common”
  System common type, path type parameters related to reducing the cycle time
- “Axis”
  Axis type parameters related to reducing the cycle time
- “Spindle”
  Spindle type parameters related to reducing the cycle time

The screen of each setting item can be displayed by pressing the soft key [COMMON], [CHANGE AXIS], [CHANGE SPINDL].

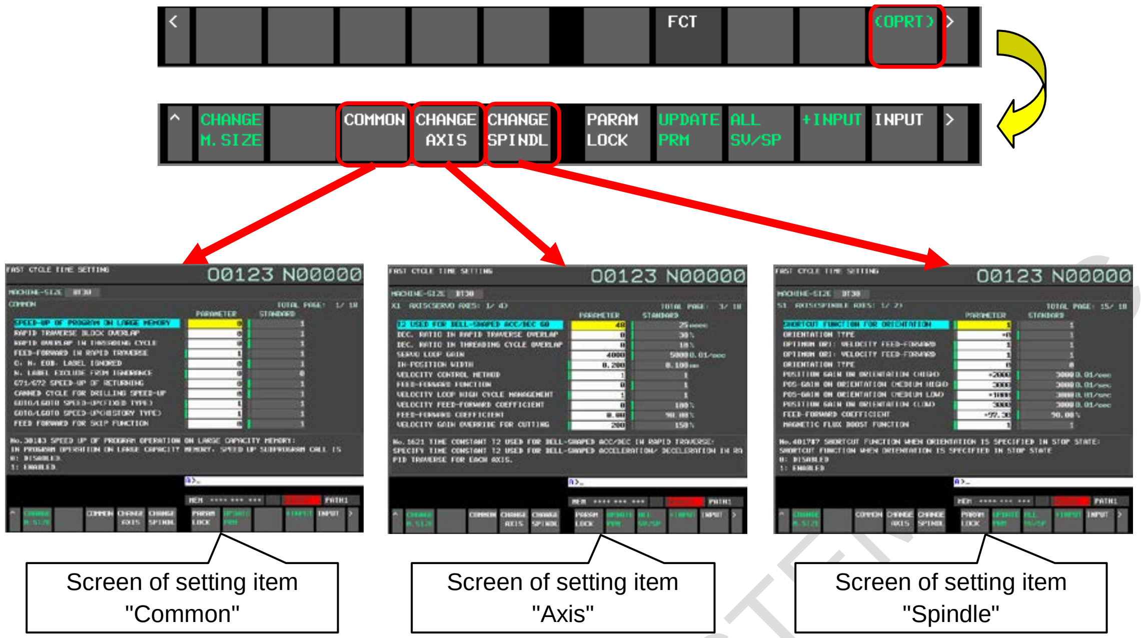

Fig. F.2 (c) Setting item "Common", "Axis", "Spindle"

NOTE

1. The parameter value on the FCS screen differs from the value displayed on the parameter screen and is displayed in general unit.
   Example 1)
   Display contents of parameter No. 1826 when the metric system machine, the detection unit 0.001 (IS-B, CMR = 1)
   Parameter screen 100 [detection unit]
   FCS screen 0.100 [mm]
   Example 2)
   Display contents of parameter No. 2092
   Parameter screen 9800 [0.01%]
   FCS screen 98.00 [%]
2. When the parameter FCS is 0 (when "ADJUST"), the FCS screen is added to the tab stop of the function key SYSTEM. Tab stop means that predetermined screens are displayed in order when the function key is repeatedly pressed.
   Example) The screen displayed when the function key POS is pressed.

Function key	Displayed screen and order
POS	→ Absolute position screen → Relative position screen → Overall position display

Step 3 : Selection of machine size

By pressing the soft key [CHANGE M.SIZE], the machine size can selected from the 3 patterns. Select the appropriate one (or closer one).

0*i*-MF Plus : Spindle taper size [BT30 / BT40 / BT50]

0*i*-TF Plus : Auto lathe and chuck size [AUTO LATHE / 8"CHUCK / 12"CHUCK]

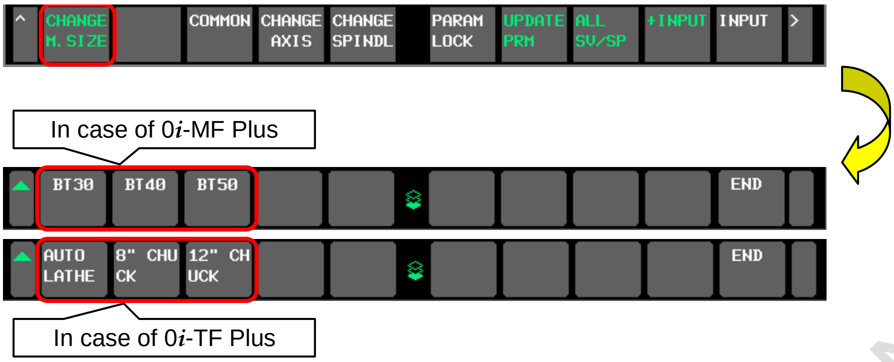

Fig. F.2 (d) Selection of machine size

When changing the machine size, the display of the machine size at the upper left of the screen changes. In addition, the Fanuc standard value also changes to the value set for each machine size.

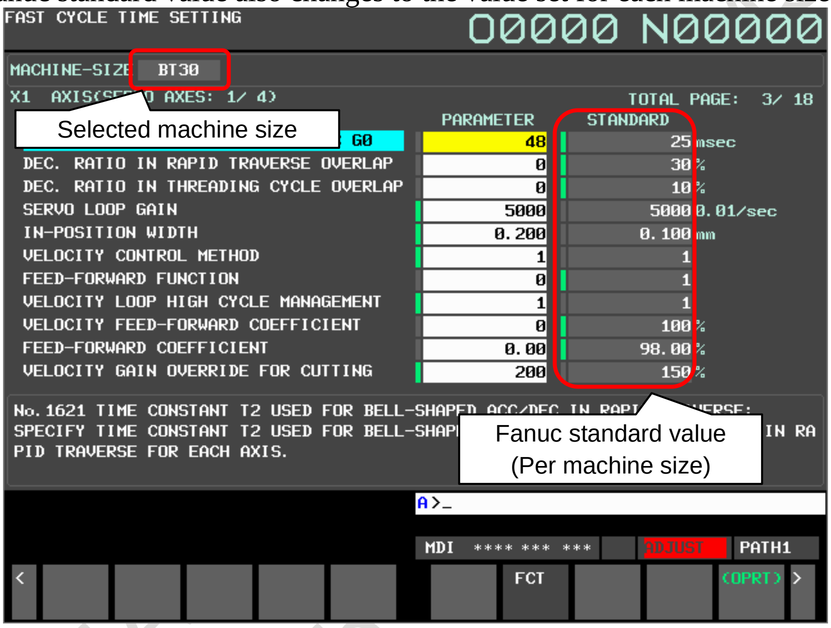

Fig. F.2 (e) Machine size and Fanuc standard value

> **NOTE**
> Machine size is common for fast cycle time setting and fine surface setting. When the machine size is changed on one setting screen, the change is reflected on the other setting screen as well.

Step 4 : Confirm recommended value

When the FCS screen is displayed, CNC compares the current "parameter value" with "FANUC standard value". As a result of the comparison, CNC judges the one with the larger cycle time reducing effect as the recommended value. Also, the green lamp lights up on the side that CNC judged as the recommended value. This allows you to check the current recommended values.

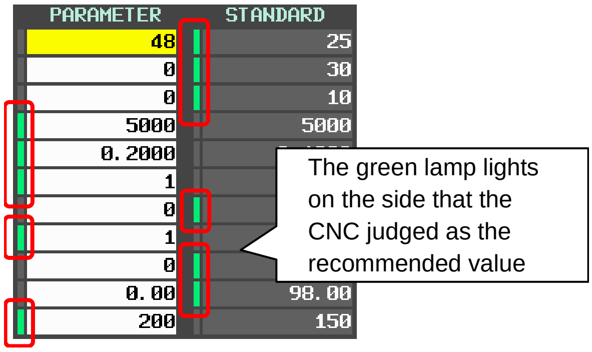

Fig. F.2 (f) Confirm recommended value

Step 5 : Parameter lock

By the soft key [PARAM LOCK], it is possible to become the state (the parameter locked state) that always select the parameter value for each item. By this, the batch setting can be done while keeping the setting unique to the machine tool builder. To set the parameter locked state, move the cursor to the item you want to set and press the soft key [PARAM LOCK]. When set, the red lamp lights up on the parameter side. By this, you can check which item is in the parameter locked state. To cancel the parameter locked state, move the cursor to the item you want to cancel and press the soft key [PARAM UNLOCK]. The soft key [PARAM UNLOCK] is displayed instead of the soft key [PARAM LOCK] when the cursor is on the item in the parameter locked state.

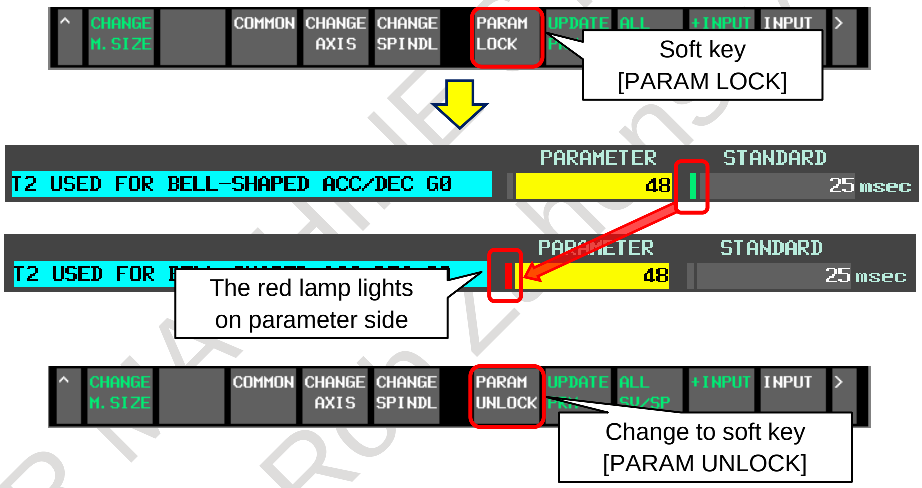

Fig. F.2 (g) Parameter lock

Step 6 : Batch setting of recommended values

When the soft key [UPDATE PRM] is pressed, the parameter values of all items (items of "common", "axis", "spindle" of all paths) are recommended values (values in which the lamp is lit) . (The standard value on which the lamp is lit is set to the parameter value all at once.)

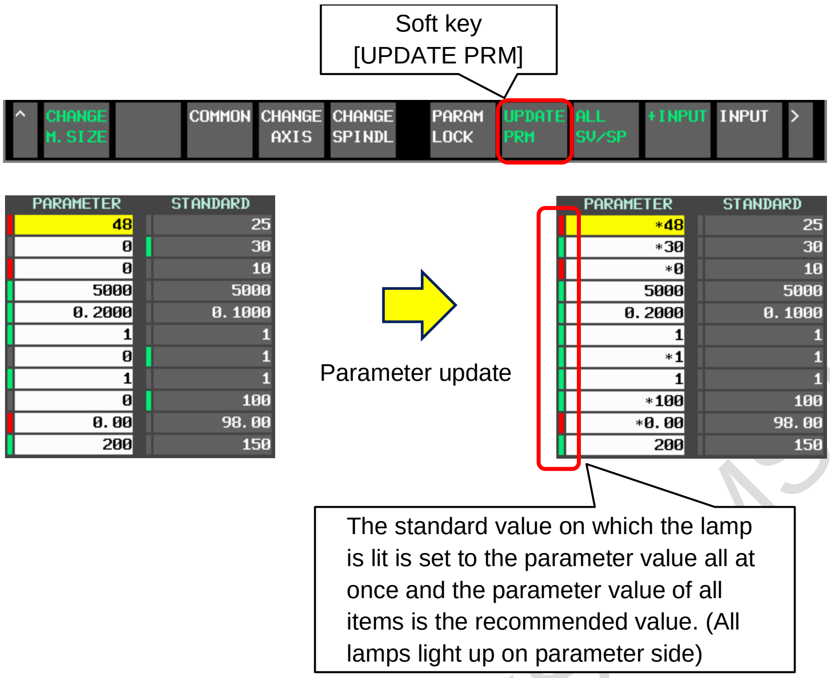

Fig. F.2 (h) Batch setting of recommended values

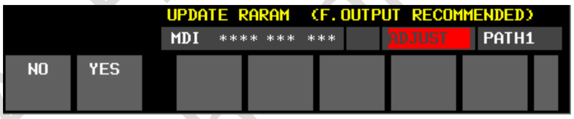
NOTE

1. The lamp only shows which parameter value or Fanuc standard value is selected as the recommended value. The operation of the machine operates according to the currently set parameter value.
2. The soft key [parameter update] is executed for all items of all paths, not for each path.
3. Items whose values are written to the parameters by the soft key [UPDATE PRM] are only the items whose standard value is the recommended value (items whose lamps are lit on the standard value side). Values are not overwritten for items whose parameter values are already recommended values (items whose lamps are lit on the parameter side).
4. Execute the soft key [UPDATE PRM] in emergency stop or in MDI mode and not in automatic operation. If it is executed in another mode, the warning "WRONG MODE" occurs.
5. The bit 0 (PWE) of parameter No. 8900 is valid for the operation to change the parameter value (direct input, the soft key [UPDATE PRM], etc.). If the write operation is executed with write disable setting (parameter PWE = 0), a warning "WRITE PROTECT " occurs. (8-Level data protection function is invalid. When a write operation is executed with the setting of write enable (parameter PWE = 1), the parameter value is changed regardless of the setting of 8-Level data protection function.)
6. The soft key [UPDATE PRM] changes the parameter value. Therefore, we recommend backup the parameters before change. The parameter input/output (the soft key [F input] [F output]) is possible on the FCS screen as well as the parameter screen. Also, when the soft key [UPDATE PRM] is pressed, the following confirmation guidance is displayed.



Parameters set by Fast cycle-time setting

Parameters set by Fast cycle-time setting are as shown in the table below.

Table F.2 (a) Parameters displayed on the FCS screen "Common"

Item Name / Parameter number	0*i*-MF Plus			0*i*-TF Plus		
	BT30 Standard value	BT40 Standard value	BT50 Standard value	Auto Lathe Standard value	8” Chuck Standard value	12” Chuck Standard value
SPEED-UP OF PROGRAM ON LARGE MEMORY / 301#3	1	1	1	1	1	1

*1 : The standard value of "T2 USED FOR BELL-SHAPED ACC/DEC G0" (parameter No. 1621) is calculated from the setting of acceleration (parameter No. 1420, No. 1620) and the standard value of rapid traverse jerk.

The standard value of rapid traverse jerk [m/sec^3]

0i-MF Plus	BT30	BT40	BT50
	250	60	20
0i-TF Plus	Auto Lathe	8”Chuck	12” Chuck
	650	100	70

Formula : The standard value of "T2 USED FOR BELL-SHAPED ACC/DEC G0" (parameter No. 1621) [msec] = (No.1420/60/1000)[mm/msec] / No.1620[msec] / The standard value of rapid traverse jerk [mm/msec^3]
When a very large value is set for acceleration, the time constant T2 used for bell-shaped acceleration/deceleration in rapid traverse may increase. In that case, check the setting of acceleration together.

*2 : For a semi-closed system (The bit 1 (OPTx) of parameter No. 1815 is 0), the standard value is 5000.
For a full-closed system (The bit 1 (OPTx) of parameter No. 1815 is 1), the standard value is 3000.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
11525	FAXx							

[Input type] Parameter input
[Data type] Bit axis

#7 FAXx In Fast cycle-time setting, the batch setting (Axis) of recommended values is :
0: not executed.
1: executed.

	#7	#6	#5	#4	#3	#2	#1	#0
11527	FSPs							

[Input type] Parameter input
[Data type] Bit spindle

#7 FSPs In Fast cycle-time setting, the batch setting (Spindle) of recommended values is :
0: not executed.
1: executed.

	#7	#6	#5	#4	#3	#2	#1	#0
24745								FCS

[Input type] Parameter input
[Data type] Bit

#0 FCS The adjustment by Fast cycle-time setting is :
0: not completed.
1: completed.

> **NOTE**
> When this parameter is 0, Fast cycle-time setting screen (FCS screen) is displayed. Moreover, "ADJUST" is blinked in the status section. Set this parameter to 1 before shipment of machines and hide FCS screen and "ADJUST" of status section.

F.3 FINE SURFACE SETTING

Overview

FANUC’s recommended values can be set by batch in parameters related to high-quality machining. Three kinds of parameter settings (called setting patterns) are available for several parameters (called selectable parameters). Moreover, operators can select an effective setting pattern from machine tool builders’ made patterns depending on the machining conditions. For these reasons, this function makes it easier to set parameters related to high-quality machining and to choose parameters according to the machining conditions.

Two screens are available in Fine surface setting; Fine surface setting screen, and Pattern select screen. Setting patterns are prepared in Fine surface setting screen. A setting pattern is selected in Pattern select screen.

This manual describes the preparation for setting patterns.

> **NOTE**
> This function is available for only machining center system.

Explanation

Setting patterns are prepared with the following steps 1 to 7.

Step 1
Display of Fine surface setting screen

↓

Step 2
Selection of machine size

↓

Step 3
Batch setting of recommended values

↓

Step 4
Preparation of setting patterns

↓

Step 5
Easy setting of parameters

↓

Step 6
Setting of pattern selection

↓

Step 7
Setting of tolerance

Step 1. Display of Fine surface setting screen

Fine surface setting is enabled to set bit 7(FSD) of parameter No.25000 to 1. And, Fine surface setting screen is displayed when bit 7(FSS) of parameter No.24745 is set to 0.

NOTE

1. The following functions cannot be used simultaneously with Fine surface setting. If Fine surface setting is enabled, the following functions are disabled.
   - Machining condition selection function
   - Machine setting switching function
2. Setting screen for reducing cycle time and Fine surface setting can be used together. However, the following items of setting screen for reducing cycle time cannot be used if both of the two functions are enabled.
   - Speedup of drill cycle, Smart overlap, and Automatic setting of overlap time on "CUTTING BLOCK ADJUSTMENT" screen
   - AI contour control and Smooth tolerance control on "CYCLE ACCURACY ADJUSTMENT" screen
3. After enabling Fine surface setting, basic parameters are enabled before selecting setting pattern, because any of patterns 1 to 3 has not been selected at this time. For the details of basic parameters, refer to the following item of "Parameters set in Fine surface setting".
4. When bit 7(FSS) of parameter No.24745 is set to 0, Adjustment of Fine surface setting is assumed to be not finished, and "ADJUST" blinks in the status section. Set bit 7(FSS) of parameter No.24745 to 1 definitely before a machine shipment, and hide Fine surface setting screen.

Display of Fine surface setting screen and pattern select screen

How to display Fine surface setting screen

1 Press function key SYSTEM several times、Fine surface setting screen is displayed.

Fig. F.3 (a) Fine surface setting screen

2 Press soft key [OPRT].

3 Press soft key [PATTERN NAME], Fine surface setting screen (pattern name setting) is displayed.

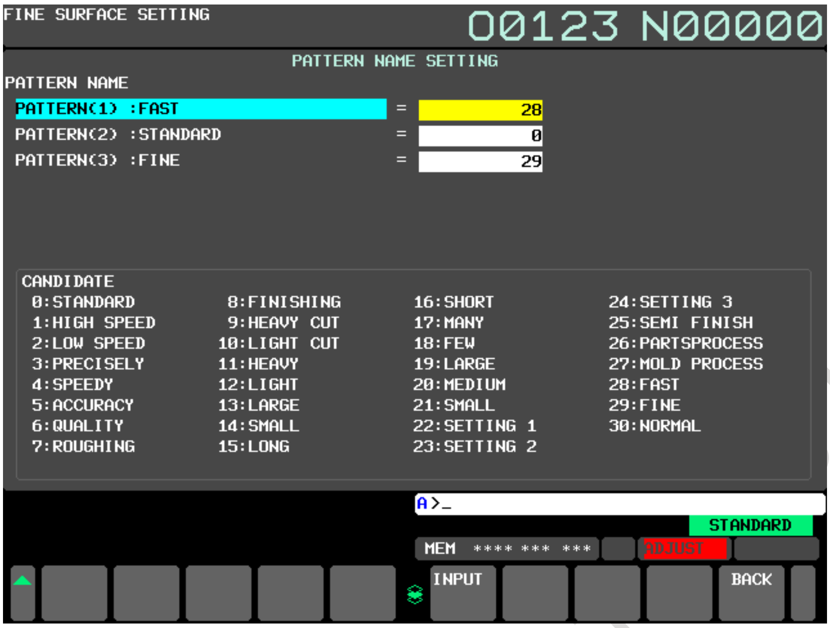

Fig. F.3 (b) Fine surface setting screen (pattern name setting)

How to display pattern select screen

1 Press function key several times、 pattern select screen is displayed.

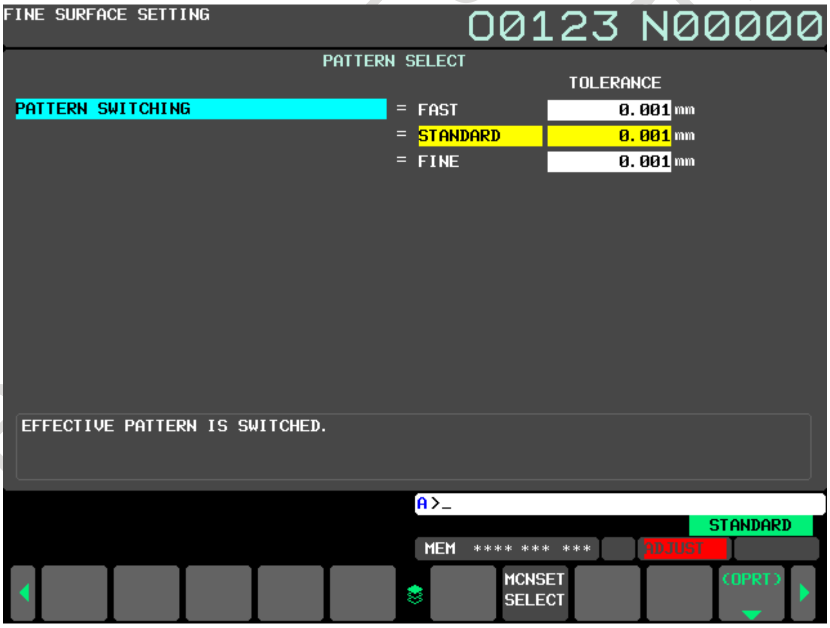

Fig. F.3 (c) Pattern select screen

Step 2. Selection of machine size

> **NOTE**
> The machine size is shared with Fast cycle-time setting. When the machine size is changed in Fine surface setting screen, the machine size in Fast cycle-time setting screen is changed.

1 Press soft key[CHANGE M.SIZE] in Fine surface setting screen, and select machine size. The selecting machine size is displayed on Fine surface setting screen.

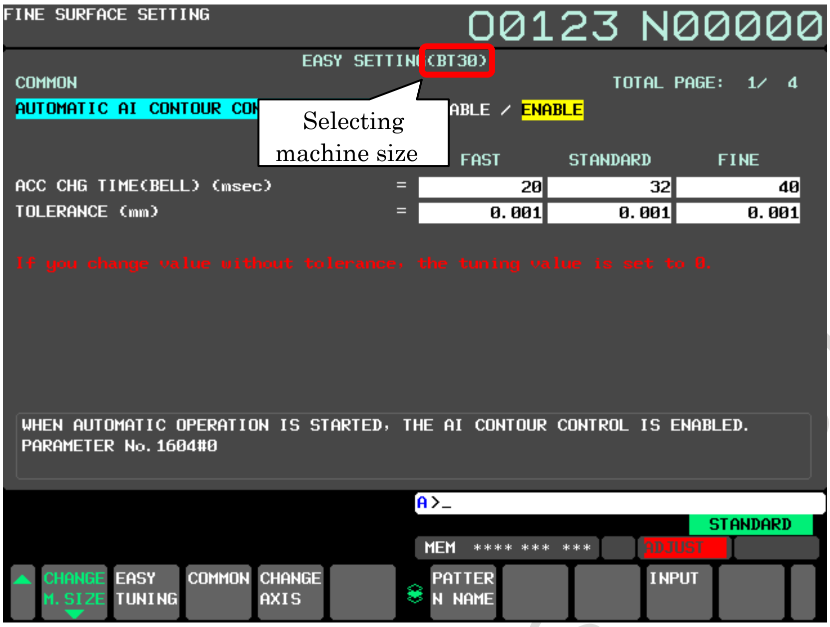

Fig. F.3 (d) Selecting machine size (Fine surface setting screen)

Step 3. Batch setting of recommended values

FANUC's recommended values can be set by batch in parameters related to high-quality machining. Nine patterns of recommended values are available; three patterns of FAST, NORMAL, and FINE for each of spindle taper size BT30, BT40 and BT50.

NOTE

1. Complete basic settings such as axis configuration on parameter screen or parameter adjustment screen before batch setting. The recommended values are not input if the basic settings are not completed.
2. If the following axis is included with the target axes of batch setting, an alarm, DS2075, "ILLEGAL AXIS FOR BATCH SETTING" occurs and batch setting is not started.
   - Incremental system is IS-E
   - Parameter IESPx (Bit 7 of No.1013) is set to 0

   Remove the axis from the target axes and retry batch setting in this case.
3. An alarm, DS2076, "BATCH SETTING CANNOT BE DONE" may be issued with batch setting. In this case, retry the batch setting.
4. Setting parameter MBEx (Bit 0 of No.25002) to 1 starts batch setting regardless of parameter PWE (Bit 0 of No.8900) and 8-Level data protection function.
5. Parameter SYPx (Bit 4 of No.8303) enables automatic parameter setting of the slave axis in Axis synchronous control. If this parameter is set to 1, the recommended value for the master axis is set for the slave axis as for "Time constant of acc./dec. after cutting feed interpolation in acc./dec. before interpolation mode" in Fine surface setting, even though the slave axis is not the target axis of batch setting.
6. Batch setting overwrites current settings with the recommended values. Don't apply the batch setting if the parameters related to high-quality machining have already been set.
7. After batch setting, 28 "FAST", 0 "STANDARD", 29 "FINE" are effective for pattern (1), (2), (3) on Fine surface setting (pattern name setting) screen.
8. After batch setting, pattern 2 is selected as an effective setting pattern.

1 Select target axes of batch setting by parameter MBE (Bit 0 of No.25002). The axes with this parameter set to 1 are the target axes. An alarm, PW0000, "POWER MUST BE OFF" occurs when parameter MBE is set for at least one axis. Turn the power off and on again after setting all target axes.

2 When turning the power on again with MBE set to 1 in at least one axis, the batch setting is started in power-on of the CNC. For the target parameters of the batch setting, refer to the item "Parameters set in Fine surface setting". For axis type parameters, the recommended values are set only in the axis with parameter MBE set to 1. For path type parameters, the recommended values are set only in the path including the axis with MBE set to 1. For the parameters common to the system, the recommended values are set when the batch setting is completed.

3 Parameter MBE is turned to 0 when turning the power on again, regardless of whether or not the batch setting succeeded.

Example)

In the system with the following axis configuration, recommended values are set as follows when setting 1 to parameter MBE in X2, Z2, Y3 axes.

Table F.3 (a) Example of batch setting

	Parameter MBEx	Recommended values		
		Common to the system	Path type	Axis type
X1	0			Not set
Y1	0		Not set	Not set
Z1	0			Not set
X2	1			**Set**
Y2	0	**Set**	**Set**	Not set
Z2	1			**Set**
X3	0			Not set
Y3	1		**Set**	**Set**
Z3	0			Not set

Step 4. Preparation of setting patterns

Select pattern name according to machining condition, and adjust parameters of each patterns.

1 Select the names of pattern 1 to 3 in Fine surface setting (pattern name setting) screen. Refer to the item of “Setting pattern name” for the details.
2 Input setting data in selectable parameters in Fine surface setting screen. Refer to the item of “Parameters set in Fine surface setting” for selectable parameters.

NOTE
1. Setting data cannot be input on Fine surface setting screen if parameter PWE is set to 0. A warning “WRITE PROTECT” is issued along with setting data input.
2. Setting data cannot be input to the item of parameter input on Fine surface setting screen if parameters are protected by 8-Level data protection function. A warning “WRITE PROTECT” is issued along with the setting data input.
3. Setting data cannot be input to the item of setting input on Fine surface setting screen if setting parameters are protected by 8-Level data protection function. A warning “WRITE PROTECT” is issued along with setting data input.
4. Setting data must be input on Fine surface setting screen during emergency stop or in MDI mode with automatic operation stopped. A warning “CNC RUNNING” is issued along with setting data input during automatic operation, and a warning “SWITCH TO MDI MODE” is issued along with setting data input in other modes.
5. Parameter SYPx (Bit 4 of No.8303) enables automatic parameter setting for the slave axis in Axis synchronous control. If this parameter is set to 1, the recommended data for the master axis is set for the slave axis as for “Time constant of acc./dec. after cutting feed interpolation in acc./dec. before interpolation mode” in Fine surface setting.
6. Fine surface setting screen is not displayed in a loader path if Loader control function is enabled.

Operation in Fine surface setting screen

Select name of setting pattern

1 Display Fine surface setting screen(Pattern name setting).
2 Press cursor key ⬆ ⬇ to move cursor to the setting pattern to be selected.
3 Input a setting to key input buffer, and press input key INPUT or soft key [INPUT].

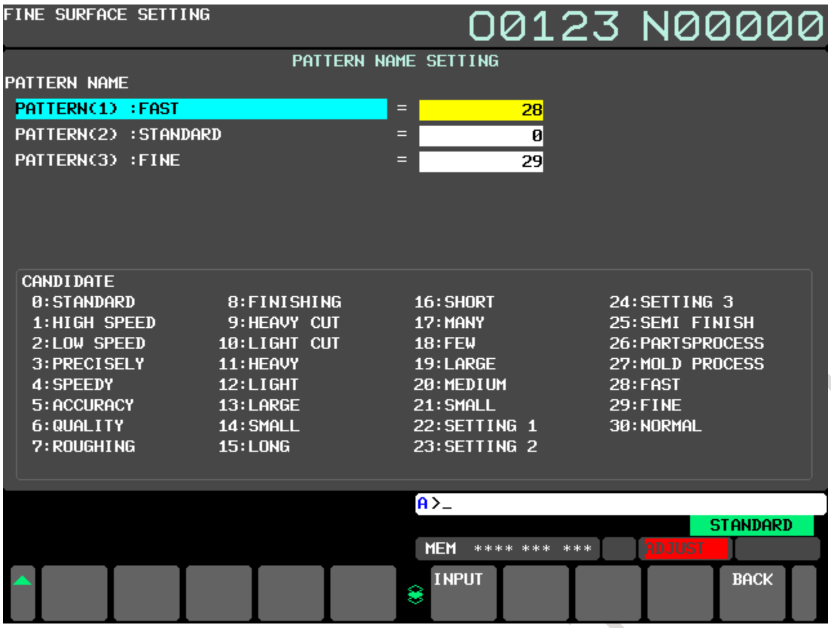

Fig. F.3 (e) Fine surface setting screen (pattern name setting)

Input parameters of each setting patterns

1 Display Fine surface setting screen.
Setting items which common to the path are displayed when press soft key[COMMON], setting items of each axes are displayed when press soft key[CHANGE AXIS]. Displayed axis is switched when press soft key[CHANGE AXIS] several times. Press page change keys to move to the screen of the axis to be set.

2 Press cursor keys to move the cursor to the parameter to be set.

3 Input a setting data to key input buffer, and press input key or soft key [INPUT]. Pressing soft key [ALL AXES] input common setting data by batch to all axes in the path.

Fig. F.3 (f) Fine surface setting screen (common)

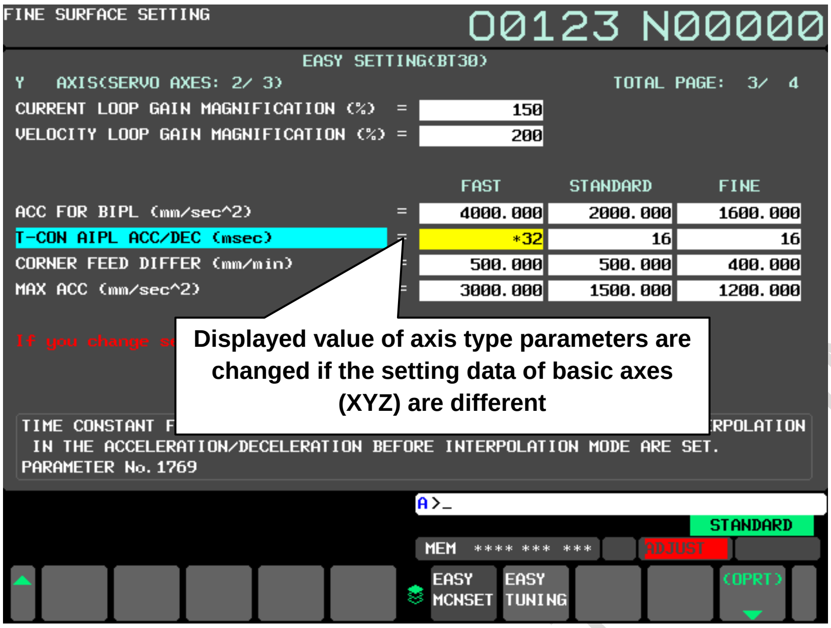

Fig. F.3 (g) Fine surface setting screen (each axes)

Step 5. Easy tuning of parameters

Tuning which set selectable parameters more high-precision/high-speed can be done in easy tuning screen.

1 Prepare setting pattern by finishing steps 1 to 4.
2 Set MAEx(bit 0 of parameter No.25003) to 0 for target axes of easy tuning.
3 Tune parameters in easy tuning screen. About the tuning parameters, refer to the item “Tuning parameters”

> **NOTE**
> 1. Easy tuning cannot be done when parameter PWE is set to 0. A warning “WRITE PROTECT” is issued along with tuning in this state.
> 2. Easy tuning cannot be done when parameters are protected by 8-Level data protection function. A warning “WRITE PROTECT” is issued along with tuning in this state.
> 3. Easy tuning must be done during emergency stop or in MDI mode with automatic operation stopped. A warning “CNC RUNNING” is issued along with tuning during automatic operation and a warning “SWITCH TO MDI MODE” is issued along with tuning input in other modes.
> 4. Easy tuning screen is not displayed when parameter MAE of all axes in a path is set to 1.

Display easy tuning screen

How to display easy tuning screen

1 Display Fine surface setting screen, and press soft key[EASY TUNING].

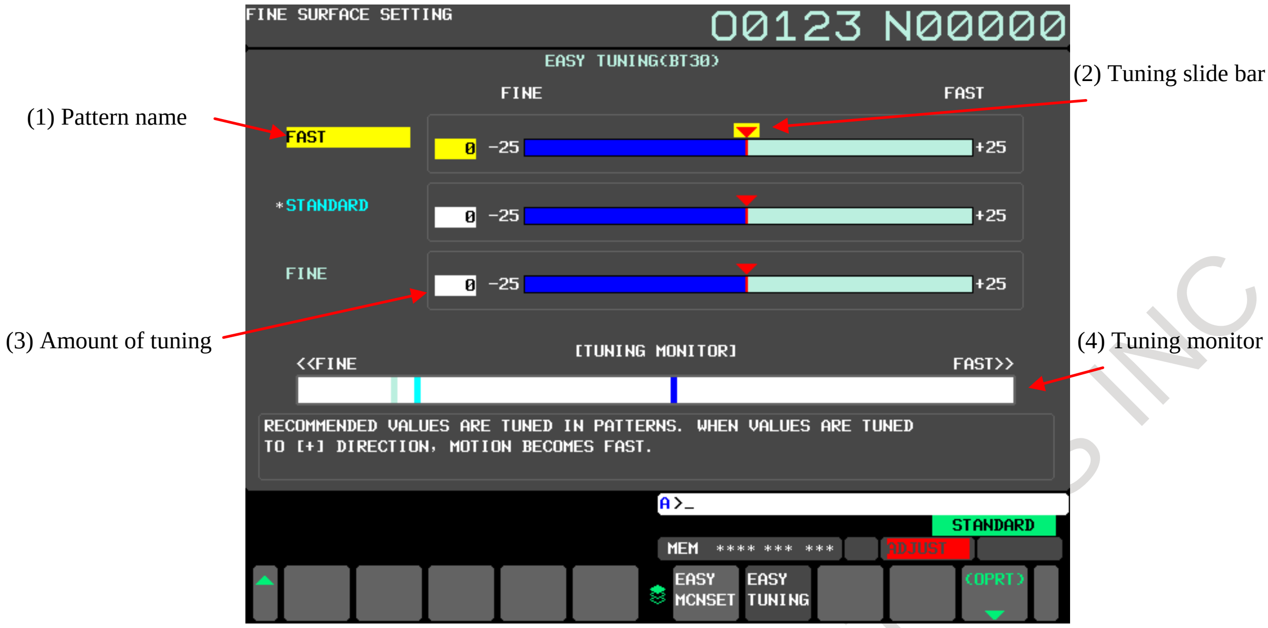

Fig. F.3 (h) Easy tuning screen

Explanation of screen

(1) Pattern name	:	Name of pattern 1 to 3 are displayed. It is displayed in order of pattern 1, pattern 2, and pattern 3.
(2) Tuning slide bar	:	Present amount of tuning is shown by the arrow. When the setting is more high-speed, the arrow moves to left. And, when the setting is more high-precision, the arrow moves to right.
(3) Amount of tuning	:	Present amount of tuning is shown by the numerical value.
(4) Tuning monitor	:	Relation of each setting pattern is displayed. When the setting is more high-speed, the arrow moves to left. And, when the setting is more high-precision, the arrow moves to right.

Operation in Easy tuning screen

Tuning of setting pattern

1. Press cursor keys ⬆ ⬇ to move the cursor to the setting pattern to be tuned.
2. Press cursor key ⬅. Setting pattern is tuned to high-precision. And, press cursor key ➡. Setting pattern is tuned to high-speed. Moreover, input the amount of tuning to key input buffer, and press input key INPUT or soft key [INPUT], same tuning can be done.
3. Setting value of setting pattern after tuning can be confirmed in Fine surface setting screen.

NOTE

1. A warning “Can’t do more adjustment.” is issued along with tuning as follows and tuning is not done. About the tuning range, refer to the item “Tuning parameters”.
   - Tuning to which setting pattern exceeds the tuning range is done.
   - Tuning is done in the state to which setting pattern has exceeded the tuning range.
2. The position of each setting pattern in tuning monitor is calculated by the setting of tuning parameters of the reference axis. When parameter MAEs of the reference axis is set to 1, the positions of each setting pattern in tuning monitor are fixed on the most high-precision.
3. When the setting value of tuning parameters is changed after doing easy tuning, amount of tuning of setting pattern which is changed becomes 0. When easy tuning is done again in this state, tuning is done by the setting of tuning parameters after changing.
4. When the setting value of parameter MAE is changed after doing easy tuning, amount of tuning of all setting patterns become 0. When easy tuning is done again in this state, tuning is done by the setting of tuning parameters after changing.

Step 6. Setting of setting pattern selection

The effective setting pattern can be selected by screen operation, program commands, and signal operation.

Pattern select screen is not displayed when parameter MPS (Bit 3 of No.25001) is set to 1. To protect setting patterns from being selected by operators, set parameter MPS equal to 1.

NOTE

If Peripheral axis control is valid, the setting pattern of Peripheral axis control follows the setting pattern of the path specified with parameter No.3040 to 3042. The setting pattern of Peripheral axis control is preserved as it is started. Even if the setting pattern specified with parameter No.3040 to 3042 is changed after Peripheral axis control is started, the actual setting pattern is not changed.

Step 6-1. Selection by screen operation

Selection of setting pattern by screen operation

The effective setting pattern can be selected on pattern select screen. Setting parameter MPD (Bit 1 of No.25001) equal to 1 enables to check the setting data of each setting pattern on this screen. The way to switch between common and each axes is same as Fine surface setting screen.

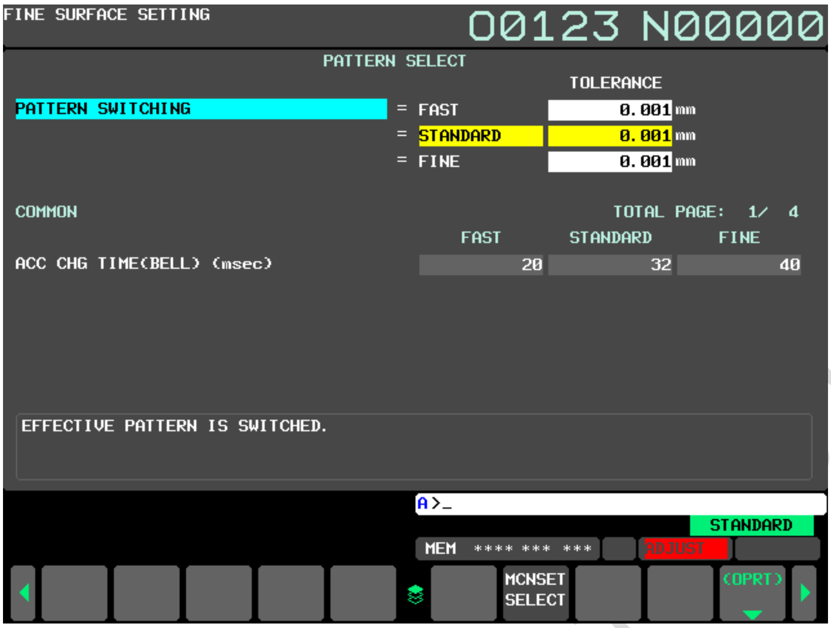

Fig. F.3 (i) Display setting values of setting pattern (common)(pattern select screen)

Fig. F.3 (j) Display setting values of setting pattern (each axes)(pattern select screen)

NOTE

1. Pattern selection by pattern select screen must be performed during emergency stop or in MDI mode with automatic operation stopped. A warning “CNC RUNNING” is issued along with the pattern selection during automatic operation, and a warning “SWITCH TO MDI MODE” is issued along with the pattern selection in other modes.
2. Pattern select screen is not displayed in a loader path if loader control function is valid.

Operation in pattern select screen

Selection of setting pattern

1 Press cursor keys ← ↑ ↓ → to move cursor to the setting pattern to be enabled.

2 Press soft key [SELECT], and the selected setting pattern is turned to valid.

Step 6-2. Selection by program command

Selection of setting pattern by G08.1 command

The effective setting pattern can be selected by commanding G08.1 during automatic operation. The setting pattern to be enabled is specified with address P. Refer to the following item of “Format” for the format of G08.1 command.

Selection of setting pattern by G05.1, G05 and G08.1 command

A setting pattern can be selected by the G code of Machining condition selection function (G05.1, G05, G08 commands) by setting parameters No.25008 and No.25009 to specify the range of accuracy level in each of pattern 1 to 3. This enables to use the machining programs without any changes, which has been used on the machines with Machining condition selection function available. Refer to the following item of “Format” for the format of G05.1, G05, G08 commands.

The range of pattern 1 and pattern 3 are specified with parameter No.25008 and No.25009, respectively.
Example)
To specify accuracy level 1 to 3 with pattern 1, level 4 to 7 with pattern 2, and level 8 to 10 with pattern 3, set 3 in parameter No.25008 and 8 in No.25009.

Setting pattern	Pattern 1			Pattern 2				Pattern 3		
Accuracy level	1	2	3	4	5	6	7	8	9	10

No.25008 No.25009

Step 6-3. Selection by signal operation

Selection of setting pattern by signal operation

The effective setting pattern can be selected by signal input.

< Setting pattern select signal MSSP1, MSSP2<Gn589.5, 6> >
A setting pattern is specified with MSSP1, MSSP2.
Set MSSP1, MSSP2 as follows.

Table F.3 (b) Setting pattern select signal

Setting pattern	Gn589	
	bit 6	bit 5
Pattern 1	0	1
Pattern 2	1	0
Pattern 3	1	1

< Setting pattern switch signal MSWSP<Gn589.7> >
Setting MSWSP equal to “1” enables the setting pattern specified by MSSP1, MSSP2.
< Setting pattern switch complete signal MSWFN<Fn537.6> >
After setting MSWSP to “1” and switching setting pattern, MSWFN is turned to “1”. When setting MSWSP to “0”, MSWFN is turned to “0”.

NOTE

1. In program operation, switch the effective setting pattern while waiting for FIN signal from mask buffering M codes. Note that these M codes must be commanded singly. An alarm, PS2083, "ILLEGAL PATTERN SELECT" occurs if MSWSP is set to "1" at other timing.
2. If MSWSP is set to "1" while either axis in the path is moving, an alarm, PS2083, "ILLEGAL PATTERN SELECT" is issued.
3. When both of Fine surface setting and Machine setting switching function are disabled, setting MSWSP to "1" issues an alarm, PS2089, "MACHINE SET SWITCHING INVALID".
4. Setting patterns does not switch when both MSSP1 and MSSP2 are set to "0", but MSWFN is turned to "1".

Output effective setting pattern

The current setting pattern can be output with signals.

< Setting pattern output signal MSPO1, MSPO2<Fn537.4, 5> >

The current effective setting pattern is output to MSPO1, MSPO2. Refer to the following table for the detail of output signals.

Table F.3 (c) Setting pattern output signal

Pattern	Fn537	
	bit 5	bit 4
Basic parameter or Fine surface setting is disabled	0	0
Pattern 1	0	1
Pattern 2	1	0
Pattern 3	1	1

Step 6-4. Selection by other way

Selection of setting pattern by power-off and reset

If a value between 1 and 3 is set in parameter No.25010, the setting pattern specified with the parameter is selected as an effective setting pattern in power-off and reset operation. The value between 1 and 3 set to parameter No.25010 corresponds to each pattern 1 to 3. If a value other than 1 to 3 is set to parameter No.25010, previously effective setting pattern is preserved in power-off or reset.

Selection way and display effective setting pattern

Relation between selection way and effective pattern

The following figure shows the relation between each selection way of setting pattern and the effective parameters.

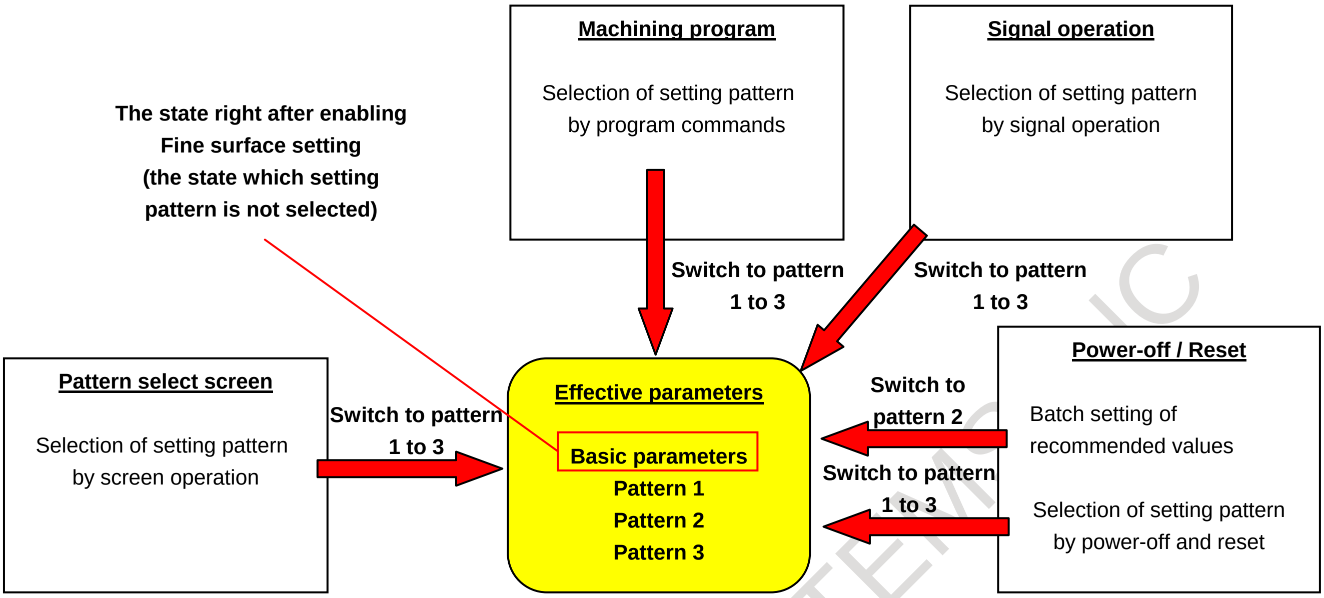

Fig. F.3 (k) Relation between selection way and effective patterns

Display effective setting pattern

The effective setting pattern is displayed at warning message area. The effective setting pattern displayed at the warning message area is hidden if parameter MPW (Bit 4 of No.25001) is set to 1. Set parameter MPW to 1 so that operators cannot see the setting pattern.

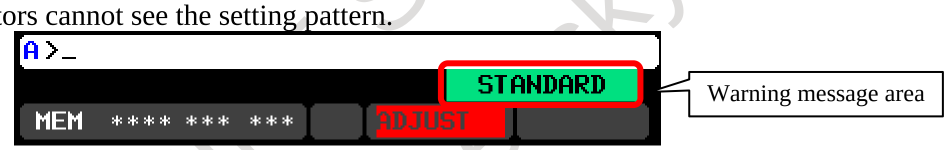

Fig. F.3 (l) Display effective setting pattern

Step 7. Setting of tolerance

The tolerance value in Smooth tolerance control+ can be set in pattern select screen.

> **NOTE**
> This setting is unnecessary if Smooth tolerance+ control is not used.

Setting of Tolerance

The tolerance value of Smooth tolerance control+ (parameter No.11786) can be set to each setting patterns in pattern select screen.

> **NOTE**
> 1. The item of tolerance is not displayed if Smooth tolerance+ control is disabled.
> 2. Setting data cannot be input on pattern select screen if setting parameters are protected by 8-Level data protection function. A warning "WRITE PROTECT" is issued along with setting data input.
> 3. Setting data must be input on pattern select screen during emergency stop or in MDI mode with automatic operation stopped. A warning "CNC RUNNING" is issued along with setting data input during automatic operation, and a warning "SWITCH TO MDI MODE" is issued along with setting data input in other modes.
> 4. Pattern select screen is not displayed in a loader path if loader control function is valid.

Operation in pattern select screen

Input setting data to tolerance

1 Press cursor keys [←] [↑] [↓] [→] to move cursors to the tolerance to be set.

2 Input setting data to key input buffer, and press input key [INPUT] or soft key [INPUT].

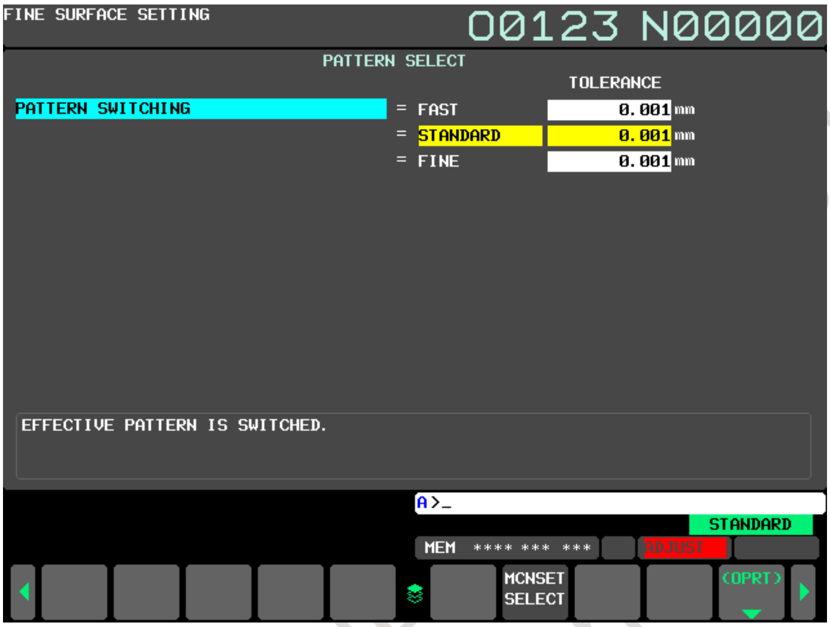

Fig. F.3 (m) Setting of tolerance (pattern select screen)

Appendix

Parameters set in Fine surface setting

The following table shows the parameters set in Fine surface setting related to high-quality machining.

Table F.3 (d) Parameters set in Fine surface setting

Items	Basic parameters	Pattern 1	Pattern 2	Pattern 3	Notes
Unit of recommended value	Recommended value BT30/40/50	Recommended value BT30/40/50	Recommended value BT30/40/50	Recommended value BT30/40/50	
AI contour control with automatic operation start	No.1604#0	-	-	-	(*1)
-	1	-	-	-	
Current loop gain magnification for cutting	No.2334	-	-	-	(*1)
[%]	150	-	-	-	
Velocity loop gain magnification for cutting	No.2335	-	-	-	(*1)
[%]	200	-	-	-	
Max allowable rate in acc./dec. before interpolation	No.1660	-	-	-	(*2)
[mm/sec^2]	2000 / 800 / 620	4000 / 2800/ 1580	2000 / 800 / 620	1600 / 400 / 300	
Acceleration change time of bell-shaped acc./dec. before interpolation	No.1772	-	-	-	(*2)
[msec]	32 / 32 / 60	20 / 20 / 48	32 / 32 / 60	40 / 40 / 64	

Items	Basic parameters	Pattern 1	Pattern 2	Pattern 3	Notes
Unit of recommended value	**Recommended value BT30/40/50**	**Recommended value BT30/40/50**	**Recommended value BT30/40/50**	**Recommended value BT30/40/50**	
Acc./dec. type after interpolation in acc./dec. before interpolation mode	No.1602#3 No.1602#6	-	-	-	(*1)
-	1, 1	-	-	-	
Time constant for acc./dec. after cutting feed interpolation in acc./dec. before interpolation mode	No.1769	-	-	-	(*2)
[msec]	16 / 16 / 24	24 / 24 / 24	16 / 16 / 24	16 / 16 / 24	
Time constant for acc./dec. after cutting feed interpolation in acc./dec. before interpolation mode	No.1783	-	-	-	(*2)
[mm/min]	500 / 300 / 248	500 / 500 / 632	500 / 300 / 248	400 / 150 / 120	
Max allowable acc. rate for deceleration function based on acc. rate	No.1735 No.1737	-	-	-	(*2)
[mm/sec^2]	1500 / 600 / 465	3000 / 2100/ 1185	1500 / 600 / 465	1200 / 300 / 225	
Min allowable feedrate for deceleration function based on acc. rate	No.1732 No.1738	-	-	-	(*1)
[mm/min]	100	-	-	-	
Smooth speed control	No.19503#0	-	-	-	(*1)
-	1	-	-	-	(*A)
Invalidation of speed control with change of acc. rate by block length in Smooth speed control	No.19517#0	-	-	-	(*1) (*A)
-	1	-	-	-	
Invalidation of speed control with acc. rate and change of acc. rate	No.19517#1	-	-	-	(*1)
-	1	-	-	-	

Items (*1) are the target of batch setting of recommended values.
Items (*2) are the target of batch setting of recommended values and selectable parameters.
Items (*A) are the target of batch setting of recommended values if AI contour control II is enabled.

NOTE

1. For items (*1) and (*2), the following parameters are called basic parameters.
   (*1): Parameters effective regardless of setting pattern selection
   (*2): Parameters effective with no setting pattern selected
2. The recommended values are varied depending on the unit of parameters and the minimum command/machine unit.
   Ex.)The minimum allowable feedrate for deceleration function by acceleration rate is a parameter with machine unit.
   The recommended value is 100 [mm/min] for millimeter machines.
   It is 3.937 [inch/min] for inch machines, on the other hand.
3. After batch setting of recommended values, items (*1) and (*2) are set as follows.
   (*1): The recommended values in the table above are set to the parameters in column "Basic parameter".
   (*2): The recommended values in the table above are set to the parameters in column "Basic parameter" and "Pattern 1 to 3".
4. Items(A*) are not displayed on Fine surface setting screen and pattern select screen if AI contour control II is disabled.

Tuning parameters

In parameters related to high-quality machining, the parameters (tuning target) which are tuned by easy tuning, the parameters (calculation target) which are used for calculation of tuning monitor, and the tuning range of each parameter is as follows.

Table F.3 (e) Tuning parameter

Item	Basic parameter	Tuning target	Calc target	Tuning range
Max allowable rate in acc./dec. before interpolation	No.1660	O	O	0.0<n≦5000.0 [mm/s^2] *
Acceleration change time of bell-shaped acc./dec. before interpolation	No.1772	O	O	7<n≦64 [ms]
Time constant for acc./dec. after cutting feed interpolation in acc./dec. before interpolation mode	No.1769	-	O	-
Max allowable feedrate difference for feedrate determination based on corner feedrate difference	No.1783	O	O	0.0<n≦1000.0 [mm/min] *
Max allowable acc. rate for deceleration function based on acc. rate	No.1735 No.1737	O	O	0.0<n≦3750.0 [mm/s^2] *

NOTE

When increment system is IS-E, tune the * parameters within the range of 0.0<n≤999.0.

Setting pattern name

The following table shows the relation between the setting data in Fine surface setting (pattern name setting) screen and the name of setting pattern.

Table F.3 (f) Name of setting pattern

Setting data in Fine surface Setting (pattern name setting) screen	Name of setting pattern
0	STANDARD
1	HIGH SPEED
2	LOW SPEED
3	PRECISELY
4	SPEEDY

Format

G08.1P_ ;

P_ : Setting pattern
- P1 : “Pattern 1”
- P2 : “Pattern 2”
- P3 : “Pattern 3”

Ex.) When commanding G08.1P3, “Pattern 3” is selected as an effective setting pattern.

NOTE
1. An alarm, PS2083, "ILLEGAL PATTERN SELECT" is issued when processing G08.1 block in the following cases.
   - A value other than 1 to 3 is commanded with address P
   - Either axis in the path is moving
2. G08.1P_ is a G code preventing buffering.
3. If Fine surface setting and Machine setting switching function are disabled, an alarm, PS0010, "IMPROPER G CODE" is issued when commanding G08.1.
4. If Fine surface setting and Loader control function are enabled, an alarm, PS0010, "IMPROPER G CODE" is issued when commanding G08.1 in a loader path.

G05.1 Q1 R_ ;
R_ : level(1 to 10)
G05 P10000 R_ ;
R_ : level(1 to 10)
G08 P1 R_ ;
R_ : level(1 to 10)

NOTE
1. An alarm, PS2083, "ILLEGAL PATTERN SELECT" is issued when processing G05.1Q1, G05P10000, G08P1 blocks in the following cases.
   - A value other than 1 to 3 is commanded with address R
   - Either axis in the path is moving
2. G05.1Q1R_, G05P10000R_, and G08P1R_ are G codes preventing buffering.
3. These commands can be used by setting parameters No.25008, No.25009 to specify the range of pattern 1 to 3. An alarm, PS0010, "IMPROPER G CODE" is issued when commanding G05.1Q1R_, G05P10000R_, or G08P1R_ if parameters No.25008, No.25009 are illegally set.
4. If Fine surface setting and Loader control function are enabled, an alarm, PS0010, "IMPROPER G CODE" is issued when commanding G05.1Q1R_, G05P10000R_, or G08P1R_ in a loader path.

Signal

Setting pattern select signal MSSP1, MSSP2<Gn589.5, 6>

[Classification] Input signal
[Function] Select an effective pattern in setting pattern selection by signal operation
[Operation] Select an effective setting pattern as follows.

Setting pattern	Gn589	
	bit 6	bit 5
Pattern 1	0	1
Pattern 2	1	0
Pattern 3	1	1

NOTE
Setting pattern does not switch when both MSSP1 and MSSP2 are set to “0”, but MSWFN<Fn537.6> is set to “1”.

Setting pattern switch signal MSWSP<Gn589.7>

[Classification] Input signal
[Function] Switch the effective pattern in setting pattern selection by signal operation
[Operation] When setting this signal from “0” to “1”, the combination of spindle axis and servo axis to synchronize (Parameter No.24208) is updated. This signal is valid when Spindle/Servo axis combination change condition signal SPSVSS<F0537.1> is “1”.

Setting pattern output signal MSPO1, MSPO2<Fn537.4, 5>

[Classification] Output signal
[Function] These signals indicate the current effective setting pattern
[Output condition] The output of these signals as follows, depending on the currently effective setting.

Pattern	Fn537	
	bit 5	bit 4
Basic parameters, or Fine surface setting is disabled	0	0
Pattern 1	0	1
Pattern 2	1	0
Pattern 3	1	1

Setting pattern switch complete signal MSWFN<F0537.6>

[Classification] Output signal
[Function] This signal indicates the end of setting pattern switching in setting pattern selection by signal operation.
[Output condition] This signal is turned to “1” in the following case:
- The setting pattern has been switched after setting pattern switch signal MSWSP is set to “1”.

This signal is turned to “0” in the following case:
- Setting pattern switch signal MSWSP is set to “0”.
- The setting pattern has not been switched yet after setting pattern switch signal MSWSP is set to “1”.

Signal address

	#7	#6	#5	#4	#3	#2	#1	#0
Gn589	MSWSP	MSSP2	MSSP1					
Fn537		MSWFN	MSPO2	MSPO1				

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
24745	FSS							

[Input type] Parameter input
[Data type] Bit

#7 FSS The adjustment by Fine surface setting is
0: not completed.
1: completed.

> **NOTE**
> When this parameter is 0, Fine surface setting screen (FSS screen) is displayed. Moreover, "ADJUST" is blinked in the status section. Be sure to set this parameter to 1 before shipment of machines and hide FSS screen and "ADJUST" of status section.

	#7	#6	#5	#4	#3	#2	#1	#0
25000	FSD							

[Input type] Parameter input
[Data type] Bit

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#7 FSD Fine surface setting is
0: enabled.
1: disabled.

	#7	#6	#5	#4	#3	#2	#1	#0
25001				MPW	MPS		MPD	

[Input type] Parameter input
[Data type] Bit

#1 MPD In Fine surface setting, the setting data of each setting pattern is
0: not displayed on pattern select screen.
1: displayed on pattern select screen.

#3 MPS In Fine surface setting, pattern select screen is
0: displayed.
1: not displayed.

#4 MPW In Fine surface setting, the effective setting pattern is
0: displayed on warning message area.
1: not displayed on warning message area.

	#7	#6	#5	#4	#3	#2	#1	#0
25002								MBE

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#0 MBE In Fine surface setting, batch setting of recommended values is
0: disabled.
1: enabled.

> **NOTE**
> Batch setting of recommended values is done when the power is turned on again. Bit 0 (MBE) of parameter No. 25002 is set to 0 after the batch setting is completed.

	#7	#6	#5	#4	#3	#2	#1	#0
25003								MAE

[Input type] Parameter input
[Data type] Bit axis

#0 MAE In Fine surface setting, easy tuning is
0: enabled.
1: disabled.

25008	Accuracy level corresponding to pattern 1 in Fine surface setting
25009	Accuracy level corresponding to pattern 3 in Fine surface setting

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 10

This parameter specifies the accuracy level of machining condition function corresponding to pattern 1 to 3 of Fine surface setting.
Example)
If the precision level 1 to 3, level 4 to 7, and level 8 to 10 correspond to pattern 1, 2, 3, respectively, set parameter No.25008 to 3 and parameter No.25009 to 8.

> **NOTE**
> Set a larger value to parameter No.25009 than to parameter No.25008. If parameter No.25009 is smaller than parameter No.25008, setting pattern cannot be selected in G05.1, G05, G08 commands.

25010	Setting pattern in Fine surface setting in power-off, reset operation

[Input type] Parameter input
[Data type] Byte path
[Valid data range] 0 to 3

This parameter specifies the setting pattern selected in power-off or reset operation during automatic operation. If this parameter is set to 1 to 3, setting pattern 1 to 3 is selected. The previously effective setting pattern is selected, otherwise.

	#7	#6	#5	#4	#3	#2	#1	#0
1013	IESP							

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#7 IESP When the incremental system is IS-C, IS-D, or IS-E, the function to set a larger value to the parameter related to speed and acceleration
0: is not used.
1: is used.

	#7	#6	#5	#4	#3	#2	#1	#0
8303				SYPx				

[Input type] Parameter input
[Data type] Bit axis

> **NOTE**
> When this parameter is set, the power must be turned off before operation is continued.

#4 SYPx Some parameters must be set to the same value for the master and slave axes in Axis synchronous control. When a value is set in such a parameter for the master axis,
0: the same value is not automatically set for the slave axis.
1: the same value is automatically set for the slave axis.

	#7	#6	#5	#4	#3	#2	#1	#0
8900								PWE

[Input type] Parameter input
[Data type] Bit
#0 PWE The setting, from an external device and MDI panel, of parameters unable to be written by setting input is
0: disabled.
1: enabled.

Alarm and message

番号	Message	Description
PW0000	POWER MUST BE OFF	A parameter has been set for which the power must be OFF then ON again.
PS0010	IMPROPER G-CODE	An unavailable G code is commanded.
PS2083	ILLEGAL PATTERN SELECT	A setting pattern cannot be selected for the following reasons. - A value other than 1 to 3 is specified with address P of G08.1 - A value other than 1 to 10 is specified with address R of G05.1Q1, G05P10000, G08P1 - Either axes in the path is moving - Setting pattern selection by signal operation is commanded during automatic operation, except for the waiting time for FIN of mask buffer M codes

番号	Message	Description
DS2075	ILLEGAL AXIS FOR BATCH SETTING	Batch setting of recommended values cannot be started for the following reason. - The incremental system of the axis is IS-E and parameter IESPx(No.1013#7) is set to 0
DS2076	BATCH SETTING CANNOT BE DONE	Batch setting of recommended values has not been performed. Set parameter MBE (Bit 0 of No.25002) and start the batch setting again.

F.4 OPERATION CHECK

Perform automatic operation and check cycle time and shape of workpiece. Adjust the parameters on each setting screen (FCS screen, FSS screen) as necessary. Parameters set by Fast cycle-time setting and Fine surface setting can be changed directly from each setting screen (FCS screen, FSS screen). For parameters of the axis type and spindle type, the same setting can be made for all axes with one input by using the soft key [ALL SV/SP]. As for the parameters of the axis type and the spindle type, when the parameter values of all axis (basic three axis in the case of the axis type and all spindle in case of the spindle type) are not the same value, an asterisk (*) is displayed.

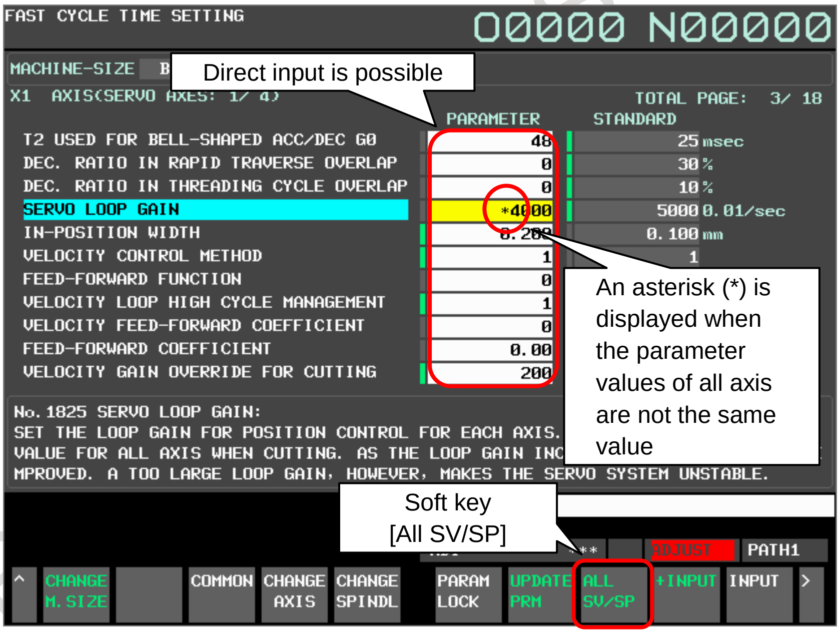

Fig. F.4 (a) Direct input of parameters (FCS screen)

> **NOTE**
> Check operation with all setting pattern of Fine surface setting. For details on how to select the setting pattern, refer to the section "Setting of pattern selection".

⚠ WARNING

By Fast cycle-time setting, the function to reduce the cycle-time, such as the overlap function, becomes valid and the tool path may change. Never attempt to machine a workpiece without first checking the operation of the machine. Before starting a production run, ensure that the machine is operating correctly by performing a trial run using, for example, the single block, feedrate override, or machine lock function or by operating the machine with neither a tool nor workpiece mounted. Failure to confirm the correct operation of the machine may result in the machine behaving unexpectedly, possibly causing damage to the workpiece and/or machine itself, or injury to the user.

F.5 ADJUSTMENT COMPLETION SETTING

Fast cycle-time setting and Fine surface setting are functions for the machine tool builder. Set adjustment completion before machine shipment and hide FCS screen, FSS screen, and "ADJUST" of status section.

The setting method of adjustment completion is as follows.

- Fast cycle-time setting
  Set the bit 0 (FCS) of parameter No. 24745 to 1 on the parameter screen.
- Fine surface setting
  Set the bit 7 (FSS) of parameter No. 24745 to 1 on the parameter screen.

NOTE

1. Disable Fine surface setting to set FSD(bit 7 of parameter 25000) to 1 when pattern switching of Fine surface setting is not used.
2. Disable Fine surface setting to set FSD(bit 7 of parameter 25000) to 1 when enable Machining condition selection function.

Parameter

	#7	#6	#5	#4	#3	#2	#1	#0
24745	FSS							FCS

[Input type] Parameter input
[Data type] Bit

#0 FCS The adjustment by Fast cycle-time setting is :
0: not completed.
1: completed.

NOTE

When this parameter is 0, Fast cycle-time setting screen (FCS screen) is displayed. Moreover, "ADJUST" is blinked in the status section. Set this parameter to 1 before shipment of machines and hide FCS screen and "ADJUST" of status section.

#7 FSS The adjustment by Fine surface setting is :
0: not completed.
1: completed.

> **NOTE**
> When this parameter is 0, Fine surface setting screen (FSS screen) is displayed. Moreover, "ADJUST" is blinked in the status section. Set this parameter to 1 before shipment of machines and hide FSS screen and "ADJUST" of status section.
